

# Crime Basket Analysis

---

**Amir Ghaseminejad**  
**Patricia Brantingham**  
**Paul Brantingham**

# Crime and Justice System Analysis

- **Historically, crime analysts and criminal case operations analysts have been limited by small and impoverished data sets.**
- **The development of comprehensive digital records management systems have created big and rich data sets.**
  - Limited computational power remains an impediment to analysis of big data for most justice analysts.
  - Few conceptual approaches to analysis of big justice data have been developed to date.
- **We propose *crime baskets* as a useful approach to understanding big justice data.**

# Events and Baskets of Attributes

- **Events are occurrences in space time**
- **Events dealt with by the justice system have two aspects:**
  - A Person aspect
  - A Case aspect
- **Both aspects have a *basket of attributes***
  - Some attributes are *inherent*
    - *Person* – age, gender, race, weight, height, education, economic status
    - *Case* – time, location, specific risk or harm
  - Some attributes are *assigned* by the justice system
    - *Person* – complainant, victim, witness, suspect, convict, parolee
    - *Case* – civil matter/criminal matter, crime type, cleared by charge, prosecuted, dismissed, convicted, sentenced
- **We speak of *Crime Baskets* as a convenient shorthand**

# Basket of Crimes is new concept

- **Crime Baskets can relate criminal acts but also link to:**
  - alcohol,
  - drugs,
  - cars,
  - residences,
  - interactions with people
- **Crime baskets can lead us to exploration of:**
  - Event complexity
  - Criminal careers
  - Social service careers
  - Criminal typologies
  - Justice system behavior
  - Social system behavior

Crime Baskets can be analyzed in many ways:

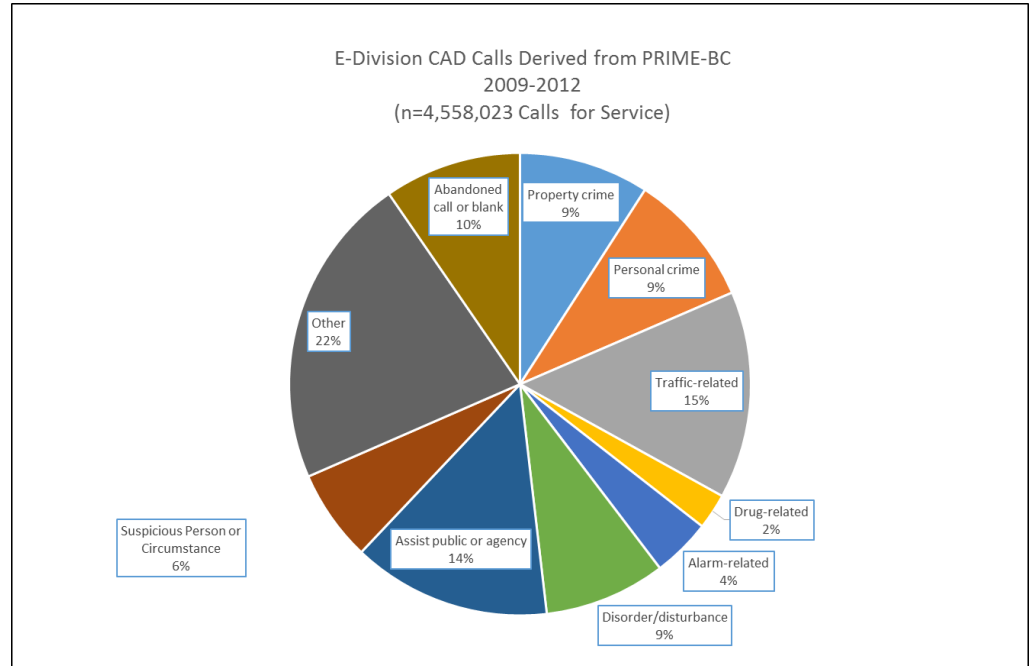

- **Individual or Aggregate**
- **Case or Person**
- **Spatial or Temporal**
- **Functional or Procedural**

# Some Types of crime baskets

- **Police function**
  - Calls for service basket: principal and subsidiary attributes
  - Crime mix basket: principal and subsidiary attributes
  - Charge recommendation baskets (crimes that occur together)
- **Court level**
  - Charge baskets (crimes that are prosecuted as a group)
  - Conviction baskets (convictions that occur together as a group)
- **System handling**
  - Tracing charge baskets from police to prosecutor to conviction
  - Tracing process and procedure in case handling baskets
- **Offender baskets (sets of crimes in criminal events)**
  - Occasional Offenders (group crime type baskets)
  - Prolific Offenders
    - Individual crime baskets over time

# Calls for service basket – RCMP E-Division

- **Less than a third of CFS would be recorded in the standard crime rate**
- **Current debate on police resources mostly focuses on declining CRIME rate rather than CALLS FOR SERVICE rate**

Total Calls for Service and Total UCR2 Violations  
Surrey Detachment  
2008-2012

Crime dropped 6%  
Calls for service increased 10%

# Big Data

- **Prior research based on small/ moderate samples**
- **Current research possible on Big Data**
  - Size
  - Complexity
- **Can explore variety of possible patterns of offending and justice system response**

# Basket of Crimes Analysis Using the *ICURS* *Secure data facility*

- **ICURS secure lab**
- **PRIME BC RMS for RCMP E-Division**
  - 182 of 193 police jurisdictions in British Columbia
  - ICURS holdings are de-identified but entity matched
- **Data base records all calls for service & all police action**
- **Data base allows entry of up to four attributes for each CFS – these can be event (e.g., crime) type or police action type**
  - Similar to NIBRS in this -- but comprehensive national coverage
- **Data base contains much detailed information about the event.**
- **PRIME data base can be linked to COUR-BC**

# Overview of CasPR

- **CasPR is an ICURS developed analytic tool for working with the PRIME BC data base**
  - Originally developed to work with Ministry of Solicitor General Uniform Crime Reporting monthly returns
- **Provides tools for quickly identifying and analyzing trends in both the prevalence and quantum of:**
  - Calls for Service
  - Criminal Events
  - Clearance Rates
- **Ability to combine crime and other encounters with police involving**
  - Anti-Social Behavior
  - Nuisance
  - Drug, alcohol and mental health driven events
- **Can now do Crime Basket Analysis**

# Background on how Crime Basket works in CasPR

- **Examines all calls for service in BC and sorts through up to four event attributes**
- **Identifies highest types of calls and their associated baskets of attributes**
- **Identifies all entities (de-identified persons) involved in calls and their associated baskets of attributes**
- **Identifies highest repeat offenders by type of call**
- **Identifies entities who are high in multiple types of crimes**
- **Identifies procedural actions associated with crime types**

Load the data mat for the time interval  Codes of Crimes be included  Statistical codes be included

Relation Between Top 20 Crimes Co-occured more than 3000

## Relation Between Baskets of Top 20 Attributes Co-occurred more than 3000 with Crimes

# Future of research

- **Case history analysis**
- **Trajectory analysis**
  - Offenders
  - Co-offenders
  - Crime sets
- **Unstructured text analysis of description of events in relation to baskets**
- **Other roles of people besides offending:**
  - Complainant
  - Victim
  - Witness
- **Bunch of stuff we don't yet know enough about crime baskets to realize we need to research as yet!**
