9

10 **Abstract**

11
12
13
14 Purpose: Recovery Colleges were developed to support the recovery of people with
15 mental health difficulties through courses co-produced by professionals and people with lived
16 experience. This study examines the use of Recovery Colleges to support people with
17 dementia.
18
19
20
21
22

23 Design/methodology/approach: A survey was circulated to UK Recovery College and
24 memory service staff, exploring provision, delivery and attendance of dementia courses.
25 Open responses provided insight into participant views about recovery in post-diagnostic
26 support and the practicalities of running dementia courses.
27
28
29
30
31

32 Findings: 51 Recovery College staff and 210 memory service staff completed the
33 survey. Twelve Recovery College dementia courses were identified across the UK. Three
34 categories emerged from the qualitative data: post-diagnostic support, recovery in the context
35 of dementia, challenges and areas of innovation.
36
37
38
39
40

41 Originality: This study highlights the benefits and practicalities of running Recovery
42 College courses with people with dementia. Peer-to-peer learning was seen as valuable in
43 post-diagnostic support but opinions were divided about the term recovery in dementia.
44
45
46
47
48
49

50 **Key words:** dementia, post-diagnostic support, recovery college, memory services, co-
51 production, peer support

Introduction

A Recovery College provides educational courses that aim to support the personal recovery of people living with mental health difficulties. There are many definitions of ‘recovery’ in mental illness, but for the purpose of this paper, ‘recovery’ refers to managing symptoms whilst living a meaningful life (Perkins *et al.*, 2012). Recovery Colleges emerged in America in 2000, and now exist in over 20 countries (including Canada, Hong Kong, Israel, Italy, Japan, the Netherlands, and Sri Lanka) and an international community of practice has been established to promote knowledge exchange (Whittle *et al.*, 2019).

Recovery Colleges have an ethos of empowerment and inclusivity (Whish *et al.*, 2022) realised through co-production and co-facilitation, with experts by experience collaborating with healthcare professionals to co-produce and co-deliver courses (Whittle *et al.*, 2019). Recognising that the consequences of an illness such as discrimination (Anthony, 1993) may be more detrimental than the illness itself, courses cover a range of topics to support people through the recovery journey, including self-management, employment advice and understanding and exploring identity.

UK Recovery Colleges are typically embedded within the National Health Service (NHS), with some run by voluntary organisations. They have been shown to have a positive long-term impact for individuals experiencing mental health difficulties (Thompson *et al.*, 2021); where attendance is associated with improved quality of life, self-management skills, and goal achievement (Thériault *et al.*, 2020). Ongoing research examines how Recovery Colleges can benefit people who use mental health services (Recovery Colleges Characterisation and Testing (RECOLLECT) programme (Henderson *et al.*, 2020), as currently little is known about who benefits from them and why. Some groups, including people with dementia, appear to be underrepresented in Recovery Colleges (Bowness *et al.*,

1
2
3 2022). A scoping survey of UK Recovery Colleges (2019) found that 11 (39.3%) of the 28
4
5 that responded, offered dementia courses (Lowen *et al.*, 2019).
6
7

8 A recovery-based approach could enable people to live a meaningful life alongside
9
10 dementia (Gavan, 2011). A key definition of recovery within mental health, aligns closely
11
12 with definitions of living 'well' with dementia (Department of Health (DH), 2009) and calls
13
14 to focus on strengths rather than deficits (Wolverson *et al.*, 2016). The importance of
15
16 education to support living positively with dementia is well recognised (van Horik *et al.*,
17
18 2022), as is the value of peer support as highlighted in the UK's national dementia strategy
19
20 'Living Well with Dementia' (DH, 2009).
21
22

23
24 Recovery Colleges could potentially drive culture change within mental health services
25
26 by challenging power dynamics between clinician and patient (Hopkins *et al.*, 2022) and
27
28 increasing inclusivity and equitability, which is urgently needed within post-diagnostic
29
30 services provided to people with dementia. According to people with dementia and their
31
32 families, post-diagnostic support does not meet their needs and access to support can be
33
34 difficult depending on where people live, resulting in inequalities (Frost *et al.*, 2021;
35
36 Robinson & Arblaster, 2020) and feelings of abandonment by the health system (Kelly &
37
38 Innes, 2014). This has been further impacted by the COVID-19 pandemic, with people left to
39
40 self-manage due to reduced healthcare service provision (Giebel *et al.*, 2021). Recovery
41
42 Colleges, therefore, could provide an innovative and empowering approach to post-diagnostic
43
44 support for people with dementia and their families while bridging a critical gap in healthcare
45
46 provision. However, there is little currently known about current provision to support
47
48 dementia within the Recovery College model.
49
50
51
52

