---

Research on modeling is becoming popular nowadays, there are several of analyses used in research for modeling and one of them is known as applied multiple linear regressions (MLR). To obtain a bootstrap, robust and fuzzy multiple linear regressions, an experienced researchers should be aware the correct method of statistical analysis in order to get a better improved result. The main idea of bootstrapping is to approximate the entire sampling distribution of some estimator. To achieve this is by resampling from our original sample. In this paper, we emphasized on combining and modeling using bootstrapping, robust and fuzzy regression methodology. An algorithm for combining method is given by SAS language. We also provided some technical example of application of method discussed by using SAS computer software. The visualizing output of the analysis is discussed in detail.

*Keywords:* Multiple linear regression, robust regression, bootstrap method

---

## Introduction

Multiple linear regression (MLR) is an extension of simple linear regression. The random error term is added to make the model probabilistic rather than deterministic. The value of the coefficient  $\beta_i$  determines the contribution of the independent variables  $x_i$ , and  $\beta_0$  is the y-intercept (Ngo & La Puente, 2012; Amir,

Shafiq, Rahim, Liza, & Aleng, 2016). A fuzzy regression model corresponding to equation (1) can be stated as:

$$y = A_0 + A_1x_1 + A_2x_2 + \dots + A_kx_k \quad (1)$$

Explanation variables  $x_i$ 's are assumed to be precise. However, response variable  $Y$  is not crisp; it is fuzzy in nature. That means the parameters are also fuzzy in nature. Hence, the objective is to estimate these parameters.

Assume  $A_i$ 's are assumed symmetric fuzzy numbers which can be presented by interval. For example,  $A_i$  can be expressed as a fuzzy set given by  $A_i = \langle a_{1c}, a_{1w} \rangle$  where  $a_{ic}$  is center and  $a_{iw}$  is radius or has associated vagueness. The fuzzy set reflects the confidence in the regression coefficients around  $a_{ic}$  in terms of symmetric triangular memberships function. Application of this method should be given more attention when the underlying phenomenon is fuzzy which means that the response variable is fuzzy. Thus, the relationship is also considered to be fuzzy.

$A_i = \langle a_{1c}, a_{1w} \rangle$  can be written as  $A_i = [ a_{1L}, a_{1R} ]$  with  $a_{1L} = a_{1c} - a_{1w}$  and  $a_{1R} = a_{1c} + a_{1w}$  (Kacprzyk & Fedrizzzi, 1992). In fuzzy regression methodology, parameters are estimated by minimizing total vagueness in the model.

$$y_j = A_0 + A_1x_{1j} + A_2x_{2j} + \dots + A_kx_{kj} \quad (2)$$

Using  $A_i = \langle a_{1c}, a_{1w} \rangle$  write

$$y_j = \langle a_{0c}, a_{0w} \rangle + \langle a_{1c}, a_{1w} \rangle x_{1j} + \dots + \langle a_{nc}, a_{nw} \rangle x_{nj} = \langle a_{jc}, a_{jw} \rangle \quad (3)$$

Thus,

$$y_{jc} = a_{0c} + a_{1c}x_{1j} + \dots + a_{nc}x_{nj} \quad (4)$$

$$y_{jw} = a_{0w} + a_{1w}|x_{1j}| + \dots + a_{nw}|x_{nj}| \quad (5)$$

As  $y_{jw}$  represent radius and so cannot be negative, therefore on the right-hand side of equation  $y_{jw} = a_{0w} + a_{1w}|x_{1j}| + \dots + a_{nw}|x_{nj}|$ , absolute values of  $x_{ij}$  are taken. Suppose there  $m$  data point, each comprising  $a(n+1)$  - row vector. Then parameters  $A_i$  are estimated by minimizing the quantity, which is total vagueness

## ALTERNATIVE MULTIPLE LINEAR MODEL REGRESSION MODELING

of the model-data set combination, subject to the constraint that each data point must fall within estimated value of response variable. This can be visualized as the following linear programming problem.

$$\text{Minimized } \sum_{j=1}^m (a_{0w} + a_{1w}|x_{1j}| + \dots + a_{nw}|x_{nj}|)$$

Subject to

$$\left\{ \left( a_{0c} + \sum_{i=1}^n a_{ic} x_{ij} \right) - \left( a_{0w} + \sum_{i=1}^n a_{iw} x_{ij} \right) \right\} \leq Y_j$$

$$\left\{ \left( a_{0c} + \sum_{i=1}^n a_{ic} x_{ij} \right) + \left( a_{0w} + \sum_{i=1}^n a_{iw} x_{ij} \right) \right\} \geq Y_j$$

and  $a_{iw} \geq 0$ . Simplex procedure is generally employed in order to solve the linear programming problem.

