| Title | ESPRESSO: the new VLT workhorse for high-precision astronomy |
| Authors | DI MARCANTONIO, Paolo |
| Handle | http://hdl.handle.net/20.500.12386/32507 |

INAF-OATs

ESPRESSO: the new VLT workhorse for high-precision astronomy

P. Di Marcantonio

on behalf of

ESPRESSO Team

Outline of the talk

INAF-OATs

- the ESPRESSO (Echelle SPectrograph for Rocky Exoplanets and Stable Spectral Observations) instrument
- ESPRESSO at the VLT
- ESPRESSO Data Flow and its final deployment
- ESPRESSO operations
- ESPRESSO “science” software in a nutshell

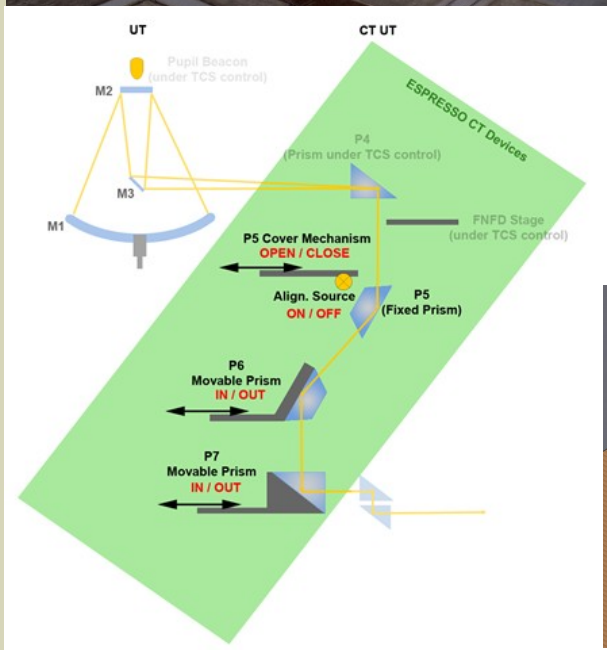

The ESPRESSO "facility"

INAF-OATs

Instrument characteristics

INAF-OATs

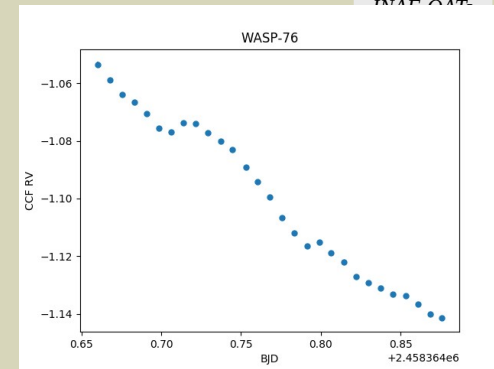

| Parameter | singleUHR | singleHR | multiMR |
|-----------------------------------|--|---|----------------|
| Wavelengths | | Blue arm: 380 – 520 nm Red arm: 520 – 780 nm | |
| Spectral coverage | | Full | |
| Spectra format | Echelle, up to 4 spectra per order (2 fibers, 2 spectra / fiber) | | |
| Resolving power | 225'000 | 134'000 | 59'000 |
| Aperture on sky | 0.5 arcsec | 1.0 arcsec | 4x1.0 arcsec |
| Spectral sampling | 2.5 pixels | 4.5 pixels | 10 pixels |
| Spatial sampling | 9 pixels | 18 pixels | 44 pixels |
| Available binning | 1x1 | 1x1 or 2x1 | 4x2 or 8x4 |
| Sky/Simultaneous reference | Yes (mutually exclusive) | | |
| Instrumental RV precision | <10 cm/s | <10 cm/s | ~1 m/s |

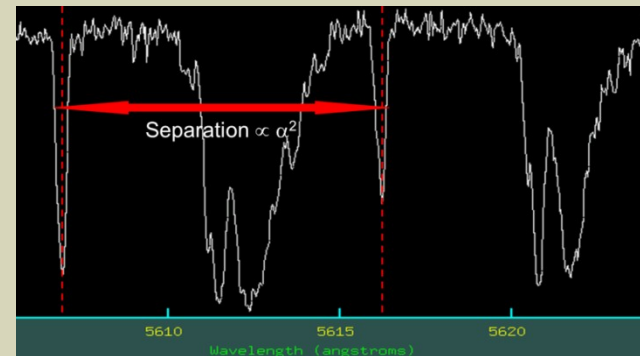

ESPRESSO science

➤ measurement of high-precision RVs of G, K and M dwarfs to search for rocky planets inside the HZ

➤ investigate possibly variability of fundamental constants

➤ study chemical composition of stars in local galaxies, IGM etc.

