Mapping Future Education and Training: Group Concept Mapping Study

Summary

The report presents the results from a Group Concept Mapping study conducted within the framework of 'A foresight on Learning, Innovation and Creativity: New ways to learn new skills for future jobs (FORLIC)' project. Thirteen experts with either technical or social sciences educational background mostly from academia and Europe participated in the study. They were asked to first individually generate ideas about the future of education. Then they had to first sort the ideas in groups according to similarity in meaning and rate them on two scales: importance and feasibility. Multidimensional scaling and hierarchical cluster analysis were applied to depict emerging structure in the data.

The analyses identified twelve clusters, namely: Technology in Education, Tools and services enhancing learning, Open education and resources, Assessment, accreditation and qualifications, Globalisation of education, Roles of institutions, Individual and profession driven education, Role of teacher, Life-long learning, Formal education goes informal, Individual and social nature of learning, and Epistemological and ontological bases of pedagogical methods. Among them, there are some more technology-oriented clusters such as 'Technology in education', and 'Tools and services enhancing learning'. 'Open education and resources' bridges more technology-oriented clusters and the clusters 'Globalization of education' and 'Assessment, accreditation and qualifications'. Technology facilitates the access of people to open education and resources. Open educational resources require adequate form for assessment and accreditation on both national and international level. There are further four clusters ('Role of teachers', 'Role of Institutions', 'Individual and profession driven education' and 'Formal education goes informal') which suggest a shift in taking responsibility for own education from institutions to individual. Finally there are two clusters ('Individual and social nature of learning' and 'Epistemological and ontological bases of pedagogical methods'), which are learning-oriented. They discuss issues related to cognitive and social aspects of learning as a basis for the design of effective, efficient and appealing learning environment. One of the most important findings that emerged from the sorting is the very central place of the cluster 'Life-Long Learning'. The cluster is a connection point for all other clusters. Life-long learning needs to take into account issues related to technology, learning and teaching, and change in the role of institutions, teachers and learners.

The analysis of the rating data indicates that the learning-oriented clusters score higher on importance than the technology-oriented clusters but lower on feasibility.

1. Introduction

This report presents the background, procedure, participants, data analysis and results from Group Concept Mapping Study within Vision Building task of the Foresight project on the *Future of Education*. The report elaborates on the outcomes of the *Review of Foresight Studies on Learning, Innovation and Creativity* (Leis, Leenderse, & Gijsbers, 2009; Deliverable WP2) to further inform building scenarios and writing personas to illustrate key dimensions of the future of education.

There are three issues in the conclusions of the Review, which this report addresses, namely: (a) the reviewed studies do not provide information about the methodology they have used for data collection and analysis; (b) it is difficult to find a patterns within the abundant amount of information; and (c) the results of the studies are biased due to unbalanced sample of experts.

1.1 Background

Group Concept Mapping (GCM) applies a structured participative approach to facilitate groups of experts to identify and arrive at a consensus about a particular issue, e.g. characteristics of learning in 2020. (Kane, 2008; Quinlan, Hall, Tuzzio, McLaughlin, Wagner, Brown, & Yabroff, 2008; Stoyanov, & Kirschner, 2004; Trochim, 1989; Wopereis, Kirschner, Paas, Stoyanov, & Hendriks, 2005). The analysis depicts, in the form of thematic clusters, the experts' common understanding of the issue under consideration. GCM uses a structured facilitative multi-step approach including a number of simple and intuitive activities such as idea generation, sorting of ideas and rating of ideas. The research method, by its "hybrid" nature, can easily integrate any qualitative method for data collection and analysis, such as individual interviews, surveys, focus groups or Delphi method. While the methodology benefits from the strengths of existing text-analysis techniques such as grounded theory and content analysis, it mitigates some of their weaknesses: relying on researcher-driven classification schemes, interdependence between coders, and weak validity and reliability assessments. GCM uses the original intact respondent statements as units of analysis to further facilitate participants to use sorting and then quantitatively aggregate their contribution to enable structures in data to emerge.

1.2 Method

1.2.1 Participants

Thirty educational experts were personally invited to take part in the FORLIC GCM study. Eighteen accepted the invitation and finally thirteen of them participated in all phases of study: idea generation, sorting and rating. The group represents a balanced sample of educational expertise and professional orientation including experts with either social sciences or technical sciences educational background. Eleven experts come from European countries located in different geographical zones. Two experts represent institutions from US. Eleven experts work at Academia and two represent industry.

1.2.2 Procedure

GCM consists of two phases: Idea generation and Sorting and rating ideas.

Idea generation

Idea generation requires the participants to individually generate ideas in respond to a focus (trigger) statement. The focus statement was as follows:

We all have the feeling that education in 20 years will have to be different from education today. Education then will possibly deal with a new set of skills and competences, new curricula or types of curricula, innovative ways of learning and assessment, different roles for teachers and educational

institutions, different impacts of technology, just to mention a few. We ask you to generate statements about your thoughts about education in 20 years, and to do this using the following format:

One specific change of Education in 20 years will be that: ...

Then we gave some examples to better illustrate what kind of outcomes the experts were expected to provide:

- *Learning will not be restricted to traditional educational institutions.*
- *Teachers will become mediators between students, knowledge and technology.*
- *Learning will be much more driven by internet-based social networking.*
- *Life-long learning will be the norm.*
- *Class size will not matter.*
- *Learning methods will take into account cognitive structures and processes*

To support the experts to generate many and various ideas about the future of education, we provided them with the following instruction:

Try at first to generate as many statements as possible. The more ideas that you generate, the greater the chance to select your best ideas. Postpone and withhold any judgments; all ideas have value and may lead to better ideas. Do not block your idea generation with a premature evaluation (no idea is stupid). Try to generate “out of box ideas”. Once you are no longer able to generate new ideas you can begin elaborating on, combining and evaluating the relevance of generated ideas. Watch the clock. A little time pressure is good for brainstorming, so decide upon a maximum time for brainstorming, say 10 to 15 minutes, and stick to it.

Try to include only one idea per statement. It’s better to have several statements, each expressing one idea, than one statement describing many ideas.

Please note: GCM brainstorming differs a little from classical brainstorming, because it is not “anything goes” but rather a targeted exercise of eliciting all possible ideas and issues in response to the context and the format of the brainstorming focus, namely:

One specific change of Education in 20 years will be that: ...

As a result of the idea generation phase, the experts generated 203 unique ideas in response to the focus statement. The practice suggests that if the number of ideas exceeds 150 for the sorting and rating a pre-selection by a small group of analysts is needed (Trochim, 2007). We decided not to apply a pre-selection procedure because of two reasons: (a) the participants in this study are experts in the domain; and (b) it does not make much sense to invite experts and do the job on their behalf; it would imply the researchers’ biases, thus affecting validity of the study.

Sorting and rating of ideas

The ideas were randomly shuffled and the final list was send back to the experts for first sorting and rating according to following separate instructions for the two idea structuring activities. The instruction for sorting contains the following standard guidelines provided with a sorting recording sheet (Concept System, 2004):

1. Group the statements for similarity in meaning (in a way that statements make the most sense to you);
2. Arrange the statements in a way that feels best (no right or wrong grouping);
3. Place each statement in one group only;
4. Place each statement somewhere (not one pile comprising all statements);
5. Place a statement in own group if it seems unrelated to the other statements (no group of statements called 'miscellaneous').
6. Once the groups have been sorted, pick up any one group of statements and write down a short phrase or title describing the content of the group.

We asked the participants to rate the statements on two scales: importance and feasibility. The instruction is also a standard one, provided with the rating recording sheet:

Please try to rate each of the statements on a 1-to-5 scale of importance and feasibility. For importance, 1 = Relatively Unimportant; 5 = Extremely Important. For feasibility, 1 = Least Feasible; 5 = Most Feasible.

When you rate the statements, try to use the full range of ratings values (e.g. 1 to 5).

The last sentence in the rating instruction is to avoid the expected mindset that implies that all ideas are important as long as they have been generated by experts. The emphasis here is on relative rather than absolute rating.

1.3 Analysis

Apart from the traditional descriptive statistics, the GCM approach applies some specific types of analyses such as multidimensional scaling (MDS) and hierarchical cluster analysis (HCA). The input for the multidimensional scaling is the creation of a total square similarity matrix from the sorting data across the participants. The matrix is binary and symmetric, showing the number of people that group together in their sorts each pair of statements. The combined matrix sums individual matrices of the participants. An individual matrix consists of as many rows and columns as are the statements. A cell indicates whether two statements are grouped together or not. '1' in the cell indicates that the two statements are sorted together by the participant, '0' that they are not.

MDS transforms the total square similarity matrix into a map depicted as a coordinated matrix. From the coordinates, MDS can compute the distances between all pair of statements (points) and can show this as matrix of distances between points. Figure 1 shows the results of MDS analysis performed on the sorting data collected from the expert-sorting. Each point represents one of the 203 statements generated. The closer the statements to each other are, the more similar in meaning they are, which also mean that more people sorted these statements together.

A reasonable question would be how accurately the point map represents the original similarity input matrix. The extent to which each of the distances between the statements on the map deviate from the values of the total similarity matrix which is used as input to the map is measured with the "stress index" (Kruskal & Wish, 1978). In principle, the lower the value of the stress index is, the better the

overall fit between the map and the input matrix is. A meta-analytical study across a broad range of concept mapping projects indicated that around 95% of concept mapping projects would produce value of the stress index in the range between 0.205 and 0.365. The stress value of the FORLIC project GCM study is 0.355, meaning it is in the same range. It has to be noted, however, that FORLIC is the first foresight study that applies GCM. Predicting the future of education brings more complexity in the data and perhaps increases the variability in the way people group the statements.

Figure 1. The Future of Education point map as a result from MDS analysis

1.3.1 Hierarchical cluster analysis

The hierarchical cluster analysis applying Ward agglomerative algorithm uses the values of the coordinates of the two dimensional MDS to partition the statements on the map in areas, which are contiguous but not overlapping with each other (Trochim, 2007). Ward hierarchical cluster analysis has been chosen because it is more appropriate than other hierarchical cluster analyses for interpreting distance data. It uses the coordinates' values of the MDS rather than the similarity matrix. This is especially useful when deciding on the number of clusters. The procedure for determining the number of clusters in the FORLIC GCM applies the heuristic called "20-to-5", which is based on the fact that most of the participants in GCM projects make between 5 and 20 clusters. We began with the 20-cluster solution checking at each step whether the solution from the merging of clusters makes sense until we arrived at the 5-cluster solution. We recorded all our judgements ("yes" or "no") about merging of clusters and after finishing the procedure we looked only at the few "yes" judgements for a deeper analysis of the clusters' content. To take decision, we also looked at the bridging/anchoring values of the statement in a particular cluster. The bridging/anchoring statistics has a value between 0 and 1. A low bridging/anchoring value means that more people have grouped the statement together with others in its vicinity. Statements with low bridging / anchoring value better represent the meaning of a particular

cluster's content than those with a higher value. This analysis concluded that the 12-cluster solution fits the FORLIC data in the best possible way. Figure 2 presents this solution. In addition, we tried to identify the label which best reflects the content of a particular cluster.