53 To address this knowledge gap, we undertook a national survey examining the views and
54
55 experiences of individual Recovery College and memory service staff regarding recovery-led
56
57
58
59
60

1
2
3 approaches for people with dementia. We aimed to establish how many UK Recovery
4
5 Colleges offer dementia courses and specifically we sought to understand:
6

- 7 - How have dementia courses been designed and delivered?
- 8
- 9 - Who has attended dementia courses?
- 10
- 11
- 12 - How has COVID-19 impacted course provision?
- 13
- 14
- 15 - What do professionals understand by the term ‘recovery’ in the context of dementia?
- 16

17
18 This work was the first step of a research project called DiSCOVERY (NIHR131676,
19
20 2022-2024) which aims to provide guidance for co-producing, implementing, delivering, and
21
22 evaluating Recovery College dementia courses.
23
24
25

26 27 **Method**

28
29 A multi-site, cross-sectional, mixed-methods questionnaire study was conducted with
30
31 UK Recovery Colleges and memory services from April to June 2022.
32
33

34
35 The survey was created using SurveyMonkey® (Momentive Inc., 2022) and
36
37 contained 74 questions, across 6 sections exploring: the development and provision of
38
39 dementia courses in Recovery Colleges and memory services, the practicalities of co-
40
41 production and the impact of COVID-19 (see supplementary file). Following demographic
42
43 questions, participants were asked different questions depending on whether they identified
44
45 as predominately working in a Recovery College or memory service. Recovery College staff
46
47 were asked about their links with NHS memory services and their understanding of the term
48
49 ‘recovery’ in dementia. Memory service staff were asked whether signposting to Recovery
50
51 College dementia courses was part of routine clinical practice, whether the term ‘recovery’
52
53 was used in relation to dementia and if staff were co-producing dementia courses in their
54
55 local Recovery College. The survey comprised of multiple-choice questions and open
56
57 response items. It was based on a previous scoping survey (Lowen *et al.*, 2019) and created
58
59
60

1
2
3 by the research team who are from a range of professions including psychology, psychiatry,
4 and nursing. The draft survey was shared with four memory clinic clinicians and two
5
6 Recovery College staff, for piloting to ensure questions were answerable, coherent, and
7
8 specific. Following adjustments in response to feedback, the survey was reviewed by the
9
10 wider research team. The final survey was user-tested by members of the research team to
11
12 ensure functionality.
13
14
15
16
17
18

19 *Recruitment*

20
21 A short film introducing the study was co-produced by study staff and Patient and
22
23 Public Involvement group members. This, alongside the survey invitation was emailed to 41
24
25 NHS mental health trusts. Contact details for Recovery Colleges were found through hand-
26
27 searching organisational websites. Targeted distribution included the Royal College of
28
29 Psychiatrists Memory Services National Accreditation Programme; Implementing Recovery
30
31 through Organisational Change networks; the Faculty for the Psychology of Older People;
32
33 Facebook Psychology groups and Occupational Therapy networks. The survey was
34
35 advertised on social media platforms including Facebook and Twitter, and the DiSCOVERY
36
37 webpage.
38
39
40
41

42 All staff working in a Recovery College or memory service were eligible to
43
44 participate, including those organisations that did not have a dementia course, and multiple
45
46 responses from each site were allowed. Mental health trusts without a Recovery College or
47
48 memory service were not eligible. Four NHS trusts declined to participate as it was not
49
50 relevant to them and two stated they do not have a Recovery College.
51
52

53 The recruitment target was 70 responses based on a response rate of 50% from all UK
54
55 Recovery Colleges and mental health Trusts.
56
57
58
59
60

Data Analysis

Descriptive statistics and tables were used to summarise quantitative data. Qualitative content analysis was used to analyse the open responses (Bengtsson, 2016). Open responses underwent repeated reading by two researchers. Key points were identified, and initial codes were generated then sorted into potential themes which were discussed and reviewed to ensure they were distinguishable and relevant to the research question. Responses provided contextual understanding to the quantitative data.

