

**Discussion:** Supplementation with MexMix improves biochemical parameters and enriches beneficial bacterial genus in MAFLD models.

**Conclusion:** MexMix supplementation is an attractive nutraceutical strategy for the treatment of diseases associated with excessive consumption of fat and sugar, such as MAFLD.

**Funding:** The resources used in this study were from the hospital without any additional financing

**Introduction and Objectives:** This study aimed to evaluate serum concentration of IL-1 $\beta$  and IL-1RA in subjects with alcoholic liver disease (ALD), chronic hepatitis C (CHC) and non-alcoholic fatty liver disease (NAFLD).

**Materials and methods:** A cross-sectional and multicenter study was carried out, which included alcoholic subjects (OH), alcoholic cirrhosis (CiOH) and alcoholic hepatitis (HA); patients with CHC and NAFLD were compared against subjects without criteria for alcohol drinking habits (CT). IL-1 $\beta$  and IL-1RA were quantified by Multiplex-MERCK®. For statistical analysis SPSS V.22 were used, Mann-Whitney U,  $p < 0.05$ ; values expressed as mean  $\pm$  standard error.

**Results:** The groups included were: 18 (OH), 25 (CiOH), 14 (HA), 55 (CHC), 22 (NAFLD) and 81 (CT). IL-1 $\beta$  results (pg/mL): 13.8 $\pm$ 9.2, OH; 4.4 $\pm$ 1.7, CiOH; 3.05 $\pm$ 0.05, HA; 7.1 $\pm$ 2.3, CHC; 5 $\pm$ 2, NAFLD and 3.2 $\pm$ 0.1, CT. With differences in HA vs. CHC. For IL-1RA (pg/mL) 83.5 $\pm$ 30, OH; 100.4 $\pm$ 53.5, CiOH; 85 $\pm$ 38.3, HA; 74.4 $\pm$ 2, CHC; 316 $\pm$ 203, NAFLD and 13.02 $\pm$ 4.4, CT. With differences in CHC and NAFLD vs. CT and CiOH vs. CHC.

**Discussion:** IL-1 $\beta$  was 2.3 times increased in HA/CHC, which highlights the effect on exacerbating the inflammatory response in acute over chronic alcohol damage; IL-1RA that inhibits the activities of IL-1 $\beta$  are increase may have protective effects on liver injury.

**Conclusion:** IL-1RA is a cytokine that limits inflammation in liver disease, especially in non-alcoholic fatty liver disease, alcoholic cirrhosis and chronic hepatitis C.

<sup>5</sup> National Institute of Medical Sciences and Nutrition "Salvador Zubirán." México City. México

**Introduction and Objectives:** To Compare serum levels of IL-12 and CXCL-10 in different etiologies of liver disease.

**Materials and methods:** A cross-sectional and multicenter study was carried out, including subjects with alcoholism according to criteria WHO, without (OH) and with liver injury (cirrhosis, CiOH) and (Alcoholic Hepatitis, HA); non-alcoholic fatty liver (NAFLD) and chronic Hepatitis C (CHC), diagnosed by clinical, biochemical data. They were compared with subjects control (CT). For determination of IL-12 and CXCL-10 with Multiplex®-MERCK®. Statistical analysis by SPSS V.22 using U de Mann Whitney,  $p < 0.05$ ; values expressed as mean  $\pm$  standard error.

**Results:** Included 20 subjects with NAFLD, 78 CHC, 14 HA, 20 CiOH, 15 OH y 60 CT. IL-12 was found elevated in OH, HA, CHC vs. CT in OH vs. HCc y HGNA ( $p \leq 0.05$ ). CXCL-10 was found elevated in CiOH, HA and CHC vs. CT ( $p \leq 0.050$ ).

**Discussion:** The IL-12 showed elevated levels in subjects with alcohol consumption and CHC vs. CT that activates other cell types involved in inflammation. CXCL-10 is induced by IFN- $\gamma$ , was found elevated in CiOH, HA and CHC, exerting their biological effects through CXCR3, including activation of peripheral immune cells and apoptosis. The ratio of IL-12/CXCL-10 in OH increased 4.6 times, ratifying the participation in chronic and continual inflammatory response by alcohol consumption.

**Conclusions:** IL-12 and CXCL-10 have an important role in alcohol-induced liver disease, confirming their contribution to inflammation, being evident CXCL-10 in advanced stages of the disease, by stimulating and favoring the migration of immune cells to the damage sites.

**Funding:** This work was partially financed by CONACyT SALUD-2016-272579 and PAPIIT- UNAM TA200515.
