Theoretical framework Design Analysis

The SRM components

Example: Case Study: X, 14 years old

- Aggressive problems in family context
- No problems at school
- Disturbed family dynamics?

Network of Relationship Inventory (Furman & Buhrmester, 1985):

- Negative interaction subscale

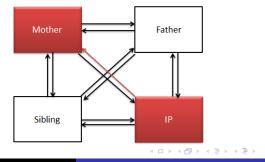

Theoretical framework Design Analysis

The SRM components

Example: Case Study: X, 14 years old

- Aggressive problems in family context
- No problems at school
- Disturbed family dynamics?

e.g. How much do you and your mother get annoyed with each other's behavior?

Theoretical framework Design Analysis

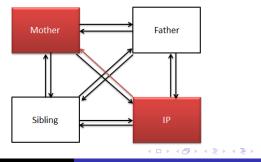

The SRM components

Example: Case Study: X, 14 years old

- Aggressive problems in family context
- No problems at school
- Disturbed family dynamics?

Result NRI :

X reports a lot of negativity in relation to his mother

Theoretical framework Design Analysis

The SRM components

X reports about negativity in relation to his mother.

Actor effect:

How much negativity does this child report in

general?

Partner effect

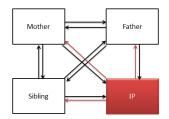

How negative is this mother perceived?

Relationship effect

Is it specific to their relationship?

• Family effect

Is it something specific to the family culture?

・ロト ・ 四 ト ・ 回 ト ・ 回 ト

Theoretical framework Design Analysis

The SRM components

X reports about negativity in relation to his mother.

Actor effect:

How much negativity does this child report in

general?

Partner effect

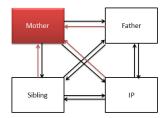

How negative is this mother perceived?

Relationship effect

Is it specific to their relationship?

• Family effect

Is it something specific to the family culture?

・ロト ・ 四 ト ・ 回 ト ・ 回 ト

Theoretical framework Design Analysis

The SRM components

X reports about negativity in relation to his mother.

Actor effect:

How much negativity does this child report in

general?

Partner effect

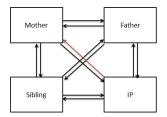

How negative is this mother perceived?

Relationship effect

Is it specific to their relationship?

• Family effect

Is it something specific to the family culture?

・ロト ・ 四 ト ・ 回 ト ・ 回 ト

Theoretical framework Design Analysis

The SRM components

X reports about negativity in relation to his mother.

Actor effect:

How much negativity does this child report in

general?

Partner effect

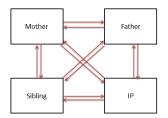

How negative is this mother perceived?

Relationship effect

Is it specific to their relationship?

Family effect

Is it something specific to the family culture?

・ロ・ ・ 四・ ・ ヨ・ ・ 日・ ・

Theoretical framework Design Analysis

The SRM is perfectly suitable for

Perform case studies

! need normative sample

(e.g. What are abnormal dynamics within this particular family?)

Examining one group

(e.g. Do mothers differ in terms of negativity?)

Comparing two groups

(e.g. Is there a difference between mothers with or without a child with externalizing problem behavior?)

Theoretical framework Design Analysis

Additional analyses

Additional questions that can be answered:

 At the individual level of analyses: What you give is what you get?

(i.e. correlation between actor and partner effect of the same person)

• At the dyadic level of analyses:

Are there bidirectional effects?

(i.e. correlation between the two relationship effects of the same dyad)

• Within generations:

Are there intragenerational similarities?

(i.e. correlation between actor or partner effects of the individuals of the same generation)

(4月) (4日) (4日)

Theoretical framework Design Analysis

Confirmatory Factor Analysis

SRM components are specified as latent variables in a CFA.

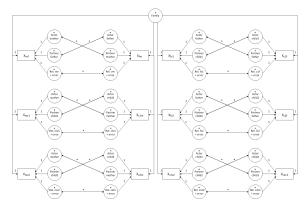

Figure : Boxes represent observed dyadic measurements, circles latent variables. Parameters that are fixed are indicated by '1', free parameters by an asterisk. Every indicator is connected with the corresponding latent variable by a single headed arrow. Double headed arrows represent reciprocities.

(日)

Main goal

Family researchers often find it hard to perform the analyses

Theoretical framework

• •

Output for each group

 Difference between groups

- More family negativity in problematic families
- Target adolescent reports more negativity

< ロ > < 圖 > < 圖 > < 필 > .

Some other features of the package:

- SRM in three person family
 - Specify which component to drop (default: family factor)
- Improve model fit
 - Modification indices
 - Fix negative or nonsignificant effects to zero
- Investigate difference over roles same component
- Handle missing data
