

Support of Part-whole Relations in Query Answering

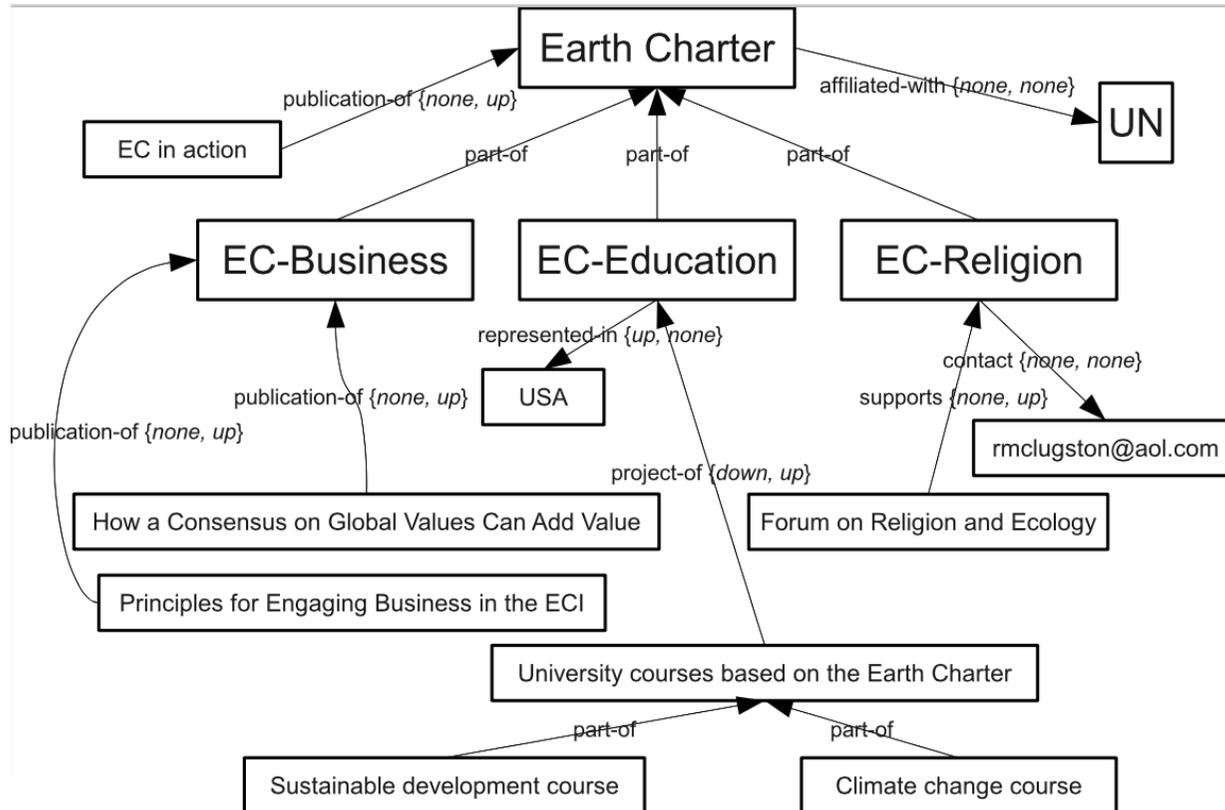

Yannis Velegarakis

University of Trento

With Francesco Guerra, Ekaterini Ioannou and Piotr Kozikowski

Data Model

- Database: $\langle E, G \rangle$
 - E: Entities
 - G: $E \times N \times \{E \cup V\}$
 - ◆ N: Names
 - ◆ V: Atomic Values
- atom :- *set of atoms*
 - atom is: $e(n_1:v_1, \dots, n_k:v_k)$

\$pub(related-to:\$org) :- \$pub(publication-of: \$ngo), \$ngo(affiliated-with: \$org)

