## 1. LittleSister

- e-Health care project: use technology to improve the quality of life of elderly people in their homes.
- In LittleSister we use a sensor network based on very low-resolution (900-pixel) visual sensors which enables monitoring of elderly people's health and safety at home, postponing institutionalized healthcare.

## 2. Approach

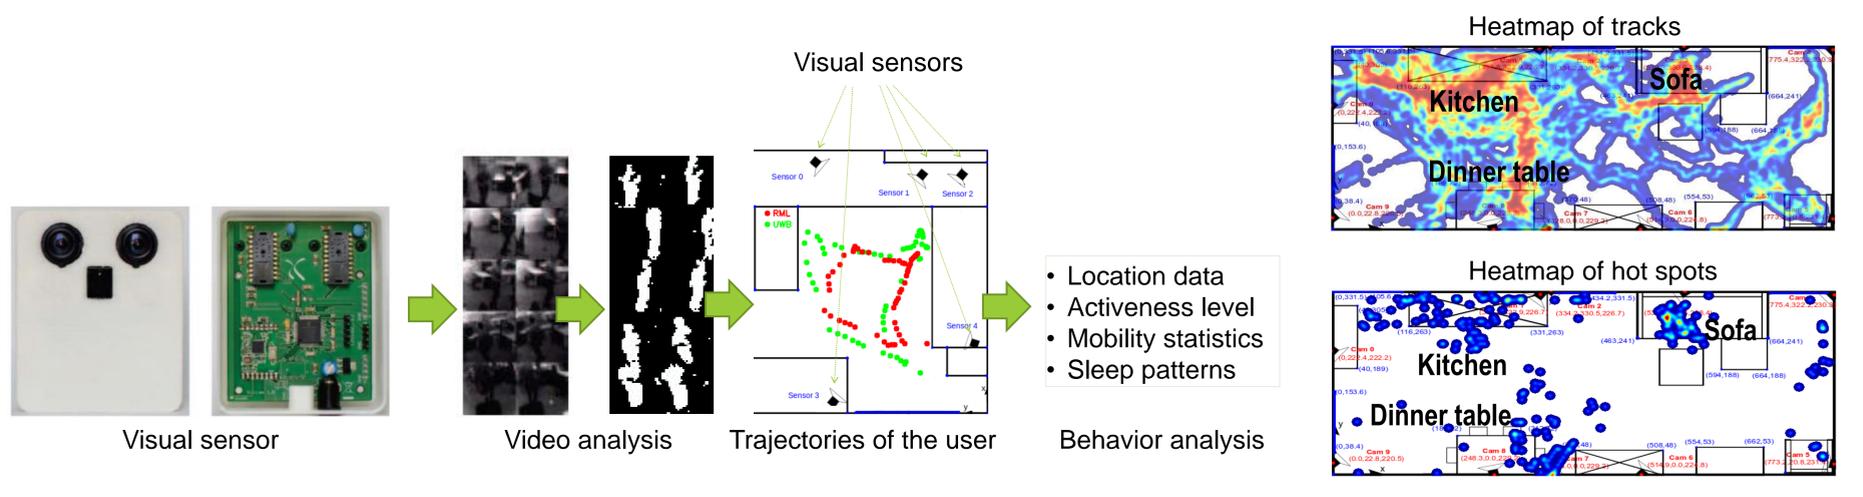

- Distributed processing algorithms running on microcontrollers and microcomputers analyze changes in motion and behavior patterns over time and detect possible emergency situations.