Ethics

The study was approved by the West Midlands - Coventry & Warwickshire Research Ethics Committee (22/WM/0021) on 9/3/22 and the Health Research Authority on 16/3/22.

Results

Response rates

The survey recorded 261 completed responses. From this, 51 were from staff who identified as predominantly working in Recovery Colleges, 210 from memory services and 38 responses were incomplete. An incomplete response was defined as any response without an organisation name or if it was unknown whether the respondent worked for a Recovery College or memory service. Table I shows the number of responses received from each UK region including the number of Recovery College dementia courses identified.

TABLE I

Recovery College support for people with dementia

1
2
3 Responses related to current, historic, and future dementia courses are shown in table
4
5
6 II. There were 12 current courses relating to dementia support across the UK which were
7
8 identified in the survey. Fourteen (6.7%) memory service respondents reported routinely
9
10 guiding people to Recovery College dementia courses for post-diagnostic support, 124 (59%)
11
12 stated they did not, and nineteen (9%) had recommended non-dementia-specific courses. It
13
14 should be noted that multiple responses could represent the same service.
15
16
17
18

19 *TABLE II*

20
21
22
23
24 *Course delivery*

25
26 Five (26.3%) of the 19 Recovery College respondents that stated they currently or
27
28 previously ran a dementia course, reported their course was co-produced with people with
29
30 dementia, compared to three (13%) memory service responses. Table III shows who courses
31
32 were delivered by.
33
34
35
36

37 *TABLE III*

38
39
40
41
42 *Who attends Recovery College dementia courses?*

43
44 Recovery College respondents provided demographic information/estimates about
45
46 attendees of their dementia courses, which are displayed in table IV.
47
48
49
50

51 *TABLE IV*

52

56 *The impact of COVID-19*
57
58
59
60

1
2
3 Of those that responded to questions about the impact of COVID-19, three (25%) said
4 their dementia courses stopped running. Three Recovery Colleges attempted to adapt to
5
6 their dementia courses stopped running. Three Recovery Colleges attempted to adapt to
7
8 difficulties brought on by lockdown restrictions by moving online.
9
10

11 12 **Qualitative Results**

13
14 Content analysis derived three categories and six sub-categories from the data (see
15
16 table V).
17
18
19
20

21 *TABLE V*

22 23 24 25 26 ***Post-diagnostic support***

27
28 This theme encompasses the value of post-diagnostic support and the importance of
29
30 co-production.
31
32
33
34

35 36 *The value of post-diagnostic support*

37
38 All respondents valued post-diagnostic support for people with dementia and their
39
40 families. Memory services often had their own bespoke support:
41
42
43

44
45 *We provide in house “Understanding Dementia” courses and have a post-diagnostic*
46
47 *clinic. – Memory service participant #043*
48
49

50
51
52 *We have a Carers Support group and are exploring a Living Well with Dementia*
53
54 *intervention. – Memory service participant #177*
55
56
57
58
59
60

1
2
3 Recovery colleges that developed dementia support recognised an unmet need following
4
5 diagnosis;
6
7
8
9

10 *We recognised that our older adults services did not have coproduced education*
11 *available for their service user and carer group. – Recovery College participant #025*
12
13

14
15
16
17 *The courses were started to ensure support, including peer support and choice was*
18 *given to both those people living with dementia and those supporting them. –*
19
20
21 *Recovery College participant #014*
22
23
24
25

26 All respondents viewed ‘education’ as central to post-diagnostic support. Ensuring people
27 understand dementia and learn practical approaches to manage, was seen as essential to living
28 well with dementia;
29
30
31
32
33
34

35 *Also to provide education to [people with dementia] and their carers regarding*
36 *maintaining a safe home environment and understanding about their condition. –*
37
38
39
40 *Recovery College participant #024*
41
42
43