Data Model - Extended

- Database: $\langle E, G, P \rangle$

- E: Entities

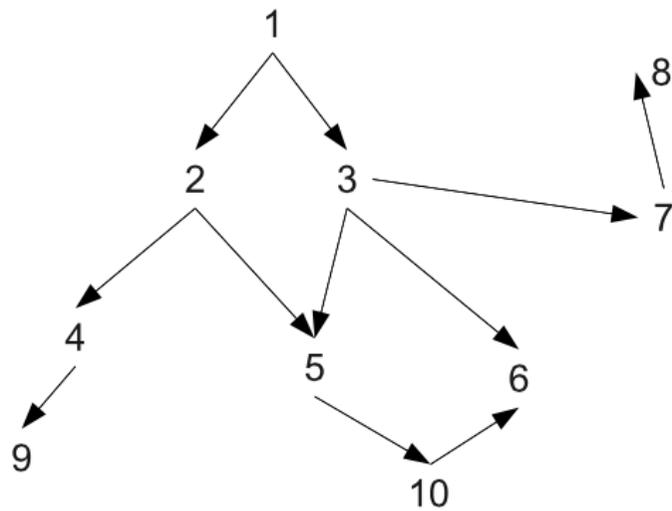

- G: $E \times N \times \{E \cup V\}$

- ◆ N : Names

- ◆ V: Atomic Values

- P: $E \times E$

(**part-of** relationships)

Data Model - Extended

- Database: $\langle E, G, P \rangle$

- E: Entities

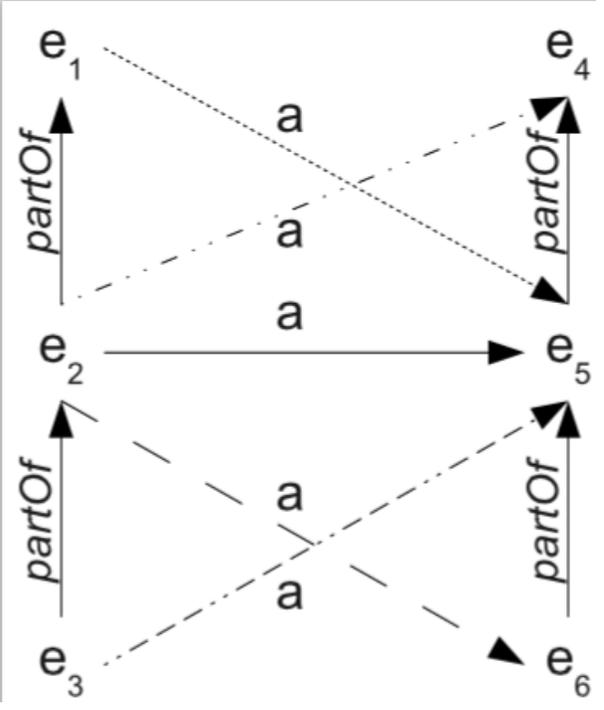

- G: $E \times N \times \{E \cup V\} \times T \times T$

- ◆ N : Names

- ◆ V: Atomic Values

- P: $E \times E$ (part-of relationships)