EFTF-FCS Besancon 1999; Opt. Commun. 172, 59 (1999); Phys. Rev. Lett. 84, 3232 (2000) & Phys. Rev. Lett. 84, 5496 (2000)

The consortium

INAF-OATs

Institutes of four countries (1 PI or Co-PI in each)

- **Switzerland:** Univ. Geneva (Lead, **F. Pepe**), Univ. Bern
- **Italy:** INAF Trieste (S. Cristiani, P. Molaro, P. Di Marcantonio), INAF Brera
- **Portugal:** Univ. Porto (N. Santos), Univ. Lisbon
- **Spain:** IAC (R. Rebolo Lopez)

Associated partner (Representative in Executive Board)

- ESO (H. Dekker)

ESPRESSO milestones:

- ✓ **PDR:** end of November 2011
- ✓ **FDR:** May 2013
 - ✓ **CT First light:** 25 Sept 2016 on UT4
- ✓ **PAE:** Q2 – Q3 2017, shipment on Aug 2017
 - ✓ **ESPRESSO single-UT first light:** 27 Nov 2017 on UT1
 - ✓ **ESPRESSO 4-UT first light:** 3 Feb 2018
- Delivery to community: **Oct 2018** (single-UT mode only)
- **Start of GTO:** September 2018

Exposure Time Calculator

INAF-OATs

Optical Echelle Spectroscopy Mode Version P103.4

IQ: arcsec FWHM at the airmass and wavelength of observation (to be used for the OB constraint set)

Target Input Flux Distribution

Template Spectrum
 MARCS Stellar Model Redshift
 Upload Spectrum Target Magnitude
 Blackbody Temperature: K
 Power Law Index: $F(\lambda) \propto \lambda^{index}$
 Emission Line nm nm nm
 Flux: 10^{-16} ergs/s/cm² (per arcsec² for extended sources)
 FWHM: nm
Magnitudes are given.

Instrument Setup

Telescope feed:
 Resolution/detector mode: *Single UT, high spectral/RV resolution, 1x1 binning and fast readout*
 Exposure Time: s

Spatial Distribution: Point Source

Sky Conditions

Override almanac sky parameters and use instead typical fixed sky model parameters except Moon phase
 Moon FLI: Airmass:

Results

Include exposure times for S/N:
 Include RV precision for wavelength 550 nm (only possible for stars of G, K or M spectral type)

Almanac

Time: UT hour
 MJD
 Paranal Local Civil Time LCT = 09:56:54
 Paranal Local Sidereal Time LST = 15:26:28 **Day!**

Target coordinates Name or ID:

| | UT rise culm. set | Hour Angle | azimuth | altitude | zenith distance | airmass | FLI | moon/sun phase angle | moon/target separation |
|--------|-------------------------|------------|---------|----------|-----------------|---------|----------------|----------------------|------------------------|
| Target | 19:33 01:30 07:31 | 11:26:28 | 199°.5 | -64°.1 | 124°.1 | --- | | | 100°.7 |
| Moon | 11:08 18:02 01:02 | | 165°.0 | 9°.8 | | | 0.06 "dark" | | |
| Sun | 09:54 16:44 23:42 | | 100°.0 | 37°.3 | day | | | 27°.9 | |

Seeing/Image Quality:

Seeing: arcsec FWHM in V-band at zenith (use this value in the proposal)
 Probability 87% of realizing the seeing ≤ 1 arcsec

During the observing run, the **Observation Block** (OB) to be executed is loaded on the Observation Handling (OH) workstation and then sent to the **BOB** (Broker for Observation Block) tool on the IWS. BOB reads the contents of the OB and executes one by one the templates specified in there. Each template consists in general of a sequence of commands determining completely a scientific exposure. *It allows presetting the telescope, to setup the instrument and detector so that the required scientific observation could be properly performed.*

