Abstract

Toxicology has been an active research field for many decades, with academic, industrial and government involvement. Modern omics and computational approaches are changing the field, from merely disease-specific observational models into target-specific predictive models. Traditionally, toxicology has strong links with other fields such as biology, chemistry, pharmacology and medicine. With the rise of synthetic and new engineered materials, alongside ongoing prioritisation needs in chemical risk assessment for existing chemicals, early predictive evaluations are becoming of utmost importance to both scientific and regulatory purposes. ELIXIR is an intergovernmental organisation that brings together life science resources from across Europe. To coordinate the linkage of various

life science efforts around modern predictive toxicology, the establishment of a new ELIXIR Community is seen as instrumental. In the past few years, joint efforts, building on incidental overlap, have been piloted in the context of ELIXIR. For example, the EU-ToxRisk, diXa, HeCaToS, transQST, and the nanotoxicology community have worked with the ELIXIR TeSS, Bioschemas, and Compute Platforms and activities. In 2018, a core group of interested parties wrote a proposal, outlining a sketch of what this new ELIXIR Toxicology Community would look like. A recent workshop (held September 30th to October 1st, 2020) extended this into an ELIXIR Toxicology roadmap and a shortlist of limited investment-high gain collaborations to give body to this new community. This Whitepaper outlines the results of these efforts and defines our vision of the ELIXIR Toxicology Community and how it complements other ELIXIR activities.

Introduction of the ELIXIR Toxicology Community

Toxicology as a field tries to understand the negative consequences that may arise from the interactions of chemicals with living organisms. In this ELIXIR (European life-sciences Infrastructure for biological Information)¹ Community, the focus will be primarily the protection of human health. There are a number of both chemical and biological “interoperability” issues key to the toxicology field that translate into data interoperability issues. These include the connection between the action and activity of a particular chemical compound to its effective amount available at a biological target (the link between toxicodynamics and toxicokinetics). Typically this is also a link between biological data analysis (including large-scale multi-omics) and kinetic modelling. Other examples include interactions between a compound and its target (a protein, nucleic sequence or membrane structure for instance). This is primarily based on the interplay between chemistry (the chemical structure and, for example, its related properties in terms of functional groups, charge, shape and related binding affinity) and biochemistry (like biomolecular 3D structures). Also, mixture toxicity needs to be considered as combinations of chemicals with synergistic or antagonistic behaviour, or a combination thereof. While chemicals with similar modes of action may act in terms of concentration addition, those with different modes may rather act according to independent action.^{2,3} Substances with low toxicity may interact in concentration addition rather than as excess toxicity drivers of one compound. Often there is a need to translate the knowledge about one compound into knowledge about other compounds, where approaches like quantitative structure-activity relationships (QSARs) help to elucidate this knowledge and predict required property and toxicity, and in more general when “read-across approaches” come into play that are based on chemical data only, biological data only, or are hybrid.^{4,5} These again need detailed information about the relationships between related chemical compounds, specific properties and toxicological endpoints and, when considering chemical-biological interactions, details regarding both the chemical structures and adequate descriptions of the biological targets. Since toxicological endpoints can be represented in a myriad of ways, the toxicological effect data are often scattered over multiple repositories and databases hosting different types of data; i.e. chemical structures, toxicity data (*in vivo* and *in vitro*), biological target details, and omics data. This itself is not a problem, but the separation and segregation make the data difficult to find and to connect. Currently, many of these deposition databases (where datasets can be archived) do not provide adequate descriptions regarding typical toxicological study designs and parameters, quality control, data acceptance criteria, or even clear identification of the compounds tested. This all adds to the need for an adequate FAIRification process, to make toxicology data more Findable, Accessible, Interoperable and Reusable (FAIR - see [Go-FAIR](#)).^{6,7}

The field of toxicology would certainly benefit from clear, standardized guidelines for data capture, approaches to integrate and connect across multiple databases, clear data licensing for these data repositories, and tools that support accessing the data (as being developed by the [ELIXIR Converge](#) data brokerage work). Existing study capture tools can be extended with templates defined for toxicology, which end up in a central place (e.g. [Biosamples](#)⁸) with links to omics and other data distributed over technology-specific deposition databases and [BioStudies](#).⁹ Relevant portals (e.g. [FAIR-sharing.org](#)^{10,11}) should then be able to identify these studies, also linking to existing but scattered toxicology databases.

