Executive Summary

Water is an important resource in Nebraska. Most of the drinking water in the state comes from groundwater sources. Public water sources are required to test their water to ensure it is safe. However, private wells are not subject to any safety or quality standards. Given that, what are the main sources of home tap water for rural Nebraskans? Do they test or treat their water? How concerned are they about water in general? Extreme weather events have also impacted Nebraska in recent years. The ongoing drought as well as flooding in 2019 have affected many Nebraskans. How concerned are rural Nebraskans about extreme weather events? What are their opinions about global climate change? What energy sources do they think Nebraska should invest in? This paper provides a detailed analysis of these questions.

This report details 1,105 responses to the 2022 Nebraska Rural Poll, the 27th annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about natural resources. Some comparisons are made to previous years when similar questions were asked. Comparisons are also made among different respondent subgroups, that is, comparisons by age, occupation, region, etc. Based on these analyses, some key findings emerged:

- **Most rural Nebraskans receive their home tap water from city water or municipal water systems.** Just over two-thirds (68%) of rural Nebraskans receive their drinking water from a municipal system. One-quarter (25%) have private well water and seven percent are on a rural water system.
- **Many rural Nebraskans have tested their home tap water for nitrates. However, a similar proportion indicated they have not tested their water or are unsure.** Just over three in ten have tested their water for nitrates. Just under one-quarter have tested their water for E.coli, lead and hardness.
 - ✓ *Persons with higher household incomes are more likely than persons with lower incomes to have tested their home water for each of the items listed.* As an example, almost four in ten persons with household incomes of \$100,000 or more have tested their water for nitrates, compared to just over two in ten persons with household incomes under \$40,000. Persons with the lowest household incomes are more likely than persons with higher incomes to be unsure if their water has been tested, with 44 percent unsure if their water has been tested.
- **Most rural Nebraskans do not treat their home tap water before drinking it.** Just under six in ten rural Nebraskans do not treat their home tap water. Just under two in ten treat their home tap water using either a carbon filter or reverse osmosis.
 - ✓ *Persons living in or near the smallest communities are more likely than persons living in or near larger communities to not treat their home tap water.* Just over seven in ten persons living in or near communities with populations under 500 (72%) do not treat their home water, compared to 45 percent of persons living in or near communities with populations ranging from 5,000 to 9,999.

- Rural Nebraskans have mixed opinions about various water problems.** At least three in ten are concerned or very concerned about the following: contaminants in their water supply (34%), water quality affecting their or their family's health (34%), water quality affecting wildlife or environment (33%), water quality affecting the cost of water bills (32%), and water will be too polluted (30%). However, either the same or larger proportions indicate they are not concerned or not very concerned about these same items.

 - ✓ *Panhandle residents are the regional group most likely to be concerned that we will not have enough water.* Just over four in ten Panhandle residents are concerned about not having enough water, compared to approximately one-quarter of the residents of the other regions of the state.
- Rural Nebraskans' concerns about severe weather events have fluctuated over time.** Concerns over extreme temperatures and more severe droughts declined between 2015 and 2020 but then increased again this year. The level of concern for these weather events this year is the highest over the three periods. Concerns about more severe droughts declined from 48 percent in 2015 to 21 percent in 2020 before increasing to 55 percent this year. However, when asked about more frequent extreme rains or floods, the level of concern was highest in 2020. Just under three in ten were concerned about extreme rains or floods in 2020, compared to just under one-quarter this year and 15 percent in 2015. In 2020, the flooding of 2019 was fresh in respondents' minds. In 2015 parts of the state had been in drought the previous year and in 2022 most of the state is experiencing drought. These likely account for the differing levels of concerns between those years.
- This year, at least one-half of rural Nebraskans are concerned or very concerned about more severe droughts or dry periods (55%) and more extreme summer temperatures (50%).** Approximately four in ten are concerned about more frequent severe storms or more extreme winter temperatures. Just under one-quarter are concerned about more frequent extreme rains or floods.

 - ✓ *Panhandle residents are more likely than residents of other regions to be concerned about more severe droughts or dry periods and more extreme summer temperatures.* Over three-quarters of Panhandle residents (76%) are concerned about more severe droughts, compared to approximately one-half of the residents of the Northeast, Southeast and South Central regions.
- Rural Nebraskans are less likely to agree that we will learn to live with and adapt to climate change this year as they were in both 2013 and 2008.** Just over six in ten (63%) agree with the statement this year, compared to just over seven in ten respondents in both 2013 and 2008.
- This year, most rural Nebraskans agree that we will learn to live with and adapt to climate change and that we have a responsibility to future generations to reduce the effects of climate change.** Just over six in ten (63%) of rural Nebraskans agree or strongly agree that we will learn to live with and adapt to climate change. Just under six in ten (59%) agree that we have a responsibility to future generations to reduce the effects of climate change.
- This year, a slight majority of rural Nebraskans agree that human activity is contributing to climate change.** Just over one-half (52%) of rural Nebraskans agree with this statement.

