Tombstone ST Segments

David H. Spodick, MD, DSc

[click an author to search for more articles by that author](#)

Shown is the electrocardiogram of precordial lead tracings of a 67-year-old man with an acute myocardial infarction. The patient survived a stormy course that included hypotension and multiple arrhythmic episodes. "Tombstoning" is quite rare, is associated with large infarcts,¹ and has been erroneously used on electrocardiograms showing "hyperacute" changes (high ST segments with tall, pointed T-waves).¹⁻³