Risk assessment, consisting of hazard identification, characterisation and risk evaluation in relation to exposure, involves expert opinions based on discussions and data interpretation. Streamlining this process is important also because of the huge number of chemicals known and produced in chemistry, biotechnology or food production, with over 350,000 chemicals documented on the global market.¹² However, expert evaluation is and will remain crucial and calls for extensive data provenance both for the actual data (how was it measured, where was it published, whom to give credit for it), and for the risk assessments themselves. Interestingly this process stumbles on problems and solutions that have much in common with other fields, where part of the data need to be hidden and other parts can be publicly accessed, as observed in pilot approaches in genetics, or patient data repositories.

Toxicology, while established as discipline, is also rapidly developing in areas, where, for example, new molecular methods to describe the adverse outcome of exposure to a toxic substance are not yet fully established. This offers opportunities for integration in systems biology approaches building on molecular pathway descriptions that benefit from modern network biology approaches. Compound profiling, where, for example, using omics methods to characterize the effect of compounds on cells, are generally useful for categorizing compounds, or for the development of predictive pathway models. For such studies, the availability of high-quality annotations for compounds is of paramount importance to enable the use of omics profiles in toxicology.

Toxicology is also an applied field. There are important applications of toxicity tests in the regulatory field and large amounts of data are collected for that purpose, often for different (governmental) agencies. Making this data more Findable and Reusable is often seen as an important way to reduce both animal testing and the cost of registration of new compounds. If some data is not available to the public due to ownership by companies or other constraints, indexes should be developed to enable the use of this data in an aggregated form (such as the [SPIN](#) index of the Swedish Chemicals agency ([KEMI](#)) and other Nordic chemical agencies). Typically, regulatory use requires very precise and rigid

descriptions of protocols, including reporting methods. On the other hand, better insights into the toxicological mechanisms, including interactions between chemicals, benefit from more innovative research methods (*e.g.* single-cell omics, induced stem cell applications, imaging methods) and from creative development of new analysis methods. While it is beneficial to combine results from both types of approaches (termed New Approach Methods (NAM) in the regulatory field), the corresponding interoperability issues are often quite different.

User community

Europe is steadily increasing demands on the risk assessment of chemicals, drugs, cosmetics ingredients and nanomaterials to lead to safer products, resulting in a strong toxicology research community with sub-communities in, for example, the drug development, environmental, nanomaterial and rare-disease areas. Recent changes in European law for animal testing and new demands for testing of lower-volume chemicals and nanomaterials have triggered large-scale research into alternative testing approaches. These activities not only produce new biological and mechanistic insights, but also large amounts of new data, which have to be managed and shared for re-usage to avoid unnecessary duplication of experiments and, in this way, reduce animal testing. The goal is that the combination of data from integrated *in vitro* and *in silico* approaches will support (ultimately personalized) risk/benefit health analysis, safer drug innovation with fewer needs to withdraw after registration, a fact-based perception of chemical safety, safe-by-design nanomaterials and sustainable and safe economies.

The European Union supports toxicological and risk assessment projects with various funding programs. Recently, large collections of data have been released, resulting from research clusters, such as SEURAT-1,¹³ the EU NanoSafety Cluster (NSC) with NANoREG, EU-ToxRisk,¹⁴ the NORMAN Network, and the EU Innovative Medicines Initiative (IMI) funded projects related to drug toxicology, including eTOX,¹⁵ eTRANSafe,¹⁶ and Eurion.¹⁷ Data from these and other projects are becoming available, sometimes as Open Data (*e.g.* NANoREG) and sometimes as FAIR data. An example of the latter is European REACH data, which has recently been made FAIR by the Cefic-LRI-funded project AMBIT-LRI.¹⁸ Furthermore, the FAIRplus project is collaborating with eTOX on making their data more FAIR, and the new Precision Toxicology will develop a data commons following the FAIR principles.

However, there are a few opportunities for data handling that need to be taken.^{19,20} Recent studies show how powerful the combination of toxicology information and omics data is,^{21,22} but to be able to obtain the statistical significance to draw these conclusions, data from the US and Japan had to be combined. In contrast to large data sets like DrugMatrix,²³ ToxCast/Tox21,²⁴ and TG-GATES²⁵ from these countries, data from European projects is often not sufficiently integrated. Luckily, there are signs that the community is going in the right direction, *e.g.* the aforementioned data integration by diXa,²⁶ NANoREG and REACH.²⁷ With respect to the European Chemical Industry, various authors have been involved in other Cefic-LRI activities related to data management (AIMT-3, AIMT-4).