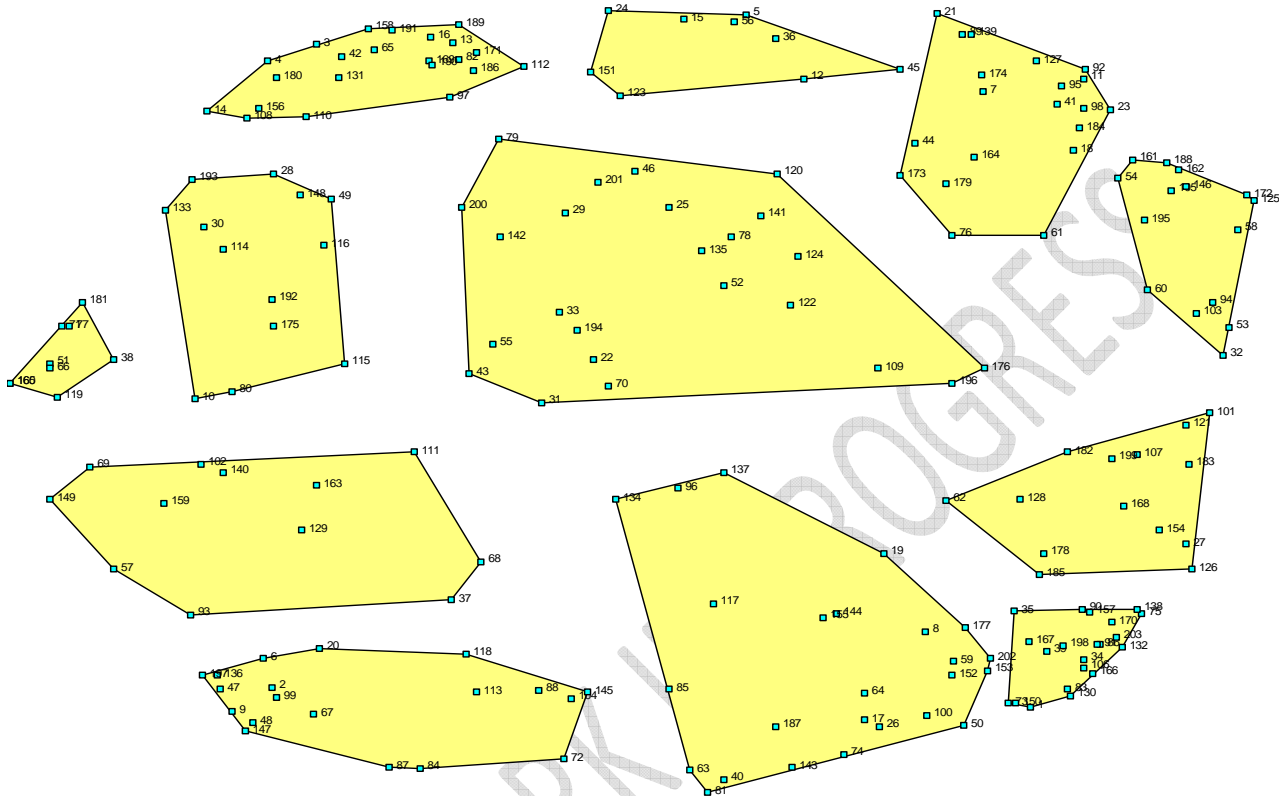

Figure 2. The 12 cluster solution

We applied two criteria: (a) statements with low bridging/anchoring value better represents the content of a cluster than the statements that are with high bridging value; and (b) analysis of the proposed labels by experts. Figure 3 presents clusters with their labels.

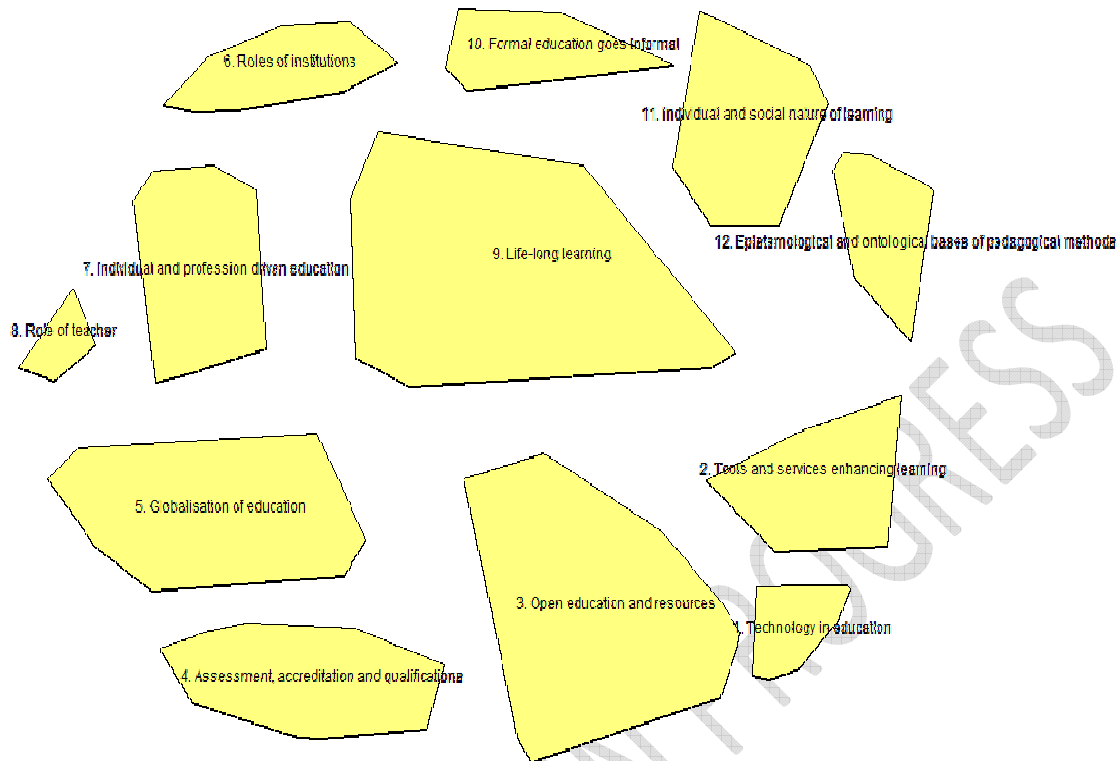

Figure 3. Cluster label map

2. Results

2.1 Clusters

The following clusters have emerged from the data: Technology in Education, Tools and services enhancing learning, Open education and resources, Assessment, accreditation and qualifications, Globalisation of education, Roles of institutions, Individual and profession driven education, Role of teacher, Life-long learning, Formal education goes informal, Individual and social nature of learning, and Epistemological and ontological bases of pedagogical methods.

The cluster *Technology in education* represents the content of the cluster well (count = 21 statements; SD = 0.08; variance = 0.01). Some representative statements are as follows:

- Virtual reality/Second life will be widely used in education.
- Practice will be captured through mobile devices and integrated with cloud based portfolios.
- Services on the internet will serve as a study environment.
- Augmented reality applications will be a major tool for learning.

The cluster *Tools and services enhancing learning* is about facilitators of learning in terms of tools, materials and services (count = 14; SD = 0.09; variance = 0.01). Some representative statements are:

- Some manual skills will be developed as usual with support of IT.
- The growing role of media for improving cognitive performance will support the learner with facts and simulation outcomes.

- Drugs that enhance learning effectiveness will be (legally?) widely available and used as well.
- Systems and services will be developed to allow mutual peer group learning between groups of interested learners.

The *Open Education and Resources* cluster is about possibilities for open education, construction and access to free of use learning resources (count = 25; SD = 0.16; variance = 0.03). Representative statements are:

- Open Educational Resources will become widely adopted.
- There will be internet and access to it everywhere and all around the globe, allowing learning to flow in all directions.
- Most physical (paper) libraries will have disappeared.
- Text books will be replaced by electronic multimedia publications.
- Mashups will be present at institutional and students level.
- Lecture capture will be omnipresent.
- Learning spaces-groups to support informal learning will be everywhere, the super-markets, on beaches, on the buses etc.

The cluster *Assessment, accreditation and qualifications* is very representative for its content (count = 19; SD = 0.24; variance = 0.06). Some of the statements included in it are:

- Different type of certifications will emerge that are not related to formal learning institutions.
- Will find ways to align assessment with how people actually learn and to make it meaningful.
- Past learning narrative now available in portfolios will be on micro-macro view and will automatically identify missing information and skills towards specific learning goals and organisational targets.
- First steps will be taken to describe qualifications on a global level.
- We will recognise people for what they do rather than what qualifications they have.

Globalisation of education is about internationalisation of education in a broader sense; looking at education from a global rather than local perspective (count = 12; SD = 0.10; variance = 0.1). Representative statements are:

- All educational systems in Europe will be connected in a central system to identify the best students in order to support them no matter the country of origin.
- In Europe (EU) many students will learn with and from each other in international collaborations.
- We will cease to rely on experts as the source of knowledge and curriculum and move towards quality based on use and endorsement through internet systems.

The cluster *Role of Institutions* (count = 22; SD = 0.08; variance = 0.01) represents very well the content of the cluster, which includes statements such as:

- The main roles of educational institutions will be about providing learners with guidance on how to shape their personal learning trajectories, how to choose learning formats and resources needed, and how to assess their progress and outcomes.

- The Sabbatical-like University will emerge, institutions that offer a syllabus of exploration, like in a sabbatical year but in 2 or 4 years, guided by mentors.
- Educational institutions will be reinvented as community knowledge centers serving both geographical communities and wider dispersed communities.
- Community colleges take care of the associate and bachelor degrees.
- Inter sector and inter subject networks of institutions will combine to form networks based on purpose and interest.
- Government funded higher education will start to privatize.

The cluster *Individual and profession driven education* is about individualisation, learner locus of control and professionalisation (count = 13; SD = 0.13; variance = 0.02). Statements included in it are as follows:

- Classmates will be matched based on their knowledge, skills and preferred teaching and learning styles rather than their age.
- Learner will choose alone its learning path.
- The responsibility for learning will be with an individual, not outsourced to an external institution.
- University programmes will be focused more on specific job profiles.
- Learners will have more opportunities to find co-learners who share their learning goals and preferences (similarly to finding people to travel together).

Some representative statements for the cluster *Role of teacher* (count: 9; SD = 0.11; variance = 0.01) are as follows:

- Natural role of the teacher will be mediator of learning.
- Teachers will need to develop coaching/mentoring skills.
- Teacher will be natural learner.
- The majority of teachers work online from home either freelance or for an online educational organization.

The cluster *Life-Long Learning* (count = 24, SD = 0.12; variance = 0.01) is about learning throughout the whole life span; not limited to particular age or institution; learning every time, everywhere. Here are some examples, representative for the clusters:

- Learning will be integrated and disappeared in everyday activities.
- Schooling will become a less important focus for learning as learning moves into the workplace, community and home.
- It will become common for people to move between occupations with learning key to supporting such moves.
- Students will choose to learn with people from their own network.
- Professional networks will be one of the main ways of education.
- We will have to develop skills in picking up relevant learning resources from what is abundant there and building our own learning trajectories around them.

The cluster *Formal education goes informal* (count = 9; SD = 0.04; variance = 0), as the title suggests, is about the shift of focus from formal to informal learning and the increasing role of informal learning. Representative statements are:

- Education will leave the class room.
- There will be a lowering of the school leaving age as it is recognised that other contexts for learning may be more effective and more motivating than school.
- Traditional disciplinary boundaries will break down with learners pursuing individual learning programmes based on multi and inter disciplinary learning.
- Secondary education will shift towards the creative authentic and social mindedness.

The cluster *Individual and social nature of learning* (count = 20; SD = 0.09; variance = 0.01) is about cognitive and social aspects of learning. Some representative examples are as follows:

- The fostering of diverse learning styles and its fit to pedagogy (becoming a mature, ethical and happy person) will become more manifest than before.
- Different learning styles and adapted teaching methods of the same courses will be available for individual and social learning.
- The learner will invest more in the cerebral aspects of learning: Strategic, problem-oriented, situational and creative.
- Practice will become a focus for learning.
- Learning will be considered in a proactive and active manner on demand
- Learner will teach other participants in process of learning.

The cluster *Epistemological and ontological bases of pedagogical methods* (count = 15; SD = 0.11; variance = 0.01) is about pedagogical methods and their theoretical and empirical foundations on how people learn. Examples of statements included in this cluster are:

- Social and cognitive processes and convergences will become part of the pedagogical methods.
- Gaming and learning are no longer opposite worlds.
- Information will be manipulated [and] anchored in specific creativity techniques to facilitate synthesis and creativity.
- Guided learning in a group will be complemented with learning in and from loosely knit networks.
- Cross-curriculum (inter-disciplinary) project activities will dominate the course design.
- Constructivism will still be there, but new paradigms will have arisen.

Annex 1 provides details about the content of the clusters.

The cluster map shows that there are some more technology-oriented clusters such as 'Technology in education', and 'Tools and services enhancing learning'. 'Open education and resources' bridges more technology-oriented clusters and the clusters 'Globalization of education' and 'Assessment, accreditation and qualifications'. Technology facilitates the access of people to open education and resources. Open educational resources require adequate form for assessment and accreditation on both national and international level. There are further four clusters ('Role of teachers', 'Role of Institutions', 'Individual and profession driven education' and 'Formal education goes informal') which suggest a shift

in taking responsibility for own education from institutions to individual. Finally there are two clusters ('Individual and social nature of learning' and 'Epistemological and ontological bases of pedagogical methods'), which are learning-oriented. They discuss issues related to cognitive and social aspects of learning as a basis for the design of effective, efficient and appealing learning environment.

