#### Abstract

The main contribution of this paper is to show that the nature of the communication mechanism of concurrent logic languages is essentially different from imperative concurrent languages. We show this by defining a compositional model based on sequences of input-output substitutions. This is to be contrasted with the compositionality in languages like CCS and TCSP, which requires more complicated structures, like trees and failure sets. Moreover, we prove that this model is fully abstract, namely that the information encoded by these sequences is necessary.

Regarding fully abstractness, our observation criterium consists of all the possible finite results, namely the computed answer substitution together with the termination mode (success, failure, or suspension). The operations we consider are parallel composition of goals and disjoint union of programs. We define a compositional operational semantics delivering sequences of input-output substitutions. Starting from this we obtain a fully abstract denotational semantics by requiring some closure conditions on sequences, that essentially model the monotonic nature of communication in concurrent logic languages. The correctness of this model is proved by refining the operational semantics in order to embody these closure conditions.

Key words and phrases: operational semantics, denotational semantics, concurrent logic languages, substitutions, sequences, compositionality fully abstractness.

[^0]
## 1 Introduction

Compositionality is considered one of the most desirable characteristics of a formal semantics, since it provides a foundation of program verification and modular design. The difficulty in obtaining this property depends upon the operators for composing programs, the behaviour we want to describe (observables), and the degree of abstractness we want to reach. A compositional model is called fully abstract (with respect to some operators and observables) if it identifies programs that behave in the same way under all the possible contexts. A fully abstract model can be considered to be the semantics of a language: all the other compositional semantics can be reduced to it by abstracting from the redundant information. Fully abstractness is important, for instance, for deciding correctness of program transformation techniques. If a fully abstract model distinguishes the transformed program from the original one then the transformation is not correct (in the sense that it does not preserve the same behaviour under composition).

In the field of logic languages there are basically two operators for composing programs: the conjunction of goals and the union of clauses. The observables are usually related to the finite result: success, failure, and computed answer substitutions. For Concurrent Logic Languages compositionality has been studied mainly with respect to the conjunction of goals, whilst union of clauses has been considered only in simple cases (union of disjoint programs [GCLS88], and union of nicely intersecting programs [GMS89]). This is rather natural since in a concurrent framework the main operation is the parallel composition of processes. On the other hand, the class of observables has to be enriched by suspension (or deadlock).

The main problem of compositionality in concurrent languages is the description of deadlock behaviour. For languages like CCS and TCSP it is well-known that sequences are not sufficient, and that, on the other hand, trees contain too much control information to be fully abstract. In order to abstract from redundant branching information encoded by the tree structure different approaches have been proposed. The most well known consist of defining an appropriate equivalence relation on trees (see, for instance, bisimulation [Mil80]), and of grouping the branching information in failure sets [BHR84]. In general, failure set semantics is more abstract than bisimulation and it is proved to be fully abstract in the case of TCSP.

Until now, with respect to compositionality, Concurrent Logic Languages have been regarded just as a particular case of the classic paradigms. Therefore, the problem has been approached by the standard methods. De Bakker and Kok ([dBK88], [Kok88]) and De Boer et. al. ([dBKPR89a], [dBKPR89b]) use tree-like structures labeled with functions on substitutions. More simple treelike structures, labeled by constraints, are used by Gabbrielli and Levi ([GL90]) and by Saraswat and Rinard ([SR89]). In [GCLS88] and in [GMS89] the authors approach the problem of fully abstractness by refining the failure set semantics of TCSP.

Let us try to argue why we think that Concurrent Logic Languages require a completely different approach. The communication mechanism in Concurrent Logic Languages is based on the production and consumption of bindings (substitutions) on shared variables. We can translate a CCS process by interpreting the action $a$ as the production of a binding on a variable $x_{a}$ and the complementary action $\bar{a}$ (in CCS parallel processes synchronize on complementary actions) as the consumption of this binding. The main difference is that the behaviour of complementary actions is not symmetrical as it is in CCS and in TCSP. Indeed, the production of a binding can always proceed, whilst the consumption has to wait. In other terms, the communication mechanism of concurrent logic languages is intrinsically asynchronous. The following example shows that this leads to an essentially different deadlock behaviour ${ }^{1}$.

Example 1.1 Let $p_{1}::=\bar{a} \bar{b}+\bar{a} \bar{c}+\bar{a} \bar{d}$ and $p_{2}::=\bar{a} \bar{b}+\bar{a}(\bar{c}+\bar{d})$. The failure set semantics distinguishes these two processes. Indeed, in case of synchronous communication, they behave differently under the context $p::=a(b+c)$. The process $p_{1}$ can deadlock, by choosing the third branch, whilst $p_{2}$ cannot. In the case of asynchronous communication however, both processes have the same

[^1]deadlock behaviour. The process $p_{2}$ can now deadlock by choosing the second branch, because p can independently decide to produce $b$ (after a). In the formalism of concurrent logic languages, this example can be translated as follows (we use here the syntax of [GMS89]. ask $(t=u)$ represents the consumption of a substitution satisfying the equation $t=u$, whilst tell $(t=u)$ represents the production of the most general substitution satisfying $t=u$, and $\mid$ is the commit operator). Figure 1 illustrates this example.
\[

\left.$$
\begin{array}{l}
\left\{p_{1}\left(x_{a}, x_{b}, x_{c}, x_{d}\right):-\operatorname{ask}\left(x_{a}=a\right) \mid \operatorname{ask}\left(x_{b}=b\right)\right. \\
p_{1}\left(x_{a}, x_{b}, x_{c}, x_{d}\right):-\operatorname{ask}\left(x_{a}=a\right) \mid \operatorname{ask}\left(x_{c}=c\right) \\
p_{1}\left(x_{a}, x_{b}, x_{c}, x_{d}\right):-\operatorname{ask}\left(x_{a}=a\right) \mid \operatorname{ask}\left(x_{d}=d\right)
\end{array}
$$\right\}
\]

Figure 1: In logic programming $p_{1}$ and $p_{2}$ cannot be distinguished by $p$.
This example indicates that in the asynchronous case the failure set semantics (at least as it is defined in [BHR84]) is not abstract enough. The essence of this redundancy relies in the following observation:

Example 1.2 In the asynchronous case, $p_{1}::=a(b+c)$ is equivalent to $p_{2}::=a b+a c$ under every context. This is due to the fact that the choice present in $p_{1}$ does not depend upon the environment. After the production of $a, p_{1}$ can proceed to produce either $b$ or $c$ in the same way as $p_{2}$.

This example may induce one to believe that simple sequences of bindings are sufficient for obtaining compositionality. However this is not true in general, because of the different behaviour of the complementary (consuming) case. Consider the following example:

Example 1.3 The process $p_{1}::=\bar{a}(\bar{b}+\bar{c})$ is not equivalent to $p_{2}::=\bar{a} \bar{b}+\bar{a} \bar{c}$. They are distinguished by the context $p:=a b$ ( $p_{2}$ can deadlock whilst $p_{1}$ cannot). This is due to the fact that the choice present in $p_{1}$ does depend upon the environment. This dependency is, however, of a different nature from the synchronous case. Here it is related only to the past behaviour of the environment, i.e., to the bindings that have already been produced.

This last remark indicates a possible way to solve the problem. Given a sequence of substitutions representing the computation of a process with respect to an arbitrary environment, we add the information about who is the producer of each substitution, the process or its environment. If the substitution obtained from such a sequence does not provide the process with the necessary information to proceed then it will deadlock assuming that the environment does not produce any bindings anymore. The composition of different processes then simply amounts to verifying that the assumptions made by one process about its environment are indeed validated by the other processes.

We will show that we can describe compositionally the behaviour of a process by means of a Plotkin-like transition system, labeled by input-output substitutions. The behaviour of the possible environments are modeled by transitions labeled with input substitutions. This kind of transition step does not occur in the usual transition system for CCS, and it allows here to obtain directly a compositional operational semantics based on (sets of) sequences. These sequences are essentially different from the scenarios of [Sar85], where input substitutions correspond to assumptions about the environment which are necessary for the process to proceed. As a consequence, compositionality is there obtained only for the success set. The input-output sequences we use have been introduced in [GCLS88] as one component of the domain of the denotational semantics, the other ingredient being the suspension set. Because of what is stated above, this first component would have already been sufficient to define there a compositional (hence denotational) semantics.

The language described in [GCLS88] contains non-monotonic test predicates. However the real intricacies of the asynchronous and declarative nature of communication in logic languages come to surface in the monotonic case. Here even the sequences contain too much information about the particular order of production of bindings, information that cannot be sensed by monotonic contexts. This is mainly due to the fact that monotonic contexts cannot be specified to ask (only) a specific amount of bindings, they can always proceed when more bindings are provided. We will define therefore a refinement of the transition system, based on some additional steps that allow to abstract from the particular order of productions by buffering them in a kind of active store. Active is meant here in the sense that it can produce bindings itself. The monotonic case has also been investigated in [GMS89]. However the model presented in that paper is based on a refinement of failure set semantics, via some equivalence relation based on simulation of sequences.

In our paper we give a fully abstract semantics for a class of Flat Concurrent Logic Languages. This class will be denoted by $\operatorname{HC}(\mathcal{A}, \mathcal{T})$, where HC stands for Horn Clauses and $\mathcal{A}, \mathcal{T}$ are parameters which denote the set of primitives that can occur in the guards. We consider the following possibilities: $\mathcal{A}=\emptyset$ or $\mathcal{A}=A s k$, where

$$
\text { Ask }=\{a s k(E) \mid E \text { is a set of equations in the Herbrand universe }\}
$$

and $\mathcal{T}=$ or $\mathcal{T}=$ Tell, where

$$
\text { Tell }=\{\text { tell }(E) \mid E \text { is a set of equations in the Herbrand universe }\} .
$$

This class includes, for instance, Oc [IIir87] ( $\mathrm{HC}(\emptyset, \emptyset)$ ), Flat GHC [Ued88] ( $\mathrm{HC}(A s k, \emptyset)$ ) ccH [GL90] and the language of [GMS89]( $\mathrm{HC}(A s k, T e l l)$ ), that is a refined version of Flat CP [Sha89]. $\mathrm{HC}(\mathcal{A}, \mathcal{T})$ can be seen as a particular instance of the cc/Herbrand framework [SR89]. For example, $\mathrm{HC}(A s k, \emptyset)$ corresponds to Eventual Herbrand and $\mathrm{HC}(A s k, T e l l)$ corresponds to atomic Herbrand.

We are mainly concerned with the above three instances of $\mathrm{HC}(\mathcal{A}, \mathcal{T})$. Observe that $\mathrm{HC}(\emptyset, \emptyset)$ is included in $\mathrm{HC}(A s k, \emptyset)$ and $\mathrm{HC}(A s k, \emptyset)$ is included in $\mathrm{HC}(A s k, T e l l)$. A model that is compositional for a language is compositional also for the sublanguages, but not vice-versa. On the other side, with respect to fully abstractness the situation is just the reverse. Therefore each case must be
considered separately. However we show that the fully abstract compositional model is the same for all these languages.

The plan of the paper is the following: In the next section we introduce some basic notions. In section 3 we give the syntax and an informal operational semantics of the class of languages we study. Then we present a compositional semantics based on a Plotkin-like labeled transition system. In the last section we present a refinement of this semantics which is fully abstract.

## 2 Preliminaries

In this section we briefly recall some basic notions and results about substitutions and unification. We will use (mainly) the terminology of [Apt88], [Llo87], [LMM88], and [Ede85], to which we refer for a more detailed presentation of these topics.

### 2.1 Substitutions

Let Var be a non empty set of variables, with typical elements $x, y, z, \ldots$. Let Cons be a set of constructors, with typical elements $a, b, c, \ldots$ (constructors with 0 arguments, or constants), and $f, g, h, \ldots$ (constructors with one or more arguments). We assume the presence of at least one constant.

The set Term, with typical elements $t, u, \ldots$, is the set of all the terms built on Var and on Cons. Examples of terms are $f(a), f(x), g(f(a), f(x)), \ldots$ The set of variables occurring in $t$ is denoted by $\operatorname{var}(t)$.

The set of substitutions, Subst, with typical elements $\vartheta, \sigma, \ldots$, consists of all the mappings $\vartheta$ from Var into Term such that the domain of $\vartheta, \operatorname{dom}(\vartheta)=\{x \in \operatorname{Var} \mid \vartheta(x) \neq x\}$, is finite. We will use the set-theoretic notation $\{x / t \mid x \in \operatorname{dom}(\vartheta) \wedge \vartheta(x) \equiv t\}$ to represent $\vartheta$.