### Calculation for linear Regression using SAS

```
/* First do Multiple linear regression */  
proc reg data=temp1;  
model y=x1 x2;  
run;
```

### Approach the MM-Estimation Procedure for Robust Regression

```
/* Then do robust regression, in this case, MM-estimation */  
ods graphics on;  
proc robustreg method = MM fwls data=biostatistics plot=fitplot(nolimits)  
plots=all;  
model y = x1 x2 / diagnostics itprint;  
output out=resids out=robout r=residual weight=weight outlier=outlier sr=stdres;  
run;  
ods graphics off;
```

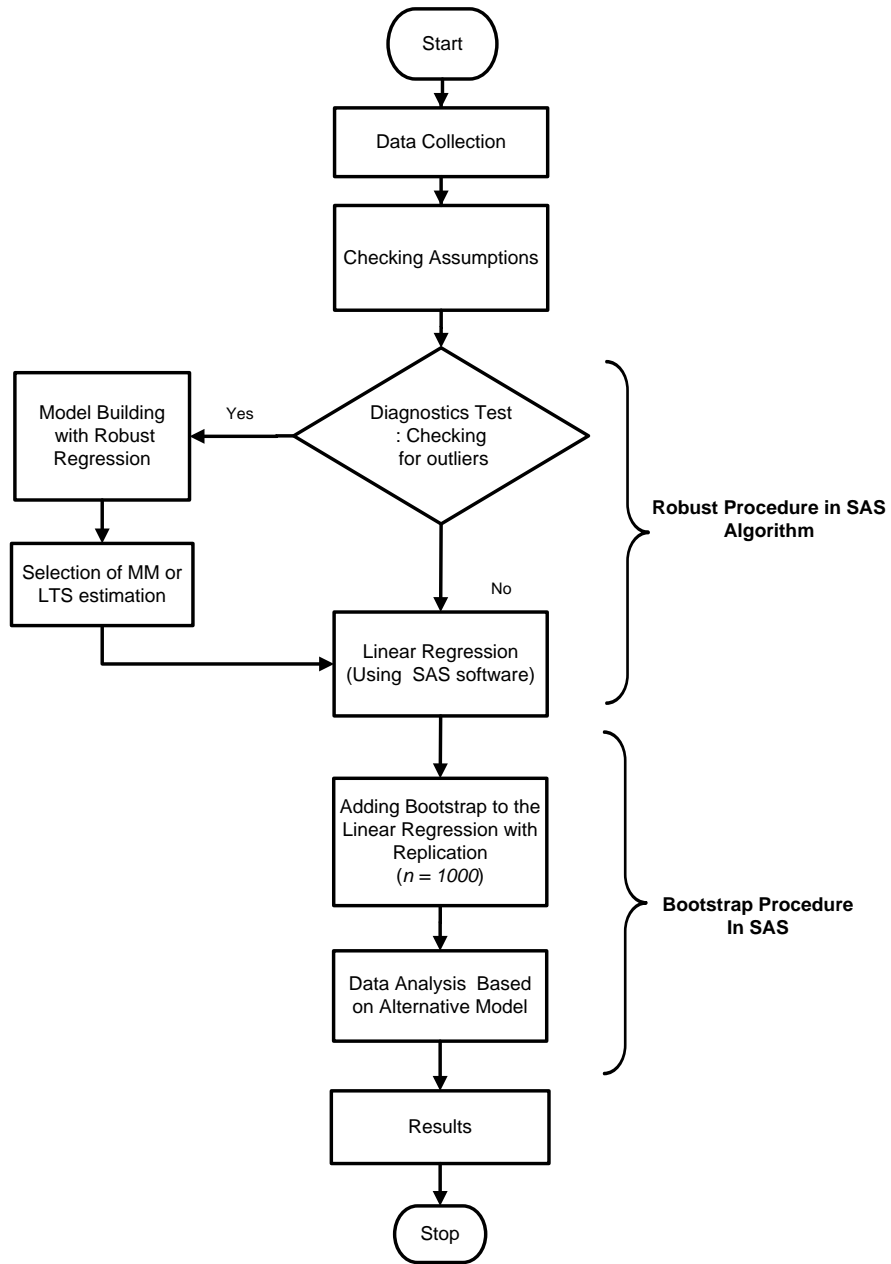

Figure 1. Flow Chart of Robust, Bootstrap and Fuzzy Regression

## ALTERNATIVE MULTIPLE LINEAR MODEL REGRESSION MODELING

### Procedure for Bootstrap with Case Resampling $n = 1000$

```
/* And finally, use a bootstrap with case resampling */
ods listing close;
proc surveyselect data=temp1 out=boot1 method=urs
samprate=1 outhits rep=1000;
run;
```

### Procedure for bootstrap into fuzzy regression Model

```
/*Combination of Bootstrap Technique with Fuzzy Regression*/
ods listing close;
proc optmodel;
set j= 1..8;
numberFish{j}, weight{j}, height{j};
read data boot1 into [_n_] Fishweight height;

/*Print Fishweight height*/
printFishweight height;
number n init 8; /*Total of Observations*/

/* Decision Variables bounded or not bounded*/
/*Theses three variables are bounded*/
var aw{1..3}>=0;

/*These three variables are not bounded*/
var ac{1..3};

/* Objective Function*/
min z1= aw[1]*n + sum{i in j} weight[i]*aw[2]+sum{i in j} height[i]*aw[3];

/*Linear Constraints*/
con c{i in 1..n}:
ac[1]+weight[i]*ac[2]+height[i]*ac[3]-aw[1]-weight[i]*aw[2]-height[i]*aw[3] <=
Fish[i];
con c1{i in 1..n}:
ac[1]+ weight[i]*ac[2]+ height[i]*ac[3]+aw[1]+ weight[i]*aw[2]+ height[i]*aw[3]
>= Fish[i];
```

```
expand;/* This provides all equations */
solve;
print ac aw;
quit;
ods rtf close;
```