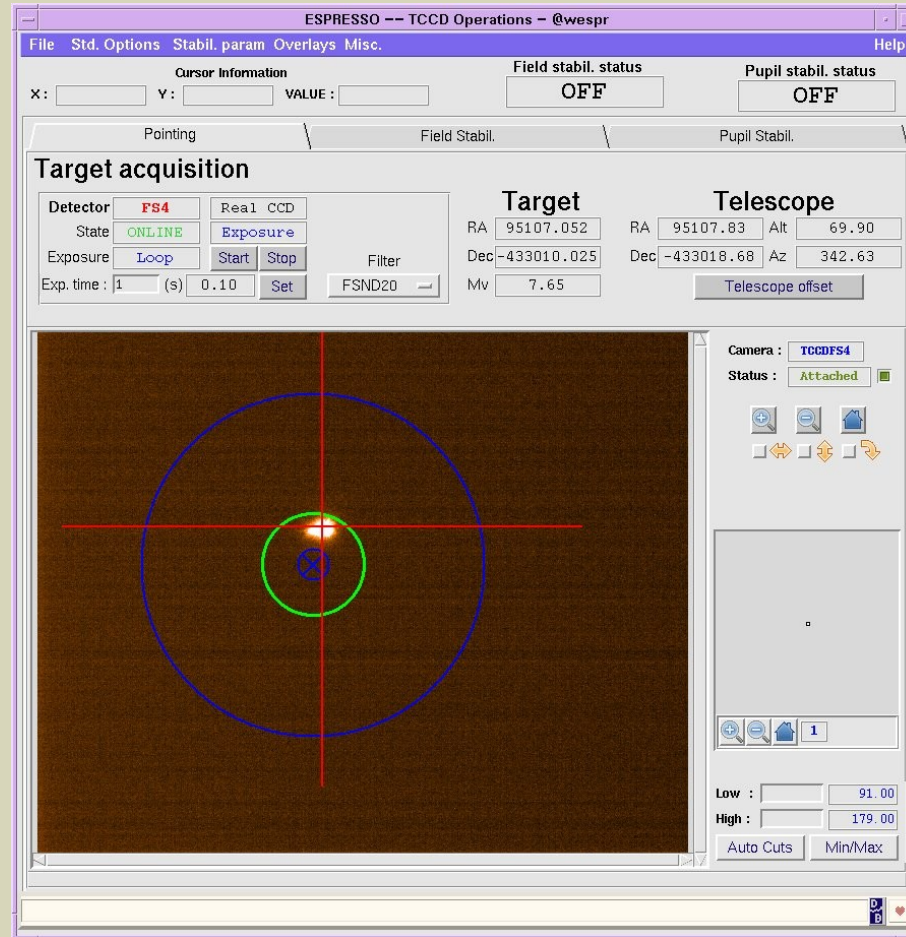

Acquisition phase

INAf-OATs

During the acquisition phase, after telescope presetting, a correction is necessary in order to center the object on the fibre entrance.

A carefully designed and tested algorithm is able to find automatically the most luminous object in the field (which usually coincides with the object under interest due to the small instrument field-of-view), computes the required correction and send it to the telescope.