The application $t \vartheta$ of $\vartheta$ to $t$ is defined as the term obtained by replacing each variable $x$ in $t$ by $\vartheta(x)$. The set $\operatorname{ran}(\vartheta)$ (range of $\vartheta$ ) is defined as $\bigcup_{x \in \operatorname{dom}(\vartheta)} \operatorname{var}(\vartheta(x)$ ). The substitution $\vartheta$ is ground iff $\operatorname{ran}(\vartheta)=\emptyset$.

The composition $\vartheta \vartheta^{\prime}$ of $\vartheta$ and $\vartheta^{\prime}$ is defined by $\left(\vartheta \vartheta^{\prime}\right)(x) \equiv(\vartheta(x)) \vartheta^{\prime}$. We recall that the composition is associative, the empty substitution $\epsilon$ is the neutral element, and, for each term $t$, $t\left(\vartheta \vartheta^{\prime}\right) \equiv(t \vartheta) \vartheta^{\prime}$ holds.

The restriction $\vartheta_{\mid V}$ of $\vartheta$ to a set of variables $V$ is the substitution $\vartheta_{\mid V}(x)=\vartheta(x)$ for $x \in V$ and $\vartheta_{\mid V}(x)=x$ otherwise. We will abbreviate $\vartheta_{\mid \operatorname{var}(\bar{A})}$ to $\vartheta_{\mid \bar{A}}$.

### 2.2 Unification

The notion of unification can be given, equivalently, either with respect to a set of sets of terms [Ede85, Llo87], or with respect to a set of equations [LMM88, Apt88]. We choose the second approach.

An equation is an expression of the form $t=u$, where $t$ and $u$ are terms. The set of sets of equations, with typical element $E$, will be denoted by $E q n$. A set of equations $E$ is unifiable iff there exists $\vartheta$ such that for all $t=u$ in $E, t \vartheta \equiv u \vartheta$ holds, where $\equiv$ is the syntactic identity on terms. $\vartheta$ is then called an unifier of $E$. The set of all the unifiers of $E$ will be denoted by unif(E). The set of all the most general unifiers of $E$ is given by $m g u(E)=\left\{\vartheta \in u n i f(E) \mid \forall \vartheta^{\prime} \in u n i f(E) . \vartheta \leq \vartheta^{\prime}\right\}$. It is well known that all the most general unifiers of a set $E$ are equivalent, and this explains why, in the literature, we often find the terminology "the mgu of $E$ ".

Given a substitution $\vartheta$ the associated set of equations will be denoted by $\mathcal{E}(\vartheta)$.

### 2.3 Constraints on the Herbrand Universe

A constraint system is essentially a system of partial information that supports the notion of consistency and entailment. The notion of constraint was introduced in Logic Programming by Jaffar and Lassez [JL87]. Maher [Mah87] suggested the use of constraints to model logically the synchronisation and communication mechanisms of concurrent logic languages. We restrict here to a particular class of constraints: the ask and tell constraints on the Herbrand universe [Sar89]. They are of the form $a s k(E)$ and tell $(E)$ respectively, where $E$ is a set of equations. A constraint of the form $\operatorname{ask}(E)$ or $\operatorname{tell}(E)$ is solved by a substitution $\vartheta$ if $\vartheta=m g u(E)$.

We use the following notations: $A s k=\{\operatorname{ask}(E) \mid E \in E q n\}$ and Tell $=\{t e l l(E) \mid E \in E q n\}$.

## 3 The class $\mathrm{HC}(\mathcal{A}, \mathcal{T})$. Syntax and informal operational semantics.

The (parametric) sets $\mathcal{A}$ and $\mathcal{T}$ specify the set of primitives used in the guards. We restrict here to the following cases: $\mathcal{A}=\emptyset$ or $\mathcal{A}=A s k$, and $\mathcal{T}=\emptyset$ or $\mathcal{T}=T e l l$.

Let Pred be a set of predicates, with typical elements $p, q, r, \ldots$. The set Atom, with typical elements $A, B, H \ldots$, is the set of all the atomic formulas built on Pred and on Term, and of the primitives of the form tell $(E)$. In the following, we use the abbreviations $\bar{A}, \bar{x}$ etc. to denote conjunctions of atoms, variables etc.

A clause $C$ of $\mathrm{HC}(\mathcal{A}, \mathcal{T})$ is a formula of the form $H \leftarrow g_{1}: g_{2} \mid \bar{B}$, where $g_{1} \in \mathcal{A}$ and $g_{2} \in \mathcal{T}$. The atom $H$ is the head, $g_{1}: g_{2}$ is the guard and $\bar{B}$, a multiset of atoms, is the body of the clause. A goal statement $G$ is a multiset of atoms $\bar{A}$. The empty goal statement is denoted by $\square$. A $\mathrm{HC}(\mathcal{A}, \mathcal{T})$ program $P$ is a (finite) set of clauses. An atom $A$ in a goal $G$ is seen as an (AND-) process. If $A$ is of the form tell $(E)$ then:

- if $E$ is unifiable then $A$ succeeds producing the substitution $\vartheta=m g u(E)$, and the remaining goal $G \backslash A$ is instantiated by $\vartheta$.
- if $E$ is not unifiable then $A$ and the whole goal fails

If $A$ is an atomic formula, its computation proceeds by looking for a candidate clause in $W$.
Definition 3.1 Let $A$ be an atomic formula and let $C \equiv H \leftarrow g_{1}: g_{2} \mid \bar{B}$ be a clause in $P$, renamed in order to have no variables in common with $A$. Then the clause $C$

- is candidate if

1. $\exists m g u(H=A)=\vartheta$,
2. $\vartheta_{\mid A}=\epsilon$
3. $\exists \vartheta_{1}$ such that $g_{1} \vartheta$ is solved by $\vartheta_{1}$,
4. $\vartheta_{1 \mid A}=\epsilon$,
5. $\exists \vartheta_{2}$ such that $g_{2} \sigma$ is solved by $\vartheta_{2}$, where $\sigma=\vartheta \vartheta_{1}$.

- suspends if (1) is satisfied but (2) is not satisfied, or (1), (2) and (3) are satisfied but (4) is not satisfied.
- fails in all the other cases.

If there are candidate clauses, then the computation of $A$ commits to one of them (i.e. no backtracking will take place), $A$ is replaced by $\bar{B} \sigma \vartheta_{2}$, and the rest of the goal is instantiated by $\vartheta_{2}$. If all the clauses for $A$ fail, then $A$ and the whole goal fail. If no clauses are candidate and at least one clause suspends, then $A$ suspends. $A$ can be resumed when its arguments get bound by other processes in the goal. If all the processes in the goal suspend, then the goal suspends.

## 4 A compositional operational semantics for $\operatorname{HC}(\mathcal{A}, \mathcal{T})$.

To define the meaning of a goal in terms of its subgoals, we describe the behaviour of a goal as a sequence of interactions with its environment. Interactions are modeled as input/output substitutions. An input substitution is provided by the environment, whereas an output substitution is produced by the goal itself.

## Definition 4.1

- The set of input substitutions is Subst ${ }_{I}=\left\{\vartheta^{I} \mid \vartheta \in\right.$ Subst $\}$.
- The set of output substitutions is Substo $=\left\{\vartheta^{\circ} \mid \vartheta \in\right.$ Subst $\}$.
- The set of input/output substitutions, with typical element $\vartheta^{\ell}$, is Subst ${ }_{I O}=$ Subst $_{I} \cup$ Subst $_{O}$.

The operational semantics we define is based on a transition system $T$ labeled on $S u b s t_{I O}$. The configurations of $T$ are pairs consisting of a goal and an infinite set of fresh variables (representing the variables still available for the renaming mechanism). To obtain a compositional operational semantics we need a compositional renaming mechanism. We propose the following (formal) solution. Let $\mathcal{P}_{i}(V a r)$ be the set of all the infinite sets of variables. We assume the existence of a partitioning function Part: $\mathcal{P}_{\boldsymbol{i}}($ Var $) \rightarrow \mathcal{P}_{\boldsymbol{i}}($ Var $) \times \mathcal{P}_{\boldsymbol{i}}($ Var $)$ such that

$$
\forall V \in \mathcal{P}_{i}(V a r)\left[\left\langle V_{1}, V_{2}\right\rangle=\operatorname{Part}(V) \Rightarrow\left(V_{1} \cup V_{2} \subseteq V \wedge V_{1} \cap V_{2}=\emptyset\right)\right]
$$

and, moreover, we assume $\operatorname{Part}(V \backslash Z)=\left(V_{1} \backslash Z, V_{2} \backslash Z\right)$, where $\operatorname{Part}(V)=\left(V_{1}, V_{2}\right)$. In this way we can split the "available variables" among the subgoals so to avoid clash of variables among the subcomputations.

Table 1 gives the rules for $T$ describing the "successful" computation steps. We call them computation rules.

Table 1: The Transition System T. Computation Rules

> C1 $\langle A, V\rangle \xrightarrow{\vartheta_{3}^{O}}\left\langle\bar{B} \sigma \vartheta_{2}, W\right\rangle$ if $\exists C \in P_{V}[C$ is candidate $] \wedge W=V \backslash \operatorname{var}\left(\bar{B} \sigma \vartheta_{2}\right)$
> C2 $\langle$ tell $(E), V\rangle \xrightarrow{\vartheta^{\circ}}\langle\square, V\rangle$ if $\exists \vartheta=m g u(E)$
> C3 $\langle A, V\rangle \xrightarrow{\vartheta^{I}}\langle A \vartheta, V\rangle$ where $A$ is either an atomic formula or $\operatorname{tell}(E)$
> C4 $\frac{\left\langle\bar{A}_{1}, V_{1}\right\rangle \xrightarrow{\vartheta^{I}}\left\langle\bar{B}_{1}, W_{1}\right\rangle\left\langle\bar{A}_{2}, V_{2}\right\rangle \xrightarrow{\vartheta^{e}}\left\langle\bar{B}_{2}, W_{2}\right\rangle}{\left\langle\bar{A}_{1}, \bar{A}_{2}, V\right\rangle \xrightarrow{\vartheta^{l}}\left\langle\bar{B}_{1}, \bar{B}_{2}, W_{1} \cup W_{2}\right\rangle}$ where $\left\langle V_{1}, V_{2}\right\rangle=\operatorname{Part}(V)$

The rule C1 describes the normal atomic reduction step. The symbols $C, \bar{B}, \sigma$, and $\vartheta_{2}$ are the ones of definition 3.1, whilst $P_{V}$ denotes the program $P$ renamed with the variables in $V$.

The rule C2 describes the output of the substitution satisfying an atom of the form tell( $E$ ). Note that in the case of $\operatorname{HC}(\mathcal{A}, \emptyset)$ this is the only rule that allows to produce bindings on the (shared) variables of the goal.

The rule C3 describes the input of a substitution produced by the external environment. Note that $\vartheta$ is any substitution, namely it represent a free assumption on the environment. In other words, it does not depend upon what the goal needs to proceed, and whether or not it will fail after this input. This is the point in which our transition system essentially differs from the semantics
described in [Sar85] and in [GMS89], and this is why our sequences contain information enough to allow for compositionality.

Finally, C4 describes the transition of a goal in terms of the transitions of the subgoals. Note that this is the rule that allows to check that the input assumptions really correspond to the outputs done by the environment.

Table 2 and table 3 illustrate the rules for failure and suspension respectively. We need to introduce in our configurations the symbols fail and susp, with the obvious meaning.