In addition, the eTOX project²⁸ has established data integration approaches *e.g.* to enable the development of QSARs relating chemical structures to *in vivo* toxicopathological outcomes. As such, the project also delivered databases and approaches to ontology development, text mining approaches, and approaches for prediction of drug metabolism and pharmacokinetic features. Moreover, in 2017 the Organisation for Economic Co-operation and Development (OECD) performed an online survey underscoring the fact that data integration for safety is of global concern for ultimate risk assessment. The purpose of the resulting knowledge base is the integration of eCHEMportal (The Global Portal to Information on Chemical Substances²⁹), IUCLID (International Uniform Chemical Information Database³⁰), and OECD's QSAR Toolbox³¹ supporting the development of Adverse Outcome Pathways and associated infrastructures (AOP-Wiki).³² Despite these positive developments, the 'data integration struggle' from various perspectives (omics, computational chemistry and more 'conventional' toxicological data within REACH and pharmaceutical industry setting) remains a challenge.

Roadmap

The above initiatives are mainly driven by user communities themselves: chemical industry, funding agencies, pharmaceutical companies, governmental agencies and organisations such as Member State organisations, the OECD and non-governmental organisations (NGOs). ELIXIR can contribute strongly to the existing infrastructure projects from a cheminformatics and bioinformatics perspective, providing tools and guidelines, linking and harmonizing the ongoing activities, serving the toxicology users.

For future risk assessment paradigms solely based on human-derived models, and in this way of higher relevance for human adverse effects,³³ various data types will need to be integrated into and cross the conventional boundaries of risk assessment. This involves external exposure assessment (*e.g.* via workplace or environmental modelling and measurements^{34,35}), internal exposure characterisation (ADME-TK (absorption, distribution, metabolism, and excretion - toxicokinetics) *e.g.* via modelling and biomarker-based detection), toxicodynamics on a molecular level,

and cell and systems biology. In this way, more data-driven mechanism-based evaluations and supporting data can integrate into regulatory risk assessment. There will not only be more but also more diverse data as *e.g.* internal exposure data may be inferred from biomonitoring data and/or physiologically-based toxicokinetic modelling to estimate target dose available at the active sites involved in the molecular initiating events of Adverse Outcome Pathways (AOPs).

Another relevant topic is the concept of the exposome,^{36–38} which aims at characterising lifetime exposure (not only to chemicals in the narrowest sense, but also dietary components, lifestyle factors, environmental exposures, etc) in relation to health outcome. Often, vulnerable periods of life (infancy, childhood, and old age) are investigated, and the evaluation also integrates epidemiology. This is one clear demonstration of the trend that the previously distinct areas of toxicology, drug and product design and personalized/precision medicine³⁹ but also environment and health and epidemiology are moving closer together. Data sharing will be increasingly necessary across these disciplines. High throughput data analysis in exposomics, for instance, shares many parallels with metabolomics and other higher level omics analyses, with an added layer of chemical complexity on top.³⁸

The toxicology community is large and well established. The current list of proponents of an ELIXIR Toxicology Community only reflects a subset of a much larger community with a lot of commitments to, and activities around open collaboration. It has clear omics, knowledge management and data infrastructure needs to accommodate the increasing wish to predict toxicology without animal testing (*e.g.* in SEURAT-1, EU-ToxRisk, eTOX OBERON⁴⁰). Foreseeing this need for better infrastructures, the community has previously contacted ELIXIR for collaboration. Various domain-specific projects exist that service the toxicology community with computational and database knowledge ([OpenRiskNet](#), [NanoCommons](#)) that can translate ELIXIR knowledge to the respective communities. These infrastructure projects are the successors of research projects focusing on data management, including [diXa](#),²⁶ [ToxBank](#)⁴¹ and [eNanoMapper](#).⁴²

To benefit the research community, small and medium-sized enterprises (SMEs) and larger industry, and to enable further future support to regulatory applications and upcoming calls (*e.g.* Green Deal^{43,44}), we need to reach an inclusive ecosystem of data, evaluation and modelling tools. The current separate consortia from different toxicity-related and neighbouring disciplines already work towards data and knowledge that is FAIR.⁶ After all, these aspects are essential to efficiently assess the risk of new compounds and materials, as well as combined risks of current stressors (*e.g.* under the exposome concept). To further accelerate these activities, more toxicology-related data and knowledge need to be linked, such as on physiologically based toxicokinetic (PBTK) modelling, biological pathways describing affected metabolism and cell biology processes, metabolism, metabolic models and metabolism predictions, drug-response, omics (*biological identity*), chemical structures and associated metadata (use, hazard, transformations), QSARs, AOPs, REACH dossiers, etc. Simultaneously, an extension towards the human (preclinical toxicology) discipline should be initiated, in which exposure data are combined with internal exposure and early biomarkers of effect data (*e.g.* from the European Human Biomonitoring Initiative ([HBM4EU](#))⁴⁵ and environmental data from [NORMAN](#)^{46,47}) towards pathways of toxicity. Interoperability with the standardization efforts of clinical research by CDISC is important.