- T: {up, down, both, none}

Data Model - Extended

- Database: $\langle E, G, P \rangle$

- E: Entities

- G: $E \times N \times \{E \cup V\} \times T \times T$

- ◆ N : Names

- ◆ V: Atomic Value

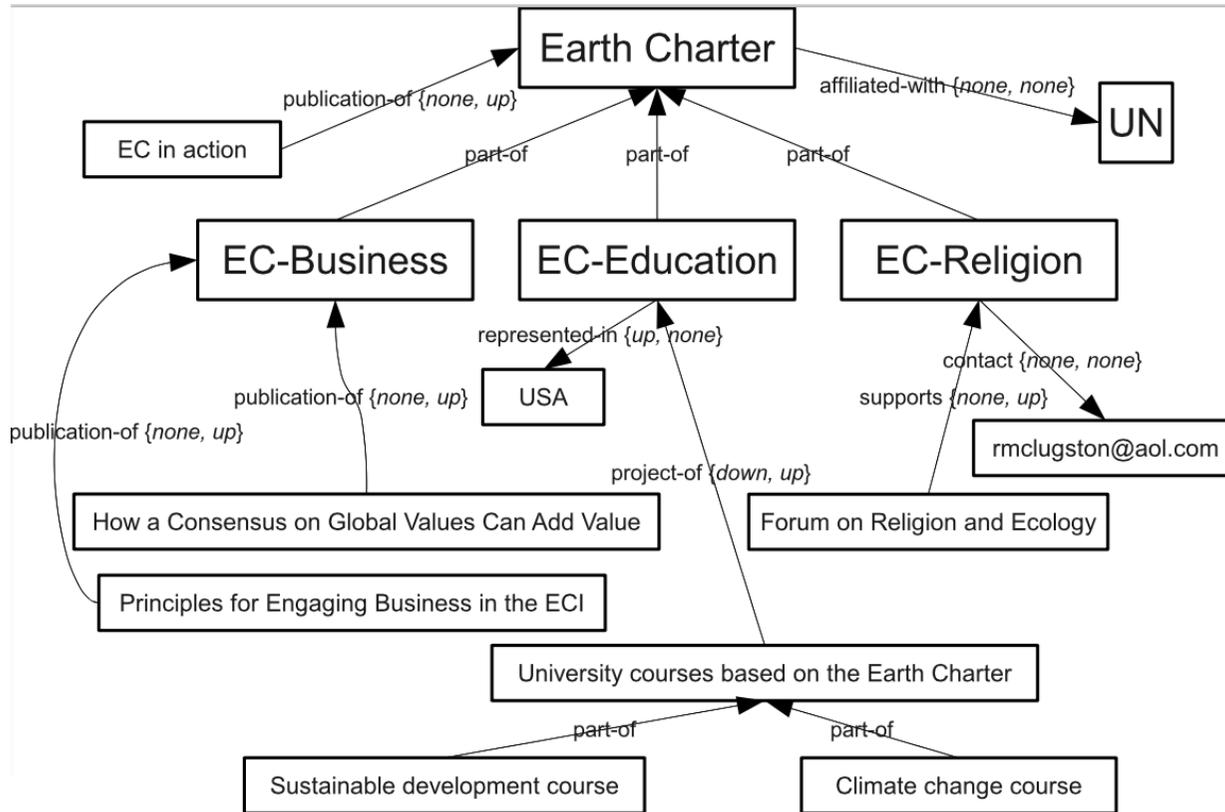

Attribute: $\langle e, n, v, et, vt \rangle$

- P: $E \times E$ (**part-of** relationships)

- T: $\{\text{up, down, both, none}\}$

- Query remains the same

- BUT with different semantics: The inferred atoms

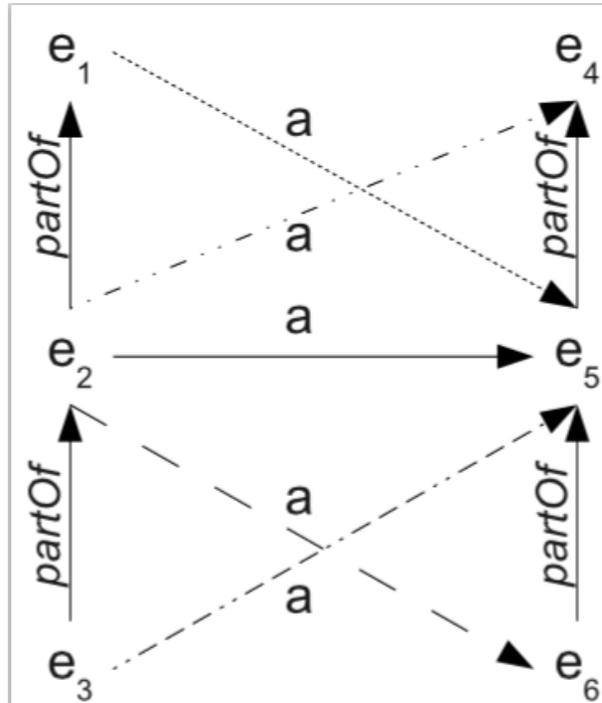

\$pub(publication-of: Earth Charter) :- \$pub(publication-of: Earth Charter)

Solution

- Closure based on part-of relationships

Solution A

- Closure based on part-of relationships
- Naïve – Lazy Approach
 - Do Nothing during updates
 - ◆ Check only the part-of cycles during insertion
 - break query into singleton atoms
 - ◆ $e(n:v)$, $e(?:v)$, $e(?,?)$, $?(n,?)$, ... etc.
 - ◆ Optimize (getting rid of redundancies)