44 *The importance of co-production*

45
46
47 The best-practice in delivering education was including people with dementia as
48 experts by experience. Recovery Colleges and memory services with dementia courses
49 recognised that co-production was essential to their success.
50
51
52
53
54
55

56
57 *Person living with dementia is absolutely key to this course and I don't think it would*
58 *be valid without her. – Recovery College participant #002*
59
60

1
2
3 *This is the most essential part of the course - they provide first-hand experience of*
4 *positive role models of people living well with dementia. Their experience and voice is*
5 *far more powerful than what clinicians are able to bring as they live and breathe it*
6 *with first hand lived experience. – Memory service participant #073*
7
8
9
10
11
12

Recovery in the context of dementia

13
14
15
16
17 Whilst agreeing on the value of post-diagnostic support particularly when co-delivered
18 alongside people with dementia, the notion of dementia ‘recovery’ resulted in strongly
19 divided opinion. For some, the idea of recovery echoed their understanding of living well and
20 related to having a ‘life worth living’. Key to recovery was maintaining independence and
21 autonomy, a sense of self and social support, living well ‘despite’, ‘regardless’, ‘within
22 limits’ of dementia;
23
24
25
26
27
28
29
30
31
32

33
34 *Supporting people to take control of their lives and live a meaningful, safe quality of*
35 *life. – Recovery College participant #024*
36
37
38
39

40 *It’s about supporting people to keep their identity and a sense of self – living with*
41 *dementia without it defining them. – Recovery College participant #027*
42
43
44
45
46

47 In contrast, some participants expressed that the word ‘recovery’ did not apply to dementia
48 given its progressive nature and the lack of a cure;
49
50
51

52
53
54 *There is a fundamental problem with the term “recovery” with respect to dementia,*
55 *not least that living well with dementia is a lot about acceptance of and adjustment to*
56
57
58
59
60

1
2
3 *the fact that you are not going to “recover” in the commonly accepted sense. –*

4
5
6 *Memory service participant #099*

7
8
9
10 *“Recovery” is a challenging concept to apply to dementia, given it is degenerative in*

11
12 *nature. – Recovery College participant #025*

13
14
15
16
17 Some memory service participants expressed concerns that the term recovery could engender

18
19 false hope in dementia specifically, due to the lack of current cure for the condition;

20
21
22
23
24 *It is a rather unusual word recovery, when discussing dementia as there is no cure or*

25
26 *recovery involved. The word recovery could give our clients false hope. – Memory*

27
28 *Service participant #105*

31 32 33 ***Challenges and areas of innovation***

34
35 This category includes reasons courses have stopped, difficulties with staffing and

36
37 partnership working.

38 39 40 41 42 *Awareness of recovery orientated services*

43
44 Despite Recovery Colleges offering a range of courses that may be useful for people with

45
46 dementia, some memory service respondents had never heard of Recovery Colleges;

47
48
49
50
51 *I’ve been running our memory clinics services since 2005 and have never heard of*

52
53 *Recovery College” – Memory service participant #063*

54
55
56
57
58
59
60

1
2
3 Other memory service participants were unaware that Recovery Colleges could offer support
4
5 to people with dementia;
6
7
8
9

10 *I was not aware this was available. Recovery college has seemed to be primarily*
11 *aimed at working age adults. – Memory service participant #010*
12
13

14
15
16
17 *I'm ashamed to admit that, as a clinician working in memory services for 6 years, I*
18 *was unaware that the recovery college applied to those with dementia. – Memory*
19 *service participant #059*
20
21
22
23

24
25
26 However, many respondents expressed interest in finding out more:
27
28

29
30
31 *It would be good to link up with the Recovery College as it has not been so much on*
32 *our radar. It is a valuable resource. – Memory service participant #136*
33
34
35
36
37

38 Participants raised concerns about support for people with dementia being offered outside
39
40 older peoples services;
41
42
43
44

45 *We do not run dementia courses as they are best run by the specialist older people's*
46 *teams. We do however support specialist teams to coproduce recovery college style*
47 *courses that they can then run. – Recovery College participant #009*
48
49
50
51

52 53 54 *Difficulties in running courses*

55
56
57 Respondents who offered recovery courses in dementia described practical difficulties
58
59 in maintaining the courses.