- **Many rural Nebraskans agree that too much attention is paid to global climate change.** Just over four in ten (44%) agree that too much attention is paid to global climate change.
 - ✓ *Persons with occupations in agriculture are more likely than persons with different occupations to agree that too much attention is paid to global climate change.* Just under seven in ten persons with occupations in agriculture (69%) agree with that statement, compared to just under one-quarter of persons with food service or personal care occupations.
- **Many rural Nebraskans favor proposals that use tax credits or taxing corporations based on the carbon emissions they produce.** Opinions are mixed on tougher carbon emission standards and tougher fuel-efficiency standards. Many rural Nebraskans *oppose* tax credits for electric vehicles.
- **Rural Nebraskans are less supportive of additional investment in wind and solar energy than they were in 2015.** This year, less than one-half of rural Nebraskans favor more investment in wind energy, down from 75 percent in 2015. Similarly, 62 percent this year support more investment in solar energy, compared to 74 percent in 2015. The support for increased investment in hydroelectric energy is unchanged from 2015. Two sources of energy have more support for increased investment this year, nuclear and coal. In 2015, 24 percent felt there should be more investment in nuclear energy. That increased to 36 percent this year.

Introduction

Water is an important resource in Nebraska. Most of the drinking water in the state comes from groundwater sources. Public water sources are required to test their water to ensure it is safe. However, private wells are not subject to any safety or quality standards. Given that, what are the main sources of home tap water for rural Nebraskans? Do they test or treat their water? How concerned are they about water in general? Extreme weather events have also impacted Nebraska in recent years. The ongoing drought as well as flooding in 2019 have affected many Nebraskans. How concerned are rural Nebraskans about extreme weather events? What are their opinions about global climate change? What energy sources do they think Nebraska should invest in? This paper provides a detailed analysis of these questions.

This report details 1,105 responses to the 2022 Nebraska Rural Poll, the 27th annual effort to understand rural Nebraskans' perceptions. Respondents were asked a series of questions about natural resources.

Methodology and Respondent Profile

This study is based on 1,105 responses from Nebraskans living in 86 counties in the state.¹ A self-administered questionnaire was mailed in May and June to 6,102 randomly selected households. Metropolitan counties not included in the sample were Cass, Douglas, Lancaster, Sarpy, Saunders, Seward and Washington. The 14-page questionnaire included questions

¹ In the spring of 2013, the Grand Island area (Hall, Hamilton, Howard and Merrick Counties) was designated a metropolitan area. To facilitate comparisons from previous years, these four counties are still included in our sample. In addition, the Sioux City area metropolitan counties of Dixon and Dakota were added in 2014 because of a joint

pertaining to well-being, community, natural resources, and the economy and employment. This paper reports only results from the natural resources section.

An 18% response rate was achieved using the total design method (Dillman, 1978). The sequence of steps used follow:

1. A pre-notification letter was sent requesting participation in the study.
2. The questionnaire was mailed with an informal letter signed by the project manager approximately two weeks later.
3. A reminder postcard was sent to those who had not yet responded approximately two weeks after the questionnaire had been sent.
4. Those who had not yet responded within approximately 30 days of the original mailing were sent a replacement questionnaire.

Appendix Table 1 shows demographic data from this year's study and previous rural polls, as well as similar data based on the entire nonmetropolitan population of Nebraska (using the latest available data from the 2015 - 2019 American Community Survey). As can be seen from the table, there are some marked differences between some of the demographic variables in our sample compared to the Census data. Thus, we suggest the reader use caution in generalizing our data to all rural Nebraska. However, given the random sampling frame used for this survey, the acceptable percentage of responses, and the large number of respondents, we feel the data provide useful insights into opinions of rural Nebraskans on

Metro Poll being conducted by the University of Nebraska at Omaha to ensure all counties in the state were sampled. Although classified as metro, Dixon County is rural in nature. Dakota County is similar in many respects to other "micropolitan" counties the Rural Poll surveys.

the various issues presented in this report. The margin of error for this study is plus or minus three percent.

Since younger residents have typically been under-represented by survey respondents and older residents have been over-represented, weights were used to adjust the sample to match the age distribution in the nonmetropolitan counties in Nebraska (using U.S. Census figures from 2010).

The average age of respondents is 50 years. Sixty-six percent are married (Appendix Table 1) and 71 percent live within the city limits of a town or village. On average, respondents have lived in Nebraska 42 years and have lived in their current community 25 years. Fifty-six percent are living in or near towns or villages with populations less than 5,000. Ninety-eight percent have attained at least a high school diploma.

