Objective

A randomized controlled cross-over trial with oxytocin nasal spray (one dose of 24 EU) was conducted to investigate effects of oxytocin in young adult males with autism.

Autism Spectrum Disorder is ...

- A lifelong developmental disorder
- Characterized by deficits in social interaction and communication, and restricted interests and behavior patterns
- Associated with altered social cognition and emotion processing

Oxytocin is ...

- Produced in the hypothalamus
- A hormone influencing a.o. digestion and sex organs
- A neurotransmitter influencing social cognition and emotion processing
- Involved in calm, healing and love

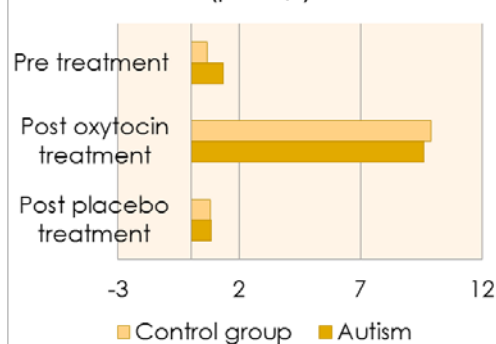

Picture viewing task

Brain responses (EEG) to emotions in humans

Oxytocin blood levels (pmol/l)

Sensitivity to distress of others, example items from the IRI:
"I sometimes feel helpless when I am in the middle of a very emotional situation"
"When I see someone who badly needs help in an emergency, I go to pieces"

Oxytocin enhances brain responses to positive emotions in humans in males with autism having:

- ✓ high sensitivity to distress of others
- ✓ high pre treatment oxytocin blood levels

Oxytocin nasal spray improves affective empathy in a select group of males with autism