58
59
60

We haven't run it for some time due to the nature of dementia meaning people involved in coproducing or delivering the workshops were no longer available due to changes in their wellbeing. – Recovery College participant #025

It was frequently highlighted that the relationship and integration between Recovery Colleges and memory services could be improved;

Don't think we have any connection with the memory service. – Recovery College participant #040

It would mean a culture shift in management to start engaging with recovery college. – Memory service participant #127

Services also shared examples of innovation and joint working. One memory service was 'in the process of recording podcasts for people with dementia to be available within the recovery college' (Memory service participant #016).

Challenges of COVID-19

The COVID-19 pandemic was a significant difficulty in continuing to deliver Recovery College dementia courses. Some colleges suspended courses and one respondent said that co-production had 'stopped altogether' (Recovery College participant #027).

Some courses continued running online, however this meant the benefits of face-to-face contact were lost:

Personable feel you get form a face to face session was lost due to lockdowns. –

Recovery College participant #004

Online delivery limited who could attend due to aspects of digital exclusion in people living with dementia:

It prevented people who are not computer literate from receiving group support. –

Recovery College participant #014

It was suggested that ‘*the people attending the virtual workshops are possibly more affluent*’ (Recovery college participant #014), thus ‘*risks excluding some people who have no or limited access to technology. (Recovery College participant #002).*

Several respondents identified benefits of online courses including allowing individuals to attend from their homes, removing the difficulties of travelling;

People from a wider geographical area can now potentially register as no travel to venue involved. – Recovery College participant #002

Positive was the move online as it helped more people access the course who couldn’t travel due to long distances or disability. – Recovery College participant #004

Discussion

1
2
3 This study highlights the divisiveness of the term recovery in the context of dementia.
4
5 For some, the idea of recovery fits well with understandings of living well with dementia and
6
7 advocacy and empowerment approaches. However others felt the term recovery in the
8
9 context of dementia could engender false hope, reflecting previous research suggesting the
10
11 word ‘recovery’ may offer an unrealistic impression of a cure for dementia (Adams, 2010). It
12
13 highlights the power of words and the need for consideration of the terminology used in the
14
15 context of dementia (Swaffer, 2014).
16
17
18

19 Twelve UK Recovery College dementia courses were located. According to survey
20
21 respondents, more women than men attend Recovery College dementia courses, reflecting the
22
23 2:1 ratio of women to men diagnosed with dementia (Mielke, 2018). Consistent with the age
24
25 relationship with dementia, Recovery College attendees are reported to be older than the
26
27 general population, with two-thirds aged 56-75 years. Respondents reported that nearly 80%
28
29 of attendees were White British, under 15% from Asian ethnic groups and few from
30
31 Black/Black British ethnicities. Some courses may be specifically attracting people of Asian
32
33 ethnic origin, but not those from Black ethnic groups for whom the incidence of dementia is
34
35 thought to be higher (Pham *et al.*, 2018). These differences may reflect the service user or
36
37 community profiles of the specific respondent organisations offering dementia courses or
38
39 may suggest there are potential barriers to access for individuals from Black ethnic groups.
40
41 These dynamics will need to be investigated further as the number of people from ethnic
42
43 minority backgrounds living with dementia is estimated to increase seven-fold by 2060
44
45 (Tsamakis *et al.*, 2021).
46
47
48
49
50
51

52 Bespoke dementia courses were based around the ‘living well’ agenda and covered
53
54 topics such as adjustment, managing symptoms, and how to live well. These courses aimed to
55
56 help people understand more about dementia, develop coping skills, and meet others with
57
58 similar experiences. The coproduction of the courses with people with dementia was viewed
59
60

1
2
3 as a strength. These findings resonate with a recent qualitative case study exploring the
4 experiences of people with dementia who undertook a Recovery College dementia course,
5 where co-production and peer-to-peer learning emerged as important aspects of the support
6 received (West *et al.*, 2022). Co-production activities promoted '*breaking down the "them*
7 *and us" barriers common in traditional healthcare professional-service user relationships*'.
8 Having a person with dementia co-facilitating the course provided attendees with positive
9 role models that bring relatability, and a genuine understanding of living with dementia.
10 Current clinical offers of post-diagnostic dementia support risk contributing to Prescribed
11 Disengagement™ (Swaffer, 2015; Low *et al.*, 2018). Threats to personhood and autonomy
12 can occur where support is professional-led, delivered 'to' rather than 'with' people with
13 dementia.
14
15