Twenty-one percent of the respondents report their 2021 approximate household income from all sources, before taxes, as below \$40,000. Sixty-three percent report incomes over \$60,000. Seventy-seven percent were employed in 2021 on a full-time, part-time, or seasonal basis.

Nineteen percent are retired. Thirty-eight percent of those employed reported working in a management, professional, or education occupation. Twelve percent indicated they were employed in agriculture.

Water

Water is an important resource in Nebraska. Most of the drinking water in the state comes from groundwater sources. Public water sources are required to test their water to

ensure it is safe. However, private wells are not subject to any safety or quality standards.

Given that, respondents were asked the main source of their home tap water. They could select more than one answer. Most rural Nebraskans receive their home tap water from city water or municipal water systems. Just over two-thirds (68%) of rural Nebraskans receive their drinking water from a municipal system (Figure 1). One-quarter (25%) have private well water and seven percent are on a rural water system.

Differences in the sources of home tap water are examined by community size, region, and various individual attributes (Appendix Table 2). Persons living in or near the largest communities are more likely than persons living in or near smaller communities to have a city water system as the main source of their home tap water. Almost eight in ten persons living in or near communities with populations of 5,000 or more have a city water system as the main source of their home tap water, compared to less than one-half of persons living in or near communities with populations under 500. Conversely, persons living in or near the smallest communities are more likely than

Figure 1. Sources of Home Tap Water

persons living in or near larger communities to have private well water. Just under four in ten persons living in or near the smallest communities (38%) have private well water, compared to less than two in ten persons living in or near the largest communities.

Persons living in both the North Central and Panhandle regions (see Appendix Figure 1 for the counties included in each region) are more likely than persons living in other regions of the state to have private well water. Approximately one-third of persons living in these two regions have a private well as the primary source of their home tap water, compared to less than two in ten persons living in the Southeast region of the state (Figure 2).

Persons living in both the Northeast and Southeast regions are more likely than persons living in other regions to have a rural water system as their primary source of their home tap water.

Persons with lower household incomes are more likely than persons with higher incomes to have a city water system as their primary source of their home water. Conversely, persons with higher incomes are more likely than persons with lower incomes to have private well water.

Figure 2. Private Well as Main Source of Tap Water by Region

In general, older persons are more likely than younger persons to have private well water. Married persons are the marital group most likely to have private well water and the *least* likely to have a city water system. Persons with occupations in agriculture are more likely than persons with different occupations to have private well water. Over six in ten persons with occupations in agriculture (61%) have private well water.

Respondents were next asked if their home tap water has been tested for various substances. Many rural Nebraskans have tested their home tap water for nitrates. Just over three in ten have tested their water for nitrates (Figure 3). However, a similar proportion indicated they have not tested their water or are unsure. Just under one-quarter have tested their water for E.coli, lead and hardness.

Testing done for home tap water was examined by community size, region, and various individual attributes (Appendix Table 3). Persons living in or near smaller communities are more likely than persons living in or near larger communities to have tested their home tap water for nitrates, E.coli and lead. Persons living in or near mid-sized communities are the group most likely to have tested for hardness.

Persons with higher household incomes are

Figure 3. Home Water Tests

more likely than persons with lower incomes to have tested their home water for each of the items listed. As an example, almost four in ten persons with household incomes of \$100,000 or more have tested their water for nitrates, compared to just over two in ten persons with household incomes under \$40,000. Persons with the lowest household incomes are more likely than persons with higher incomes to be unsure if their water has been tested, with 44 percent unsure if their water has been tested.

Older persons are more likely than younger persons to have tested their water for nitrates and hardness. Younger persons are more likely than older persons to say their water has not been tested.

Married persons are the marital group most likely to indicate their water has been tested for all the items listed. Both persons who are divorced/separated and persons who have never married are the groups most likely to say their water has not been tested.

Persons with lower education levels are more likely than persons with more education to be unsure if their water has been tested.

Persons with occupations in agriculture are the occupation group most likely to have tested their water for nitrates, hardness, and E.coli. Persons with healthcare support or public safety occupations are the group most likely to say their water has not been tested. Persons with construction, installation or maintenance occupations are the group most likely to be unsure if their water has been tested.

Next, respondents were asked if they treat their home tap water for safety before drinking it. Most rural Nebraskans do not treat their home tap water before drinking it. Just under six in ten rural Nebraskans do not treat their home

Figure 4. Treatments for Home Tap Water

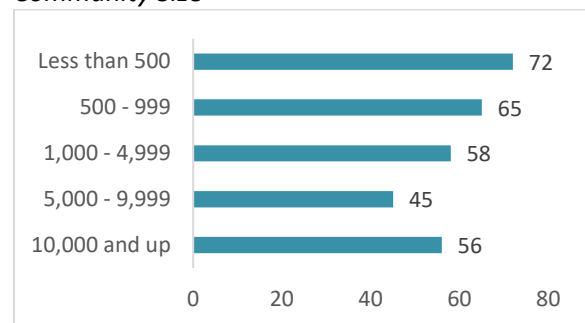

tap water (Figure 4). Just under two in ten treat their home tap water using either a carbon filter or reverse osmosis.