One of the most important findings emerging from the data sorting is the very central place of the cluster 'Life-Long Learning'. It means that this cluster is a connection point for all other clusters. Life-long learning needs to take into account issues related to technology, learning and teaching, and change in the role of institutions, teachers and learners.

2.2 Importance and feasibility of clusters

The analysis of the rating data provides pictures indicating which ideas about the future of education the experts think are important and which ones are feasible in 20 years. Figures 4 and 5 show the cluster maps on importance and feasibility.

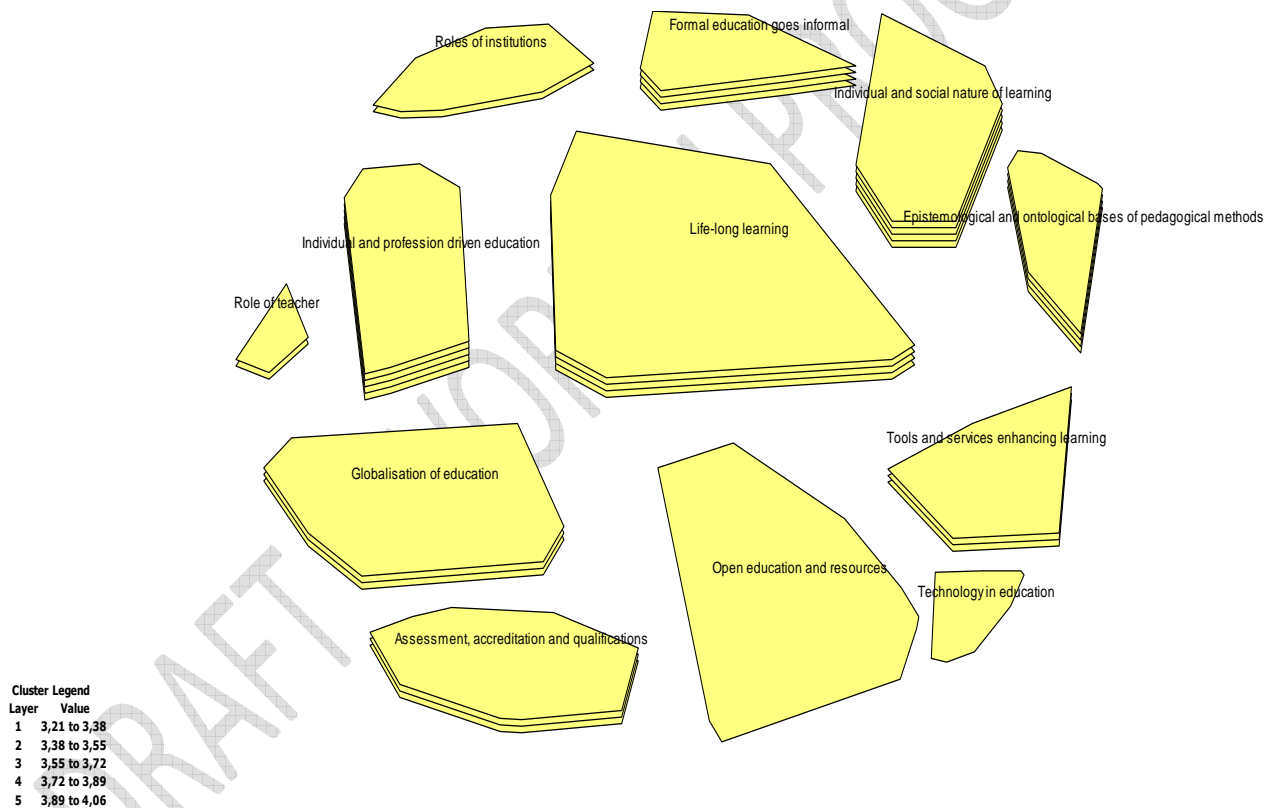

Figure 4. Cluster rating map on importance

Generally speaking, the 'learning' related clusters score higher on importance than the technology-oriented clusters. The cluster *Individual and social aspect of learning* and *Individual and profession driven education* get the highest score on importance (5 layers). The clusters *Life-long learning*, *Epistemological and ontological bases of pedagogical methods*, and *Formal education goes informal* have one layer less. The participants in the study perceived as the least important the clusters *Technology in education* and *Open education and resources*. One probable explanation for this result is that the participants perceive technology and open education just as means for learning. As the map

shows the two clusters are closely related. Technology alone is neither the problem, nor the solution for education and training. Good understanding of cognitive and social aspects of learning is a basis for designing effective learning environment and materials.

Feasibility rating (see Figure 5.) provides additional information and complementary support for the results generated through rating.

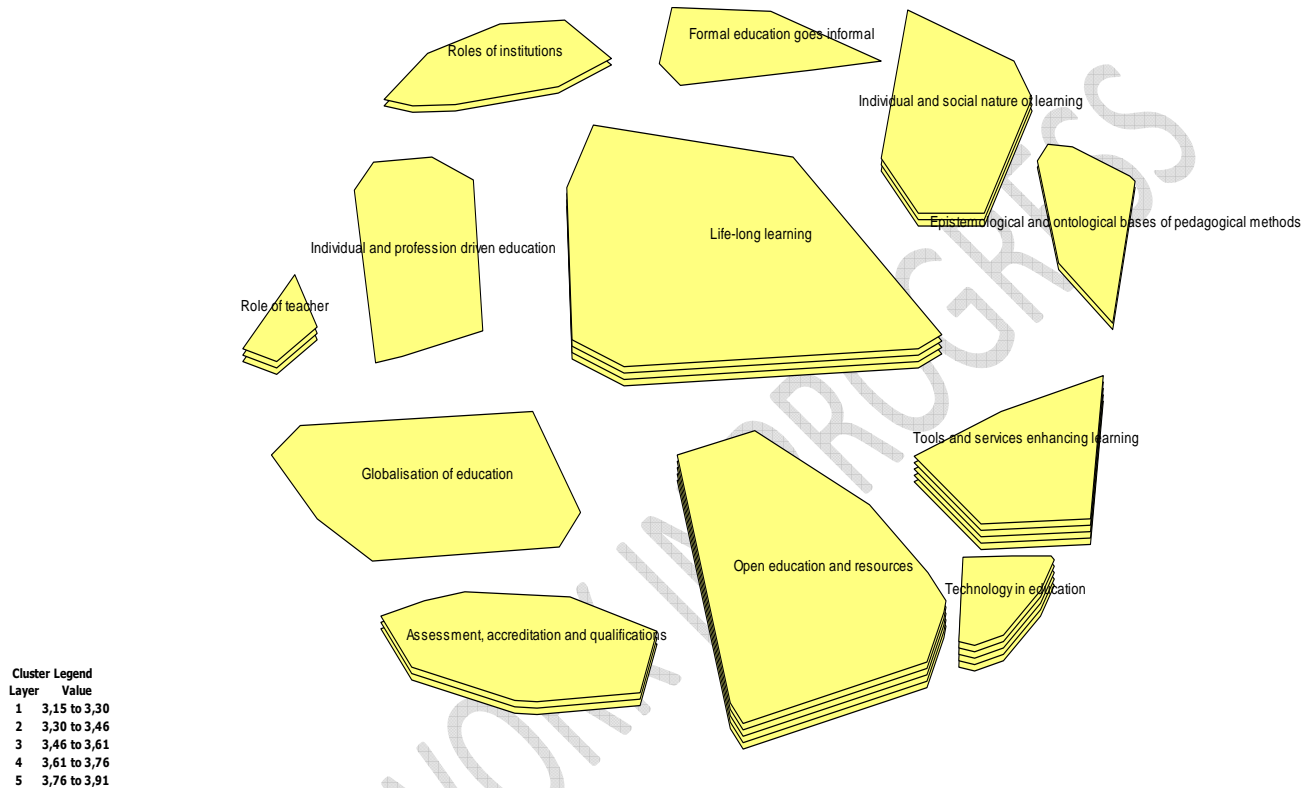

Figure 5. Cluster rating map on feasibility

The cluster map on feasibility clearly shows that technology-oriented clusters (*Technology in education, Open education and resources* and *Tools and services enhancing learning*) are perceived as easy to achieve. On the opposite side are more learning-oriented clusters. Informal learning, self-directed learning, personalization and professionalization of education and training are difficult issue to implement. It also seems that it is easier to understand learning than to use this knowledge to design learning environments (*Individual and social nature of learning* has 3 layers; *Epistemological and ontological bases of pedagogical methods* – two). Annex 2 presents the importance and feasibility value of each of the statements.

2.2.1 Between clusters comparison on importance and feasibility

The ladder graph in Figure 6 provides a visual comparison of the clusters on importance and feasibility.

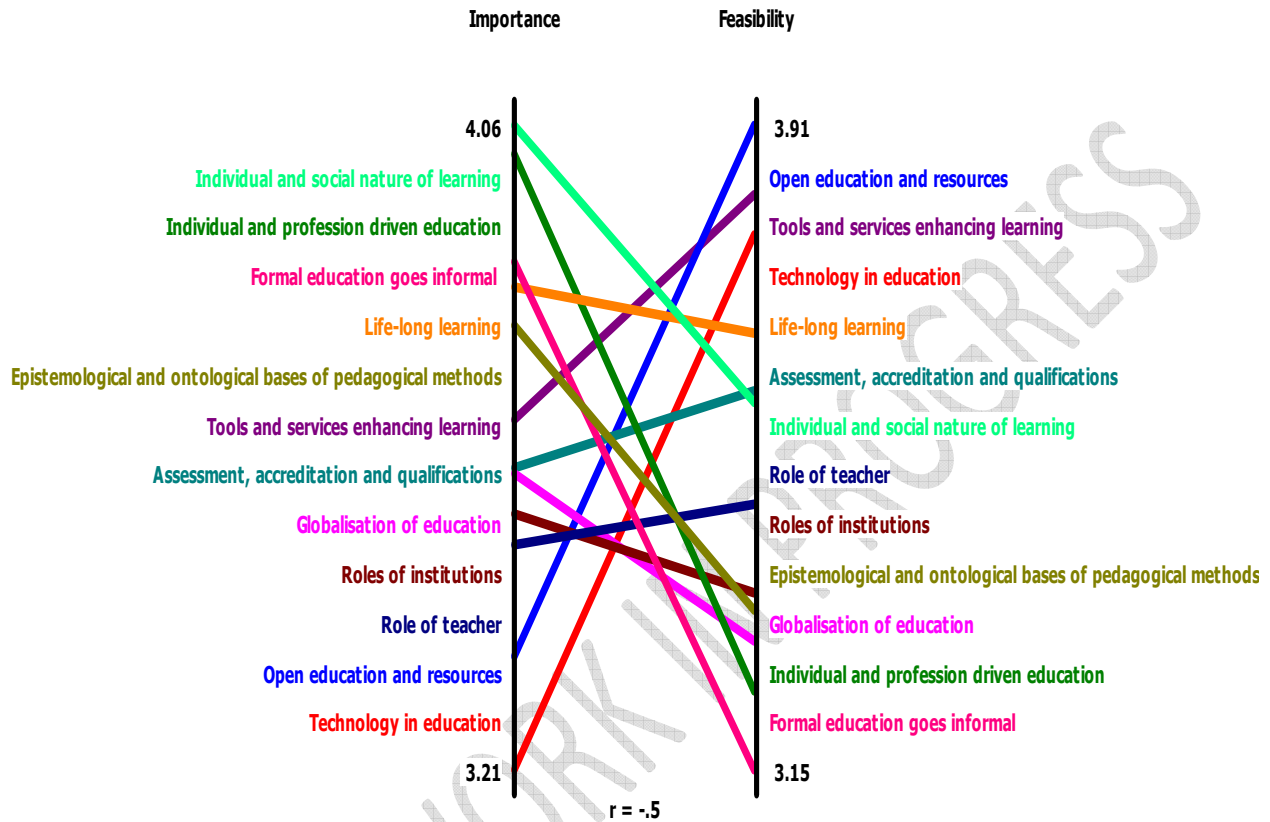

Figure 6. Comparison of clusters on importance and feasibility

There is a very weak relationship between the two values. Clusters rated as important are perceived as not feasible. The clusters ‘Open Education and resources’, ‘Technology in education’, ‘Individual and social aspects of learning’ and ‘Formal education goes informal’ represent the largest margins in scores on the two scales. There are relatively small differences in scores of clusters such as Life-long learning, ‘Role of teacher’, and ‘Assessment, accreditation’ and ‘qualification’.