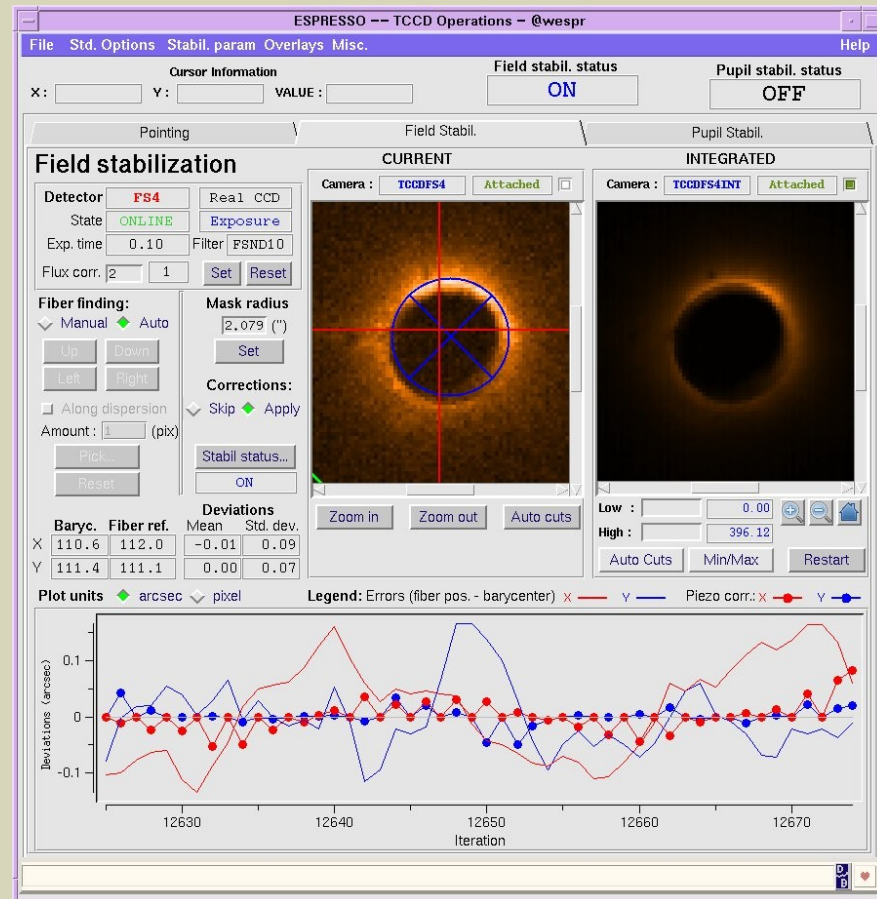

Stabilization phase

INAF-OATs

The purpose of the (field) stabilization is to maintain the object centered on the fiber during the whole duration of the scientific exposure. The TCCD(s), one per front end, acquires the image in a *continuous loop up to 7 Hz*; two auxiliary software processes, in real-time, analyze the obtained image and command the low-level piezo tip-tilt devices such to try to keep the object well centered on the fiber.

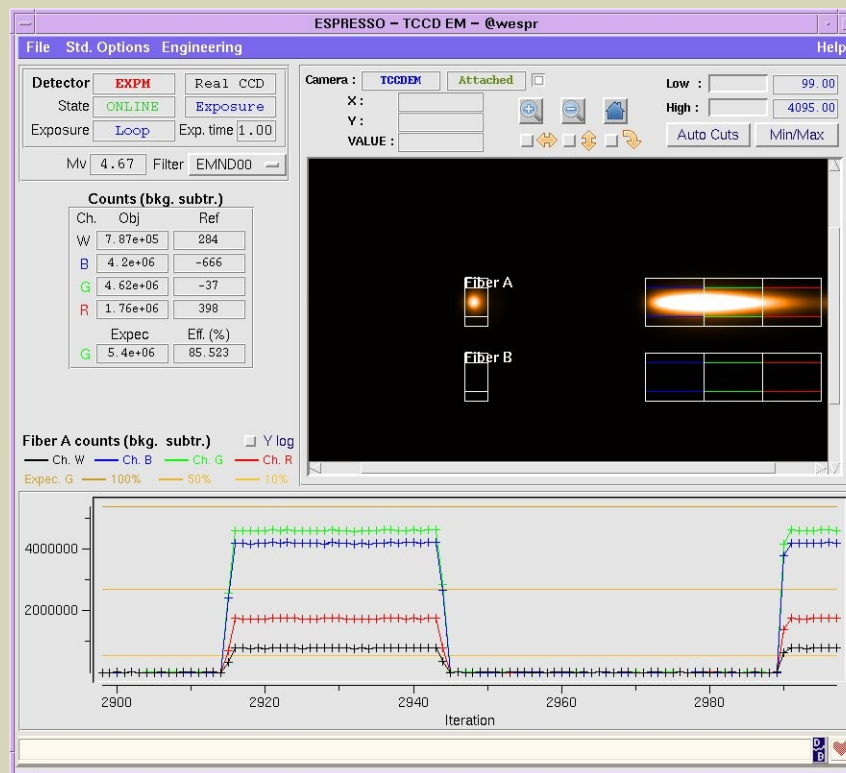

ESPRESSO exposure meter

INAF-OATs

The signal-to-noise ratio of the ongoing scientific exposure is continuously monitored by the ESPRESSO exposure meter (EM). In ESPRESSO, the EM is actually a **small spectrograph** in itself and a dedicated process continuously computes the counts in three spectra channels from images obtained by a dedicated TCCD.

ESPRESSO degraded mode / 4 -UT

INAF-OATs

Science software

INAf-OATs

Thanks to its fixed spectral format and long-term stability, ESPRESSO has been conceived, starting already from the preliminary design phases, as “*truly science-grade products generating machine*”.

To this purpose, in addition to the standard **Data Reduction Software (DRS)** package, a dedicated ESPRESSO **Data Analysis Software (DAS)** package has been developed with the aim to extract scientific information as soon as reduced data are available.

Pipeline, esorex, esoreflex

INAF-OATs

@ Paranal: pipeline as quick-look tools to do a real-time coarse assessment of the quality of calibrations and science observations; runs unsupervised with the help of data organizer (DO) and Reduction Block Scheduler (RBS) via OCA rules;

ESPRESSO specific: each science image can be reduced using the wavelength calibration taken few hours or even minutes before - **virtual product functionality**