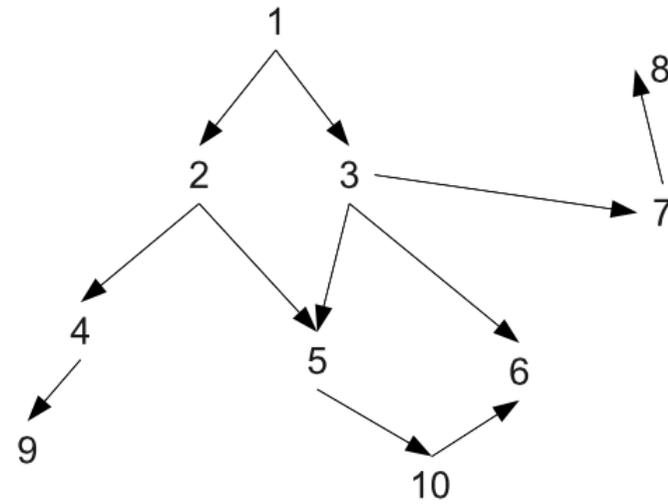

e2("a",?)

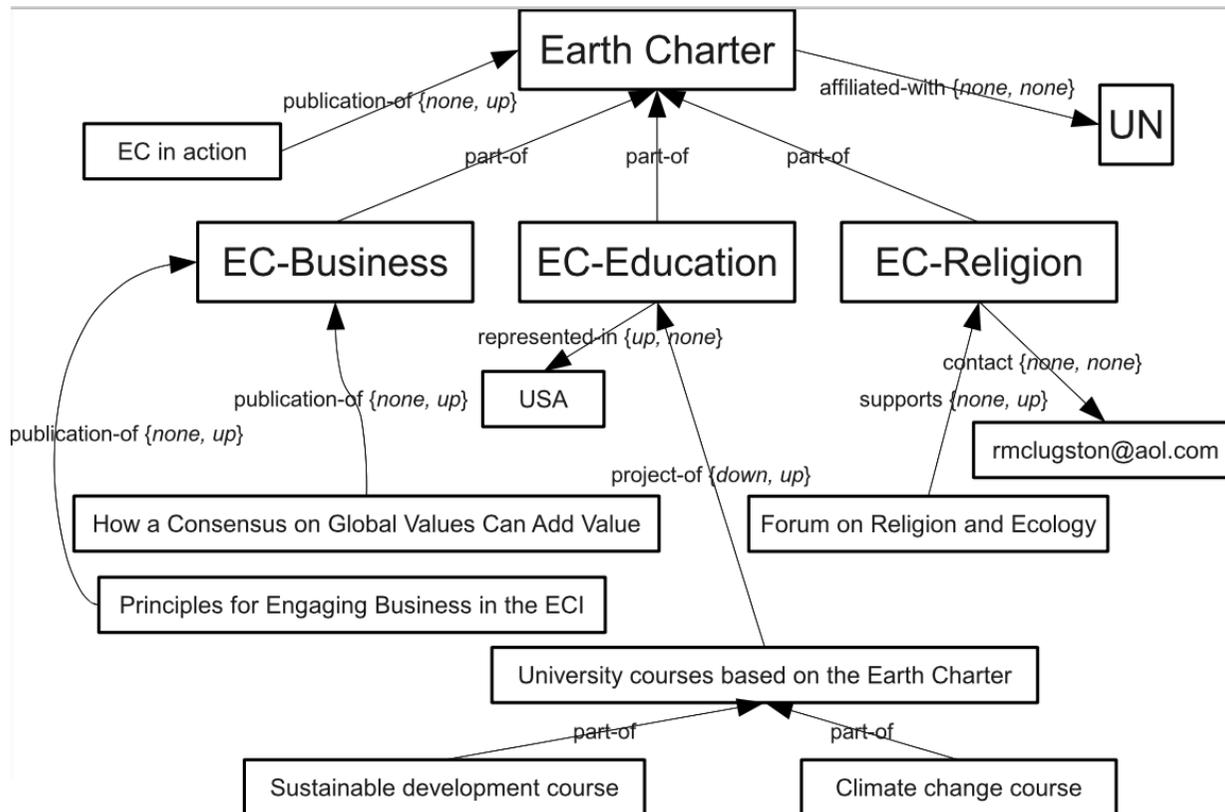

Solution B

- Closure based on part-of relationships
- Total Materialization Approach
 - Infer all derived singleton atoms during update
 - ◆ Insert them in the database
 - Query is as usual