Table 2: The Transition System T. Failure Rules

F1 $\langle A, V\rangle \xrightarrow{\epsilon^{\circ}}\langle$ fail,$V\rangle$ if $\forall C \in P_{V}[C$ fails $]$
F2 $\langle t e l l(E), V\rangle \xrightarrow{\epsilon^{\circ}}\langle f a i l, V\rangle$ if $A m g u(E)$
F3 $\frac{\langle A, V\rangle \xrightarrow{\epsilon^{\circ}}\langle f a i l, V\rangle}{\left\langle A, \bar{B}, V \xrightarrow{\epsilon^{\circ}}\langle f a i l, V\rangle\right.}$ where $A$ is either an atomic formula or tell $(E)$

Table 3: The Transition System T. Suspension Rules

$$
\begin{aligned}
& \text { S1 }\langle A, V\rangle \xrightarrow{\epsilon^{\circ}}\langle\text { susp, } V\rangle \text { if } \stackrel{\exists C \in P_{V}[C \text { suspends }]}{\wedge} \\
& \forall C \in P_{V}[C \text { is not candidate }] \\
& \text { S2 } \frac{\left\langle\bar{A}_{1}, V_{1}\right\rangle \xrightarrow{\epsilon^{\circ}}\left\langle\text { susp, } V_{1}\right\rangle \quad\left\langle\bar{A}_{2}, V_{2}\right\rangle \xrightarrow{\epsilon^{\circ}}\left\langle\text { susp, } V_{2}\right\rangle}{\left\langle\bar{A}_{1}, \bar{A}_{2}, V\right\rangle \xrightarrow{\epsilon^{\circ}}\left\langle\text { susp }, V_{1} \cup V_{2}\right\rangle} \text { where }\left\langle V_{1}, V_{2}\right\rangle=\operatorname{Part}(V)
\end{aligned}
$$

The operational semantics $\mathcal{O}$ based on this transition system $T$ delivers sets of sequences $s$ of input/output substitutions, ended by a termination mode. We denote the set of these sequences as $S e q=S_{b s t}{ }^{\prime}{ }^{*} \cdot\{s s, f f, d d, \perp\}$. The set Subst $_{I O^{*}}$, with typical element $c$, denotes the sequences of substitutions generated during the computation, whilst the symbols $s s, f f$, and $d d$ represent the possible ways in which a process can terminate: success, failure and suspension (or deadlock) respectively. Sequences ending in $\perp$ will denote unfinished computations. The symbol $\alpha$ will denote an element ranging over the set $\{s s, f f, d d, \perp\}$.

We need first to introduce a technical notion: the restriction operator. Intuitively, this operator restricts the substitutions in the sequences generated by a goal $A$ to only those bindings which affect the variables of $A$. This is not really necessary to achieve compositionality here, but it is a step towards fully abstractness, since, intuitively, we must identify all those processes that only differ for the assignments to the local variables (no contexts can distinguish them). Moreover, if $V$ is the set of local variables available for the computation of $A$, we must abstract from all those sequences that are of the form $c . \vartheta^{I} . s$ such that $\vartheta$ introduces a variable in $V$ that has not yet been introduced by $c$.

Definition 4.2 (Restriction operator) Let $\bar{A}$ be a goal and let $V \in \mathcal{P}_{i}($ Var $)$. Then $r_{\bar{A}, V}$ : $\mathcal{P}($ Seq $) \rightarrow \mathcal{P}($ Seq $)$ is defined by

$$
r_{\bar{A}, V}(S)=\left\{\operatorname{Restrict}_{\bar{A}}(s) \mid s \in S \wedge\left[s=c . \vartheta^{I} . s^{\prime} \Rightarrow \operatorname{var}(\vartheta) \cap V \subseteq \operatorname{var}\left(A \vartheta_{c}\right)\right]\right\}
$$

where $\vartheta_{c}$ denotes the substitution obtained by composing all the elements of $c: \vartheta_{\lambda}=\epsilon$ and $\vartheta_{\sigma . c}=$ $\sigma \vartheta_{c}$.
and

$$
\begin{aligned}
& \text { Restrict }_{\bar{A}}(\alpha)=\alpha \\
& \text { Restrict }_{\bar{A}}\left(\vartheta^{I} . s\right)=\vartheta^{I} \cdot \text { Restrict }_{\bar{A} \vartheta}(s) \\
& \text { Restrict }_{\bar{A}}\left(\vartheta^{O} . s\right)= \begin{cases}\vartheta_{\mid \bar{A}}^{O} \cdot \text { Restrict }_{\bar{A} \vartheta}(s) & \text { if } \vartheta_{\mid \bar{A}} \neq \epsilon \\
\text { Restrict }_{\bar{A}}(s) & \text { otherwise }\end{cases}
\end{aligned}
$$

We can now define the operational semantics.
Definition 4.3 (Operational Semantics) The operational semantics $\mathcal{O}:$ Goal $\rightarrow\left[\mathcal{P}_{\boldsymbol{i}}(\right.$ Var $) \rightarrow$ Seq] is given by

```
\(\mathcal{O} \llbracket \square](V) \quad=\quad\{c . \alpha: \alpha=\perp, s s\), and \(c\) contains only input substitutions \(\}\)
\(\mathcal{O} \llbracket f a i l \rrbracket(V)=\{\perp, f f\}\)
\(\mathcal{O} \llbracket s u s p \rrbracket(V)=\{\perp, d d\}\)
\(\mathcal{O} \llbracket \bar{A} \rrbracket(V)=r_{\bar{A}, V}\left(\left\{\vartheta^{\ell} . \mathcal{O} \llbracket \bar{B} \rrbracket(W) \mid\langle\bar{A}, V\rangle \xrightarrow{\vartheta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp\}\right)\)
```

Note that this definition is recursive. We consider $\mathcal{O}$ as the least fixpoint of the transformation (continous on the domain $\mathcal{P}_{\perp}(S e q)$, the set of subsets of $S e q$ containing $\perp$, ordered with respect to set inclusion) associated with its defining equations.

From this operational semantics we obtain our observation criterium as follows:

## Definition 4.4 (Observables)

$$
O b s(\bar{A})=\operatorname{Result}_{\bar{A}}(\mathcal{O} \llbracket \bar{A} \rrbracket(V))
$$

where $V$ is the set $\operatorname{Var} \backslash \operatorname{var}(A)$, and

$$
\operatorname{Result}_{\bar{A}}(S)=\left\{\left\langle\vartheta_{c \mid \bar{A}}, \alpha\right\rangle \mid c . \alpha \in S \wedge c \in S u b s t_{O}^{*} \wedge \alpha \in\{s s, f f, d d\}\right\}
$$

In the following, when $V=\operatorname{Var} \backslash \operatorname{var}(A)$, we will write simply $\mathcal{O} \llbracket \bar{A} \rrbracket$ instead of $\mathcal{O} \llbracket \bar{A} \rrbracket(V)$.
Note that in this definition we pick up the sequences entirely composed by output substitutions. This amounts to require that each substitution we observe has been really produced. It is easy to see that this notion of observables, based on $T$, correspond to the set of finite results (computed answeer substitution, termination mode) that can be derived by the classical operational semantics described in section 3.

To show the compositionality of the operational semantics we define the parallel composition ||. This operator, first introduced in [GCLS88], allows to combine sequences of input/output substitutions that are equal at each point, apart from the labels, so modeling the interaction of a process with its environment. It corresponds to apply iteratively the rule $\mathbf{C 4}$ of the transition system $T$.

Definition 4.5 (Parallel composition operator) The partial operator $\|: S e q \times S e q \rightarrow S e q$ is defined by

- $s_{1}\left\|s_{2}=s_{2}\right\| s_{1}$
- $\alpha \| s s=\alpha$
- $\alpha \| f f=f f$
- $d d\|d d=d d, \perp\| d d=\perp$
- $\vartheta^{J} \cdot s_{1} \| \vartheta^{\ell} \cdot s_{2}=\vartheta^{\ell} .\left(s_{1} \| s_{2}\right)$

The natural extension of $\|$ on sets will be still denoted by $\|$.
The following result shows the compositionality of our operational semantics with respect to goal conjunction. The compositionality with respect to the union of disjoint programs (or nicely intersecting programs) is obviously given by the set union.

## Theorem 4.6 (Compositionality of $\mathcal{O}$ )

$$
\mathcal{O} \llbracket \bar{A}_{1}, \bar{A}_{2} \rrbracket(V)=\mathcal{O} \llbracket \bar{A}_{1} \rrbracket\left(V_{1}\right) \| \mathcal{O} \llbracket \bar{A}_{2} \rrbracket\left(V_{2}\right), \quad \text { where }\left\langle V_{1}, V_{2}\right\rangle=\operatorname{Part}(V)
$$

Proof
Notice that the parallel composition operator models consecutive applications of the rule C4 of the transition system.

We end this section by noticing that $\mathcal{O}$ is also a denotational semantics, since it is compositional and it is defined as the fixpoint of an (higher order) operator.

## 5 Fully abstract semantics for the languages of the class $\mathrm{HC}(\mathcal{A}, \mathcal{T})$.

The operational semantics defined in the previous section is not fully abstract, this is due mainly to the fact that it enforces synchronization between the producer and the consumer. This synchronization consists in that a substitution produced by an atom has to be consumed at the same time by the other atoms of the goal. To abstract from this phenomenon we will define some closure conditions on sets of sequences of elementary substitutions. The fully abstract denotational semantics $\mathcal{D}$ then will be based on the transition system $T$ plus these closure conditions.

We first introduce the notion of an elementary substitution.
Definition 5.1 We denote by ESubst the set of all the elementary substitutions, namely the ones of the form $\{x / t\}$. Moreover we define

- ESubst $I_{I}=\left\{\vartheta^{I} \mid \vartheta \in E S u b s t\right\}$
- ESubsto $=\left\{\vartheta^{\circ} \mid \vartheta \in E S u b s t\right\}$
- ESubst $_{I O}=$ ESubst $_{I} \cup$ ESubst $_{O}$
- $E S e q=E S u b s t_{I O}^{*} \cdot\{s s, f f, d d, \perp\}$

To decompose a substitution into elementary ones we define
Definition 5.2 The function decomposition, Dec: Subst ${ }_{I O} \rightarrow$ ESubst $_{I O}^{*}$, is defined as follows

$$
\operatorname{Dec}\left(\left\{x_{1} / t_{1}, \ldots, x_{n} / t_{n}\right\}^{\ell}\right)=\left\{x_{1} / t_{1}\right\}^{\ell} \ldots\left\{x_{n} / t_{n}\right\}^{\ell}
$$

We next give the definition of the closure conditions.
Definition 5.3 Given an initial goal $\bar{A}$, a set of local variables $V$, we define Closure $_{\bar{A}, V}(S)$ to be the minimal set that contains $S$ and that is closed with respect to the conditions P1-P6 of table 4.

Table 4: The closure conditions with respect to an initial goal $\bar{A}$ and set of local variables $V$

$$
\begin{aligned}
& \text { P1 } \quad c_{1} . \vartheta^{O} . s \in S \Rightarrow c_{1} . \vartheta^{I} . s \in S \\
& \text { P2 } c_{1} \cdot \vartheta_{1}^{O} \cdot \vartheta_{2}\left[\vartheta_{1}\right]^{I} . s \in S \Rightarrow c_{1} \cdot \vartheta_{2}^{I} \cdot \vartheta_{1}\left[\vartheta_{2}\right]^{O} . s \in S \\
& \text { P3 } \quad c_{1} \cdot \vartheta_{1}^{O} \cdot \operatorname{Dec}\left(\vartheta_{2}^{I}\right) \cdot s \in S \Rightarrow c_{1} \cdot \vartheta_{1}\left[m g u\left(\mathcal{E}\left(\vartheta_{2}\right)\right)\right]^{I} . \operatorname{Dec}\left(\vartheta_{2}^{O}\right) \cdot s \in S \\
& \text { P4 } c_{1} \cdot \vartheta_{1}\left[m g u\left(\mathcal{E}\left(\vartheta_{2}\right)\right)\right]^{O} \cdot \operatorname{Dec}\left(\vartheta_{2}^{I}\right) . s \in S \Rightarrow c_{1} \cdot \vartheta_{1}^{I} \cdot \operatorname{Dec}\left(\vartheta_{2}^{O}\right), s \in S \\
& \text { P5 } \quad c \equiv c_{1} \cdot \vartheta_{1}^{\ell} \ldots \vartheta_{m}^{\ell} \cdot s \in S \Rightarrow c_{1} \cdot \sigma_{1}^{\ell} \ldots \sigma_{n}^{\ell} \cdot s \in S \text {, } \\
& \text { where } Z_{1} \cap \operatorname{var}\left(c_{1}\right)=\emptyset, Z_{2} \cap \operatorname{var}(c)=\emptyset \text {, } \\
& \left(\vartheta_{1} \cdots \vartheta_{m}\right)_{V a r \backslash Z_{1}}=\left(\sigma_{1} \cdots \sigma_{n}\right)_{V a r \backslash Z_{2}} \text {, } \\
& \text { for } \ell=I: Z_{1} \text { and } Z_{2} \text { have no variables in common with } V \text { or } \bar{A} \text {, } \\
& \text { for } \ell=O: Z_{1}, Z_{2} \subseteq V \\
& \text { P6 } \quad c . \alpha \in S \Rightarrow c . \perp \in S \text { where } \alpha \in\{s s, f f, d d\}
\end{aligned}
$$

Here $\vartheta_{1}\left[\vartheta_{2}\right]$ denotes the substitution $\left\{x / t \vartheta_{2}: x / t \in \vartheta_{1}\right\}$. With respect to the rules $\mathbf{P} 3$ and P4 we require that $\operatorname{dom}\left(\operatorname{mgu}\left(\mathcal{E}\left(\vartheta_{2}\right)\right)\right) \subseteq \operatorname{ran}\left(\vartheta_{1}\right)$. The first condition expresses that there is no
direction involved in the communication of substitutions, that is, a substitution produced can also be consumed. The condition P2 expresses that a input substitution received after the production of a substitution can also be received before. The following condition states that a input substitution preceded by a output substitution can be produced when the environment provides the instantiated output substitution. On the other hand the condition P4 expresses that when the environment provides less information than the process is able to produce the additional information then can be produced by the process itself. Condition P5 states that successive input (output) substitutions can be replaced by a equivalent sequence of substitutions. This equivalence is defined in such a way that local variables can be added and deleted. Here is the definition of the denotational semantics D.