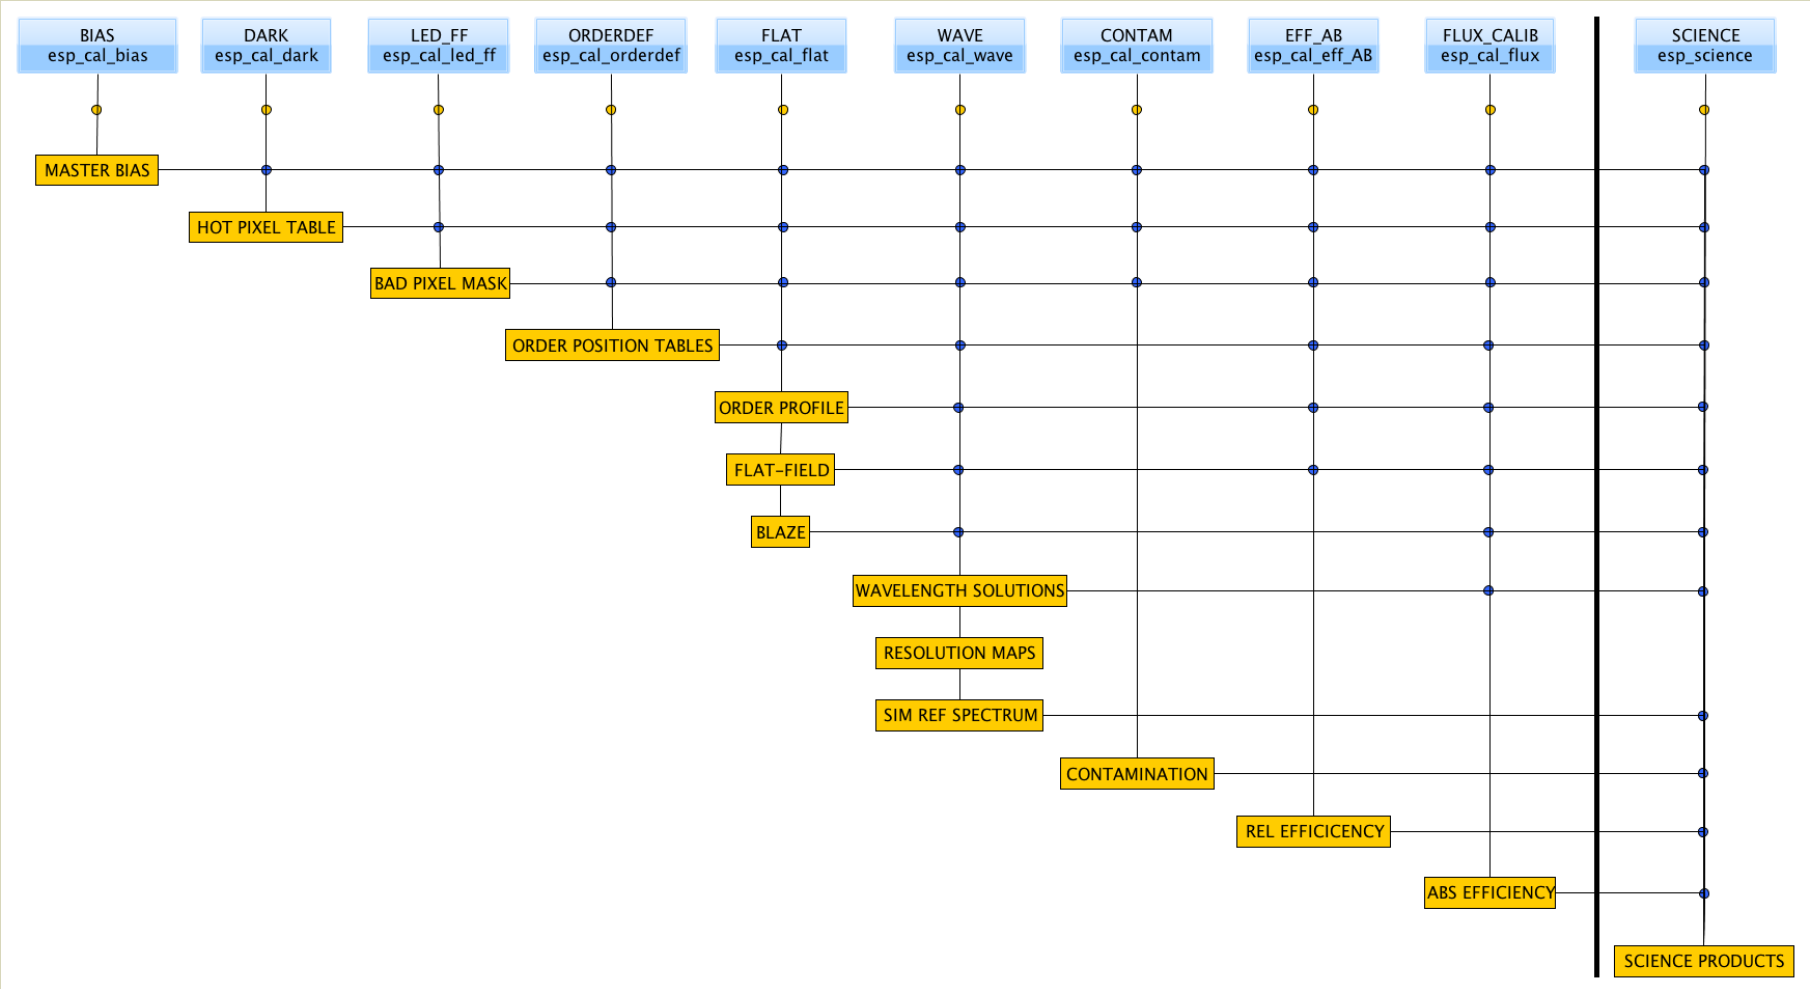

@ Garching: more thorough data processing and evaluation - raw calibration frames into master calibrations; generate quality control parameters to monitor the instrument and detector performance

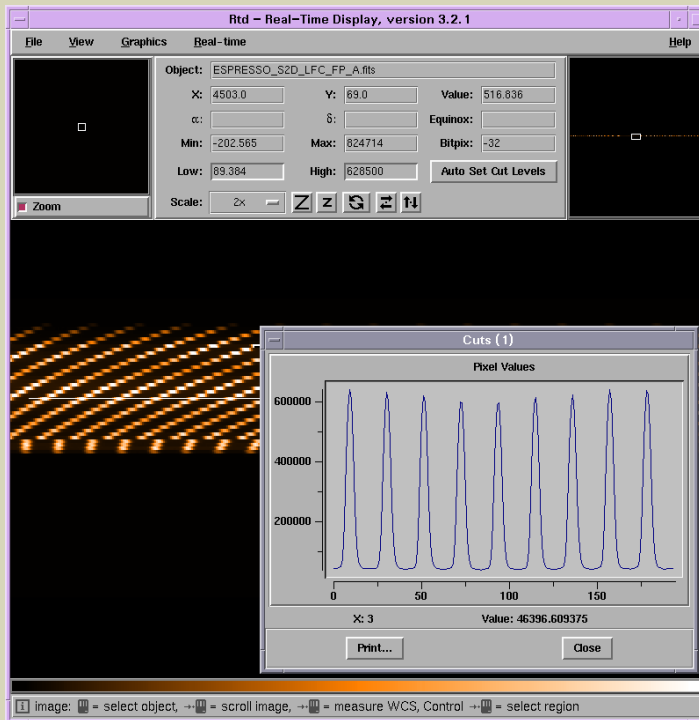

Data Reduction Cascade

INAF-OATs

Wavelength coverage starts at 378.25 nm for the bluest order of fiber A and ends at 525.1 nm for the reddest order on the blue chip. On the red chip the shortest wavelength is 523.8 nm while the longest wavelength is 788.4 nm.

Single two-dimensional (S2D) spectrum extracted from the LFC exposure with one order shown by cuts. Regular spacing and the almost constant flux level could be easily noticed.

ESPRESSO Data Analysis

INAF-OATs

The ESPRESSO DAS comprises a total of 13 recipes. It is split into four branches: one for the *analysis of QSO spectra* and three for the *analysis of star spectra*.

Some of the recipes are common to more branches while others are specific to the treated spectra.

Each DAS branch is managed by a dedicated *Reflex workflow*.

All the recipes are *available off-line at the telescope* on a dedicated workstation and *the users* have the possibility to install the whole package also on his/her computer.

| Operation | Branch | Name |
|---|--------------|-----------------------|
| Co-addition of spectra | star, quasar | espda_coadd_spec |
| Creation of a spectral mask | star, quasar | espda_mask_spec |
| Creation of a list of absorption lines | star, quasar | espda_create_linelist |
| Continuum fitting of a 1D spectrum | quasar | espda_fit_qsocont |
| Identification of the absorption systems | quasar | espda_iden_syst |
| Voigt-profile fitting of absorption lines | star, quasar | espda_fit_line |
| Measurement of the EW of spectral lines | star | espda_compu_eqwidth |
| Computation of the stellar parameters | star | espda_compu_starpar |
| Continuum fitting of single orders | star | espda_fit_starcont |
| Comparison with a synthetic spectrum | star | espda_synth_spec |
| Computation of the radial velocity using a synth. spec. | star | espda_rv_synth |
| Computation of the radial velocity | star | espda_compu_radvel |
| Computation of the stellar activity indexes | star | espda_compu_rhk |

Notice:
The general concepts of Reflex are described in A&A 559, A96. Please credit this article if you use Reflex for your research. Workflow tutorial, demo data, and user manuals are available on http://www.eso.org/sc/software/pipelines/#reflex_workflows.