2.2.2 Within clusters comparison on importance and feasibility

A specific analysis that compares the statements on importance and feasibility within a particular cluster is “go-zone”. Go-zone identifies statements that score high on both importance and feasibility, thus suggesting where we should look first when planning the implementation of changes in education and training. Go-zone is a bivariate graph that shows the average ratings for importance and feasibility on each statement within a specific cluster. For example, something that is considered to be very important could be deemed not to be very feasible. The graph is divided into quadrants based upon the mean rating values of importance and feasibility. The upper right quadrant represents issues that are above average on both variables (“go to” – very important and very feasible). Figure 7 is an example of a go-zone comparing the statements in the cluster Life-long learning on importance and feasibility.

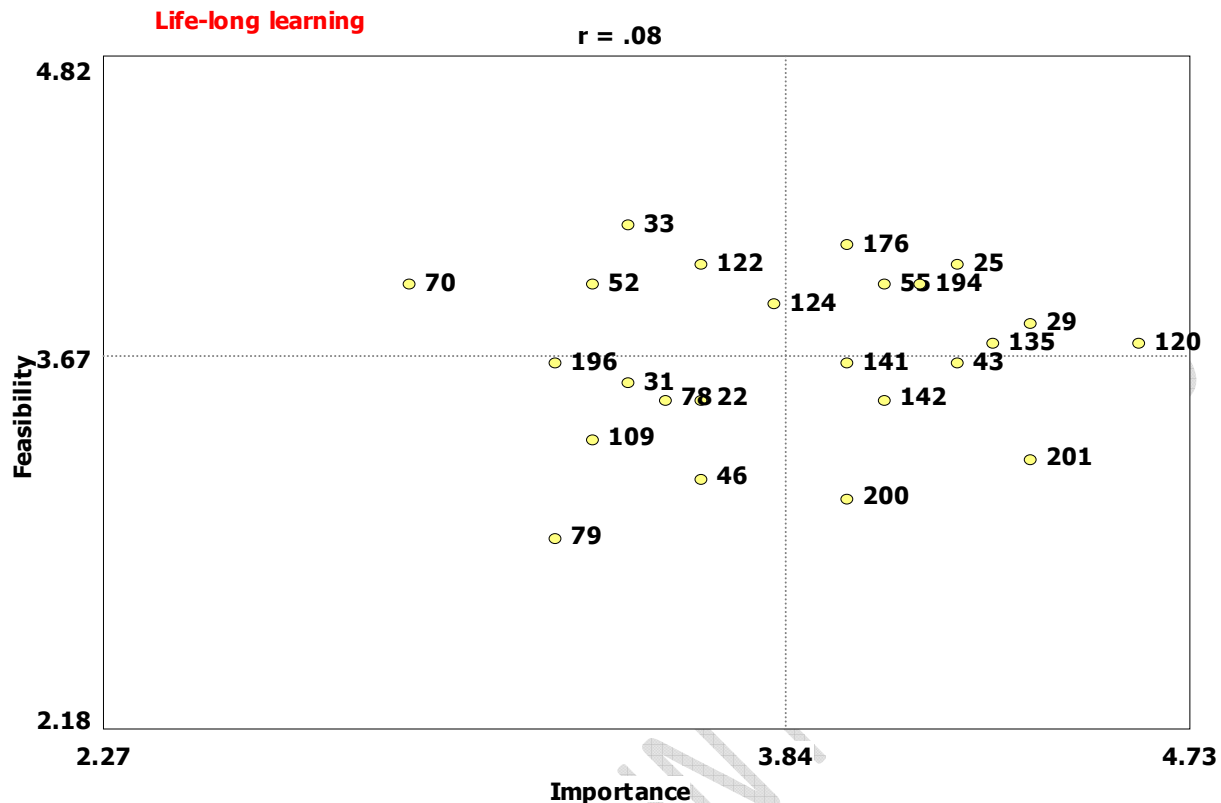

Figure 7. Life-long learning go zone

The following statements are located in the upper-right quadrant (go zone), that is to say important and feasible: “Open learning through the internet will become common” (176); “The workplace will become a major context for learning” (25); “Students will combine working and learning” (194); “University students will attend courses within their working schedule” (55); “We will have to develop skills in picking up relevant learning resources from what is abundant there and building our own learning trajectories around them” (29); “The learning environment will change throughout one's life time, from school to workplace and home” (124); “Lifelong learning will be natural” (120); and “Education and learning will last throughout one's whole life, from cradle to grave so to speak, going from Kindergarten age to being a senior citizen” (135). Annex 3 presents go-zone graphics for all clusters. The most visible orientation to the upper-right side of the graphic can be seen in the clusters *Individual and social nature of learning* and *Individual and profession driven education*. *Globalisation of education* and *Role of teacher* have each only one statement in the upper-right quadrant. *Individual and social nature of learning* has the highest positive correlation between importance and feasibility ($r = .66$), followed by *Individual and profession driven education* ($r = .48$). *Globalisation of education* has the highest negative correlation between the two values ($r = -.41$). The lowest correlation between importance and feasibility can be found in the following clusters: *Assessment, accreditation and qualification* ($r = .07$), *Life-long learning* ($r = .08$), and *Role of teacher* ($r = -.09$). Annex 4 is a list of statements for all clusters that are located in the upper-right quadrant. They represent about 25 % of all the ideas generated.

3. Conclusions

Group Concept Mapping in the FORLIC project proved to be an effective, efficient and appealing to the participants approach for data collection, structuring and analysis. Idea generation, sorting and rating are activities that the participants are used to. Thirteen participants generated 203 unique ideas, which is a very high number. It exceeds the number of ideas produced in any other GCM study. This is due to the sample of experts and instruction provided. Sorting and rating were time consuming activities, but not difficult for the participants from conceptual point of view.

In contrast to some other similar techniques (e.g affinity diagram or card sorting), GCM applies some rigorous statistical techniques for data analysis such as multidimensional scaling and hierarchical cluster analysis to identify emerging structures in the data.

The visualisations provided by the software (Concept System, 2010) support the interpretation of the results.

The results from the GCM study lay an empirical ground for writing FORLIC personas and building scenarios.

Annex 1: Full Cluster Description

Cluster 1: Technology in education

N	Statement	Bridging value
166	Augmented reality applications will be a major tool for learning,	.00
130	Mobile internet enabled devices will become the major tool for learning.	.00
83	Phone, pc, e-reader will have merged in one application.	.00
34	Technology will bridge time and space in learning.	.03
150	Mobile devices will be used in education to create content.	.04
86	Electronic learning environments will have greatly increased possibilities.	.04
106	The role of ICT will change throughout one's life time, from a supporting role to an overriding, unavoidable presence (wearable computers, in one's ordinary functioning integrated).	.07
132	Electronic learning environments will become more and more integrated with groupware systems.	.07
91	Virtual reality/Second life will be widely used in education.	.07
1	Practice will be captured through mobile devices and integrated with cloud based portfolios.	.07
138	The intense merger of new technologies with the better understanding of learning will produce educational application that never allows people to forget what they have previously experienced or learned.	.09
203	Services on the internet will serve as a study environment.	.10
198	Desktop conferencing will become used to keep in touch with peer students from abroad.	.10
167	Information will be available in many different forms, not only multimedia but connected media via mash-ups.	.12
39	Life communication in education will never be fully replaced by technologies.	.17
170	Education will leverage the technology advancement	.18
73	Wearable, computing devices.	.18
90	There will be no such thing as a 'digital learning environment.	.21
75	Mobile learning will be natural.	.23
35	Multi User Virtual Environments will render physical attendance in school and university unnecessary.	.24
157	Internet will be main media for delivery of education.	.27

Count:	21	Std. Dev.:	0.08	Minimum:	0.00	Average:	.11
		Variance:	0.01	Maximum:	0.27	Median:	0.09

Cluster 2: Tools and services enhancing learning

N	Statement	Bridging value
126	Technologies will change emphases on some of the subjects.	.27
178	Technology-enhanced learning should be basic requirement skills for every learner.	.33
154	Some manual skills will be developed as usual with support of IT.	.33
27	The growing role of media for improving cognitive performance will support the learner with facts and simulation outcomes.	.34
185	Precious time of f2f contact will not be missed for activities that could be done in technology-mediated [environment].	.35
168	Learning should be social and supported by social web technology.	.38
199	Drugs that enhance learning effectiveness will be (legally?) widely available and used as well.	.44
128	Context specific learning materials and tasks will lead to more localised learning.	.47
182	Courses will be available in different forms (text. online. mobile. teacher-based instructions).	.51
121	Learning from one's own mistakes takes an entirely new dimension thanks to user-generated content, social media and attention metadata.	.51
183	Systems and services will be developed to allow mutual peer group learning between groups of interested learners.	.52
101	Technology and pedagogy will align such that students can participate in learning environments that will allow them to have high quality learning experiences.	.52
107	Online communities will be widely used in education.	.53
62	Students and faculty will choose their own application providers.	.55

Count:	14	Std. Dev.:	0.09	Minimum:	0.27	Average:	.43
		Variance:	0.01	Maximum:	0.55	Median:	0.46

Cluster 3: Open education and resources

N	Statement	Bridging value
153	Although time constraints will still apply. the constraints of physical space will go, allowing communication wherever one wants at the time agreed upon.	.16
50	Consumer/Communication electronics will continue to drive technology	.16
59	Replays of previous learning experience with user- generated videos and posts on the social software sites bring up evidence and revokes the re-learning.	.17
202	There will be internet and access to it everywhere and all around the globe, allowing learning to flow in all directions.	.19
100	Mashups will be present at institutional and students level.	.20
152	Digital identities (and portfolios) will replace traditional CVs.	.22
26	Portfolio views will be mashed-up.	.24
74	Lecture capture will be omnipresent.	.26
8	Internships will be better supervised by using social networking tools.	.27
143	Lecture capture will contain student contributions.	.31
64	Most physical (paper) libraries will have disappeared.	.31
17	Blogs and other internet based multi media will be recognised as legitimate publications for researchers.	.34
177	Students will obtain online profiles (and kudos) in their institutions.	.34
19	Online social networking will become more important.	.34
144	Learning on the move (anytime and anywhere).	.34
40	Text books will be replaced by electronic multimedia publications.	.37
81	Physical (paper) libraries have the task to preserve rare collections.	.38
187	There will be digital library services.	.45
155	Online courses will be available in many different languages with access from all over the world.	.47
85	Portfolios will be generated by aggregating content from other sources.	.50
63	Open Educational Resources will become widely adopted.	.51
96	Learning spaces-groups to support informal learning will be everywhere, the super-markets, on beaches, on the buses etc.	.51
117	Knowledge-based society would mean access and sharing of knowledge with technology support.	.54
137	Most IT services of Higher Education institutions will come from commercial providers.	.66
134	Knowledge will be build-up non-systematically.	.81

Count:	25	Std. Dev.:	0.16	Minimum:	0.16	Average:	.36
		Variance:	0.03	Maximum:	0.81	Median:	0.34

Cluster 4: Assessment, accreditation and qualifications

N	Statement	Bridging value
147	There will be specialized (commercial) testing/assessment organizations that take care of grading.	.06
48	The degrees will also include information about the students' soft skills.	.08
47	Qualifications will be checked and maintained on a European level.	.15
9	High stakes testing will disappear.	.15
99	Continued education, assessment of certificates of acquired knowledge/skills/competences by standard educational framework.	.22
136	First steps will be taken to describe qualifications on a global level.	.24
2	There will be ways to get accredited for learning outside of formal institutions.	.27
197	Different type of certifications will emerge that are not related to formal learning institutions.	.27
67	Student test performance/progress is logged over years.	.29
87	Most testing will be done online.	.33
84	There will be vast item banks for testing.	.38
6	We will recognise people for what they do rather than what qualifications they have.	.46
20	Will find ways to align assessment with how people actually learn and to make it meaningful.	.56
72	Most (educational) content will be digital.	.63
118	Past learning narrative now available in portfolios will be on micro-macro view and will automatically identify missing information and skills towards specific learning goals and organisational targets.	.70
145	Students will create content in all courses.	.71
113	Free online content is used as a marketing tool.	.72
88	There will be an abundance of easily available learning resources, but a challenge [is] to find guidance around them.	.73
104	Virtual mobility will break down barriers between national education systems.	.83