However, to reach such interoperable toxicology, resources need to be better integrated. Despite the work of many projects, their FAIR features can still be improved and applying newly developed FAIR metrics will help steer this.⁴⁸ Even though there is overlap in content with existing ELIXIR Communities ([Table 1](#), key demands specifically fostering the integration for interoperable toxicology and risk assessment include the following roadmap^{19,20}):

- chemical structure interoperability challenges (*e.g.* links to [ELIXIR Metabolomics Community](#)⁴⁹)
- metadata, open standards (*e.g.* links to [ELIXIR Interoperability Platform](#), and [TeSS](#)⁵⁰)
- continued ontology development (*e.g.* links to [ELIXIR Interoperability Platform](#) and [Ontology Lookup Service](#))
- interoperable computation (*e.g.* links to the [Galaxy](#)⁵¹ and [bio.tools](#)⁵² communities)
- interactions with other [ELIXIR Core Data Resources](#) (*e.g.* [Ensembl](#) and [Europe PMC](#))
- interactions with other communities, including nanomedicine and health
- deployment of existing tools and modelling approaches on the ELIXIR Compute infrastructure (also allowing future growth towards risk estimations needing Monte Carlo approaches)
- integration of ELIXIR AAI

Table 1. Overlap of the proposed ELIXIR Toxicology Community with ELIXIR platforms and communities.

	Overlap
Platforms	
Tools	Semantic annotation of services (e.g. bio.tools ⁵²). Alignment with BioContainers ⁶² to make toxicology reproducible and redeployable (e.g. OpenRiskNet)
Data	BioStudies was co-developed by the ChEMBL-EBI team, and builds on ArrayExpress , ⁶³ an ELIXIR Core Data Resource. Better adoption of the core resources. Sharing toxicology workflows on WorkflowHub
Compute	ELIXIR Authentication and Authorisation Infrastructure (AAI) is used by OpenRiskNet . Better and more sustainable compute infrastructure reuse of core elements (ELIXIR AAI, modelling toolsets)
Interoperability	FAIR and Research Data Management (RDM) standards have already been adopted by various projects. Registries of toxicology tools need integration with FAIRsharing; There is a huge identifier mapping service need (also for ontology mapping and chemical (sub) structures), Common Workflow Language (CWL) ⁶⁹ as interoperability for workflow, and standardized data exchange formats like the Investigation-Study-Assay (ISA) standard. ⁶⁴
Training	Bioschemas annotated tutorials. Several projects have training tasks that could be added to TeSS, already partially automated.
Communities	
3D-bioinfo & Intrinsically Disordered Proteins (IDP)	Structural information about molecular actions of toxic compounds, molecular initiating events in AOPs
Galaxy	Application Programming Interface (API) standards and ontological annotation of APIs
Marine Metagenomics	Ecotoxicology data reflects effects on populations of species
Plant Sciences	Ecotoxicology data reflects effects of toxicants on plants
Metabolomics	Toxicants Chemical identifiers, data standards, data repository, common resources
Proteomics	Data standards and repository for proteomics data
Microbial Biotechnology	Chemical transformations in biological systems of toxicants
Federated Human Data & Human Copy Number Variation Community	Federated search, phenotype and genotype data
Rare Diseases	Shared biological pathways and interaction effects between rare diseases and exposure of toxicants

- InChI implementation for small molecule data
- Spectral database functionality (open implementations)

The concrete steps forward proposed in this roadmap include:

1. Leverage from open solutions (models, ontologies, educational material, standards etc) developed by past and ongoing toxicology and ELIXIR projects
2. Connect more closely with the core ELIXIR resources (FAIR data, database interoperability, etc), strengthen and connect the inclusive communities that have evolved over the past few years ([OpenTox](#), [eNanoMapper](#), [diXa](#), [OpenRiskNet](#), [NORMAN](#)) and older communities like the Federation of European Toxicologists & European Societies of Toxicology ([EUROTOX](#)), the Society of Environmental Toxicology and Chemistry ([SETAC](#)) and [European Environmental Mutagenesis and Genomics Society](#) ([EEMGS](#), formerly known as [EEMS](#))
3. Develop open community standards to support common interest (ontologies, APIs, data formats, deposition databases and publication recommendations)

Table 2. Examples of existing and anticipated collaboration.