Use of these various home water treatments are examined by community size, region, and various individual attributes (Appendix Table 4). Some differences are detected.

Persons living in or near the smallest communities are more likely than persons living in or near larger communities to not treat their home tap water. Just over seven in ten persons living in or near communities with populations under 500 (72%) do not treat their home water, compared to 45 percent of persons living in or near communities with populations ranging from 5,000 to 9,999 (Figure 5).

Figure 5. Do Not Treat Home Tap Water by Community Size

Panhandle residents are the regional group most likely to use boiling to treat their home tap water.

Persons with higher household incomes are more likely than persons with lower incomes to use whole house sediment filters, carbon filters and reverse osmosis to treat their home tap water.

Both widowed persons and persons who are divorced or separated are the groups most likely to not treat their home tap water. Married persons are the marital group most likely to use reverse osmosis. Persons with lower education levels are more likely than persons with more education to say they don't treat their home tap water.

Finally, respondents were asked to think about water more generally and indicate how concerned they are about various items being a problem in Nebraska in the coming years. Rural Nebraskans have mixed opinions about various

water problems. At least three in ten are concerned or very concerned about the following: contaminants in their water supply (34%), water quality affecting their or their family's health (34%), water quality affecting wildlife or environment (33%), water quality affecting the cost of water bills (32%), and water will be too polluted (30%) (Figure 6). However, either the same or larger proportions indicate they are not concerned or not very concerned about these same items.

The levels of concern about these water issues are examined by community size, region, and various individual attributes (Appendix Table 5). Many differences exist.

Persons living in or near mid-sized communities are more likely than persons living in or near both smaller or larger communities to be concerned about contaminants in their water supply. Four in ten persons living in or near communities with populations ranging from 1,000 to 4,999 are concerned about this,

Figure 6. Concerns about Water Issues Becoming Problems in Nebraska in Coming Years

compared to just over three in ten persons living in smaller or larger communities. Persons living in or near communities with populations ranging from 5,000 to 9,999 are the community size group most likely to be concerned about water quality affecting the cost of water bills.

Panhandle residents are the regional group most likely to be concerned that we will not have enough water. Just over four in ten Panhandle residents are concerned about not having enough water, compared to approximately one-quarter of the residents of the other regions of the state (Figure 7). They are also the group most likely to be concerned that water systems (infrastructure) will break down and that water quality will affect cost of water bills. Four in ten Panhandle residents are concerned about the prospect of failing water systems, compared to less than two in ten residents of both the North Central and South Central regions.

Both Panhandle residents and residents of the Southeast region are the regional groups most concerned that drinking water will be unsafe

Figure 7. Level of Concern about Not Having Enough Water by Region

and that water quality will affect water recreation. Approximately one-third of residents of these two regions are concerned about the possibility of unsafe drinking water, compared to just over two in ten residents of both the North Central and South Central regions.

Residents of the Northeast region are the regional group most likely to be concerned about water quality or contamination affecting their or their family’s health. Just over four in ten Northeast region residents are concerned about this, compared to just over one-quarter of residents of both the North Central and South Central regions.

Persons with lower household incomes are more likely than persons with higher incomes to be concerned about the following: water will be too polluted, drinking water will be unsafe, contaminants in their water supply, water quality affecting their family’s health, water quality affecting the cost of water bills, water quality affecting water recreation, and water quality affecting wildlife or environment. As an example, just over one-third of persons with the lowest household incomes are concerned that drinking water will be unsafe, compared to just over two in ten persons with the highest household incomes.

Older people are more likely than younger people to be concerned about the following: we will not have enough water, water will be too polluted, drinking water will be unsafe, water systems will break down, and water quality affecting the cost of water bills. One-third of persons age 65 and older are concerned that drinking water will be unsafe, compared to approximately two in ten persons under the age of 40.

Younger people are more likely than older

people to be concerned about contaminants in their water supply. Four in ten persons age 19 to 29 are concerned about contaminants in their water supply, compared to just over one-quarter of persons age 30 to 39.

Females are more likely than males to be concerned about contaminants in their water supply, water quality affecting their family’s health, and water quality affecting wildlife or environment. Just under four in ten females are concerned about water quality affecting their family’s health, compared to just under three in ten males.

Married persons are more likely than other marital groups to be concerned about contaminants in their water supply. Persons who are divorced or separated are the marital group most likely to be concerned about water quality affecting cost of water bills and water quality affecting water recreation.

Persons with lower education levels are more likely than persons with higher education to be concerned that water will be too polluted, drinking water will be unsafe, contaminants in their water supply, water quality affecting their family’s health, water quality affecting cost of water bills, water quality affecting water recreation, and water quality affecting wildlife or environment.