Count:	19	Std. Dev.:	0.24	Minimum:	0.06	Average:	.41
		Variance:	0.06	Maximum:	0.83	Median:	0.33

Cluster 5: Globalisation of education

N	Statement	Bridging value
93	All educational systems in Europe will be connected in a central system to identify the best students in order to support them no matter the country of origin.	.61
57	High course fees will deter many working class students from attending higher education.	.66
140	Appropriate, accessible, affordable education.	.70
68	Educational content will be produced by commercial organizations.	.72
149	Students will pay more for their learning programmes.	.73
37	We will cease to rely on experts as the source of knowledge and curriculum and move towards quality based on use and endorsement through internet systems.	.77
111	Knowledge will be bringing in education from interested stakeholders.	.81
129	The right people (wherever they are) gain strength and are the key to success.	.83
102	Getting free education and educational contents should become basic human rights.	.83
163	Students will learn increasingly globally.	.84
159	In Europe (EU) many students will learn with and from each other in international collaborations.	.87

Count:	12	Std. Dev.:	0.10	Minimum:	0.53	Average:	.74
		Variance:	0.01	Maximum:	0.87	Median:	0.75

Cluster 6: Roles of institutions

N	Statement	Bridging value
16	The main roles of educational institutions will be about providing learners with guidance on how to shape their personal learning trajectories, how to choose learning formats and resources needed, and how to assess their progress and outcomes.	.24
158	Higher education will return to its traditional core purpose of research.	.24
169	Educational institutions will be driven by interests of society.	.24
190	Schools will loose their function.	.25
3	Research universities will provide expensive on campus education.	.25
42	Online teaching universities will provide cheap online education.	.29
13	The Sabbatical-like University will emerge, institutions that offer a syllabus of exploration, like in a sabbatical year but in 2 or 4 years, guided my mentors.	.30
191	Private higher education organizations will have an increased market.	.30
4	The number of on campus Higher Education institutions will have reduced to a few that able to compete internationally.	.30
65	Educational institutions will be reinvented as community knowledge centres serving both geographical communities and wider dispersed communities.	.33
189	The role of institutions will change from being the single provider of learning opportunities that delivers a variety of services to being one of several institutions that delivers a specialised service only.	.33
186	Formal learning will become more episodic with people entering and leaving education at various points in their career path.	.35
131	Bricks and mortar educational structures will be unnecessary for most students as they will have access to education where ever they are.	.36
82	Community colleges take care of the associate and bachelor degrees.	.38
97	Inter sector and inter subject networks of institutions will combine to form networks based on purpose and interest.	.40
108	The financial crisis will lead to increasing privatization of university.	.42
110	Educational institutions or certifications may disappear. and communities or networking will replace these.	.43
180	Higher Education institutions will merge cross borders in Europe.	.44
112	The locus of learning will shift from physical institutions in the beginning (schools certainly at the age of Kindergarten or preschool) to non-institution based at best at virtual institutions but probably mostly in self-organising network-like construction.	.44
14	Higher Education institutions will expand cross borders in Europe.	.45
171	There will be specialized (commercial) organizations for brush-up courses.	.45
156	Government funded higher education will start to privatize.	.47

Count:	22	Std. Dev.:	0.08	Minimum:	0.24	Average:	.35
		Variance:	0.01	Maximum:	0.47	Median:	0.34

Cluster 7: Individual and profession driven education and training

N	Statement	Bridging value
175	Education will continue to support the need for a highly qualified work force.	.55
28	Classmates will be matched based on their knowledge, skills and preferred teaching and learning styles rather than their age.	.55
0	The global university will be a fact, people distributed all around, no boundaries, location loses power.	.60
116	Networked education settings rather than centralized educational institutes.	.61
49	Learner will choose alone its learning path.	.64
114	Classes will be not limited in terms of age, distance, etc.	.64
148	The responsibility for learning will be with an individual, not outsourced to an external institution.	.69
193	Learners will be expected to take control of their own learning.	.71
133	University programmes will be focused more on specific job profiles.	.74
115	Learners will have more opportunities to find co-learners who share their learning goals and preferences (similarly to finding people to travel together).	.79
192	Schools will be places where students will go to learn techniques of handling information.	.81
10	The ability of an individual to make choices about where and how to learn will be supported by laws and financial mechanisms.	.90
80	Teachers target more the metacognitive, emotional and the moral aspects.	1.00

Count:	13	Std. Dev.:	0.13	Minimum:	0.55	Average:	.71
		Variance:	0.02	Maximum:	1.00	Median:	0.69

Cluster 8: Role of teachers/trainers

N	Statement	Bridging value
165	Natural role of the teacher will be mediator of learning.	.34
160	Teachers will need to develop coaching/mentoring skills	.34
51	Teacher will be natural learner.	.39
66	The best teachers/researchers work on campus.	.47
71	On campus teachers will use tutors to assist them in teaching.	.49
119	Privacy of staff will decrease.	.54
181	The majority of teachers work online from home either freelance or for an online educational organization.	.54
77	Teachers will be orchestrators of learning activities.	.61
38	Privacy of students will decrease.	.65

Count:	9	Std. Dev.:	0.11	Minimum:	0.34	Average:	.49
		Variance:	0.01	Maximum:	0.65	Median:	0.49

Cluster 9: Life-long learning

N	Statement	Bridging value
33	The boundary between learning-work-private life will disappear.	.29
78	Learning will be integrated and disappeared in everyday activities.	.32
25	The workplace will become a major context for learning.	.34
142	The learning component of education will become more and more endemic to life (work. play. and socialize) rather than the certificate-oriented formal learning according to modal curricula.	.34
135	Education and learning will last throughout one's whole life, from cradle to grave so to speak, going from Kindergarten age to being a senior citizen.	.35
79	Vocational education and training become the major organisational form of learning.	.35
194	Students will combine working and learning.	.37
200	Schooling will become a less important focus for learning as learning moves into the workplace, community and home.	.38
120	Lifelong learning will be natural.	.39
124	The learning environment will change throughout one's life time, from school to workplace and home.	.40
55	University students will attend uni courses within their working schedule.	.40
43	It will become common for people to move between occupations with learning key to supporting such moves.	.40
141	The learning environment will change throughout one's life time, from knowledge transfer and socialization to knowledge independent knowledge acquisition and voluntary social interaction.	.42
22	Occupational profiles will become broader incorporating elements of what are now seen as individual occupations.	.43
201	Education should cater the functional needs of every citizen irrespective of age.	.45
46	There will be a shift from career focus to personal focus.	.47
122	Students will choose to learn with people from their own network.	.51
70	Students will keep in touch with their universities after they have graduated.	.52
196	A study environment will consist of services that are not specific to education.	.56
109	Professional networks will be one of the main ways of education.	.58
29	We will have to develop skills in picking up relevant learning resources from what is abundant there and building our own learning trajectories around them.	.63
31	Management of digital identities will become a crucial competence.	.66
52	Higher Education institutions will cooperate in procuring services from commercial providers.	.67
176	Open learning through the internet will become common.	.70

Count:	24	Std. Dev.:	0.12	Minimum:	0.29	Average:	.45
		Variance:	0.01	Maximum:	0.70	Median:	0.41

Cluster 10: Formal education and training goes informal

N	Statement	Bridging value
123	Education will leave the class room.	.47
24	Exploratory and creative learning initiatives or institutions will emerge to help build the leadership of the future.	.50
5	Secondary education will shift towards the creative, authentic and social mindedness.	.51
12	There will be a lowering of the school leaving age as it is recognised that other contexts for learning may be more effective and more motivating than school.	.52
45	Participants in education will be really motivated to participate in it.	.54
151	Class size will depend on the selected course/method.	.56
36	Traditional disciplinary boundaries will break down with learners pursuing individual learning programmes based on multi and inter disciplinary learning.	.57
56	Online teaching universities will provide centres for skills development (skills labs).	.58
15	Institutions will integrate the power of the self in their core programs. career stepping behind.	.58

Count:	9	Std. Dev.:	0.04	Minimum:	0.47	Average:	.54
		Variance:	0.00	Maximum:	0.58	Median:	0.54

Cluster 11: Individual and social nature of learning

N	Statement	Bridging value
11	The fostering of diverse learning styles and its fit to pedagogy (becoming a mature, ethical and happy person) will become more manifest than before.	.27
95	Learning will be much individualized.	.27
41	Students' learning will be based on curiosity.	.29
92	The pedagogy of learning will change throughout one's life time, from fit for children to fit for adults.	.32
127	Education will be segmented into bites of learning, so individuals can make their personal paths to gaining the knowledge they require.	.32
23	Different learning styles and adapted teaching methods of the same courses will be available for individual and social learning.	.33
173	Learning will be more integrated with daily life or work.	.36
179	The learner will invest more in the cerebral aspects of learning: Strategic, problem-oriented, situational, and creativeness.	.37
98	Education will be more personalized.	.38
164	Practice will become a focus for learning	.39
44	Learning at all levels will be closer connected to practice.	.39
21	Education will be interests-driven.	.43
76	Informal education will be main type of education.	.44
7	Learning will be considered in a proactive and active manner on demand.	.44
139	Study paths will become more flexible.	.45
184	Choices and flexibility around learning will be the norm, also in primary/secondary education.	.45
174	Personalized educational contents which meet learners job requirements.	.47
89	Personal Learning Environments will replace institutional Virtual Learning environments.	.47
18	Learner will teach other participants in process of learning.	.53
61	Learning programmes will be more flexible then they are now.	.64

Count:	20	Std. Dev.:	0.09	Minimum:	0.27	Average:	.40
		Variance:	0.01	Maximum:	0.64	Median:	0.39

Cluster 12: Epistemological and ontological bases of pedagogical methods

N	Statement	Bridging value
188	Experiential and immersive learning will be the norm.	.29
172	Social and cognitive processes and convergences will become part of the pedagogical methods.	.32
125	Constructivism will still be there, but new paradigms will have arisen.	.34
162	Primary education will accept a larger pedagogical role: Learning to Learn rather than learning the complete subject domains like nowadays.	.34
161	Learning methods will gradually change over one's life time: from being instructor led to learner led.	.36
105	Learning will be accepted more and more as a social and personality-bounded process.	.36
146	Collaborative-learning will be widely spread.	.41
32	Our knowledge of the biological determinants of learning will vastly increase (relation to diurnal rhythms, to brain chemistry and brain topography of learning).	.41
58	Art will take a much stronger role in all educational institutions and initiatives.	.47
103	Gaming and learning are no longer opposite worlds.	.50
54	Collaboration in learning -and not only- will be the only way forward.	.51
94	Information will be manipulated [and] anchored in specific creativity techniques to facilitate synthesis and creativity.	.57
53	Guided learning in a group will be complemented with learning in and from loosely knit networks.	.57
195	Cross-curriculum (inter-disciplinary) project activities will dominate the course design.	.59
60	Learning content should be joyful. game-based and functional	.60

Count:	15	Std. Dev.:	0.11	Minimum:	0.29	Average:	.44
		Variance:	0.01	Maximum:	0.60	Median:	0.41