	Existing collaboration/Reuse	Anticipated collaboration
Tools	Semantic annotation of services (e.g. bio.tools)	Alignment with BioContainers of toxicology workflow efforts (e.g. OpenRiskNet)
Data	diXa was co-developed by the ChEMBL-EBI team, and builds on ArrayExpress an ELIXIR Core Data Resources	Better adoption of these Resources
Compute		Better and more sustainable compute infrastructure reuse of core elements (ELIXIR AAI, modelling toolsets)
Interoperability	FAIR and RDM standards have already been adopted by various projects	Registries of toxicology tools need integration with FAIRsharing; There is a huge identifier mapping service need (also for ontology mapping and chemical (sub) structures)
Training	Bioschemas annotated tutorials	Several projects have training tasks that could be added to TeSS, already partially automated

Specifically, we will continue to grow the list of involved toxicology research groups, projects, and ELIXIR Node activities. This Community has already held a joint meeting to select the key priorities and use cases (see [Tables 2 and 3](#)), resulting in this positioning paper. The ELIXIR Toxicology Community will continue to expand and search for contributors with relevant expertise as the community and activities mature. By bootstrapping from Open Science approaches developed in aforementioned projects (e.g. [Open PHACTS](#)⁵³), the new Community will focus on mutual benefit, an open and inclusive community, solving practical community problems. The goal is not to design domain-specific approaches, but a pragmatic approach that provides FAIR and open tools from the start, allowing all toxicology and neighbouring communities to benefit from these harmonized solutions. The inclusive community will involve the existing sub-communities in pharmaceuticals, e.g. from eTOX, [transQST](#),⁵⁴ and [eTRANSafe](#),¹⁶ cosmetic ingredients, e.g. from SEURAT-1, high and low-volume chemicals, e.g. from HBM4EU and soon from Horizon Europe Partnership for the Assessment of Risk from Chemicals (PARC),⁴⁷ or from different Cefic-LRI (Lang-Range Research Initiative) projects, and nanomaterials, via the NanoSafety Cluster, building on shared needs and community solutions and strongly aligned to other ELIXIR communities. Open licensing and interfaces (ontologies, standards, formats) will encourage new solutions and collaborations, which will be accessible to any organisation and every project within and outside Europe. This will allow close interoperability with toxicology communities outside Europe that also use open approaches, while at the same time allowing compatibility with closed approaches too. This dual model has been demonstrated successfully in recent projects. A prioritized roadmap is essential; the label “ELIXIR Community” would enable us to set priorities at a level above the individual projects. Existing components that will give this Community an initial boost, include, software (e.g. [AMBIT with OpenTox API](#)⁵⁵), databases (e.g. diXa, eNanoMapper, [AMBIT-LRI](#), [NORMAN-SLE](#), [MassBank](#)), ontologies (e.g. the eNanoMapper ontology,⁵⁶ [AOP ontology](#)⁵⁷), interoperability concepts (e.g. annotation of OpenAPIs, in collaboration with bio.tools, semantic structural searches with [IDSMS](#)), teaching/education material (Bioschemas annotation of outreach activities, in collaboration with TeSS), and virtual infrastructures (e.g. [OpenRiskNet Virtual Research Environment](#) and the [NORMAN Digital Sample Freezing Platform](#)). However, each of these approaches would benefit from integration in the ELIXIR Platforms (see examples in [Table 1](#)) and with Core and National Resources. Various existing ELIXIR Communities need similar solutions, e.g. for chemical structure handling, toxicology needs proteomics and metabolomics, toxicology involves human data, and ecotoxicology has significant impact on crops and health.

The following projects have been adopting and integrating FAIR toxicology concepts, but need integration with ELIXIR Platforms and Communities: eTOX, NanoCommons (NanoSafety Cluster), EU-ToxRisk, OpenRiskNet, OpenTox Foundation, Open PHACTS Foundation, and the diXa platform. Many other projects have a specific scientific focus but also need integration and some will work on the FAIR concepts. A non-exhaustive list is [ACEnano](#), [SmartNanoTox](#), [HeCaToS](#), [NewGeneris](#), [EnviroGenoMarkers](#), [EXPOsOMICS](#), [HELIX](#), [ASAT](#),⁵⁸ [PATROLS](#), and [HEALS](#), as well as new projects e.g. new Horizon 2020 projects [RISK-HUNT3R](#) and [HARMLESS](#) and the new Horizon Europe project [PARC](#). Companies and organisations will profit from this Community either as users or as providers of services on top of the infrastructure, including [ECHA](#) (FI), [Edelweiss Connect](#) (CH), [IdeaConsult Ltd.](#) (BG), [Misvik Biology](#) (FI), [TNO](#) (NL), [Seven Past Nine](#) (SI), and the [Swedish Academic Consortium for Chemical Safety](#) (SwACCS, SE). Industries showed a strong interest in toxicology, demonstrated by their activities: [Cosmetics Europe](#) was participant in the

Table 3. The Toxicology Community roadmap is roughly defined by three themes (steps). Each step comes with a 10-year aim, further detailed with possible work that could be done in ELIXIR activities.