Definition 5.4 (The denotational semantics)

```
\(\mathcal{D} \llbracket \square(V) \quad=\quad\{c . \alpha: \alpha=\perp\), ss, and \(c\) contains only input substitutions \(\}\)
\(\mathcal{D} \llbracket f a i l \rrbracket(V)=\{\perp, f f\}\)
\(\mathcal{D} \llbracket s u s p \rrbracket(V)=\{\perp, d d\}\)
\(\mathcal{D} \llbracket A \rrbracket(V)=r_{A, V}\left(\right.\) Closure \(\left._{A, V}\left(\left\{\operatorname{Dec}\left(\vartheta^{\ell}\right) \cdot \mathcal{D} \llbracket \bar{B} \rrbracket(W) \mid\langle A, V\rangle \xrightarrow{\vartheta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp\}\right)\right)\)
\(\mathcal{D} \llbracket \bar{A}_{1}, \bar{A}_{2} \rrbracket(V)=r_{\bar{A}_{1}, \bar{A}_{2}, V}\left(\right.\) Closure \(\left._{\bar{A}_{1}, \bar{A}_{2}, V}\left(\mathcal{D} \llbracket \bar{A}_{1} \rrbracket\left(V_{1}\right) \| \mathcal{D} \llbracket \bar{A}_{2} \rrbracket\left(V_{2}\right)\right)\right)\),
    where \(\left\langle V_{1}, V_{2}\right\rangle=\operatorname{Part}(V)\)
```

## 6 The correctness of $\mathcal{D}$

The first question is now the correctness of $\mathcal{D}$, i.e., whether it distinguishes enough. In other words, if two processes that have the same denotational semantics give also the same observables. We show this by defining a transition system $T^{\prime}$, which adds to $T$ some rules that model the closure conditions. Essentially $T^{\prime}$ describes the asynchronous communication by the use of a store of bindings. Substitutions produced are communicated to this store. The consumption of a substitution then consists of retrieving this substitution from the store. The store is modeled by adding to a goal constructs of the form store $(E)$, which is to be interpreted as that the equation $E$ is present in the store.

Table 5: The Transition System $T^{\prime}$. Additional computation Rules

$$
\begin{aligned}
& \text { C1 }\langle A, V\rangle \xrightarrow{\epsilon^{\circ}}\left\langle\bar{B} \sigma, \text { store }\left(E_{2} \sigma\right), W\right\rangle \text { if } \exists C \in P_{V}[C \text { is candidate }] \wedge W=V \backslash \operatorname{var}\left(P_{V}\right) \\
& \text { C2 }\langle\text { tell }(E), V\rangle \xrightarrow{\epsilon^{\circ}}\langle\operatorname{store}(E), V\rangle \\
& \text { C5 }\langle p(t), V\rangle \xrightarrow{\epsilon}\langle p(z), \text { store }(z=t), V \backslash\{z\}\rangle \text { where } z \in V
\end{aligned}
$$

$$
\begin{aligned}
& \text { C7 }\langle\operatorname{store}(x=t), V\rangle \xrightarrow{\vartheta^{\circ}}\langle\square, V\rangle \text { if } \vartheta=m g u(x=t) \\
& \text { C8 } \frac{\langle\bar{A}, V\rangle \xrightarrow{\vartheta^{\circ}}\langle\bar{B}, W\rangle}{\langle\bar{A}, V\rangle \xrightarrow{\epsilon^{\circ}}\langle\operatorname{store}(\mathcal{E}(\vartheta)), \bar{B}, W\rangle}
\end{aligned}
$$

With respect to the transition system $T^{\prime}$ we modify the rule $\mathbf{C 1}$ so that the output substitution of the guard is added to the store. Rule C2 is modified such that instead of producing the mgu of a set of equations of a tell construct these equations are added to the store. In the rule C3 $A$ can now also be of the form store $(E)$. It is important to note that the failure rules remain the same, as a consequence inconsistencies in the store do not lead to failure. The rule C5 allows to add information about the terms occurring in the goal to the store. The rule $\mathbf{C 6}$ describe how a store can resolve itself into a equivalent one. The rule $\mathbf{C 7}$ describes the retrieval of a substitution from the store. The last rule describes the partial consumption of substitutions, i.e., it allows the retrieval of some information from the store by a single atom of a goal. We illustrate this by a simple example.

Example 6.1 We show how to derive $p(a), q(x)$, store $(x=a)$ from the goal $p(x), q(x)$, tell $(x=a)$. (As it plays no role in this example we forget about the set of fresh variables.)

1. $\operatorname{tell}(x=a) \xrightarrow{\epsilon^{\circ}} \operatorname{store}(x=a)$, by $\mathbf{C} 2$
2. $p(x), q(x)$, tell $(x=a) \xrightarrow{\epsilon^{o}} p(x), q(x)$, store $(x=a)$, from 1 by C3 and C4
3. $\operatorname{store}(x=a) \xrightarrow{(x / a)^{\circ}}$ ם, by $\mathbf{C 7}$
4. $p(x)$, store $(x=a) \xrightarrow{\{x / a\}^{\circ}} p(a)$, from 9 by C3 and C4
5. $p(x)$, store $(x=a) \xrightarrow{\epsilon^{\circ}} p(a)$, store $(x=a)$, from $\& b y \mathbf{C 8}$
6. $p(x), q(x)$, store $(x=a) \xrightarrow{\epsilon^{\circ}} p(a), q(x)$, store $(x=a)$, from 5 by C3 and C4.

This partial consumption may lead to additional failures, but these occur as inconsistencies in the store, and are as such not visible in the final result.

Given this transition system $T^{\prime}$ we define $\mathcal{O}^{\prime}$ a follows:
Definition 6.2 We define

$$
\mathcal{O}^{\prime} \llbracket \bar{A} \rrbracket(V)=r_{\bar{A}, V}\left(\left\{\vartheta^{\ell} \cdot \mathcal{O}^{\prime} \llbracket \bar{B} \rrbracket(W):\langle\bar{A}, V\rangle \xrightarrow{\vartheta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp: \bar{A} \subseteq \text { Atoms } \cup \text { Tell }\}\right)
$$

where the transtition relation is defined with respect to $T^{\prime}$.
To prove the correctness of $D$ we show that

$$
\operatorname{Dec}(\mathcal{O} \llbracket \bar{A} \rrbracket(V)) \subseteq \mathcal{D} \llbracket \bar{A} \rrbracket(V) \subseteq \mathcal{O}^{\prime} \llbracket \hat{A} \rrbracket(V)
$$

and

$$
\operatorname{Result}(\mathcal{O} \llbracket \bar{A} \rrbracket(V))=\operatorname{Result}\left(\mathcal{O}^{\prime} \llbracket \bar{A} \rrbracket(V)\right)
$$

Therefore we obtain (by monotonicity of the operator Result)
Theorem 6.3 (Correctness of $\mathcal{D}) \quad \operatorname{Result}_{\bar{A}}(\mathcal{D} \llbracket \bar{A} \rrbracket(V))=\operatorname{Obs}(\bar{A})$, with $V=\operatorname{Var} \backslash \operatorname{var}(\bar{A})$
We start with the proposition
Proposition 6.4 For every goal $\bar{A}$ and set $V$ we have

$$
\operatorname{Dec}(\mathcal{O} \llbracket \bar{A} \rrbracket(V)) \subseteq \mathcal{D} \llbracket \bar{A} \rrbracket(V)
$$

## Proof

Let $\Phi$ be a continous operator with its least fixed point $\operatorname{Dec} \circ \mathcal{O}(\operatorname{Dec} \circ \mathcal{O} \llbracket \bar{A} \rrbracket(V)=\operatorname{Dec}(\mathcal{O} \llbracket \bar{A} \rrbracket(V)))$. It suffices to prove that $\Phi(\mathcal{D}) \subseteq \mathcal{D}$. We proceed by induction on the complexity of the goal $\bar{A}$.

$$
\begin{aligned}
& \Phi(\mathcal{D}) \llbracket A \rrbracket(V)= \\
& \operatorname{Dec}\left(r_{A, V}\left(\left\{\vartheta^{\ell} \cdot \mathcal{D} \llbracket \bar{B} \rrbracket(W):\langle A, V\rangle \xrightarrow{\vartheta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp\}\right)\right)= \\
& r_{A, V}\left(\left\{\operatorname{Dec}\left(\vartheta^{\ell}\right) \cdot \mathcal{D} \llbracket \bar{B} \rrbracket(W):\langle A, V\rangle \xrightarrow{\vartheta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp\}\right) \subseteq \\
& r_{A, V}\left(\text { Closure }_{A, V}\left(\left\{\operatorname{Dec}\left(\vartheta^{\ell}\right) \cdot \mathcal{D} \llbracket \bar{B} \rrbracket(W):\langle A, V\rangle \xrightarrow{\theta^{\ell}}\langle\bar{B}, W\}\right\rangle \cup\{\perp\}\right)\right)= \\
& \mathcal{D} \llbracket A \rrbracket(V)
\end{aligned}
$$

And, for $\bar{A}=\bar{A}_{1}, \bar{A}_{2}$ :

$$
\begin{aligned}
& \Phi(\mathcal{D}) \llbracket \bar{A} \rrbracket(V)= \\
& \operatorname{Dec}\left(r_{\bar{A}, V}\left(\left\{\vartheta^{\ell} \cdot \mathcal{D}\left\lceil\bar{B} \rrbracket(W):\langle\bar{A}, V\rangle \xrightarrow{\vartheta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp\}\right)\right)=\right. \\
& r_{\bar{A}, V}\left(\left\{\operatorname{Dec}\left(\vartheta^{\ell}\right) \cdot \mathcal{D}[\bar{B}](W):\langle\bar{A}, V\rangle \xrightarrow{\vartheta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp\}\right)= \\
& \left.r_{\bar{A}, V}\left(\left\{\operatorname{Dec}\left(\vartheta^{\ell}\right) \cdot r_{\bar{B}, W}\left(\text { Closure }_{\bar{B}, W}\left(\mathcal{D} \llbracket \bar{B}_{1}\right]\left(W_{1}\right) \| \mathcal{D} \llbracket \bar{B}_{2} \rrbracket\left(W_{2}\right)\right)\right):\langle\bar{A}, V\rangle \xrightarrow{\vartheta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp\}\right)= \\
& r_{\bar{A}, V}\left(\left\{\operatorname{Dec}\left(\vartheta^{\ell}\right) . \text { Closur }_{\bar{B}, W}\left(\mathcal{D} \llbracket \bar{B}_{1} \rrbracket\left(W_{1}\right) \| \mathcal{D} \llbracket \bar{B}_{2} \rrbracket\left(W_{2}\right)\right):\langle\bar{A}, V\rangle \xrightarrow{\theta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp\}\right) \subseteq \\
& r_{\bar{A}, V}\left(\operatorname{Closure}_{\bar{A}, V}\left(\left\{\operatorname{Dec}\left(\vartheta^{\ell}\right) \cdot \mathcal{D} \llbracket \bar{B}_{1} \rrbracket\left(W_{1}\right) \| \mathcal{D} \llbracket \bar{B}_{2} \rrbracket\left(W_{2}\right):\langle\bar{A}, V\rangle \xrightarrow{\vartheta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp\}\right)\right)= \\
& r_{\bar{A}, V}\left(\text { Closure }_{\bar{A}, V}\left(r_{\bar{A}, V}\left(\left\{\operatorname{Dec}\left(\vartheta^{\ell}\right) \cdot \mathcal{D} \llbracket \bar{B}_{1} \rrbracket\left(W_{1}\right) \| \mathcal{D} \llbracket \bar{B}_{2} \rrbracket\left(W_{2}\right):\langle\bar{A}, V\rangle \xrightarrow{\vartheta^{\ell}}\langle\bar{B}, W\rangle\right\} \cup\{\perp\}\right)\right)\right)= \\
& r_{\bar{A}, V}\left(\text { Closure }_{\bar{A}, V}\binom{r_{\bar{A}_{1}, V_{1}}\left(\left\{\operatorname{Dec}\left(\vartheta^{\ell_{1}}\right) \cdot \mathcal{D}\left[\bar{B}_{1} \rrbracket\left(W_{1}\right):\left\langle\bar{A}_{1}, V_{1}\right\rangle \xrightarrow{\vartheta^{\ell_{1}}}\left\langle\bar{B}_{1}, W_{1}\right\rangle\right\} \cup\{\perp\}\right)\right.}{r_{\bar{A}_{2}, V_{2}}\left(\left\{\operatorname{Dec}\left(\vartheta^{\ell_{2}}, \mathcal{D}\left[\bar{B}_{2} \rrbracket\left(W_{2}\right):\left\langle\bar{A}_{2}, V_{2}\right\rangle \xrightarrow{\vartheta^{\ell_{2}}}\left\langle\bar{B}_{2}, W_{2}\right\rangle\right\} \cup\{\perp\}\right)\right.\right.}\right) \subseteq \\
& r_{\bar{A}, V}\left(\operatorname{Closure}_{\bar{A}, V}\left(\mathcal{D} \llbracket \bar{A}_{1} \rrbracket\left(V_{1}\right) \| \mathcal{D} \llbracket \bar{A}_{2} \rrbracket\left(V_{2}\right)\right)\right)= \\
& \mathcal{D} \llbracket \bar{A} \rrbracket(V)
\end{aligned}
$$