Annex 2: List of all Statements with their Ratings on Importance and Feasibility

No	Statements	Criteria	
		Importance	Feasibility
1	Practice will be captured through mobile devices and integrated with cloud based portfolios.	2.73	4.00
2	There will be ways to get accredited for learning outside of formal institutions.	3.82	3.91
3	Research universities will provide expensive on campus education.	2.27	3.55
4	The number of on campus Higher Education institutions will have reduced to a few that able to compete internationally.	2.91	3.18
5	Secondary education will shift towards the creative, authentic and social mindedness.	3.73	2.73
6	We will recognise people for what they do rather than what qualifications they have.	4.27	3.36
7	Learning will be considered in a proactive and active manner on demand.	4.18	3.45
8	Internships will be better supervised by using social networking tools.	2.91	3.82
9	High stakes testing will disappear.	2.91	2.18
10	The ability of an individual to make choices about where and how to learn will be supported by laws and financial mechanisms.	4.09	3.18
11	The fostering of diverse learning styles and its fit to pedagogy (becoming a mature, ethical and happy person) will become more manifest than before.	3.64	3.45
12	There will be a lowering of the school leaving age as it is recognised that other contexts for learning may be more effective and more motivating than school.	3.27	2.55
13	The Sabbatical-like University will emerge, institutions that offer a syllabus of exploration, like in a sabbatical year but in 2 or 4 years, guided my mentors.	3.55	2.82
14	Higher Education institutions will expand cross borders in Europe.	4.18	4.18
15	Institutions will integrate the power of the self in their core programs, career stepping behind.	3.82	2.55
16	The main roles of educational institutions will be about providing learners with guidance on how to shape their personal learning trajectories, how to choose learning formats and resources needed, and how to assess their progress and outcomes.	4.18	3.36
17	Blogs and other internet based multi media will be recognised as legitimate publications for researchers.	2.82	3.18
18	Learner will teach other participants in process of learning.	3.91	3.82
19	Online social networking will become more important.	3.82	4.45
20	Will find ways to align assessment with how people actually learn and to make it meaningful.	4.18	3.00
21	Education will be interests-driven.	3.82	3.45
22	Occupational profiles will become broader incorporating elements of what are now seen as individual occupations.	3.64	3.45
23	Different learning styles and adapted teaching methods of the same courses will be available for individual and social learning.	3.64	3.45
24	Exploratory and creative learning initiatives or institutions will emerge to help build the leadership of the future.	3.91	2.91
25	The workplace will become a major context for learning.	4.27	4.09
26	Portfolio views will be mashed-up.	3.18	3.91
27	The growing role of media for improving cognitive performance will support the learner with facts and simulation outcomes.	3.82	4.09

No	Statements	Criteria	
		Importance	Feasibility
28	Classmates will be matched based on their knowledge, skills and preferred teaching and learning styles rather than their age.	4.27	3.09
29	We will have to develop skills in picking up relevant learning resources from what is abundant there and building our own learning trajectories around them.	4.45	3.82
30	The global university will be a fact, people distributed all around, no boundaries, location loses power	4.00	3.45
31	Management of digital identities will become a crucial competence.	3.45	3.55
32	Our knowledge of the biological determinants of learning will vastly increase (relation to diurnal rhythms, to brain chemistry and brain topography of learning).	3.27	3.55
33	The boundary between learning-work-private life will disappear.	3.45	4.27
34	Technology will bridge time and space in learning.	4.00	4.45
35	Multi User Virtual Environments will render physical attendance in school and university unnecessary.	2.73	3.00
36	Traditional disciplinary boundaries will break down with learners pursuing individual learning programmes based on multi and inter disciplinary learning.	4.55	3.55
37	We will cease to rely on experts as the source of knowledge and curriculum and move towards quality based on use and endorsement through internet systems.	3.36	3.36
38	Privacy of students will decrease.	2.55	3.55
39	Life communication in education will never be fully replaced by technologies.	3.64	3.64
40	Text books will be replaced by electronic multi media publications.	3.27	4.27
41	Students' learning will be based on curiosity.	4.09	3.00
42	Online teaching universities will provide cheap on line education.	3.91	3.36
43	It will become common for people to move between occupations with learning key to supporting such moves.	4.27	3.64

72	Most (educational) content will be digital.	3.73	4.36
73	Wearable computing devices.	2.55	4.00
74	Lecture capture will be omnipresent.	2.64	4.00
75	Mobile learning will be natural.	3.36	3.91
76	Informal education will be main type of education.	3.00	2.36
77	Teachers will be orchestrators of learning activities.	3.82	3.27
78	Learning will be integrated and disappeared in everyday activities.	3.55	3.45
79	Vocational education and training become the major organisational form of learning.	3.27	2.82
80	Teachers target more the metacognitive, emotional and the moral aspects.	3.64	2.55
81	Physical (paper) libraries have the task to preserve rare collections.	3.36	4.27
82	Community colleges take care of the associate and bachelor degrees.	3.27	3.36
83	Phone, pc, e-reader will have merged in one application.	2.82	4.82
84	There will be vast item banks for testing.	3.18	4.27
85	Portfolios will be generated by aggregating content from other sources.	3.55	3.91
86	Electronic learning environments will have greatly increased possibilities.	3.91	4.09
87	Most testing will be done online.	3.27	4.18
88	There will be an abundance of easily available learning resources, but a challenge [is] to find guidance around them.	4.18	4.36
89	Personal Learning Environments will replace institutional Virtual Learning environments.	3.73	3.91
90	There will be no such thing as a 'digital learning environment.	2.55	3.27
91	Virtual reality/Second life will be widely used in education.	2.55	3.27
92	The pedagogy of learning will change throughout one's life time, from fit for children to fit for adults	4.36	3.82
93	All educational systems in Europe will be connected in a central system to identify the best students in order to support them no matter the country of origin.	3.45	2.45

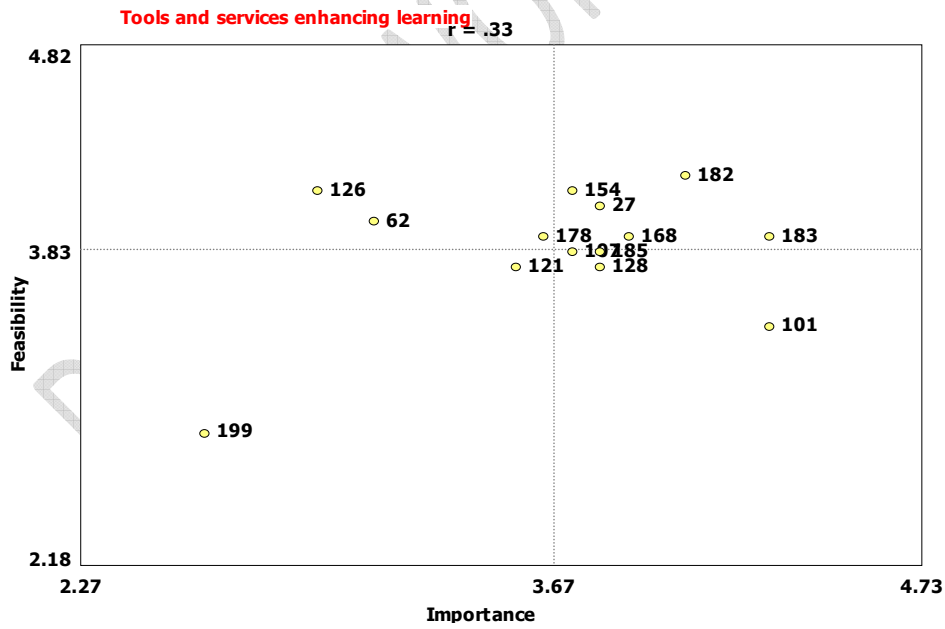

No	Statements	Criteria	
		Importance	Feasibility
94	Information will be manipulated [and] anchored in specific creativity techniques to facilitate synthesis and creativity.	3.91	2.82
95	Learning will be much individualized.	4.09	3.82
96	Learning spaces-groups to support informal learning will be everywhere, the supermarkets, on beaches, on the buses etc.	3.45	3.45
97	Inter sector and inter subject networks of institutions will combine to form networks based on purpose and interest.	4.09	3.64
98	Education will be more personalized.	4.64	3.73
99	Continued education, assessment of certificates of acquired knowledge/skills/competences by standard educational framework.	3.82	3.73
100	Mashups will be present at institutional and students level.	3.00	3.91
101	Technology and pedagogy will align such that students can participate in learning environments that will allow them to have high quality learning experiences.	4.36	3.36
102	Getting free education and educational contents should become basic human rights.	4.64	2.45
103	Gaming and learning are no longer opposite worlds.	3.09	3.27
104	Virtual mobility will break down barriers between national education systems.	3.91	3.36
105	Learning will be accepted more and more as a social and personality-bounded process.	3.82	2.82
106	The role of ICT will change throughout one's life time, from a supporting role to an overriding, unavoidable presence (wearable computers, in one's ordinary functioning integrated).	3.82	3.73
107	Online communities will be widely used in education.	3.73	3.82
108	The financial crisis will lead to increasing privatisation of university.	3.36	3.82
109	Professional networks will be one of the main ways of education.	3.36	3.27
110	Educational institutions or certifications may disappear, and communities or networking will replace these.	2.91	2.36
111	Knowledge will be bringing in education from interested stakeholders.	3.36	3.09
112	The locus of learning will shift, from physical institutions in the beginning (schools, certainly at the age of Kindergarten or preschool) to non-institution based, at best at virtual institutions but probably mostly in self-organising network-like constructions.	3.82	3.27
113	Free online content is used as a marketing tool.	2.27	3.64
114	Classes will be not limited in terms of age, distance, etc.	3.91	2.91
115	Learners will have more opportunities to find co-learners who share their learning goals and preferences (similarly to finding people to travel together).	4.45	3.64
116	Networked education settings rather than centralized educational institutes.	4.00	3.64
117	Knowledge-based society would mean access and sharing of knowledge with technology support.	3.82	3.64
118	Past learning narrative now available in portfolios will be on micro-macro view and will automatically identify missing information and skills towards specific learning goals and organisational targets.	3.91	3.27
119	Privacy of staff will decrease.	2.73	3.09
120	Lifelong learning will be natural.	4.73	3.73
121	Learning from one's own mistakes takes an entirely new dimension thanks to user-generated content, social media and attention metadata.	3.55	3.73
122	Students will choose to learn with people from their own network.	3.64	4.09