Persons with construction, installation or maintenance occupations are the occupation group most likely to be concerned that drinking water will be unsafe and that water quality will affect their family’s health. Persons with production, transportation, or warehousing occupations are the group most likely to be concerned that water systems will break down, about contaminants in their water supply, and water quality affecting the cost of water bills.

Weather and Global Climate Change

Next, respondents were asked their level of concern about various weather events in their area. This question was also asked in both 2015 and 2020. Rural Nebraskans’ concerns about severe weather events have fluctuated over time. Concerns over extreme temperatures and more severe droughts declined between 2015 and 2020 but then increased again this year. The level of concern for these weather events this year is the highest over the three periods. Concerns about more severe droughts declined from 48 percent in 2015 to 21 percent in 2020 before increasing to 55 percent this year (Figure 8). However, when asked about more frequent extreme rains or floods, the level of concern was highest in 2020. Just under three in ten were concerned about extreme rains or floods in 2020, compared to just under one-quarter this year and 15 percent in 2015.

Figure 8. Level of Concern about Weather Events in 2015, 2020, and 2022

In 2020, the flooding of 2019 was fresh in respondents' minds. In 2015 parts of the state had been in drought the previous year and in 2022 most of the state is experiencing drought. These likely account for the differing levels of concerns between those years.

This year, at least one-half of rural Nebraskans are concerned or very concerned about more severe droughts or dry periods (55%) and more extreme summer temperatures (50%) (Figure 9). Approximately four in ten are concerned about more frequent severe storms or more extreme winter temperatures. Just under one-quarter are concerned about more frequent extreme rains or floods.

The level of concern with these events is examined by community size, region, and various individual attributes (Appendix Table 6). Persons living in or near communities with populations ranging from 5,000 to 9,999 are the community size group most concerned with more severe droughts or dry periods.

Panhandle residents are more likely than residents of other regions to be concerned about more severe droughts or dry periods and

more extreme summer temperatures. Over three-quarters of Panhandle residents (76%) are concerned about more severe droughts, compared to approximately one-half of the residents of the Northeast, Southeast and South Central regions (Figure 10).

Residents of both the Panhandle and North Central regions are *less* likely than residents of other regions of the state to be concerned about more frequent extreme rains or floods.

Persons with lower household incomes are more likely than persons with higher incomes to be concerned about more extreme summer temperatures, more extreme winter temperatures, and more frequent severe storms.

Persons age 40 to 49 are the age group most concerned about more severe droughts and more extreme summer temperatures.

Females are more likely than males to be concerned about each of the weather events listed. For example, just over four in ten females are concerned about more extreme winter temperatures, compared to just under

Figure 9. Level of Concern about Weather Events

Figure 10. Level of Concern with More Severe Droughts by Region

three in ten males.

Married persons are the marital group *least* concerned about more extreme rains or floods. Widowed persons are the group most likely to be concerned about more frequent severe storms.

When comparing levels of concern by education level, persons with less education are more likely than persons with more education to be concerned with both more extreme summer and winter temperatures as well as more frequent severe storms.

Persons with food service or personal care occupations are the occupation group most likely to be concerned about more frequent extreme rains or floods. Persons with sales or office support occupations join this group as most likely to be concerned with more extreme winter temperatures.

Respondents were next given a set of statements about global climate change and were asked the extent to which they agree or disagree with each. Some of these statements were also included in both the 2008 and 2013 Nebraska Rural Polls.

Rural Nebraskans have similar opinions about human activity contributing to climate change and having a responsibility to reduce the effects of climate as they did in 2013. This year, just over one-half of rural Nebraskans agree that human activity is contributing to climate change. This is similar to the 54 percent that agreed with a slightly different statement (human activity, including industry and transportation, is a significant cause of climate change) in 2013 but less than the 65 percent agreeing with the latter statement in 2008 (Figure 11). While the statements are similar, the one used in 2008 and 2013 does add the qualifier that human activity is a *significant cause* of climate change. Similarly, just under six in ten rural Nebraskans this year agree with the statement “We have a responsibility to future generations to reduce the effects of climate change.” The same proportion agreed with a similar statement (It is my responsibility to help reduce the impacts of global climate change) in 2013, but less than the 70 percent who agreed with the latter statement in 2008.

This year, rural Nebraskans are less likely to agree that we will learn to live with and adapt to climate change as they were in both 2013 and 2008. Just over six in ten (63%) agree with the statement this year, compared to just over seven in ten respondents in both 2013 and 2008.

When asked about being able to reduce global climate change, rural Nebraskans are more likely to agree this year than they were in 2013. Just under one-half of rural Nebraskans agree

Figure 11. Opinions about Climate Change: 2008, 2013 and 2022

that global climate change is something people can reduce. Just over four in ten (41%) of respondents in 2013 agreed that “global climate change is something people can *control*.” This was down from the 51 percent agreeing in 2008.