Instructions:

- Turn on highlighting: 'Tools' > 'Animate at Runtime...', set to '1'
- Edit ROOT_DATA_DIR to point to your data (subdirs will be searched)
- Edit END_PRODUCTS_DIR to your preferred location (N.B.: must not be a subdir of ROOT_DATA_DIR)
- Run the workflow: ▶ or ctrl-R
- Monitor the progress: 'Window' > 'Runtime Window -'

PARAMETERS

NB: Parameters in yellow boxes are temporary.

General parameters:

- RecipeFailureMode: Ask In case of recipe failure: 'Continue', 'Stop', 'Ask'
- EraseDirs: false Erase working directories: 'true' or 'false'
- FITS_VIEWER: fv Fits viewer used for inspection: 'fv'
- ProductExplorerMode: Triggered Show Product Explorer window: 'Triggered'
- SelectDatasetMethod: Interactive Dataset selection: 'All', 'New', 'Reduced', 'Interactive'

Auxiliary parameters (do not change):

- INSTR: ESPRESSO Instrument (ESPRESSO/UVES/XSH/HARPS)
- WAVEL_MIN: 380 Minimum wavelength
- WAVEL_MAX: 780 Maximum wavelength

Global parameters:

- GLOBAL_TIMESTAMP: 2018-05-28T12:10:13
- END_PRODUCTS_SUBDIR: r/ESPRE.2017-11-28T05:01:10.428-A01_0001/2018-05-10T13:55:00
- ESORxArgs: --suppress-prefix=TRUE
- N_SELECTED_DATASETS: 1
- N_SELECTED_SYSTEMS: 1
- CURRENT_LINE: 1

Workflow parameters:

- VEL_STEP_UVES: 3.0
- VEL_STEP_XSH: 13

- GLOB_VEL_STEP: 0.5
- RESOL_UVES: 45000
- RESOL_XSH: 5900
- RESOL_HARPS: 115000
- GLOB_RESOL: 140000
- LINE_VEL_STEP: 1.5

execution finished: 2517 ms. Memory: 681984K Free: 219687K (32%)

DAS quasar branch results

INAF-OATs

An absorption system (MgII) detected and fitted on the spectrum of quasar HE0515–4414 (observed during the comm 1b run, rebinned at 1 km/s). **Blue:** normalized spectrum; **green:** best-fit composite Voigt profile; **red:** residuals.

