LETTER

A little less saturation?

Jack JM Ligtenberg^{*1}, Renate Stolmeijer¹, Josien J Broekema¹, Jan C ter Maaten¹ and Jan G Zijlstra²

See related viewpoint by Cornet *et al.*, <http://ccforum.com/content/17/2/313>

In the previous issue of *Critical Care*, Alexander Cornet and colleagues reasoned quite convincingly that the liberal use of supplemental oxygen, which is common in the resuscitation of critically ill patients, may be detrimental instead of beneficial [1].

The Surviving Sepsis Campaign guidelines do not give specific recommendations about the amount of oxygen to be administered for patients with severe sepsis or septic shock; instead, they advise one to maintain peripheral oxygen saturation between 88 and 95% [2]. Most pre-hospital and emergency department (ED) sepsis protocols administer 15 l oxygen/minute with a nonrebreather mask or 10 l oxygen/minute with a VentiMask (Intersurgical Ltd, Wokingham, Berkshire, UK), resulting in an inspired oxygen fraction (FiO₂) of respectively ±0.6 to 0.8 and 0.4.

Although evidence is accumulating that hyperoxia is disadvantageous in more instances than only after cardiac arrest [3], this topic has not been investigated in sepsis patients. We decided to reduce the FiO₂ in our ED sepsis protocol from 0.6–0.8 to 0.4 and subsequently evaluated the incidence of hyperoxia and hypoxia in sepsis patients admitted to the ED [4]. Only 7% of all patients showed hypoxia and needed a nonrebreather mask with 15 l oxygen/minute; most of these patients had a positive history for pulmonary diseases. Of the patients treated with a FiO₂ of 0.4, 64% still showed hyperoxia (defined as PaO₂ >13.5 kPa). Decreasing the FiO₂ therefore seems justified and appears to be safe; the small portion of patients with hypoxia can be identified within 5 minutes and oxygen can be increased immediately.

We agree with Cornet and colleagues that oxygen should be titrated to normoxia (with the use of the point-of-care blood gas analyser), also with oxygen use for sepsis patients admitted to the ED. However, serious action will be required to abolish the widespread attitude that one cannot get enough oxygen.

Abbreviations

ED, emergency department; FiO₂, inspired oxygen fraction.