This year, most rural Nebraskans agree that we will learn to live with and adapt to climate change and that we have a responsibility to future generations to reduce the effects of climate change. Just over six in ten (63%) of rural Nebraskans agree or strongly agree that we will learn to live with and adapt to climate change (Figure 12). Just under six in ten (59%) agree that we have a responsibility to future generations to reduce the effects of climate change.

A slight majority of rural Nebraskans agree that human activity is contributing to climate

change. Just over one-half (52%) of rural Nebraskans agree with this statement.

Just under one-half of rural Nebraskans agree that recent extreme weather is related to climate change and global climate change is something people can reduce. Just under one-half (48%) agree that people can reduce global climate change and recent extreme weather is related to climate change (47%).

Many rural Nebraskans agree that too much attention is paid to global climate change and actions to address climate change will benefit the economy in the long run. Just over four in ten (44%) agree that too much attention is paid to global climate change and that actions to address climate change will benefit the economy in the long run (42%).

Many rural Nebraskans *disagree* that actions to

Figure 12. Opinions about Global Climate Change, 2022

address climate change will benefit the economy in the short term. Over four in ten (43%) rural Nebraskans *disagree* with this statement while just over two in ten (22%) agree.

Opinions about global climate change are examined by community size, region, and various individual attributes (Appendix Table 7). Many differences exist.

Persons living in or near larger communities are more likely than persons living in or near smaller communities to agree that human activity is contributing to climate change. Over one-half of persons living in or near communities with populations of 1,000 or more agree with the statement, compared to just over four in ten persons living in or near smaller communities.

Younger persons are more likely than older

persons to agree that human activity is contributing to climate change. Over seven in ten persons age 19 to 29 agree with the statement, compared to 38 percent of persons age 50 to 64.

Other groups most likely to agree that human activity is contributing to climate change include: females, persons who have never married, persons who are divorced or separated, persons with higher education levels, and persons with management, professional or education occupations.

Residents of the North Central region are the regional group *least* likely to agree that recent extreme weather is related to climate change. Just under four in ten (38%) of residents of the North Central region agree with this statement, compared to approximately one-half of the residents of the Northeast, South Central and Southeast regions.

Persons with higher education levels are more likely than persons with less education to agree that recent extreme weather is related to climate change. Just over one-half (54%) of persons with at least a four-year college degree agree with the statement, compared to just over four in ten persons with some college education but less than a four-year degree.

Other groups most likely to agree that recent extreme weather is related to climate change include: persons living in or near larger communities, younger persons, females, widowed persons, persons who have never married, and persons with food service or personal care occupations.

Persons with occupations in agriculture are more likely than persons with different occupations to agree that too much attention is paid to global climate change. Just under seven in ten persons with occupations in agriculture (69%) agree with that statement, compared to just under one-quarter of persons with food service or personal care occupations (Figure 13).

Males are more likely than females to agree that too much attention is paid to global climate change. Just over one-half (53%) of males agree with this statement, compared to just over one-third (35%) of females.

Other groups most likely to agree that too much attention is paid to global climate change include: persons age 50 to 64, married persons, and persons with some college education but less than a four-year degree.

Persons with occupations in agriculture are more likely than persons with different occupations to agree that we will learn to live with and adapt to climate change. Just over three-quarters (76%) of persons with

Figure 13. Too Much Attention is Paid to Climate Change by Occupation

occupations in agriculture agree with this statement, compared to just over one-half (54%) of persons with production, transportation, or warehousing occupations.

Other groups most likely to agree that we will learn to live with and adapt to climate change include: persons with higher education levels, married persons, and males.

Persons age 65 and older are the age group most likely to agree that global climate change is something people can reduce. Just over one-half (54%) of persons age 65 and older agree with that statement.

Other groups most likely to agree that global climate change is something people can reduce

include: females, widowed persons, and persons with food service or personal care occupations.

Persons with higher education levels are more likely than persons with less education to agree that we have a responsibility to future generations to reduce the effects of climate change. Almost two-thirds (65%) of persons with at least a four-year college degree agree with this statement, compared to just over one-half of persons with less education.

Other groups most likely to agree that we have a responsibility to reduce the effects of climate change include: persons age 19 to 29, females, and persons with management, professional, or education occupations.

The groups most likely to agree that actions to address climate change will benefit the economy in the short term include: persons living in or near larger communities, persons with lower household incomes, older persons, females, and widowed persons.

Persons living in or near the largest communities are more likely than persons living in or near smaller communities to agree that actions to address climate change will benefit the economy in the long term. Just over one-half of persons living in or near the largest communities agree with this statement, compared to just over one-quarter of persons living in or near the smallest communities.