DAS star branch results

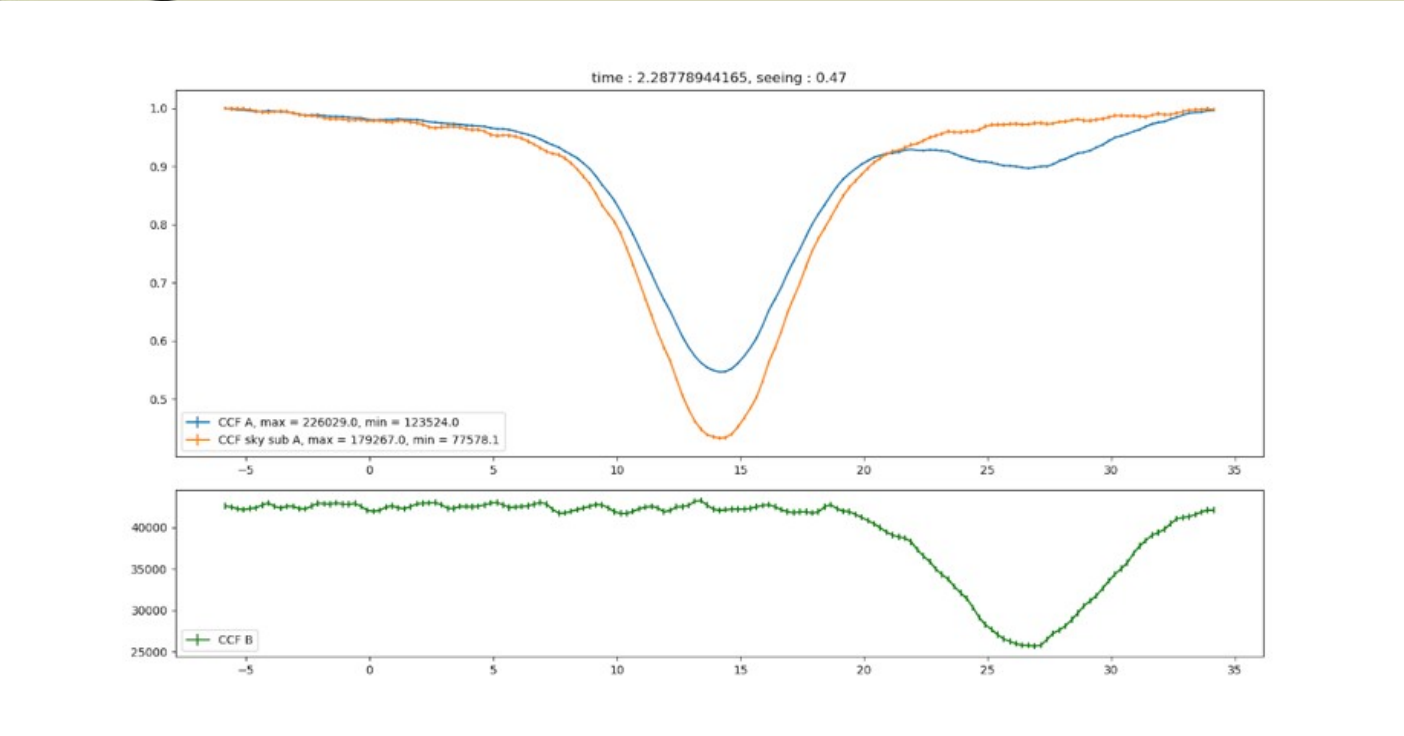

INAF-OATs

Top: plot of the output for the RV standard star HD 35854; **blue:** the observed normalized merged spectrum corrected for RV compared with the synthetic spectrum (**red**).

Center: Observed - synthetic flux residuals. **Bottom:** cross-correlation function fitted with a Lorentzian function

First results I

Cross correlation function (CCF) of a RV standard close to the Moon. The **blue line** is the CCF of the star spectrum and the RV dip corresponding to the Moon RV is clearly visible. The **orange line** is the CCF of the star spectrum after subtraction of the sky spectrum. **Bottom panel** show instead the CCF of the sky spectrum alone.

A comparison of a portion of HE0515-44 taken in 3600s the equivalent of 18 HARPS exposures for a total 93000 sec.

First results III

INAF-OATs

The image shows a drift sequence of more than 20 hours duration. The instrument drifted during this time by less than 1 m s^{-1} . On fiber A and B individually a scatter of about 1 m s^{-1} *rms* is observed, which we consider to be due to the detector itself (self-heating due to fast read-out). The proof is that this scatter is perfectly common-mode. In fact, the differential drift B-A remained small for the whole duration. The 20-hours dispersion is about 18 cm s^{-1} , but if we consider the last 10 hours only, *the dispersion is 9.4 cm s^{-1}* , comparable with the photon noise and compliant with the requirements!

GTO - Fundamental constants

INAF-OATs

Figure 1 – Radial velocity differences between the solar lines as measured in the ESPRESSO 1UT Single 2x1 mode spectrum of Iris (6-Dec-2017) and the CERES-HARPS solar spectrum calibrated with the Laser Frequency Comb from⁹. The gap at 530 nm is due to the HARPS gap.

E-ELT HIRES

Galactic Archaeology in the Gaia Era

HIRES layout

INAF-OATs

Figure 1 Left: Simulated cross-correlation values of the detection of the CO₂ molecule in a Venus-like atmosphere in Trappist-1b or c, combining data of 4 transits with HIRES. Right: Reflected light cross-correlation signal of the direct surroundings of Proxima Cen.

Figure 5 Expected statistical precision on variations in the fine-structure constant, $\Delta\alpha/\alpha$, achievable with future high-resolution spectrographs as a function of telescope diameter. The equivalent velocity precision is also shown (assuming a typical variety of metal-ion transitions). The length of the bars indicates the range of precision expected for different spectral resolutions available on those facilities. Two modes of operation for VLT/ESPRESSO are shown, its single-telescope mode (8-m effective diameter), with a range of resolving powers, and its anticipated four-telescope mode (16-m effective diameter), with R up to $\approx 70,000$.

Conclusions

INAF-OATs

In this talk I have presented ESPRESSO, its DFS, challenges and instrument peculiarities together with some first “results”.

- *ESPRESSO*, the next generation ESO VLT high-resolution ultra-stable spectrograph, *is ready for operations*.
- After the very successful commissioning periods where instrument performance have been assessed and validated ESO gave green light *for starting routine observations from October 2018 in single UT mode*.
- 4 UT mode will be offered in 2019 after a final science verification phase.