Here $\bar{B}_{1}, \bar{B}_{2}=\bar{B}$ and $\left(W_{1}, W_{2}\right)=\operatorname{Part}(W)$. Some remarks are in order here:

1. The fourth equality holds because the operation $r_{\bar{B}, W}$ occurs in the scope of $r_{\bar{A}, V}$ and as such it is not so difficult to see that it can be deleted.
2. The first inclusion holds because $W \subseteq V$ and $V \backslash W=\operatorname{var}(\bar{B}) \backslash \operatorname{var}(\bar{A})$.
3. The fifth equality holds because of the property $r_{\bar{A}, V}\left(\right.$ Closure $\left._{\bar{A}, V}(X)\right)=r_{\bar{A}, V}\left(\right.$ Closure $\left._{\bar{A}, V}\left(r_{\bar{A}, V}(X)\right)\right)$, $X$ arbitrary, which we leave the reader to verify.
4. The sixth equality holds because $\operatorname{Part}(V \backslash Z)=\left(V_{1} \backslash Z, V_{2} \backslash Z\right)$, with $\left(V_{1}, V_{2}\right)=\operatorname{Part}(V)$. Furthermore we note that $r_{\bar{A}_{1}, \bar{A}_{2}, V}$ can be splitted into $r_{\bar{A}, V_{1}}$ and $r_{\bar{A}_{2}, V_{2}}$ due to the renaming mechanism.

To prove that for every goal $\bar{A}$ and set $V$ we have that $\mathcal{D} \llbracket \bar{A} \rrbracket(V) \subseteq \mathcal{O}^{\prime} \llbracket \bar{A} \rrbracket(V)$ we have first to verify that $\mathcal{O}^{\prime}$ satisfies the closure conditions.

Proposition 6.5 For every goal $\bar{A}$ and set $V$ we have

$$
r_{\bar{A}, V}\left(\text { Closure }_{\bar{A}, V}\left(\mathcal{O}^{\prime} \llbracket \bar{A} \rrbracket(V)\right)\right)=\mathcal{O}^{\prime} \llbracket \bar{A} \rrbracket(V)
$$

## Proof

It suffices to verify that the closure conditions are satisfied by the transition system $T^{\prime}$. However with respect to condition $\mathbf{P} 5$ we have to require for $\ell=O$ that $\left(\vartheta_{1} \ldots \vartheta_{m}\right)=\left(\sigma_{1} \ldots \sigma_{n}\right)_{V a r \backslash Z}$, with $Z \cap \operatorname{var}(c)=\emptyset$. So in this case we only allow the introduction of local variables. Deletion of local variables is then taken care of by the restriction operator. Here we go.

P1 This case follows from the observation that if

$$
\langle\text { store }(E), V\rangle \xrightarrow{\vartheta^{\circ}\langle\square, V\rangle .}
$$

with $\vartheta=m g u(E)$, then, identifying store $(t=t)$ with $\square$, we have

$$
\langle\operatorname{store}(E), V\rangle \xrightarrow{\vartheta^{I}}\langle\square, V\rangle
$$

P2 We have to consider the following cases corresponding to the computation rules:

## C1 Let

$$
\langle A, V\rangle \xrightarrow{\epsilon^{o}}\left\langle\bar{B} \vartheta_{0} \vartheta_{1}, \text { store }\left(E_{2} \vartheta_{0} \vartheta_{1}\right), W\right\rangle \xrightarrow{\vartheta^{I}}\left\langle\bar{B} \vartheta_{0} \vartheta_{1} \vartheta, \text { store }\left(E_{2} \vartheta_{0} \vartheta_{1} \vartheta\right), W\right\rangle
$$

where for $H \leftarrow \operatorname{ask}\left(E_{1}\right): \operatorname{tell}\left(E_{2}\right) \mid \bar{B}$ we have

- $\vartheta_{0}=m g u(A, H), \vartheta_{0 \mid A}=\epsilon$
- $\vartheta_{1}=m g u\left(E_{1} \vartheta_{0}\right), \vartheta_{1 \mid A}=\epsilon$

It follows that $\vartheta_{0}[\vartheta]=m g u(A \vartheta, H)$ and $\vartheta_{1}[\vartheta]=m g u\left(E_{1} \vartheta_{0}[\vartheta]\right)$. Furthermore we $\left(\vartheta_{0}[\vartheta]\right)\left(\vartheta_{1}[\vartheta]\right)=$ $\left(\vartheta_{0} \vartheta_{1}\right)[\vartheta]$ (we may assume $\operatorname{dom}(\vartheta) \cap \operatorname{dom}\left(\vartheta_{1}\right)=\emptyset$ because sequences generated by such transitions do not occur in the operational semantics, as defined by $\mathcal{O}^{\prime}$, of any goal). Furthermore we have that $E_{2}\left(\vartheta_{0} \vartheta_{1}\right)[\vartheta]=E_{2} \vartheta_{0} \vartheta_{1} \vartheta$ and $\bar{B}\left(\vartheta_{0} \vartheta_{1}\right)[\vartheta]=\bar{B} \vartheta_{0} \vartheta_{1} \vartheta$, so we conclude

$$
\langle A, V\rangle \xrightarrow{\vartheta^{I}}\langle A \vartheta, V\rangle \xrightarrow{\epsilon^{O}}\left\langle\bar{B} \vartheta_{0} \vartheta_{1} \vartheta, \text { store }\left(E_{2} \vartheta_{0} \vartheta_{1} \vartheta\right), W\right\rangle
$$

## C2 Let

$$
\langle\text { tell }(E), V\rangle \xrightarrow{\epsilon^{\circ}}\langle\operatorname{store}(E), V\rangle \xrightarrow{\vartheta^{I}}\langle\operatorname{store}(E \vartheta), V\rangle
$$

Obviously we then have

$$
\langle\operatorname{tell}(E), V\rangle \xrightarrow{\vartheta^{l}}\langle\text { tell }(E \vartheta), V\rangle \xrightarrow{\epsilon^{\circ}}\langle\operatorname{store}(E \vartheta), V\rangle
$$

## C5 Let

$$
\langle p(t), V\rangle \xrightarrow{\epsilon^{o}}\langle p(z), \text { store }(z=t), V \backslash\{z\}\rangle \xrightarrow{\vartheta^{t}}\langle p(z) \vartheta, \text { store }(z=t \vartheta), V \backslash\{z\}\rangle
$$

It then follows that

$$
\langle p(t), V\rangle \xrightarrow{\vartheta^{I}}\langle p(t) \vartheta, V\rangle \xrightarrow{\epsilon^{\circ}}\langle p(z) \vartheta, \text { store }(z=t \vartheta), V \backslash\{z\}\rangle
$$

C6 Let

$$
\left\langle\operatorname{store}\left(E_{1}, \ldots, E_{n}\right), V\right\rangle \xrightarrow{\epsilon^{\circ}}\left\langle\operatorname{store}\left(E_{1}^{\prime}, \ldots, E_{m}^{\prime}\right), V \backslash Z\right\rangle \xrightarrow{\vartheta^{t}}\left\langle\operatorname{store}\left(E_{1}^{\prime} \vartheta, \ldots, E_{m}^{\prime} \vartheta\right), V \backslash Z\right\rangle
$$

where $\left(E_{1} \wedge \ldots \wedge E_{n}\right) \Leftrightarrow \exists Z\left(E_{1}^{\prime} \wedge \ldots \wedge E_{m}^{\prime}\right)$. It follows that $\left(E_{1} \wedge \ldots \wedge E_{n}\right) \vartheta \Leftrightarrow \exists Z\left(E_{1}^{\prime} \wedge \ldots \wedge E_{m}^{\prime}\right) \vartheta$. (Here we assume that $\vartheta$ does not affect the local variables $Z$, this assumption being justified because sequences generated by such transitions do not occur in the semantics, as defined by $\mathcal{O}^{\prime}$, of any goal.) So we have

$$
\left\langle\operatorname{store}\left(E_{1}, \ldots, E_{n}\right), V\right\rangle \xrightarrow{\vartheta^{I}}\left\langle\operatorname{store}\left(E_{1} \vartheta, \ldots, E_{n} \vartheta\right), V\right\rangle \stackrel{\epsilon^{\circ}}{\rightarrow}\left\langle\text { store }\left(E_{1}^{\prime} \vartheta, \ldots, E_{m}^{\prime} \vartheta\right), V \backslash Z\right\rangle
$$

C7 Next we consider:

$$
\langle\bar{A}, \operatorname{store}(x=t), V\rangle \xrightarrow{\vartheta_{1}^{o}}\left\langle\bar{A} \vartheta_{1}, V\right\rangle \xrightarrow{\vartheta_{2}\left[\vartheta_{1}\right]^{I}}\left\langle\bar{A} \vartheta_{1}\left(\vartheta_{2}\left[\vartheta_{1}\right]\right), V\right\rangle
$$

where $\vartheta_{1}=m g u(x=t)$. Without loss of generality we may assume that $\vartheta_{1}=\{x / t\}$, furthermore, let $\vartheta_{2}=\left\{y / t^{\prime}\right\}$. As $y \in \operatorname{var}(t)$ implies $x \notin \operatorname{var}\left(t^{\prime}\right)$ and $x \in \operatorname{var}\left(t^{\prime}\right)$ implies $y \notin \operatorname{var}(t)$ we have $\vartheta_{1}\left(\vartheta_{2}\left[\vartheta_{1}\right]\right)=\vartheta_{2}\left(\vartheta_{1}\left[\vartheta_{2}\right]\right)$. Furthermore we have $m g u\left(x \vartheta_{2}=t \vartheta_{2}\right)=\vartheta_{1}\left[\vartheta_{2}\right]$. So we conclude

$$
\langle\bar{A}, \operatorname{store}(x=t), V\rangle \xrightarrow{\vartheta_{2}^{I}}\left\langle\bar{A} \vartheta_{2}, \text { store }\left(x \vartheta_{2}=t \vartheta_{2}\right), V\right\rangle \xrightarrow{\vartheta_{1}\left[\vartheta_{2}\right]^{\circ}}\left\langle\bar{A} \vartheta_{1}\left(\vartheta_{2}\left[\vartheta_{1}\right]\right), V\right\rangle
$$

C8 Finally, the last case:

$$
\langle\bar{A}, \text { store }(x=t), V\rangle \xrightarrow{\epsilon^{\mathcal{O}}}\langle\bar{A} m g u(x=t), \text { store }(x=t), V\rangle \xrightarrow{\vartheta^{I}}\langle\bar{A} m g u(x=t) \vartheta, \text { store }(x \vartheta=t \vartheta), V\rangle
$$

Let $\vartheta=\left\{y / t^{\prime}\right\}$ and $z \in V$ correspond to $y$. We have

$$
\begin{aligned}
& \langle\bar{A}, \text { store }(x=t), V\rangle \stackrel{\vartheta^{I}}{\rightarrow}\langle\bar{A} \vartheta, \text { store }(x \vartheta=t \vartheta), V\rangle \xrightarrow{\epsilon^{\circ}} \\
& \left\langle\bar{A}[z / y], \text { store }\left(z=t^{\prime}, x[z / y]=t[z / y]\right), V \backslash\{z\}\right\rangle \stackrel{\epsilon^{\circ}}{\rightarrow} \\
& \left\langle\bar{A}[z / y] \operatorname{mg} u(x[z / y]=t[z / y]), \text { store }\left(z=t^{\prime}, x[z / y]=t[z / y]\right), V \backslash\{z\}\right\rangle= \\
& \left\langle\bar{A} m g u(x, t)[z / y], \text { store }\left(z=t^{\prime}, x[z / y]=t[z / y]\right), V \backslash\{z\}\right\rangle \xrightarrow{\left\{z / t^{\prime}\right\}^{\circ}} \\
& \langle\bar{A} m g u(x=t) \vartheta, \text { store }(x \vartheta=t \vartheta), V \backslash\{z\}\rangle
\end{aligned}
$$

Note that in this case we have generated additionally a binding to a local variable. This however does not matter as this binding can be deleted by the restriction operator. The main point is that an input substitution made after an application of C8 can also be made before it.