Roadmap step	10-year aim	Possible implementation study aim & general criteria
Disseminate existing open solutions (data, database software, models, ontologies, standards, or otherwise) developed among receptive toxicology projects, allowing the advantages of these solutions to become visible to the whole toxicology community	<p>1. Integrating data types across toxicological exposure, biological, Adverse Outcome Pathways, chemical prioritization, hazard assessment, and risk assessment. Data spanning the toxicological domains, properties, exposure, kinetics and dynamics, that support hazard and risk assessment. Approaches include QSAR, QSARDB,⁶⁵ <i>in vitro</i> kinetics, kinetic modelling (toolboxes and parameter estimation), AOPs and Key Event measuring method data results, supporting read-across.</p> <p>2. Interoperable Software and Predictive Models</p>	<p>(a) Better adoption of the ELIXIR core and national node resources. (b) Share teaching material about data exchange between resources on TeSS. (c) Disseminate the need of linking database content, e.g. with identifier mapping and solutions to match entries between databases</p>
3. Ontology and Standards		<p>(a) Explore technical connections between existing platforms (e.g. OpenRiskNet) and the Compute Platform and make them more interoperable, working with ELIXIR Interoperability Platform. (b) Wider adoption of the EDAM ontology⁶⁶ and OpenAPI (c) Explore Common Workflow Language (CWL), port a risk assessment case study as CWL workflow</p> <p>(a) Adoption of standards like InChI/InChIKey (b) Bioschemas adoption by web databases, and listing in Bioschemas Live Deploys (c) Semantic annotation of assays, cell lines, and Standard Operating Procedures (d) Encourage ontology reuse with dissemination of entering ontology terms as free text with autocorrect, autocomplete and autolookup (e.g. Clinical Data Interchange Standards)</p>

Table 3. Continued

Roadmap step	10-year aim	Possible implementation study aim & general criteria
Connect and stimulate cross-project collaborations by making all toxicology research output FAIR.	<p>1. FAIRify existing community resources and solutions for findability and easier reuse</p> <p>2. Increase FAIRness of relevant data</p> <p>3. Inventorize Question-and-Answer (Q/A) platforms and sub-communities (e.g. tags) on those platforms where people can learn about solutions</p> <p>4. Develop journal editorial standards for minimal reporting standards for describing the chemical entities in deposition databases and compact identifiers in the main text</p>	<p>(a) Register all Toxicology resources in FAIRsharing^{11,10} and/or the Registry of Research Data Repositories⁶⁷ to build an awareness and overview of ongoing activities and infrastructures</p> <p>(b) Link up with non-toxicology communities, such as GO FAIR and CDISC</p> <p>(c) Use LabLinks to link Toxicology resources to EuropePMC</p> <p>(a) Register/connect chemicals between PubChem, CompTox, ChEMBL, ChEBI, MolMedB, IPCHEM, IUCLiD, HBM4EU, etc and increase integration of toxicologically-relevant information in open resources</p> <p>(b) Develop citation standard for these solutions</p> <p>(c) Integrate kinetics databases and databases needed for kinetic modelling</p> <p>(d) develop and deploy tool boxes that make data registration in repositories easy (e.g. analogous to OneDep in PDB)</p>
		<p>(a) Identify how/where toxicologists are asking questions and what their practices are</p> <p>(b) Define tags to be used cross-platform for toxicology and disseminate these among three Q/A platforms</p> <p>(a) Reach out to editors. Make an “easy to refer to” guideline available. Find enough journals to join/support this and point to these guidelines.</p> <p>(b) Define a simple format for reporting names and InChI (Keys) and/or SMILES. Consider the possible ontologies for study descriptions for other things often used in toxicology research and toxicity testing (like Salmonella Typhimurium strains, cell systems, LD50 tests)</p> <p>(c) Advocate using compact identifiers (structured as database:dbID, e.g. uniprot: P1234) that are easy to use and human readable and that can be resolved by adding links to identifiers.org or n2t.net.</p>