Part-of Index

1	{2, 3}	{4, 5, 6, 7, 8, 9, 10}	{}	{}
2	{4, 5}	{6, 9, 10}	{1}	{}
3	{5, 6, 7}	{8, 10}	{1}	{}
4	{9}	{}	{2}	{1}
5	{10}	{6}	{2, 3}	{1}
6	{}	{}	{3, 10}	{1, 2, 5}

\$pub(publication-of: Earth Charter) :- \$pub(publication-of: Earth Charter)

Transitive Attribute Index

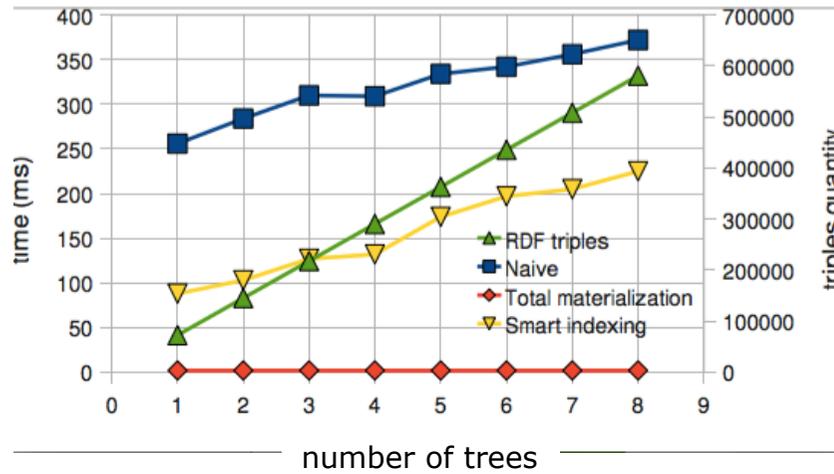

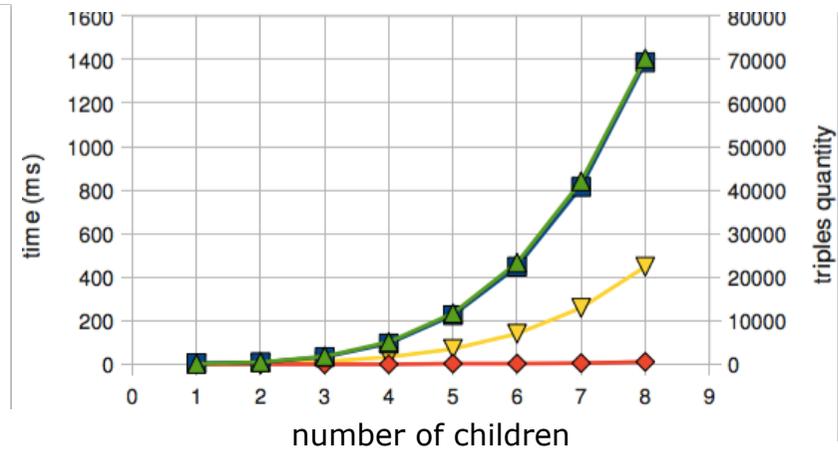

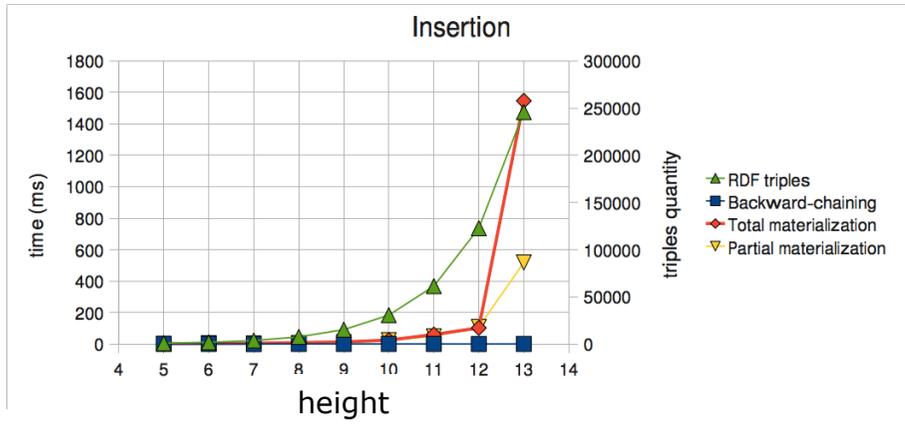

e_1, n_1, v_1	$eu=true, ed=true, vu=false, vd=false$
e_1, n_2, v_2	$eu=true, ed=false, vu=false, vd=false$
e_1, n_3, v_3	$eu=false, ed=true, vu=false, vd=false$
e_2, n_4, v_4	$eu=false, ed=false, vu=true, vd=true$
e_2, n_5, v_5	$eu=false, ed=false, vu=true, vd=false$
e_2, n_6, v_6	$eu=false, ed=false, vu=false, vd=true$