## 3. Data capture installation

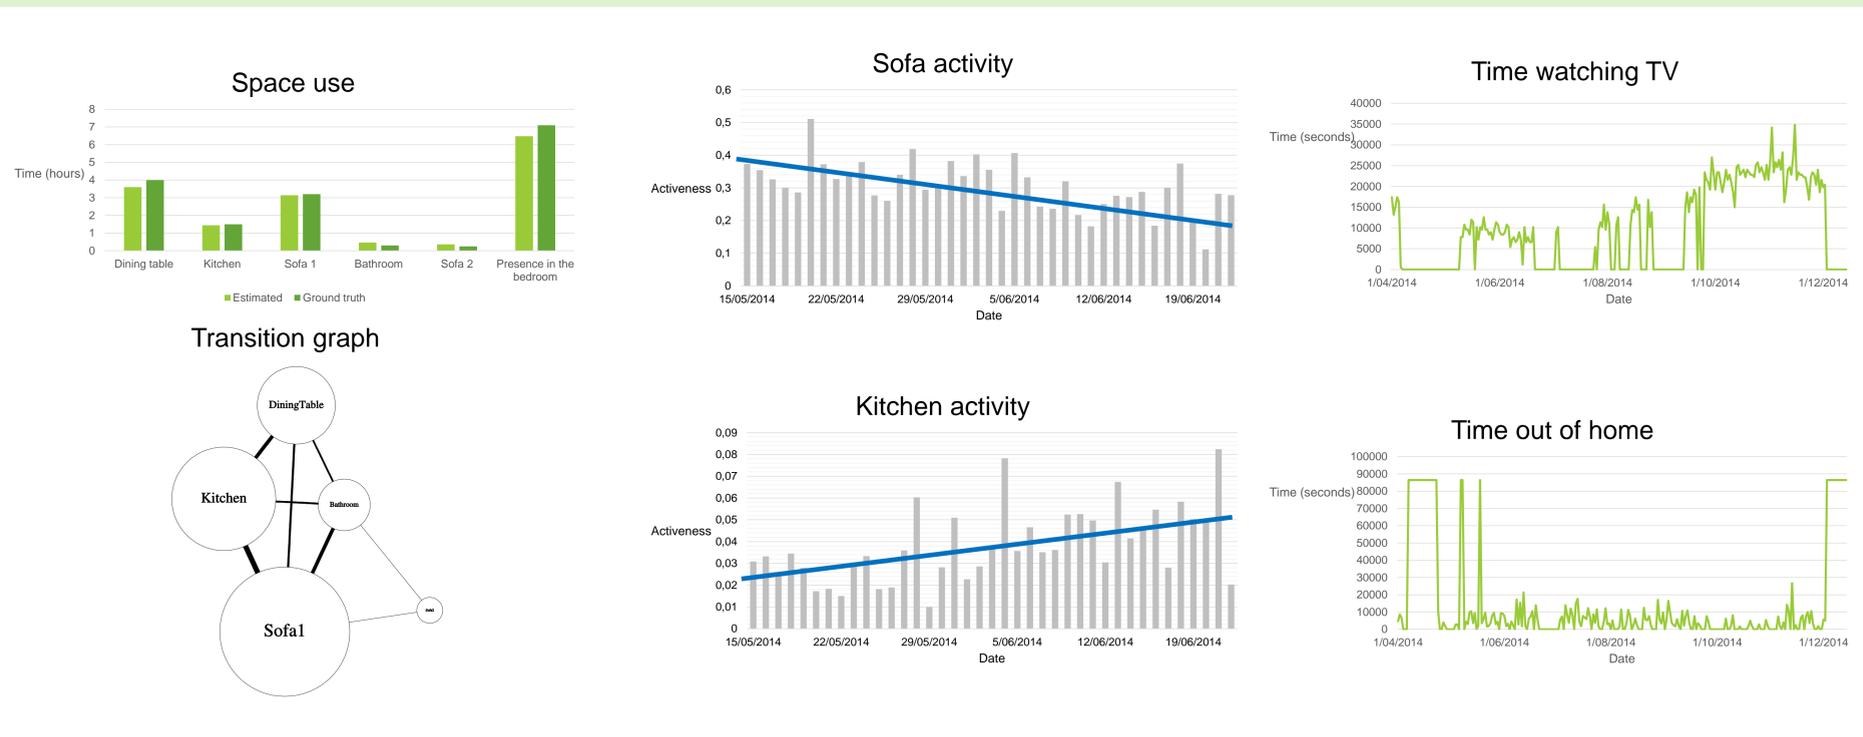

- Service flat — CM, Dendermonde
- Installation date: 01/03/2014
  - 10 visual sensors
  - Capture duration: 12 months
- 1 inhabitant
- 83 years old
  - Diabetic
  - Decreased mobility

## 4. Distributed processing pipeline for automatic behavior analysis

## 5. Results of long-term behavioral change analysis

## 6. Conclusion

Despite significant technical challenges, low-resolution visual sensor networks are a viable solution to monitor people's behavior at home. They provide sufficiently rich information to detect health-related behavioral changes.