This concludes the case of P2.
P3 Let

$$
\langle\bar{A}, \operatorname{store}(x=t), V\rangle \xrightarrow{\vartheta_{1}^{O}}\left\langle\bar{A} \vartheta_{1}, V\right\rangle \xrightarrow{\operatorname{Dec}\left(\vartheta_{2}^{I}\right)}\left\langle\bar{A} \vartheta_{1} \vartheta_{2}, V\right\rangle
$$

where $\vartheta_{1}=m g u(x=t)$. Let $\vartheta=m g u\left(\mathcal{E}\left(\vartheta_{2}\right)\right)$. Without loss of generality we may assume that $\vartheta_{1}=\{x / t\}$. First we note that $\vartheta_{1} \vartheta_{2}=\left(\vartheta_{1}[\vartheta]\right) \vartheta_{2}\left(\vartheta \vartheta_{2}=\vartheta_{2}\right)$. Furthermore we have that $\vartheta_{2} \in m g u(t \vartheta=t)=m g u\left(x \vartheta_{1}[\vartheta]=t \vartheta_{1}[\vartheta]\right)$. So we conclude

$$
\langle\bar{A}, \operatorname{store}(x=t), V\rangle \xrightarrow{\vartheta_{1}[\vartheta]^{I}}\left\langle\bar{A} \vartheta_{1}[\vartheta], \text { store }(t \vartheta=t), V\right\rangle \xrightarrow{\operatorname{Dec}\left(\vartheta^{\circ}\right)}\left\langle\bar{A} \vartheta_{1} \vartheta_{2}, V\right\rangle
$$

## P4 Let

$$
\langle\bar{A}, \text { store }(x=t), V\rangle \xrightarrow{\vartheta_{1}[\vartheta]^{\circ}}\left\langle\bar{A} \vartheta_{1}[\vartheta], V\right\rangle \xrightarrow{\operatorname{Dec}\left(\vartheta_{2}^{I}\right)}\left\langle\bar{A} \vartheta_{1}[\vartheta] \vartheta_{2}, V\right\rangle
$$

where $\vartheta=\operatorname{mgu}\left(\mathcal{E}\left(\vartheta_{2}\right)\right)$. First we note that $\left(\vartheta_{1}[\vartheta]\right) \vartheta_{2}=\vartheta_{1} \vartheta_{2}\left(\vartheta \vartheta_{2}=\vartheta\right)$. Again, without loss of generality we assume that $\vartheta_{1}[\vartheta]=m g u(x=t)=\{x / t\}$. So for some $t^{\prime}$ we have $\vartheta_{1}=\left\{x / t^{\prime}\right\}$, with $t^{\prime} \vartheta=t$. From this we infer that $\vartheta_{2} \in m g u\left(t^{\prime}=t^{\prime} \vartheta\right)=m g u\left(x \vartheta_{1}=t \vartheta_{1}\right)$. We conclude

$$
\langle\bar{A}, \text { store }(x=t), V\rangle \xrightarrow{\vartheta_{1}^{I}}\left\langle\bar{A} \vartheta_{1}, \text { store }\left(x \vartheta_{1}=t \vartheta_{1}\right), V\right\rangle \xrightarrow{\vartheta_{2}^{o}}\left\langle\bar{A} \vartheta_{1} \vartheta_{2}, V\right\rangle
$$

P5 First we treat the case $\ell=I$. Let

$$
\left\langle\bar{A}_{1}, V_{1}\right\rangle \xrightarrow{\vartheta_{1}^{I}} \ldots \xrightarrow{\vartheta_{m}^{I}}\left\langle\bar{A}_{m+1}, V_{m+1}\right\rangle
$$

We have $\bar{A}_{1}\left(\vartheta_{1} \ldots \vartheta_{m}\right)=\bar{A}_{m+1}$ (note that $V_{1}=\ldots=V_{m}$ ). Furthermore by the restrictions on the variables $Z_{1}$ and $Z_{2}$ we have $\left(Z_{1} \cup Z_{2}\right) \cap \operatorname{var}\left(\bar{A}_{1}\right)=\emptyset$. Thus we have $\bar{A}_{m+1}=\bar{A}_{1}\left(\vartheta_{1} \ldots \vartheta_{m}\right)=$ $\bar{A}_{1}\left(\vartheta_{1} \ldots \vartheta_{m}\right)_{V a r \backslash Z_{1}}=\bar{A}_{1}\left(\sigma_{1}, \ldots \sigma_{n}\right)_{V a r \backslash Z_{2}}=\bar{A}_{1}\left(\sigma_{1} \ldots \sigma_{n}\right)$. Now let for $1 \leq i<n: \bar{A}_{i}^{\prime}=$ $\bar{A}_{1}\left(\sigma_{1} \ldots \sigma_{i}\right)$. We then have

$$
\left\langle\bar{A}_{1}, V_{1}\right\rangle \xrightarrow{\sigma_{1}^{I}}\left\langle\bar{A}_{1}^{\prime}, V_{1}\right\rangle \ldots \xrightarrow{\sigma_{n}^{I}}\left\langle\bar{A}_{m+1}, V_{m+1}\right\rangle
$$

Next we consider the case $\ell=O$. Let

$$
\left\langle\bar{A}_{1}, V_{1}\right\rangle \xrightarrow{\vartheta_{1}^{\circ}} \ldots \xrightarrow{\vartheta_{m}^{\circ}}\left\langle\bar{A}_{m+1}, V_{m+1}\right\rangle
$$

Applying rule C6 and C8 we have

$$
\left\langle\bar{A}_{1}, V_{1}\right\rangle \xrightarrow{\epsilon^{o}}\left\langle\bar{A}_{m+1}, \operatorname{store}\left(\mathcal{E}\left(\vartheta_{1}\right), \ldots, \mathcal{E}\left(\vartheta_{m}\right)\right), V_{m+1}\right\rangle \xrightarrow{\epsilon^{\circ}}\left\langle\bar{A}_{m+1}, \text { store }\left(\mathcal{E}\left(\sigma_{1}\right), \ldots, \mathcal{E}\left(\sigma_{n}\right)\right), V_{m+1}\right\rangle
$$

By the restriction on the variables $Z$ we may assume that $Z \cap \operatorname{var}\left(\bar{A}_{m+1}\right)=\emptyset$. Furthermore we have $\operatorname{dom}\left(\vartheta_{1} \ldots \vartheta_{m}\right) \cap \operatorname{var}\left(\bar{A}_{m+1}\right)=\emptyset$. So we infer $\bar{A}_{m+1}\left(\sigma_{1} \ldots \sigma_{n}\right)=\bar{A}_{m+1}\left(\sigma_{1} \ldots \sigma_{n}\right)_{\operatorname{Var} \backslash Z}=$ $\bar{A}_{m+1}\left(\vartheta_{1} \ldots \vartheta_{m}\right)=\bar{A}_{m+1}$. So applying rule $\mathbf{C 7}$ gives us

$$
\left\langle\bar{A}_{m+1}, \text { store }\left(\mathcal{E}\left(\sigma_{1}\right), \ldots, \mathcal{E}\left(\sigma_{n}\right)\right), V_{m+1}\right\rangle \xrightarrow{c}\left\langle\bar{A}_{m+1}, V_{m+1}\right\rangle
$$

where $c=\sigma_{1}^{O} \ldots \sigma_{n}^{O}$.
Now we can prove the following theorem.
Theorem 6.6 For every goal $\bar{A}$ and set $V$ we have

$$
\mathcal{D} \llbracket \bar{A} \rrbracket(V) \subseteq \mathcal{O}^{\prime} \llbracket \bar{A} \rrbracket(V)
$$

## Proof

Let $\Phi$ be a continous operator with its least fixed point $\mathcal{D}$. It suffices to show that for every goal $\bar{A}$ and set $V$ we have $\Phi\left(\mathcal{O}^{\prime}\right) \llbracket \bar{A} \rrbracket(V) \subseteq \mathcal{O}^{\prime} \llbracket \bar{A} \rrbracket(V)$. Using proposition 6.5 this is proved by a straightforward induction on the goal $\bar{A}$.

Finally we have to establish that for every goal $\bar{A}$ and set $V$ we have $\operatorname{Result}_{\bar{A}}(\mathcal{O} \llbracket \bar{A} \rrbracket(V))=$ $\operatorname{Result}_{\bar{A}}\left(\mathcal{O}^{\prime} \llbracket \bar{A} \rrbracket(V)\right)$. By proposition 6.4 and theorem 6.6 we have Result $_{\bar{A}}(\mathcal{O} \llbracket \bar{A} \rrbracket(V)) \subseteq \operatorname{Result}_{\bar{A}}\left(\mathcal{O}^{\prime} \llbracket \bar{A} \rrbracket(V)\right)$. To relate $T$ and $T^{\prime}$ we define a transition system $\bar{T}$, which is obtained from $T$ by introducing the constructs of the form store $(E)$ and adding the rule

$$
\langle\operatorname{store}(E), V\rangle \xrightarrow{\vartheta^{\circ}}\langle\square, V\rangle
$$

$\vartheta=m g u(E)$. It is important to note that inconsistencies in the store do not lead to failures in this extension of $T$. We have the following proposition about $\bar{T}$.

Proposition 6.7 With respect $\bar{T}$ we have that if

$$
\langle\bar{A}, \operatorname{store}(E), V\rangle \xrightarrow{*}^{*}\langle\bar{B}, W\rangle
$$

with $\langle\bar{B}, W\rangle \rightarrow\langle$ fail,$W\rangle \mid\langle$ susp,$W\rangle \mid\langle\square, W\rangle$ and $\bar{B} \subseteq$ Atoms $\cup$ Tell ( $\bar{B}$ does not contain constructs of the form store $(E)$ ), then there exists $\vartheta_{0}=m g u(E)$ and $\vartheta_{1}$ such that

$$
\left\langle\bar{A} \vartheta_{0}, V\right\rangle{\stackrel{\vartheta}{{ }_{1}}}^{*}\langle\bar{B}, W\rangle
$$

with $\vartheta=\vartheta_{0} \vartheta_{1} . \quad\left(\right.$ Here $\langle\bar{A}, V\rangle \xrightarrow{\vartheta^{*}}\langle\bar{B}, W\rangle$ is to be interpreted as there exists $\vartheta_{1}, \ldots, \vartheta_{n}$ with $\vartheta=\vartheta_{1} \ldots \vartheta_{n}$ and $\left.\langle\bar{A}, V\rangle \xrightarrow{\vartheta_{1}^{\circ}} \ldots \xrightarrow{\vartheta_{n}^{\circ}}\langle\bar{B}, W\rangle.\right)$

## Proof

We proceed by induction on the length of the derivation in $\bar{T}$. Let

$$
\left.\langle\bar{A}, \text { store }(E), V\rangle \stackrel{\vartheta^{\prime 0}}{\rightarrow}\left\langle\bar{A}^{\prime} \vartheta^{\prime}, \text { store }\left(E \vartheta^{\prime}\right), V^{\prime}\right\rangle{\stackrel{\vartheta}{ }{ }^{\prime \prime}}_{*}^{B}, W\right\rangle
$$