eu

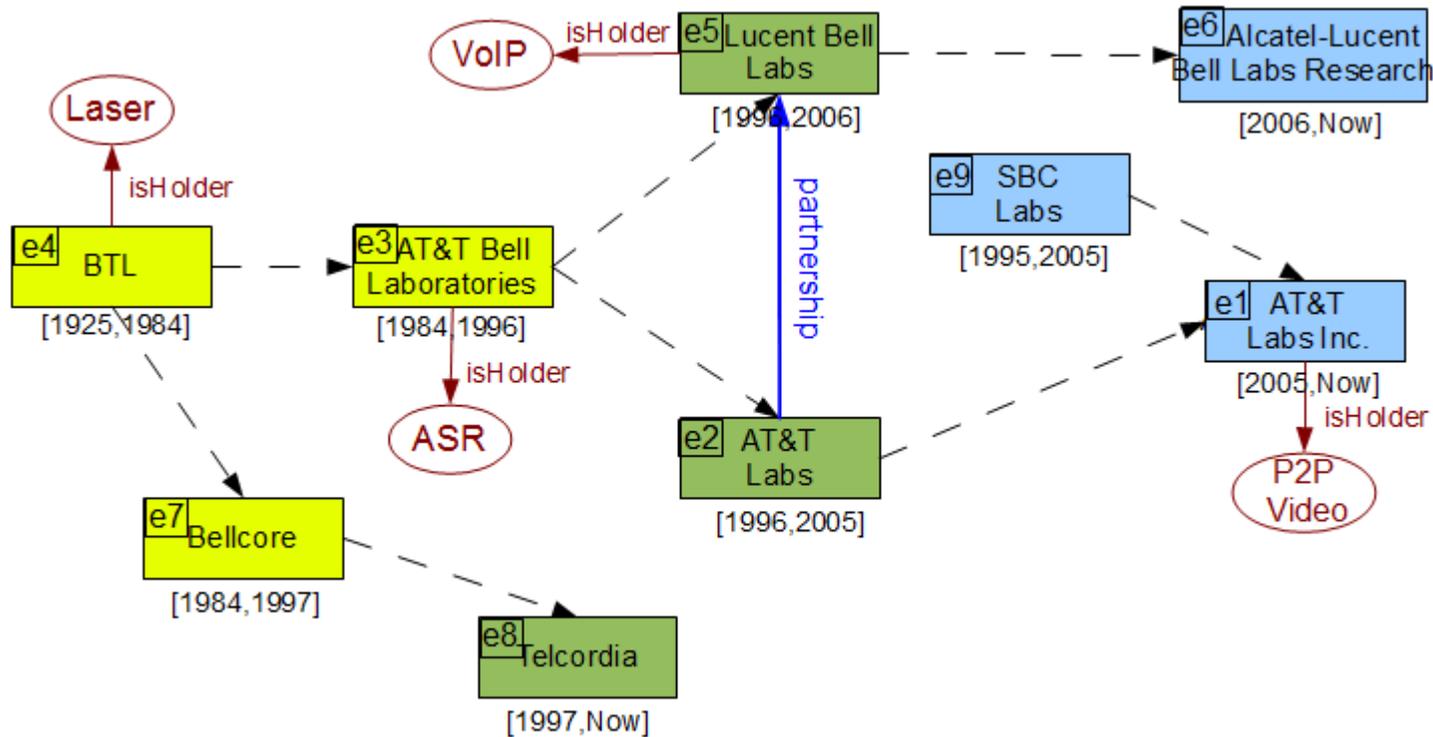

e_1	e_1, n_1, v_1
e_1	e_1, n_3, v_3

ed

e_1	e_1, n_1, v_1
e_1	e_1, n_2, v_2
