Fused-Nonacyclic Multi-Resonance Delayed Fluorescence Emitter Based on Ladder-Thiaborin Exhibiting Narrowband Sky-Blue Emission with Accelerated Reverse Intersystem Crossing

Nagata, M.; Min, H.; Watanabe, E.; Fukumoto, H.; Mizuhata, Y.; Tokitoh, N.; Agou, T.; Yasuda, T., *Angew. Chem. Int. Ed.*, **60**, 20280-20285 (2021).

Abstract

Developing organic luminophores with unique capability of strong narrowband emission is both crucial and challenging for the further advancement of organic light-emitting diodes (OLEDs). Herein, a nanographitic fused-nonacyclic π -system (**BSBS-N1**), which was strategically embedded with multiple boron, nitrogen, and sulfur atoms, was developed as a new multi-resonance thermally activated delayed fluorescence (MR-TADF) emitter. Narrowband sky-blue emission with a peak at 478 nm, full width at half maximum of 24 nm, and photoluminescence quantum yield of 89% was obtained with **BSBS-N1**. Additionally, the spin-orbit coupling was enhanced by incorporating two sulfur atoms, thereby facilitating the spin-flipping process between the excited triplet and singlet states. OLEDs based on **BSBS-N1** as a sky-blue MR-TADF emitter achieved a high maximum external electroluminescence quantum efficiency of 21.0%, with improved efficiency roll-off.

Determinants of Crystal Structure Transformation of Ionic Nanocrystals in Cation Exchange Reactions

Li, Z.; Saruyama, M.; Asaka, T.; Tatetsu, Y.; Teranishi, T., *Science*, **373**, 332-337 (2021).

Abstract

Changes in the crystal system of an ionic nanocrystal during a cation exchange reaction are unusual yet remain to be systematically investigated. In this study, chemical synthesis and computational modeling demonstrated that the height of hexagonal-prism roxbyite ($\text{Cu}_{1.8}\text{S}$) nanocrystals with a distorted hexagonal close-packed sulfide anion (S^{2-}) sublattice determines the final crystal phase of the cation-exchanged products with Co^{2+} [wurtzite cobalt sulfide (CoS) with hexagonal close-packed S^{2-} and/or cobalt pentlandite (Co_9S_8) with cubic close-packed S^{2-}]. Thermodynamic instability of exposed planes drives reconstruction of anion frameworks under mild reaction conditions. Other incoming cations (Mn^{2+} , Zn^{2+} , and Ni^{2+}) modulate crystal structure transformation during cation exchange reactions by various means, such as volume, thermodynamic stability, and coordination environment.

1,3-Diradicals Embedded in Curved Paraphenylene Units: Singlet versus Triplet State and In-Plane Aromaticity

Abstract

Curved π -conjugated molecules and open-shell structures have attracted much attention from the perspective of fundamental chemistry, as well as materials science. In this study, the chemistry of 1,3-diradicals (**DRs**) embedded in curved cycloparaphenylene (**CPPs**) structures, **DR-(n+3)CPPs** ($n = 0-5$), was investigated to understand the effects of the curvature and system size on the spin-spin interactions and singlet versus triplet state, as well as their unique characteristics such as in-plane aromaticity. A triplet ground state was predicted for the larger 1,3-diradicals, such as the seven- and eight-paraphenylene-unit-containing diradicals **DR-7CPP** ($n = 4$) and **DR-8CPP** ($n = 5$), by quantum chemical

calculations. The smaller-sized diradicals **DR-(n+3)CPPs** ($n = 0-3$) were found to possess singlet ground states. Thus, the ground-state spin multiplicity is controlled by the size of the paraphenylene cycle. The size effect on the ground-state spin multiplicity was confirmed by the experimental generation of **DR-6CPP** in the photochemical denitrogenation of its azo-containing precursor (**AZ-6CPP**). Intriguingly, a unique type of in-plane aromaticity emerged in the smaller-sized singlet states such as **S-DR-4CPP** ($n = 1$), as proven by nucleus-independent chemical shift calculations (NICS) and an analysis of the anisotropy of the induced current density (ACID), which demonstrate that homoconjugation between the 1,3-diradical moiety arises because of the curved and distorted bonding system.

Colossal Barocaloric Effect by Large Latent Heat Produced by First-Order Intersite-Charge-Transfer Transition

Abstract

Materials which show novel thermal properties can be used to make highly efficient and environmentally friendly energy systems for thermal energy storage and refrigeration through caloric effects. An A-site-ordered quadruple perovskite-structure oxide, $\text{NdCu}_3\text{Fe}_4\text{O}_{12}$, is found to release significant latent heat, 25.5 kJ kg⁻¹ (157 J cc⁻¹), at the intersite-charge-transfer transition temperature near room temperature. The transition is first-order and accompanied by an unusual magnetic ordering and a large negative-thermal-expansion-like volume change, and thus, it causes a large entropy change (84.2 J K⁻¹ kg⁻¹). The observed entropy change is comparable to the largest changes reported in inorganic solid materials, and more importantly, it is utilized through a colossal barocaloric effect. The adiabatic temperature change by applying 5.1 kbar pressure is estimated to reach 13.7 K, which means efficient refrigeration can be realized through this effect.

Abstract

Molybdenum nitrogenase catalyses the reduction of N_2 to NH_3 at its cofactor, an [(R-homocitrate)MoFe₇S₉C] cluster synthesized via the formation of a [Fe₈S₉C] L-cluster prior to the insertion of molybdenum and homocitrate. We have previously identified a [Fe₈S₈C] L*-cluster, which is homologous to the core structure of the L-cluster but lacks the ‘ninth sulfur’ in the belt region. However, direct evidence and mechanistic details of the L*- to L-cluster conversion upon ‘ninth sulfur’ insertion remain elusive. Here we trace the ‘ninth sulfur’ insertion using SeO_3^{2-} and TeO_3^{2-} as ‘labelled’ SO_3^{2-} . Biochemical, electron paramagnetic resonance and X-ray absorption spectroscopy/extended X-ray absorption fine structure studies suggest a role of the ‘ninth sulfur’ in cluster transfer during cofactor biosynthesis while revealing the incorporation of Se^{2-} and Te^{2-} -like species into the L-cluster. Density functional theory calculations further point to a plausible mechanism involving in situ reduction of SO_3^{2-} to S^{2-} , thereby suggesting the utility of this reaction to label the catalytically important belt region for mechanistic investigations of nitrogenase.