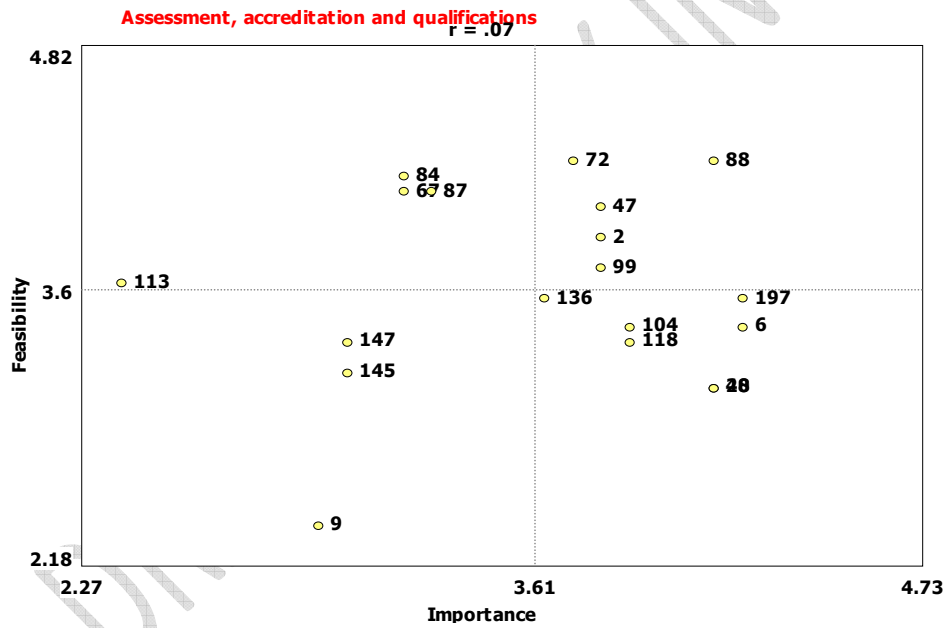

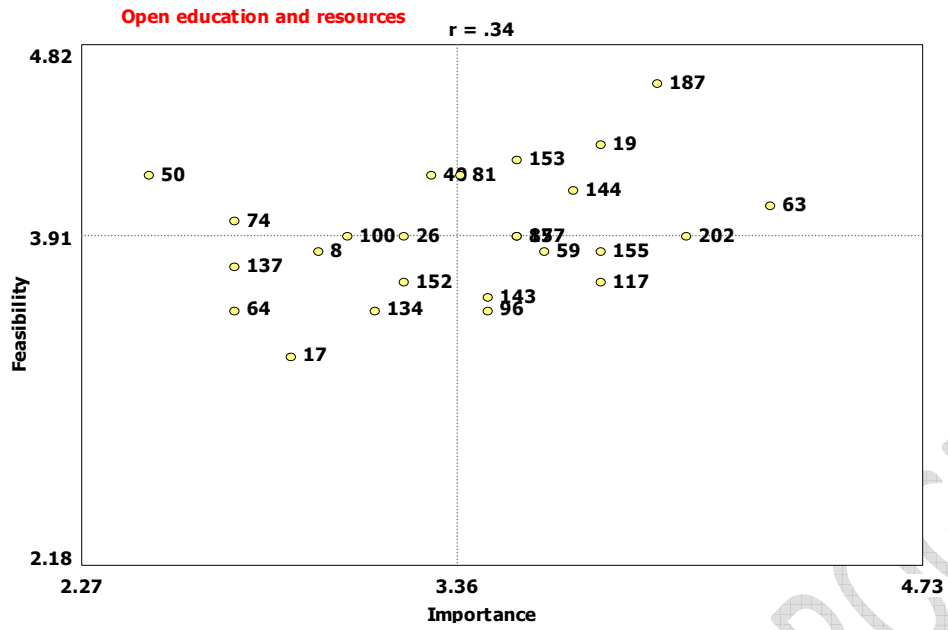

No	Statements	Criteria	
		Importance	Feasibility
123	Education will leave the class room.	3.45	3.82
124	The learning environment will change throughout one's life time, from school to workplace and home	3.82	3.91
125	Constructivism will still be there, but new paradigms will have arisen.	4.09	4.55
126	Technologies will change emphases on some of the subjects.	2.91	4.18
127	Education will be segmented into bites of learning, so individuals can make their personal paths to gaining the knowledge they require.	3.45	3.45
128	Context specific learning materials and tasks will lead to more localised learning.	3.82	3.73
129	The right people (wherever they are) gain strength and is the key to success.	4.00	2.73
130	Mobile internet enabled devices will become the major tool for learning.	2.91	3.55
131	Bricks and mortar educational structures will be unnecessary for most students as they will have access to education where ever they are.	3.36	2.91
132	Electronic learning environments will become more and more integrated with groupware systems.	3.18	3.82
133	University programmes will be focused more on specific job profiles.	3.45	3.18
134	Knowledge will be build-up non-systematically.	3.09	3.45
135	Education and learning will last throughout one's whole life, from cradle to grave so to speak, going from Kindergarten age to being a senior citizen.	4.36	3.73
136	First steps will be taken to describe qualifications on a global level.	3.64	3.55
137	Most IT services of Higher Education institutions will come from commercial providers.	2.64	3.73
138	The intense merger of new Technologies with the better understanding of learning will produce educational application that never allows people to forget what they have previously experienced or learned.	2.64	2.55
139	Study paths will become more flexible.	4.55	3.91
140	Appropriate, accessible affordable Education.	4.64	3.09
141	The learning environment will change throughout one's life time, from knowledge transfer and socialization to knowledge independent knowledge acquisition and voluntary social interaction	4.00	3.64
142	The learning component of education will become more and more endemic to life (work, play, and socialize) rather than the certificate-oriented formal learning according to modal curricula.	4.09	3.45
143	Lecture capture will contain student contributions.	3.45	3.55
144	Learning on the move (anytime and anywhere).	3.73	4.18
145	Students will create content in all courses.	3.00	3.09
146	Collaborative-learning will be widely spread.	4.09	3.45
147	There will be specialized (commercial) testing/assessment organizations that take care of grading	3.00	3.27
148	The responsibility for learning will be with an individual, not outsourced to an external institution.	4.27	3.27
149	Students will pay more for their learning programmes.	2.64	3.82
150	Mobile devices will be used in education to create content.	3.36	4.00
151	Class size will depend on the selected course/method.	3.55	3.64
152	Digital identities (and portfolios) will replace traditional CVs.	3.18	3.64

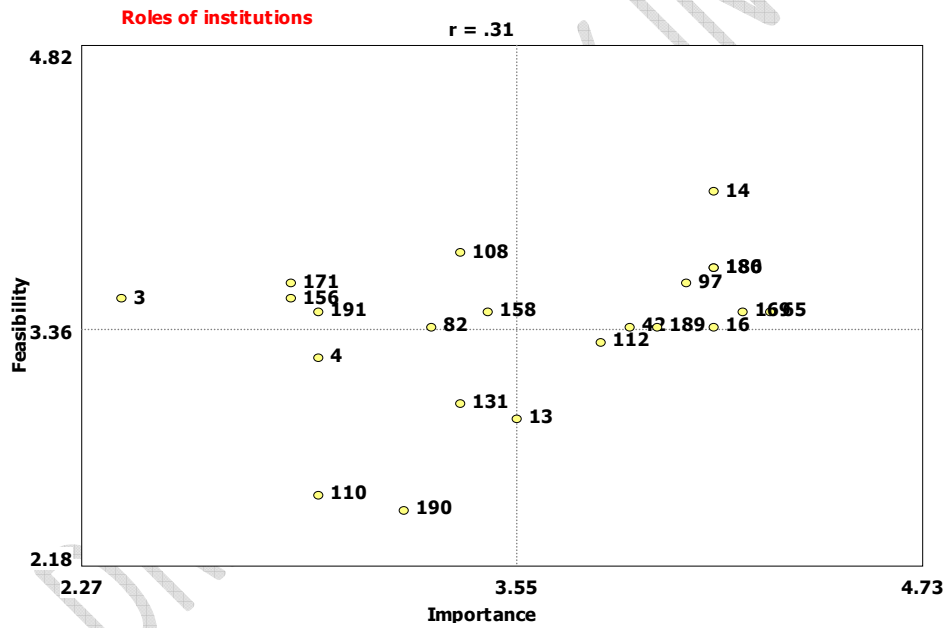

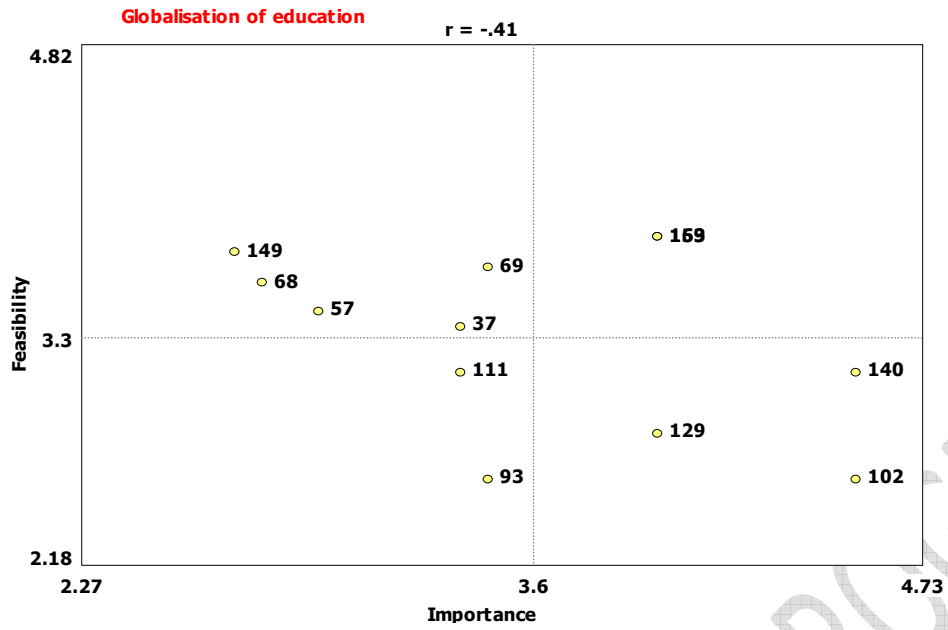

No	Statements	Criteria	
		Importance	Feasibility
153	Although time constraints will still apply, the constraints of physical space will go, allowing communication wherever one wants at the time agreed upon.	3.55	4.36
154	Some manual skills will be developed as usual with support of IT.	3.73	4.18
155	Online courses will be available in many different languages with access from all over the world.	3.82	3.82
156	Government funded higher education will start to privatize.	2.82	3.55
157	Internet will be main media for delivery of education.	3.09	4.00
158	Higher education will return to its traditional core purpose of research.	3.45	3.45
159	In Europe (EU) many students will learn with and from each other in international collaborations.	4.00	3.91
160	Teachers will need to develop coaching/mentoring skills	4.55	3.73
161	Learning methods will gradually change over one's life time: from being instructor led to learner led	4.09	3.36
162	Primary education will accept a larger pedagogical role: Learning to Learn rather than learning the complete subject domains like nowadays.	4.27	3.27
163	Students will learn increasingly globally.	4.00	3.91
164	Practice will become a focus for learning	4.00	3.55
165	Natural role of the teacher will be mediator of learning.	4.18	3.36
166	Augmented reality applications will be a major tool for learning,	3.00	3.18
167	Information will be available in many different forms, not only multimedia but connected media via mash-ups.	3.55	4.18
168	Learning should be social and supported by social web technology.	3.91	3.91
169	Educational institutions will be driven by interests of society.	4.27	3.45
170	Education will leverage the technology advancement	3.91	3.36
171	There will be specialized (commercial) organizations for brush-up courses.	2.82	3.64
172	Social and cognitive processes and convergences will become part of the pedagogical methods.	4.45	3.36
173	Learning will be more integrated with daily life or work.	4.45	4.18
174	Personalized educational contents which meet learners job requirements.	4.27	3.82
175	Education will continue to support the need for a highly qualified work force.	4.09	3.91
176	Open learning through the internet will become common.	4.00	4.18
177	Students will obtain online profiles (and kudos) in their institutions.	3.55	3.91
178	Technology-enhanced learning should be basic requirement skills for every learner.	3.64	3.91
179	The learner will invest more in the cerebral aspects of learning: Strategic, problem-oriented, situational and creativeness.	4.27	3.18
180	Higher Education institutions will merge cross borders in Europe.	4.18	3.73
181	The majority of teachers work online from home either freelance or for an online educational organization.	3.45	3.82
182	Courses will be available in different forms (text, online, mobile, teacher-based instructions).	4.09	4.27
183	Systems and services will be developed to allow mutual peer group learning between groups of interested learners.	4.36	3.91

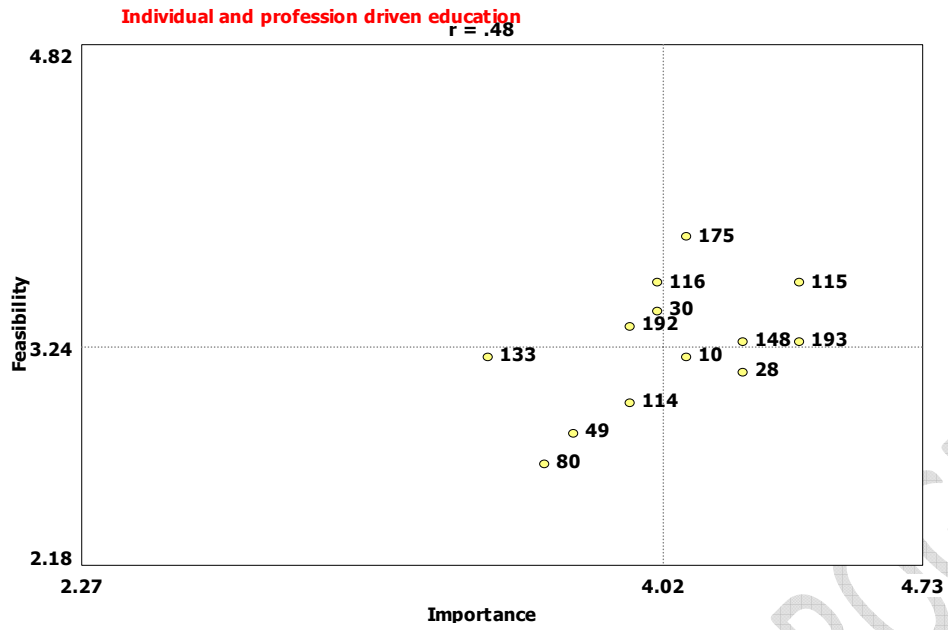

No	Statements	Criteria	
		Importance	Feasibility
184	Choices and flexibility around learning will be the norm, also in primary/secondary education.	4.27	3.36
185	Precious time of f2f contact will not be missed for activities that could be done in technology-mediated [environment].	3.82	3.82
186	Formal learning will become more episodic with people entering and leaving education at various points in their career path.	4.18	3.73
187	There will be digital library services.	4.00	4.82
188	Experiential and immersive learning will be the norm.	3.64	3.45
189	The role of institutions will change from being the single provider of learning opportunities that delivers a variety of services to being one of several institutions that delivers a specialised service only.	4.00	3.36
190	Schools will lose their function.	3.18	2.27
191	Private higher education organizations will have an increased market.	2.91	3.45
192	Schools will be places where students will go to learn techniques of handling information.	3.91	3.36
193	Learners will be expected to take control of their own learning.	4.45	3.27
194	Students will combine working and learning.	4.18	4.00
195	Cross-curriculum (inter-disciplinary) project activities will dominate the course design.	3.91	3.27
196	A study environment will consist of services that are not specific to education.	3.27	3.64
197	Different type of certifications will emerge that are not related to formal learning institutions.	4.27	3.55
198	Desktop conferencing will become used to keep in touch with peer students from abroad.	3.09	4.18
199	Drugs that enhance learning effectiveness will be (legally?) widely available and used as well.	2.55	2.73
200	Schooling will become a less important focus for learning as learning moves into the workplace, community and home.	4.00	3.00
201	Education should cater the functional needs of every citizen irrespective of age.	4.45	3.18
202	There will be internet and access to it everywhere and all around the globe, allowing learning to flow in all directions.	4.09	3.91
203	Services on the internet will serve as a study environment.	4.00	4.45