Table 3. Continued

Roadmap step	10-year aim	Possible implementation study aim & general criteria
Design and ideally develop missing open community standards to support common interest (Open educational resources, ontologies, APIs, data formats, etc) in advancing toxicology research.	<p>1. Engage with existing (ELIXIR) solutions, like Bioschemas and Bio.tools, ELIXIR AAI, Galaxy including these from connected organisations like RDA, Global Alliance for Genomics and Health (GA4GH), European Open Science Cloud (EOSC), and identify and communicate missing features.</p> <p>2. Sharing of standard operating procedures (SOPs)</p> <p>3. Continued evaluation by adoption of existing ontologies for annotation of toxicology research output</p> <p>4. Communicate and where possible disseminate FAIR data entry and/or study capture with matching software and/or templates to bench toxicologists</p>	<p>(a) Continue semantic annotation of service APIs (e.g. at bio.tools) and discuss limitations with service and solution providing communities</p> <p>(b) Semantic annotation of training materials, databases, etc with Bioschemas JSON-LD and discuss found limitations</p> <p>(c) ELIXIR AAI rollout in Toxicology platforms (already on OpenRiskNet platform as an example to build from) and report on experiences</p> <p>(a) Explore existing solutions to share SOPs (e.g. protocols.io) and discuss limitations</p> <p>(a) Work with other communities on meta ontologies and mechanisms for (re) creating those from underlying ones and adding dedicated parts. With automated updates and feedback to integrate changes in the base ontologies, e.g. Experimental Factor Ontology and the food & nutrition (Ontology of Nutritional Studies⁶⁸).</p> <p>(a) Engage with ELIXIR Training and explore solutions to repurpose existing solutions for data capturing better known in the ELIXIR Toxicology Community (e.g. BioSamples, NanoSafety Cluster templates)</p> <p>(b) Make sure we can capture study designs based on templates can be used for toxicology studies</p> <p>(c) Adopt DataCite practices</p>

SEURAT-1 cluster; chemical industries ([Nanotechnology Industries Association](#)) are participant of the NSC; chemical branch organisation ([Cefic](#)) funds LRI projects around toxicology; pharmaceutical industries funds toxicology research via IMI projects like eTOX, eTRANSAFE, and Open PHACTS. The [Research Data Alliance](#) (RDA) organized a workshop recently about integration of toxicogenomics resources,⁵⁹ and collaboration with international organizations has already been established with, for example, the [CompTox Chemicals Dashboard](#) team of the US EPA⁶⁰ and [PubChem](#) from the [US National Institutes of Health](#).⁶¹

In this opinion article, the authors describe the establishment of a new ELIXIR Toxicology Community in order to enable the transition from traditional disease-specific observational models to target-specific predictive models. The article introduces the rapidly developing field of toxicology and the interoperability issues arising in combining chemical and biochemical analysis, biological data, and kinetic modelling. The authors argue for "*clear, standardized guidelines for data capture, approaches to integrate and connect across multiple datasets, clear data licensing for these data repositories, and tools that support accessing the data*". The ELIXIR Toxicology Community is suggested to 1) connect the different user communities (including industry, governmental agencies, NGOs, and more), 2) strongly contribute to link between, and harmonize the already existing relevant infrastructure projects, resources, and activities, and 3) provide useful tools, guidelines, and training.

Acknowledging the vast number of chemicals that are currently being produced, and the limited knowledge of the consequences of exposure to humans and the environment, this is a timely and important effort. From my impression, an ELIXIR Community is a good tool to drive and coordinate such an international initiative.

I find the article comprehensive and well-written, and their arguments well discussed. However, I have some points that I hope the authors will take into consideration when taking the initiative further:

1. It is early stated that "*in this ELIXIR Community, the focus will be primarily on the protection of human health*". I would argue that this is an unfavorable restriction for three reasons:
 - It disregards the 'OneHealth approach' recognized by WHO, FAO, OIE, and UNEP, which is defined as "*an integrated, unifying approach that aims to sustainably balance and optimize the health of people, animals and ecosystem. It recognizes the health of humans, domestic and wild animals, plants, and the wider environment (including ecosystems) are closely linked and inter-dependent*" ([One Health High-Level Expert Panel](#))

Annual Report 2021). EFSA, ECHA, EMA *et al.* are also organizing a conference on the topic in June 2022 (<https://www.one2022.eu>). Seeing that animals and ecosystems are closely linked to human health, for example through foods, their responses to and effects from toxicant exposures are also highly important to study and include in risk assessments.