First we consider the case that for some $A \in \bar{A}$ of the form tell $\left(E^{\prime}\right)$ or store $\left(E^{\prime}\right)$ we have $\vartheta^{\prime}=m g u\left(E^{\prime}\right)$, and $\bar{A}^{\prime}=\bar{A} \backslash A$. By the induction hypothesis we have for some $\vartheta_{1}^{\prime}$

with $m g u\left(E \vartheta^{\prime}\right) \vartheta_{1}^{\prime}=\vartheta^{\prime \prime}$. But $\vartheta^{\prime} m g u\left(E \vartheta^{\prime}\right)=m g u(E) m g u\left(E^{\prime} m g u(E)\right)$. This we can prove as follows: first note that for idempotant substitutions $\vartheta_{1}$ and $\vartheta_{2}$ such that $\operatorname{dom}\left(\vartheta_{1}\right) \cap \operatorname{ran}\left(\vartheta_{2}\right)=\emptyset$ we have $\vartheta_{1} \vartheta_{2}=m g u\left(\mathcal{E}\left(\vartheta_{1}\right) \cup \mathcal{E}\left(\vartheta_{2}\right)\right)$. We then have

```
mgu(E')mgu(Emgu(E')) =
mgu(\mathcal{E}(mgu(\mp@subsup{E}{}{\prime}))\cup\mathcal{E}(mgu(Emgu(\mp@subsup{E}{}{\prime})))=
mgu(E'\cupEmgu(E')) =
mgu(E'\cupE) =
mgu(E\cup\mp@subsup{E}{}{\prime}mgu(E)) =
mgu(\mathcal{E}(mgu(E))\cup\mathcal{E}(mgu(E'mgu(E))) =
mgu(E)mgu(E'mgu(E))
```

From the above we infer

$$
\left\langle\bar{A} m g u(E), V^{\prime}\right\rangle{\xrightarrow{\vartheta_{1}}}^{*}\langle\bar{B}, W\rangle
$$

where $\vartheta_{1}=m g u\left(E^{\prime} m g u(E)\right) \vartheta_{1}^{\prime}$, and $m g u(E) \vartheta_{1}=\vartheta^{\prime} \vartheta^{\prime \prime}$.
Next we have to consider the case that for some $A \in \bar{A}$ there exists a candidate clause $H \leftarrow$ $\operatorname{ask}\left(E_{1}\right): \operatorname{tell}\left(E_{2}\right) \mid \bar{B}^{\prime}$ such that $\vartheta^{\prime}=m g u\left(E_{2} \sigma_{0} \sigma_{1}\right)$, where $\sigma_{0}=m g u(A, H)$ and $\sigma_{1}=m g u\left(E_{1} \sigma_{0}\right)$. Given the following observations this case can be dealt with in a similar way as above: As $\sigma_{0}$ and $\sigma_{1}$ do not instantiate the variables of $A$ we have for $\vartheta_{0}=m g u(E)$

$$
\sigma_{0}\left[\vartheta_{0}\right]=m g u\left(A \vartheta_{0}, H\right) \text { and } \sigma_{1}\left[\vartheta_{0}\right]=m g u\left(E_{1} \sigma_{0}\left[\vartheta_{0}\right]\right)
$$

Furthermore as $\operatorname{dom}\left(\vartheta_{0}\right) \cap \operatorname{dom}\left(\sigma_{1}\right)=\emptyset$ we have $\sigma_{0}\left[\vartheta_{0}\right]\left(\sigma_{1}\left[\vartheta_{0}\right]\right)=\left(\sigma_{0} \sigma_{1}\right)\left[\vartheta_{0}\right]$ and $E_{2} \sigma_{0} \sigma_{1} \vartheta_{0}=$ $E_{2}\left(\sigma_{0} \sigma_{1}\right)\left[\vartheta_{0}\right]$ ) (due to the renaming mechanism $\vartheta_{0}$ does not affect the variables of $E_{2}$ ).

Given the above proposition about the system $\bar{T}$ we can prove the following relation between the sytem $\bar{T}$ and $T^{\prime}$.

Proposition 6.8 If

$$
\langle\bar{A}, V\rangle \stackrel{\vartheta}{*}^{*}\langle\bar{B}, W\rangle \text { in } T^{\gamma}
$$

with $\langle\bar{B}, W\rangle \rightarrow\langle$ fail,$W\rangle \mid\langle$ susp,$W\rangle \mid\langle\square, W\rangle$ and $\bar{B} \subseteq$ Atoms, then there exists a $\vartheta^{\prime}$ such that

$$
\langle\bar{A}, V\rangle \stackrel{\vartheta}{\rightarrow}^{\prime}\langle\bar{B}, W\rangle \text { in } \bar{T}
$$

with $\vartheta_{\mid \bar{A}}^{\prime}=\vartheta_{\mid \bar{A}}$. We remark that $\bar{A}$ may contain constructs of the form store $(E)$.

Proof We proceed by induction on the length of the derivation in $T^{\prime}$. We have to consider the following cases:

C1 Let with respect to $T^{\prime}$

$$
\langle\bar{A}, V\rangle \xrightarrow{\epsilon^{\circ}}\left\langle A_{1}, \ldots, \bar{B}^{\prime} \sigma, \ldots, A_{n}, \operatorname{store}\left(E_{2} \sigma\right), V^{\prime}\right\rangle{\stackrel{\vartheta}{ }{ }^{*}}_{\vartheta^{\circ}}^{\bar{B}, W\rangle}
$$

where for some $A \in \bar{A}=A_{1}, \ldots, A_{n}$ there exists a candidate clause $H \leftarrow a s k\left(E_{1}\right): \operatorname{tell}\left(E_{2}\right) \mid \bar{B}^{\prime}$ such that $\sigma=\vartheta_{0} \vartheta_{1}$, with

- $\vartheta_{0}=m g u(A, H), \vartheta_{0 \mid A}=\epsilon$
- $\vartheta_{1}=m g u\left(E_{1} \vartheta_{0}\right), \vartheta_{1 \mid A}=\epsilon$
- $\vartheta_{2}=m g u\left(E_{2} \sigma\right)$

By the induction hypothesis we have in $\bar{T}$

$$
\left\langle A_{1}, \ldots, \bar{B}^{\prime} \sigma, \ldots, A_{n}, \text { store }\left(E_{2} \sigma\right), V^{\prime}\right\rangle \stackrel{\vartheta}{\rightarrow}^{*}\langle\bar{B}, W\rangle
$$

with $\vartheta_{\mid \bar{A}^{\prime}}=\vartheta_{\mid \bar{A}^{\prime}}^{\prime}$, where $\bar{A}^{\prime}=A_{1}, \ldots, \bar{B}^{\prime} \sigma, \ldots, A_{n}$, store $\left(E_{2} \sigma\right)$. Applying proposition 6.7 we have in $\bar{T}$

$$
\left\langle A_{1} \vartheta_{2}, \ldots, \bar{B}^{\prime} \sigma \vartheta_{2}, \ldots, A_{n} \vartheta_{2}, V^{\prime}\right\rangle{\stackrel{\vartheta^{\prime \prime}}{ }}^{*}\langle\bar{B}, W\rangle
$$

with $\vartheta^{\prime}=\vartheta_{2} \vartheta^{\prime \prime}$. From this it is easy to obtain (in $\bar{T}$ )

$$
\langle\bar{A}, V\rangle{\xrightarrow{\vartheta} \stackrel{\vartheta}{*}^{\prime \prime}}_{\langle\bar{B}, W\rangle, ~}
$$

with $\left(\vartheta_{2} \vartheta^{\prime \prime}\right)_{\mid \bar{A}}=\vartheta_{\mid \bar{A}}$.
C2 Let (in $T^{\prime}$ )

$$
\langle\bar{A}, V\rangle \xrightarrow{\epsilon^{o}}\left\langle A_{1}, \ldots, A_{n}, \text { store }(E), V\right\rangle \xrightarrow{*}^{*}\langle\bar{B}, W\rangle
$$

where $\bar{A}=A_{1}, \ldots$, tell $(E), \ldots, A_{n}$. By the induction hypothesis we have (in $\bar{T}$ )

$$
\left\langle A_{1}, \ldots, \operatorname{store}(E), \ldots, A_{n}, V\right\rangle{\stackrel{\vartheta^{\prime}}{*}}_{*}\langle\bar{B}, W\rangle
$$

with $\vartheta_{\mid \bar{A}}=\vartheta_{\mid \bar{A}}^{\prime}$. Applying propostion 6.7 we have in $\bar{T}$

$$
\left\langle A_{1} \vartheta_{0}, \ldots, A_{n} \vartheta_{0}, V\right\rangle \stackrel{\vartheta}{\rightarrow}^{* \prime}\langle\bar{B}, W\rangle
$$

with $\vartheta^{\prime}=\vartheta_{0} \vartheta^{\prime \prime}$ and $\vartheta_{0}=m g u(E)$. From this we obtain in $\bar{T}$

$$
\langle\bar{A}, V\rangle \xrightarrow{\vartheta_{0} \theta^{\prime \prime}}\langle\bar{B}, W\rangle
$$

C5 Let (in $T^{\prime}$ )

$$
\langle\bar{A}, V\rangle \xrightarrow{\varepsilon^{\circ}}\left\langle A_{1}, \ldots, p(z), \ldots, A_{n}, \text { store }(z=t), V \backslash\{z\}\right\rangle \xrightarrow{\vartheta} *\langle\bar{B}, W\rangle
$$

where $p(t) \in \bar{A}=A_{1}, \ldots, A_{n}$. By the induction hypothesis we have (in $\bar{T}$ )

$$
\left\langle A_{1}, \ldots, p(z), \ldots, \text { store }(z=t), V \backslash\{z\}\right\rangle{\stackrel{\vartheta^{\prime}}{*}}^{*}\langle\bar{B}, W\rangle
$$

with $\vartheta_{\mid \bar{A}^{\prime}}=\vartheta_{\mid \bar{A}^{\prime}}^{\prime}$, where $\bar{A}^{\prime}=A_{1}, \ldots, p(z), \ldots, A_{n}$, store $(z=t)$. Applying again propostion 6.7 we have in $\bar{T}$

$$
\langle\bar{A}, V \backslash\{z\}\rangle{\stackrel{v^{\prime \prime}}{\rightarrow}}^{*}\langle\bar{B}, W\rangle
$$

with $\vartheta^{\prime}=\{z / t\} \vartheta^{\prime \prime}$. From this we infer

$$
\langle\bar{A}, V\rangle \stackrel{\vartheta}{\rightarrow}^{*}\langle\bar{B}, W\rangle
$$

with $\vartheta_{\mid \bar{A}}=\vartheta_{\mid \bar{A}}^{\prime \prime}$.
C6 Let (in $T^{\prime}$ )

$$
\left\langle\bar{A}, \text { store }\left(E_{1}\right), \ldots, \text { store }\left(E_{m}\right), V\right\rangle \stackrel{\epsilon^{o}}{\rightarrow}\left\langle\bar{A}, \text { store }\left(E_{1}^{\prime}\right), \ldots, \text { store }\left(E_{n}^{\prime}\right), V \backslash Z\right\rangle \xrightarrow{\bullet}\langle\bar{B}, W\rangle
$$

where $\left(E_{1} \wedge \ldots \wedge E_{m}\right) \Leftrightarrow \exists Z\left(E_{1}^{\prime} \wedge \ldots \wedge E_{n}^{\prime}\right), Z \subseteq V$. By the induction hypothesis we have (in $\left.\bar{T}\right)$

$$
\left\langle\bar{A}, \operatorname{store}\left(E_{1}^{\prime}\right), \ldots, \text { store }\left(E_{n}^{\prime}\right), V \backslash Z\right\rangle \stackrel{\vartheta}{\prime}^{*}\langle\bar{B}, W\rangle
$$

with $\vartheta_{\mid \bar{A}^{\prime}}=\vartheta_{\mid \bar{A}^{\prime}}^{\prime}\left(\bar{A}^{\prime}=\bar{A}\right.$, store $\left(E_{1}^{\prime}\right), \ldots$, store $\left.\left(E_{n}^{\prime}\right)\right)$. Applying propostion 6.7 (repeatedly) we have in $\bar{T}$

$$
\left\langle\bar{A} \vartheta_{0}\right\rangle \stackrel{\vartheta}{ }^{* \prime}\langle\bar{B}, W\rangle
$$

with $\vartheta^{\prime}=\vartheta_{0} \vartheta^{\prime \prime}$ and $\vartheta_{0}=m g u\left(E_{1}^{\prime}\right) \ldots m g u\left(E_{n}^{\prime}\right)$. Now, as $\left(E_{1} \wedge \ldots \wedge E_{m}\right) \Leftrightarrow \exists Z\left(E_{1}^{\prime} \wedge \ldots \wedge E_{n}^{\prime}\right)$, we have $m g u\left(E_{1}\right) \ldots m g u\left(E_{n}\right)=\left(m g u\left(E_{1}^{\prime}\right) \ldots m g u\left(E_{n}^{\prime}\right)\right)_{\operatorname{Var} \backslash Z}$. Furthermore we have that $\operatorname{var}(\bar{A}) \cap$ $Z=\emptyset$, so we obtain in $\bar{T}$

$$
\left\langle\bar{A}, \text { store }\left(E_{1}\right), \ldots, \text { store }\left(E_{m}\right), V\right\rangle \xrightarrow{\vartheta_{1} \vartheta^{\prime \prime}}\langle\tilde{B}, W\rangle
$$

with $\vartheta_{1} \vartheta_{\mid \bar{A}}^{\prime \prime}=\vartheta_{\mid \bar{A}}$, where $\vartheta_{1}=m g u\left(E_{1}\right) \ldots m g u\left(E_{m}\right)$.
C7 Let (in $T^{\prime}$ )

$$
\langle\bar{A}, \operatorname{store}(x=t), V\rangle \xrightarrow{\vartheta_{O}^{\circ}}\langle\bar{A}, V\rangle \xrightarrow{\vartheta}{ }^{*}\langle\bar{B}, W\rangle
$$

where $\vartheta_{0}=m g u(x=t)$. Follows immediately from the induction hypothesis.