Other groups most likely to agree that actions to address climate change will benefit the economy in the long term include: persons with lower household incomes, the oldest persons, females, persons with higher education levels,

and persons with management, professional, or education occupations.

Next, respondents were asked if they favor or oppose various proposals to reduce the effects of global climate change. Many rural Nebraskans favor proposals that use tax credits or taxing corporations based on the carbon emissions they produce. Opinions are mixed on tougher carbon emission standards and tougher fuel-efficiency standards. Many rural Nebraskans *oppose* tax credits for electric vehicles. One-half of rural Nebraskans favor or strongly favor tax credits for businesses to use clean energy (Figure 14). Many rural Nebraskans also favor taxing corporations based on the amount of carbon emissions they produce (43%) and tax credits to use technology that captures and stores carbon emissions (42%). Similar proportions both favor and oppose proposals for tougher restrictions on carbon emissions and tougher fuel-efficiency standards for cars and trucks. Almost one-half (49%) *oppose* tax credits for buying electric vehicles and trucks while just under three in ten (29%) favor this proposal.

Support for those proposals are examined by community size, region, and various individual attributes (Appendix Table 8). Many differences emerge.

Persons with higher education levels are more likely than persons with less education to favor tax credits for businesses to use clean energy. Almost six in ten (58%) of persons with at least a four-year college degree favor that proposal, compared to less than one-half of persons with less education. Persons with management, professional, or education occupations are the occupation group most likely to favor this proposal.

Figure 14. Support for Proposals to Reduce Effects of Global Climate Change

Females are more likely than males to support tax credits for buying electric vehicles. Just over one-third (34%) of females support this proposal, compared to less than one-quarter (23%) of males.

Other groups most likely to favor tax credits for buying electric vehicles include: persons living in or near larger communities, persons with higher household incomes, persons with the highest education levels, and persons with healthcare support or public safety occupations.

Persons living in or near larger communities are more likely than persons living in or near smaller communities to favor taxing corporations based on the amount of carbon emissions they produce. Other groups most likely to favor this proposal include: females, widowed persons, and persons who are divorced or separated. Panhandle residents are the regional group *least* likely to favor this proposal.

The groups most likely to favor tax credits to

use technology that captures and stores carbon emissions include: persons living in or near larger communities, younger persons, females, persons with the highest education levels, and persons with management, professional, or education occupations.

Older persons are more likely than younger persons to favor tougher restrictions on carbon emissions. Just under one-half (49%) of persons age 65 and older favor this proposal, compared to 27 percent of persons age 30 to 39.

Other groups most likely to favor this proposal include: persons living in or near larger communities, persons with lower household incomes, females, widowed persons, and persons with management, professional, or education occupations.

The groups most likely to favor tougher fuel-efficiency standards for cars and trucks include: persons living in or near communities with populations ranging from 1,000 to 9,999; older people; females; and widowed persons.

Energy Sources

Finally, respondents were given a list of sources of electrical energy and were asked if they think Nebraska should invest less, more, or about the same in each over the next several years. This same question was asked in the 2015 Rural Poll.

Rural Nebraskans are less supportive of more investment in wind and solar energy than they were in 2015. This year, less than one-half of rural Nebraskans favor more investment in wind energy, down from 75 percent in 2015 (Figure 15). Similarly, 62 percent this year support more investment in solar energy, compared to 74 percent in 2015. The support for increased investment in hydroelectric energy is unchanged from 2015. Two sources of energy have more support for increased investment this year, nuclear and coal. In 2015, 24 percent felt there should be more investment in nuclear energy. That increased to 36 percent this year.

This year, most rural Nebraskans believe Nebraska should invest more in solar energy

Figure 15. Suggested Levels of Investment in Sources of Electrical Energy, 2015 and 2022

over the next several years. Just over six in ten rural Nebraskans (62%) support increased investment in solar energy (Figure 16). One-half of rural Nebraskans believe more should be invested in hydroelectric energy. Less than one-half of rural Nebraskans favor increased investment in wind energy, natural gas, nuclear energy and coal. Many rural Nebraskans favor the same amount of investment for natural gas, hydroelectric, nuclear, and coal.

Opinions about the future levels of investment for many of these sources differ by community size, region, and individual attributes (Appendix Table 9). Persons with production, transportation, or warehousing occupations are more likely than persons with different occupations to believe more should be invested in coal over the next several years. Just under four in ten persons with these types of occupations believe more should be invested in coal, compared to 18 percent of persons with

Figure 16. Suggested Levels of Investment in Sources of Electrical Energy over the Next Several Years, 2022

management, professional, and education occupations.

The other groups most likely to support spending more on coal include: Panhandle residents, residents of the North Central region, persons with higher household incomes, males, and persons with lower education levels.