- Live animals, as well as animal tissue, cells, and molecules, are often used as models for toxicological studies. As the toxicological defense systems are highly preserved through evolution, they can give a good indication of human outcomes. Thus, it is important to also ensure supporting infrastructure for integrating these as well.
 - Ontologies, standards, and data resources (like omics repositories, data analysis tools, etc.) are often already overlapping.
2. Although I welcome different stakeholders being identified as “user communities”, I am concerned by the, from my understanding, lack of industry and governmental/administrative agencies in the author list of this article. I believe that if the aim of improving FAIR data integration for safety to enable ultimate risk assessments is to be met, it is eminent to include non-academic perspectives, experiences, and concerns into the initiative from early on. Experiences from the PARC project could for example be useful in how to approach this.
 3. From my experience, the field of toxicology in general has limited experience with FAIR data management and is not familiar with the resources that are in place. I see that toxicologists’ communication, dissemination, and training are mentioned in the proposed roadmap, but I am missing a more targeted approach to engaging with the communities. For example, such activities could include organizing toxicology-specific workshops, presenting at toxicology conferences, and targeted information through different channels. As the proposed ELIXIR Community seems to have a good overview of ongoing initiatives and infrastructures and a good anchoring in the scientific community, a mapping of their target audience and users in the field could be suggested as a starting point.
 4. As mentioned in the paper, systems biology approaches are also getting implemented in toxicology, i.e. systems toxicology (described in Sturla *et al.*, 2014¹). From my point of view, I am missing mentioning of tools for this, such as the FAIRDOME SEEK platform that integrates ISA-structured metadata and workflows with JWS-based biological systems modelling. However, there might already be other solutions for this that I don’t recognize in the paper

Is the topic of the opinion article discussed accurately in the context of the current literature?

Yes

Are all factual statements correct and adequately supported by citations?

Yes

Are arguments sufficiently supported by evidence from the published literature?

Yes

Are the conclusions drawn balanced and justified on the basis of the presented arguments?

Yes

Competing Interests: No competing interests were disclosed.

Reviewer Expertise: Environmental toxicology, endocrine disruption, bioinformatics, systems toxicology, marine toxicology

I confirm that I have read this submission and believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard.

This wide-ranging review circumscribes an important data integration task with a major cat-herding dimension. Whilst also appearing herculean, this esteemed author collective fully understands what they are letting themselves in for and I wish them the best for this endeavor. It is, of course, early days, but I will make a few points (whether these might be addressed in a revision and blending in what other reviewers may come up with I will leave to the authors)

1. Harvesting tox data from the extant and future literature seems to neither be specifically addressed nor proposed via direct interactions with the pharmaceutical companies generating most of it. Standardised data from their large historical internal sets only surfaces sparsely and heterogeneously public databases. Companies such as LahsaVtic, Instem, and ToxPlanet claim to have large databases compiled from the literature. Might ChEMBL come into the frame here if they could strategically increase their toxicology data extraction from the literature, both prospectively and retrospectively? (So far with only 24 assays)
2. My impression is there are simply too many resources mentioned for realistic overarching harmonisation. Could these be cut back to a smaller "active membership" prioritised by the amount of data they have and will continue to generate?

3. Quote “standardized guidelines for data capture, approaches to integrate and connect across multiple databases”. As we know, this is going to be the really tough bit. It needs the major sources to share not only their data schema and metadata indexing but push for a level of convergence. It has to be said that ELIXIR does not have a good record on this. Unless I have missed it, none of the core data resources has made any significant changes in their individual (and often decades-old) data models to really enhance interoperability.
4. PubChem has 113,110 compounds from ~ 30 annotation sources (although most relatively small) indexed under “PubChem Compound TOC: Toxicological Information” and toxicology-related submitting sources cover over 0.5 million substances. In addition, the term “toxicology” matches 3,774 BioAssays covering 86,068 compounds. This makes PubChem a *de facto* toxicology integration hub. The ELIXIR effort should consolidate and expand this, including where an increase in toxicology curation by ChEMBL could feed into BioAssay and thus become interoperative with the 294,000 biological activity data points already in there.

Is the topic of the opinion article discussed accurately in the context of the current literature?

Yes

Are all factual statements correct and adequately supported by citations?

Yes

Are arguments sufficiently supported by evidence from the published literature?

Yes

Are the conclusions drawn balanced and justified on the basis of the presented arguments?

Yes

Competing Interests: No competing interests were disclosed.

Reviewer Expertise: Bioinformatics and cheminformatics (see LinkedIn)

I confirm that I have read this submission and believe that I have an appropriate level of expertise to confirm that it is of an acceptable scientific standard, however I have significant reservations, as outlined above.

The benefits of publishing with F1000Research:

- Your article is published within days, with no editorial bias
- You can publish traditional articles, null/negative results, case reports, data notes and more
- The peer review process is transparent and collaborative
- Your article is indexed in PubMed after passing peer review
- Dedicated customer support at every stage

For pre-submission enquiries, contact research@f1000.com