19
20
21
22
23
24
25
26
27
28

29 These findings revealed exciting innovations in Recovery College provision for
30 people with dementia including the co-production of podcasts and the move to a blended or
31 online approach. Online delivery was seen as having some benefits related to improved
32 accessibility but could exclude those who are less computer literate or lack the resources
33 needed to participate, highlighting socioeconomic barriers in accessing courses during the
34 pandemic. Further work is needed to explore what works for whom and when.
35
36
37
38
39
40
41
42

43 There were Recovery College dementia courses that stopped during the COVID-19
44 pandemic and some had not restarted. People with dementia and their families have been
45 disproportionately affected by COVID-19 (Daley *et al.*, 2022), with many reporting increased
46 loneliness and increased psychological distress (Alzheimer's Society, 2020). Post-diagnostic
47 support is more important than ever to reduce isolation, particularly for people who received
48 their diagnosis remotely with reduced access to subsequent support. With various NHS Trusts
49 looking to review and restart services this would seem a key time to consider a Recovery
50 College approach.
51
52
53
54
55
56
57
58
59
60

1
2
3 This is perhaps particularly timely given Recovery College are an example of
4 integrated working between mental health services, patient advocates and the voluntary
5 sector, aligning with the NHS drive to integrate services to tackle inequalities in outcomes,
6 experience, and access (NHS, 2022). People with dementia often fall between the cracks in
7 services and feel they have been left to manage their difficulties alone (Arblaster & Brennan,
8 2022). A significant proportion of memory services respondents were unaware of Recovery
9 Colleges running in their organisation or even that such services were relevant to people with
10 dementia, although it is possible that their local Recovery College did not run a dementia
11 course. This perhaps explains concerns about poor attendance at some dementia courses.
12 Encouragingly, several participants who were unaware that Recovery College dementia
13 courses existed, expressed interest in exploring this further. The need for joint working
14 between services was emphasised in relation to role clarity in Recovery Colleges, the overlap
15 between clinical support or therapy and Recovery Colleges where the latter focus is on
16 empowerment through education and peer support (Whittley *et al.*, 2019). One implication
17 here is the need for buy-in by all services in developing this provision, the need for clear roles
18 and responsibilities to be established in the co-production of Recovery College dementia
19 courses, and discussion to arrive at a palatable name for recovery-orientated courses.

45 *Limitations*

46 The strength of this study is its good response rate with data from across the UK
47 collected in a short time. However, the study has some limitations. Multiple responses from
48 the same trust could have skewed findings related to the number of Recovery College
49 dementia courses currently running. It is possible that some services have not responded to
50 the survey. The survey may also be subject to a response bias. People may be more likely to
51 respond if they feel passionate about Recovery Colleges and may feel the need to positively
52
53
54
55
56
57
58
59
60

1
2
3 represent their service rendering the survey vulnerable to a social desirability effect.
4
5 Furthermore, the qualitative data obtained is likely to lack detail without the exploratory
6
7 aspect of qualitative interviews. It should be noted that survey respondents have provided
8
9 retrospective estimates of Recovery College attendee characteristics, as this information is
10
11 not collected routinely, so its accuracy cannot be verified. Also, this was collected from a
12
13 limited number of respondents, so may not be generalisable nationally. Conclusions from this
14
15 data can only be indicative at this stage. Future work will explore how these courses work for
16
17 people of diverse backgrounds. Finally, responses given may not reflect the experiences and
18
19 opinions of all participants as they were completed by one person representing a Recovery
20
21 College course.
22
23
24
25
26
27

28 *Conclusions*

30 To our knowledge this is the first study exploring the use of Recovery College
31
32 dementia courses in post-diagnostic dementia support. The results demonstrate the
33
34 importance of peer-to-peer support and involving people with dementia in the co-production
35
36 post-diagnostic services to support living positively. Findings highlight the significance of the
37
38 language used in the discourse around dementia, issues around accessibility, and the need for
39
40 improved integration and partnership working between services.