## An Illustration of a Biostatistics Case

### A Case Study of Aquaculture

**Table 1.** Description of the Variables

Variables	Code	Description
Fish	Y	Number of Fish Caught
Weight	X1	Weight in (g)

```

## Results

A higher R-squared value indicated how well the data fit the model and indicates a better model.

**Table 2.** Goodness-of-fit

Goodness-of-Fit	
Statistic	Value
R-Square	0.8199
AICR	5.5323
BICR	9.4456
Deviance	234.4750

Method of Multiple linear regression (MLR), we obtained the result as shown in Table 3

Table 4 shows the results by using bootstrapping method for fuzzy regression with  $n = 1000$ . The aim of bootstrapping procedure is to approximate the entire sampling distribution of some estimator by resampling (simple random sampling with replacement) from the original data (Yaffee, 2002). Table 4 summarizes the findings of the calculated parameter.

## ALTERNATIVE MULTIPLE LINEAR MODEL REGRESSION MODELING

**Table 3.** Parameter Estimates for Final Weighted Least Squares Fit

Parameter Estimates for Final Weighted Least Squares Fit							
Parameter	DF	Estimate	Standard Error	95% Confidence Limits		Chi-Square	Pr > ChiSq
Intercept	1	-6334.91	608.3789	-7527.31	-5142.51	108.43	<.0001
x1	1	-3.0164	2.1608	-7.2516	1.2188	1.95	0.1627
x2	1	65.2183	7.5704	50.3807	80.0559	74.22	<.0001
Scale	0	7.1356					

### Method of Fuzzy Regression (FR) (OPTMODEL)

**Table 4.** Value of ac and aw

	ac	aw
1	-5764.1545	0.000000
2	-3.0958	0.000000
3	59.8722	0.075811

While using bootstrap procedure, different output for the ac and aw will be obtained:

ac1= -5764.1545  
 ac2= -3.0958  
 ac3= 59.8722  
 aw1= 0  
 aw2=0  
 aw3=0.075811.

The next step is to compare the performance of multiple linear regression and fuzzy regression.

### ***The Fitted Model for Multiple Linear Regressions***

$$Y = -6334.91 - 3.0164 \textit{ weight} + 62.21 \textit{ height} \quad (6)$$

Standard Error (608.3789)      (2.1608)      (7.5704)

The upper limits of prediction interval are computed by coefficient plus standard error

$$Y = (-6334.91 + 608.3789) + (-3.0164 + 2.1608) \textit{weight} + (65.21 + 7.5704) \textit{height}$$

$$Y = (-5726.53) + (-0.86) \textit{weight} + (72.78) \textit{height}$$

The lower limits of prediction interval are computed by coefficient minus standard error

$$Y = (-6334.91 - 608.3789) + (-3.0164 - 2.1608) \textit{weight} + (65.21 - 7.5704) \textit{height}$$

$$Y = (-6943.29) + (-5.1772) \textit{weight} + (57.6396) \textit{height}$$

***The Fitted Model for Fuzzy bootstrap Regression Is***

$$Y = [-5764.1545, 0] + [-3.0958, 0] \textit{weight} + [59.8722, 0.075811] \textit{height} \quad (7)$$

The upper limits of prediction interval are computed by coefficient plus standard error

$$Y = [-5764.1545 + 0] + [-3.0958 + 0] \textit{weight} + [59.8722 + 0.075811] \textit{height}$$

$$Y = [-5764.15] + [-3.10] \textit{weight} + [60.00] \textit{height}$$

The lower limits of prediction interval are computed by coefficient minus standard error

$$Y = [-5764.1545 - 0] + [-3.0958 - 0] \textit{weight} + [59.8722 - 0.075811] \textit{height}$$

$$Y = [-5764.15] + [-3.10] \textit{weight} + [59.80] \textit{height}$$

The width of prediction intervals in respect of multiple linear regression model and fuzzy regression model corresponding to each set of observed explanatory variables is computed manually.

## ALTERNATIVE MULTIPLE LINEAR MODEL REGRESSION MODELING

**Table 5.** Average Width for Former Multiple Linear Regression model and Fuzzy Bootstrap Regression Model

Multiple Linear Regression model			Fuzzy Bootstrap Regression Model		
Lower limit	Upper limit	Width	Lower limit	Upper limit	Width
-1535.37	1728.71	3264.09	97.23	117.98	20.75
-1477.74	1800.92	3278.66	154.95	179.50	24.55
-1445.48	1868.16	3313.64	200.87	222.01	21.14
-1466.60	1836.84	3303.44	177.10	1988.15	21.05
-1450.17	1850.95	3301.12	191.49	212.58	21.09
-1467.93	1841.04	3308.99	178.06	199.13	21.07
-1471.06	1825.99	3297.05	170.38	191.41	21.02
-1459.81	1862.62	3322.43	191.03	212.16	21.13
	Average	3298.68		Average	21.48

From Table 5, average width for former multiple regression was found to be 3298.68 while using fuzzy regression, the average width is 21.48 this indicate that the superiority of fuzzy regression methodology. From this analysis, the most efficient method to obtained relationship between response and explanatory variable is to apply fuzzy regression method compared to linear regression method.

### Conclusion

It was explained how to combine an algorithm between robust, fuzzy regression and the bootstrap method. A small sample size (8 observations only) was used

- (a) to apply a bootstrap method in order to achieve an adequate of sample size.
- (b) to compare the efficiency between original method and with the bootstrap method.
- (c) to give a better understanding on how the algorithm works

According to biostatistics history, all the independent variables that we used in this case were significant to the number of fish caught. Without using bootstrapping, the result shows that two out of eight were significant. It is surprising that, using bootstrapping method (with  $n = 1000$ ) the entire significant variable are included in the model as the finding from the biostatistics record. This algorithm provides us with the improved understanding of the modified method and underlying of relative contributions. For further study, it is possible to

approach response surface methodology for every each of significant variables in single algorithm.