The groups most likely to support increasing the investment in wind energy include: persons living in or near communities with populations ranging from 5,000 to 9,999; persons with lower household incomes; older persons; and females. Residents of the North Central region are the regional group *least* likely to support increased investment in wind energy.

Panhandle residents are more likely than residents of other regions of the state to support increased spending for solar energy over the next several years. Three-quarters (75%) of Panhandle residents say more should be spent on solar energy, compared to 53 percent of the residents of the North Central region.

The other groups most likely to favor increased investment in solar energy include: persons living in or near communities with populations ranging from 5,000 to 9,999; females; persons with higher education levels; and persons with food service or personal care occupations.

Persons living in or near larger communities are more likely than persons living in or near smaller communities to support increased investment in hydroelectric energy. The other groups that are most likely to support increased spending for hydroelectric energy include: residents of the Northeast region, persons with higher household incomes, males, and persons with occupations in production, transportation, and warehousing.

Residents of the Northeast region are more likely than persons living in other regions of the state to support increased investment in nuclear energy. Over four in ten persons living in the Northeast region support increased investment in nuclear energy, compared to just over one-quarter of persons living in the North Central region.

The other groups most likely to support increased investment in nuclear energy over the next several years include: persons with higher household incomes, younger persons, males, persons with higher education levels, and persons with occupations in construction, installation, or maintenance.

Older persons are more likely than younger persons to support increased investment in natural gas over the next several years. Just under one-half of persons over the age of 50 support this increased investment, compared to just over one-third of persons age 40 to 49.

The other groups most likely to support increased investment in natural gas include: males, persons with some college education but not a four-year degree, and persons with occupations in production, transportation, and warehousing. Residents of the Southeast region are the regional group *least* likely to support increased investment in natural gas.

Conclusion

Most rural Nebraskans receive their home tap water from city water or municipal water systems. Just over two-thirds of rural Nebraskans receive their drinking water from a municipal system. One-quarter have private well water and seven percent are on a rural water system.

Many rural Nebraskans have tested their home

tap water for nitrates. However, a similar proportion indicated they have not tested their water or are unsure. Persons with higher household incomes are more likely than persons with lower incomes to have tested their home water for each of the items listed. Many persons with the lowest household incomes unsure if their water has been tested.

Most rural Nebraskans do not treat their home tap water before drinking it. Persons living in or near the smallest communities (who were more likely to have private well water) are more likely than persons living in or near larger communities to not treat their home tap water.

Rural Nebraskans have mixed opinions about various water problems. At least three in ten are concerned or very concerned about the following: contaminants in their water supply, water quality affecting their or their family's health, water quality affecting wildlife or environment, water quality affecting the cost of water bills, and water will be too polluted. However, either the same or larger proportions indicate they are not concerned or not very concerned about these same items.

Rural Nebraskans' concerns about severe weather events have fluctuated over time. Concerns over extreme temperatures and more severe droughts declined between 2015 and 2020 but then increased again this year. The level of concern for these weather events this year is the highest over the three periods. Concerns about more severe droughts declined from 48 percent in 2015 to 21 percent in 2020 before increasing to 55 percent this year. However, when asked about more frequent extreme rains or floods, the level of concern was highest in 2020. Just under three in ten were concerned about extreme rains or floods in 2020, compared to just under one-quarter this year and 15 percent in 2015. In 2020, the

flooding of 2019 was fresh in respondents' minds. In 2015 parts of the state had been in drought the previous year and in 2022 most of the state is experiencing drought. These likely account for the differing levels of concerns between those years.

This year, at least one-half of rural Nebraskans are concerned or very concerned about more severe droughts or dry periods (55%) and more extreme summer temperatures (50%). The Panhandle residents are more likely than residents of other regions to be concerned about more severe droughts or dry periods and more extreme summer temperatures.

Rural Nebraskans are less likely to agree that we will learn to live with and adapt to climate change this year as they were in both 2013 and 2008. Just over six in ten agree with the statement this year, compared to just over seven in ten respondents in both 2013 and 2008.

This year, most rural Nebraskans agree that we will learn to live with and adapt to climate change and that we have a responsibility to future generations to reduce the effects of climate change. A slight majority of rural Nebraskans agree that human activity is contributing to climate change. However, many rural Nebraskans agree that too much attention is paid to global climate change. This opinion was particularly apparent among persons with occupations in agriculture.

Many rural Nebraskans favor proposals to reduce the effects of climate change that use tax credits or taxing corporations based on the carbon emissions they produce. Opinions are mixed on tougher carbon emission standards and tougher fuel-efficiency standards. Many rural Nebraskans *oppose* tax credits for electric vehicles.

Rural Nebraskans are less supportive of additional investment in wind and solar energy than they were in 2015. The support for increased investment in hydroelectric energy is unchanged from 2015. Two sources of energy have more support for increased investment this year, nuclear and coal.