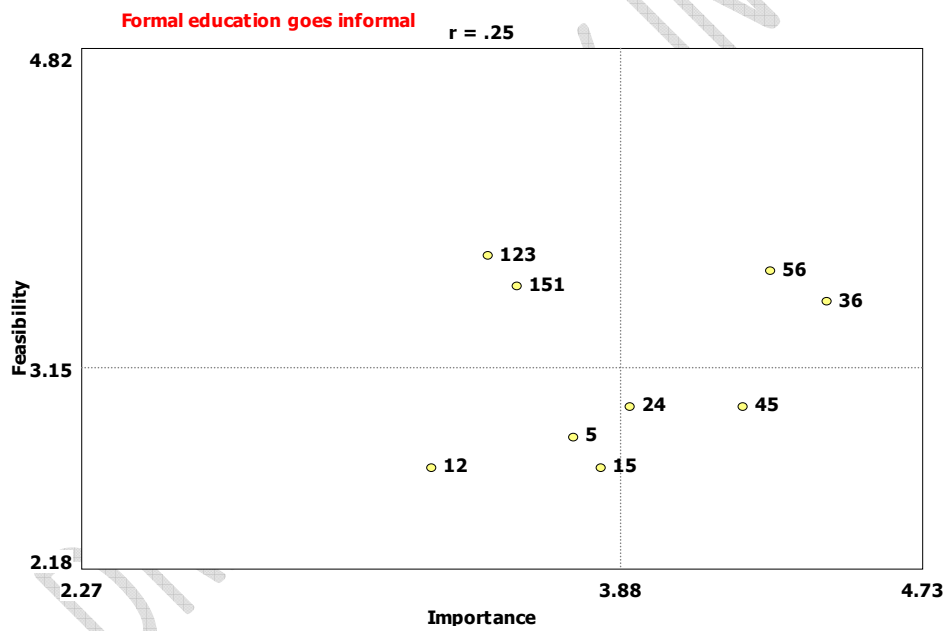

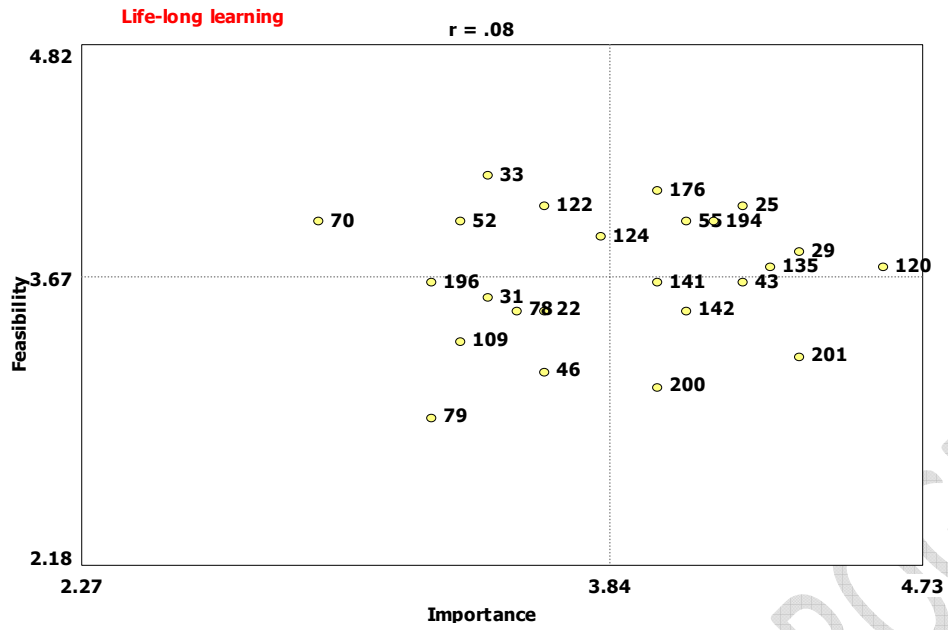

Annex 3. Go Zone for all Clusters

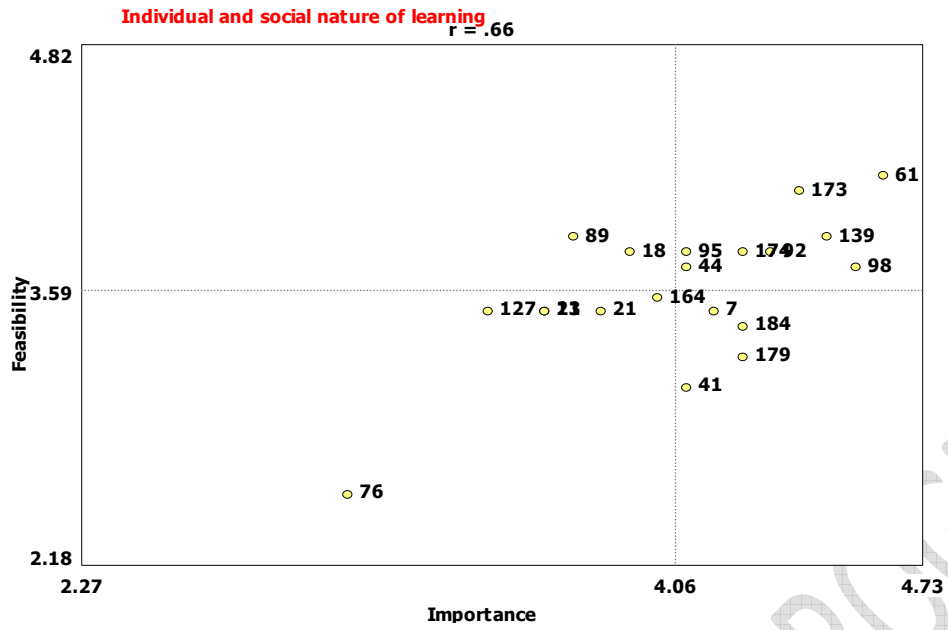

Annex 4. Statements Rating on Importance and Feasibility above the Average

N	Statement	X	Y
2	There will be ways to get accredited for learning outside of formal institutions.	3,82	3,91
14	Higher Education institutions will expand cross borders in Europe.	4,18	4,18
18	Learner will teach other participants in process of learning.	3,91	3,82
19	Online social networking will become more important.	3,82	4,45
25	The workplace will become a major context for learning.	4,27	4,09
27	The growing role of media for improving cognitive performance will support the learner with facts and simulation outcomes.	3,82	4,09
29	We will have to develop skills in picking up relevant learning resources from what is abundant there and building our own learning trajectories around them.	4,45	3,82
34	Technology will bridge time and space in learning.	4,00	4,45
43	It will become common for people to move between occupations with learning key to supporting such moves.	4,27	3,64
44	Learning at all levels will be closer connected to practice.	4,09	3,73
47	Qualifications will be checked and maintained on a European level.	3,82	4,09
53	Guided learning in a group will be complemented with learning in and from loosely knit networks.	4,27	4,55
55	University students will attend uni courses within their working schedule.	4,09	4,00
56	Online teaching universities will provide centres for skills development (skills labs).	4,36	3,73
61	Learning programmes will be more flexible then they are now.	4,73	4,27
63	Open Educational Resources will become widely adopted.	4,36	4,09
72	Most (educational) content will be digital.	3,73	4,36
86	Electronic learning environments will have greatly increased possibilities.	3,91	4,09
88	There will be an abundance of easily available learning resources, but a challenge [is] to find guidance around them.	4,18	4,36
89	Personal Learning Environments will replace institutional Virtual Learning environments.	3,73	3,91
92	The pedagogy of learning will change throughout one's life time, from fit for children to fit for adults	4,36	3,82
95	Learning will be much individualized.	4,09	3,82
97	Inter sector and inter subject networks of institutions will combine to form networks based on purpose and interest.	4,09	3,64
98	Education will be more personalized.	4,64	3,73
99	Continued education, assessment of certificates of acquired knowledge/skills/competences by standard educational framework.	3,82	3,73
106	The role of ICT will change throughout one's life time, from a supporting role to an overriding, unavoidable presence (wearable computers, in one's ordinary functioning integrated).	3,82	3,73
107	Online communities will be widely used in education.	3,73	3,82
115	Learners will have more opportunities to find co-learners who share their learning goals and preferences (similarly to finding people to travel together).	4,45	3,64
116	Networked education settings rather than centralized educational institutes.	4,00	3,64
117	Knowledge-based society would mean access and sharing of knowledge with technology support.	3,82	3,64

N	Statement	X	Y
120	Lifelong learning will be natural.	4,73	3,73
124	The learning environment will change throughout one's life time, from school to workplace and home	3,82	3,91
125	Constructivism will still be there, but a new paradigms will have arisen.	4,09	4,55
128	Context specific learning materials and tasks will lead to more localised learning.	3,82	3,73
135	Education and learning will last throughout one's whole life, from cradle to grave so to speak, going from Kindergarten age to being a senior citizen.	4,36	3,73
139	Study paths will become more flexible.	4,55	3,91
141	The learning environment will change throughout one's life time, from knowledge transfer and socialization to knowledge independent knowledge acquisition and voluntary social interaction	4,00	3,64
144	Learning on the move (anytime and anywhere).	3,73	4,18
154	Some manual skills will be developed as usual with support of IT.	3,73	4,18
155	Online courses will be available in many different languages with access from all over the world.	3,82	3,82
159	In Europe (EU) many students will learn with and from each other in international collaborations.	4,00	3,91
160	Teachers will need to develop coaching/mentoring skills	4,55	3,73
163	Students will learn increasingly globally.	4,00	3,91
168	Learning should be social and supported by social web technology.	3,91	3,91
173	Learning will be more integrated with daily life or work.	4,45	4,18
174	Personalized educational contents which meet learners job requirements.	4,27	3,82
175	Education will continue to support the need for a highly qualified work force.	4,09	3,91
176	Open learning through the internet will become common.	4,00	4,18
180	Higher Education institutions will merge cross borders in Europe.	4,18	3,73
182	Courses will be available in different forms (text, online, mobile, teacher-based instructions).	4,09	4,27
183	Systems and services will be developed to allow mutual peer group learning between groups of interested learners.	4,36	3,91
185	Precious time of f2f contact will not be missed for activities that could be done in technology-mediated [environment].	3,82	3,82
186	Formal learning will become more episodic with people entering and leaving education at various points in their career path.	4,18	3,73
187	There will be digital library services.	4,00	4,82
194	Students will combine working and learning.	4,18	4,00
202	There will be internet and access to it everywhere and all around the globe, allowing learning to flow in all directions.	4,09	3,91
203	Services on the internet will serve as a study environment.	4,00	4,45