## C8 Let (in $T^{\prime}$ )

$$
\langle\bar{A}, \text { store }(x=t), V\rangle \xrightarrow{\epsilon^{\circ}}\left\langle\bar{A}^{\prime}, \text { store }(x=t), V\right\rangle \xrightarrow[\rightarrow]{\bullet}\langle\bar{B}, W\rangle
$$

where $\vartheta_{0}=m g u(x=t)$ and $\bar{A}^{\prime}=A_{1}^{\prime}, \ldots, A_{n}^{\prime}$, with $A_{i}^{\prime}=A_{i}$ or $A_{i}^{\prime}=A_{i} \vartheta_{0}\left(\bar{A}=A_{1}, \ldots, A_{n}\right)$. By the induction hypothesis we have in $\bar{T}$

$$
\left\langle\bar{A}^{\prime}, \text { store }(x=t), V\right\rangle \stackrel{\vartheta}{ }^{\vartheta^{\prime}}\langle\bar{B}, W\rangle
$$

with $\vartheta_{\mid \bar{A}^{\prime \prime}}=\vartheta_{\mid \bar{A}^{\prime \prime}}^{\prime}\left(\bar{A}^{\prime \prime}=\bar{A}^{\prime}\right.$, store $\left.(x=t)\right)$. Applying proposition 6.7 we have in $\bar{T}$

$$
\left\langle\bar{A} \vartheta_{0}, V\right\rangle{\stackrel{\vartheta^{\prime \prime}}{*}}^{*}\langle\bar{B}, W\rangle
$$

with $\vartheta^{\prime}=\vartheta_{0} \vartheta^{\prime \prime}$. From this we obtain in $\bar{T}$

$$
\langle\bar{A}, \text { store }(x=t), V\rangle \stackrel{\vartheta}{\rightarrow}^{*}\langle\bar{B}, W\rangle
$$

Now we can state the proposition
Proposition 6.9 We have
Result $_{\bar{A}}\left(\mathcal{O}^{\prime} \llbracket \bar{A} \rrbracket\right) \subseteq$ Result $_{\bar{A}}(\llbracket \mathcal{O} \llbracket \bar{A} \rrbracket)$

Proof Straightforward, given proposition 6.8.

## 7 The full abstractness of $\mathcal{D}$

In this section we prove the full abstractness of $\mathcal{D}$ with respect to our observation criterium. To formulate the full abstractness of $\mathcal{D}$ we introduce the notion of an initialized program $P ; \bar{A}$. We will write $\mathcal{D} \llbracket P ; \bar{A} \rrbracket$ to make explicit that we consider $\mathcal{D} \llbracket \bar{A} \rrbracket$, the meaning of the goal $\bar{A}$, with respect to the program $P$.

In the following definition we give, given a sequence $s$ and set of variables $V$, the construction of a context, that is, an initialized program $C(s, V) \in \mathrm{HC}(\emptyset, \emptyset)$, which will recognize the sequence $s$. The set of variables $V$ are supposed to denote the set of variables of the initial goal for which $s$ is a computation plus the varuables introduced by input substitutions of $s$.

## Definition 7.1

- $C(s s, V)=C(f f, V)=C(d d, V)=\{ \} ;$ ㅁ

$$
C(\perp, V)=\{ \} ; p
$$

- $C\left(\left\{x_{i} / t\right\}^{I} s,\left\{x_{1}, \ldots, x_{n}\right\}\right)=$ $\left\{p_{0}\left(x_{1}, \ldots, x_{n}\right) \leftarrow x_{i}=t, r\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}\right)\right.$ $\left.r\left(x_{1}, \ldots, t, \ldots, x_{n}\right) \leftarrow p_{1}\left(x_{1}, \ldots, x_{i-1}, x_{i+1}, \ldots, x_{n}\right)\right\} \cup P ; p_{0}\left(x_{1}, \ldots, x_{n}\right)$
where $C\left(s,\left\{x_{1}, \ldots, x_{i-1}, x_{i+1}, \ldots, x_{n}\right\}\right)=P ; p_{1}\left(x_{1}, \ldots, x_{i-1}, x_{i+1}, \ldots, x_{n}\right)$ and $p_{0}$ is a new predicate variable, not occurring in $C\left(s,\left\{x_{1}, \ldots, x_{i-1}, x_{i+1}, \ldots, x_{n}\right\}\right)$. (Note that we assume $\left.\operatorname{var}(t) \subseteq\left\{x_{1}, \ldots, x_{n}\right\}.\right)$
- $C\left(\left\{x_{i} / t\right\}^{O} s,\left\{x_{1}, \ldots, x_{n}\right\}\right)=$
$\left\{p_{0}\left(x_{1}, \ldots, t, \ldots, x_{n}\right) \leftarrow p_{1}\left(x_{1}, \ldots, x_{i-1}, x_{i+1}, \ldots, x_{n}, \bar{y}\right)\right\} \cup P ; p_{0}\left(x_{1}, \ldots, x_{n}\right)$
where $\bar{y}=\operatorname{var}(t) \backslash\left\{x_{1}, \ldots, x_{n}\right\}$,
$C\left(c,\left\{x_{1}, \ldots, x_{i-1}, x_{i+1}, \ldots, x_{n}, \bar{y}\right\}\right)=P ; p_{1}\left(x_{1}, \ldots, x_{i-1}, x_{i+1}, \ldots, x_{n}, \bar{y}\right)$, and $p_{0}$ is a new predicate variable, not occurring in $C\left(c,\left\{x_{1}, \ldots, x_{i-1}, x_{i+1}, \ldots, x_{n}, \bar{y}\right\}\right)$.

The following proposition essentially states that a context $C(s, V)$ indeed recognizes the sequence $s$. However, to state this proposition we need first to introduce the notion $\operatorname{Visible}(V, c)$ which gives the set of variables which can be "reached" from the set of variables $V$ by the sequence $c$.

Definition 7.2 We define $\operatorname{Visible}(V, c)$ by induction on the length of $c$ :

$$
\begin{array}{ll}
\operatorname{Visible}(V, \lambda) & =V \\
\operatorname{Visible}\left(V, \vartheta^{\ell} . c\right) & =\operatorname{Visible}(V \vartheta, c)
\end{array}
$$

where $V \vartheta=\{\operatorname{var}(\vartheta(x)): x \in V\}$.
Proposition 7.3 For $c^{\prime} . \alpha^{\prime} \in \mathcal{D} \llbracket C(c . \alpha, V) \rrbracket(W)$ such that

- $\vartheta_{c^{\prime} \mid V}=\vartheta_{\bar{c} \mid V}$,
- Visible $\left(V, c^{\prime}\right)=\operatorname{dom}\left(\vartheta_{c^{\prime}}\right)$, the variables introduced by output substitutions of $c$ do not occur in $W$, and
- the variables introduced by input substitutions of $c^{\prime}$ which are not visible in the resulting substitution (they are not contained in $\operatorname{var}\left(V \vartheta_{c^{\prime}}\right)$ ) do not occur in $\bar{c}$,
we have $c^{\prime} \in$ Closure $_{V, W}(\bar{c})$. (Here $\bar{c}$ denotes the "mirror" of $c: \overline{\vartheta^{I} c}=\vartheta^{O} \bar{c}$ and $\overline{\vartheta^{O} c}=\vartheta^{I} \bar{c}$.)

## Proof

We proceed by induction on the length of $\bar{c}$. Let's go.
$\bar{c}=\lambda:$ From $\vartheta_{c^{\prime} \mid V}=\rho\left(\vartheta_{\bar{c} \mid V}\right)$ and Visible $\left(V, c^{\prime}\right)=\operatorname{dom}\left(\vartheta_{c^{\prime}}\right)$ it follows that $c^{\prime}=\bar{c}$.
$\bar{c}=\{x / t\}^{\ell} \bar{c}_{1}:$ Let $P_{1} ; p_{1}=C\left(c_{1}, \alpha, V \backslash\{x\} \cup \operatorname{var}(t)\right)$. We consider the cases $\ell=I$ and $\ell=O$ separately. (Note that for $\ell=I$ we have $\operatorname{var}(t) \subseteq V$.)
$\bar{c}=\{x / t\}^{I} \bar{c}_{1}$ : By the definition of the denotational semantics $\mathcal{D}$ we have

$$
c^{\prime} \in \operatorname{Closure}_{V, W}\left(\vartheta_{1}^{I} \ldots \vartheta_{k}^{I} \cdot c_{1}^{\prime}\right)
$$

with $\vartheta_{1} \ldots \vartheta_{k}(x)=t \vartheta^{\prime}, \vartheta_{\mid V}^{\prime}=\left(\vartheta_{1} \ldots \vartheta_{k}\right)_{\mid V}$, and $c_{1}^{\prime} \cdot \alpha^{\prime} \in \mathcal{D} \llbracket P_{1} ; p_{1} \vartheta_{1} \ldots \vartheta_{k} \vartheta^{\prime} \rrbracket\left(W^{\prime}\right)$, for some $W^{\prime} \subseteq$ $W$. First note that actually we have $W^{\prime}=W$ because all the variables of $p_{1}$ are instantiated. Now let $\sigma_{1}, \ldots, \sigma_{m}$ such that $\sigma_{1}=\{x / t\}$ and $\left(\sigma_{1} \ldots \sigma_{m}\right)_{V a r \backslash Z_{1}}=\left(\vartheta_{1} \ldots \vartheta_{m}\right)_{V a r \backslash Z_{2}}$, where $Z_{1} \subseteq$ $\operatorname{var}(t) \backslash V$ contains those variables bound by $\vartheta^{\prime}$ and $Z_{2}=\operatorname{dom}\left(\vartheta_{1} \ldots \vartheta_{m}\right) \backslash V$. Thus we have by P5

$$
\vartheta_{1}^{I} \ldots \vartheta_{k}^{I} \cdot c_{1}^{\prime} \in \operatorname{Closure}_{V, W}\left(\sigma_{1}^{I} \ldots \sigma_{m}^{I} \cdot c_{1}^{\prime}\right)
$$

Note that the sequence $\sigma_{1}^{I} \ldots \sigma_{m}^{I} \cdot c_{1}^{\prime}$ is well-defined because we may assume that $Z_{1} \cap \operatorname{var}\left(c_{1}^{\prime}\right)=\emptyset$. This we can justify as follows: suppose first that $z \in Z_{1}$ is introduced by an output substitution of $c_{1}^{\prime}$. So we then would have $z \in W$ which contradicts the assumption that the variables introduced by output substitutions of $c$ do not occur in $W$. Suppose then that $z \in Z_{1}$ is introduced by a input substitution of $c_{1}^{\prime}$. As $\vartheta_{c \mid V}^{\prime}=\vartheta_{\bar{q} \mid V}, \vartheta_{1} \ldots \vartheta_{k}(x)=t \vartheta^{\prime}$, and $c^{\prime} \in \operatorname{Closure}_{V, W}\left(\vartheta_{1}^{I} \ldots \vartheta_{k}^{I} . c_{1}^{\prime}\right)$ we have that $z \notin \operatorname{var}\left(V \vartheta_{c}^{\prime}\right)$. But variables introduced by input subsitutions of $c^{\prime}$ (and $z$ is such a variable as $\left.c^{\prime} \in \operatorname{Closure}_{V, W}\left(\vartheta_{1}^{I} \ldots \vartheta_{k}^{I}, c_{1}^{\prime}\right)\right)$ which are not contained in $\operatorname{var}\left(V \vartheta_{c}^{\prime}\right)$ do not occur in $\bar{c}$ (as $z$ does).

Furthermore we note that the application of $\mathbf{P 5}$ is justified because the variables of $Z_{1}$ do not occur in $W$ as the variables introduced by output substitutions of $c$ (thus introduced by input substitutions of $\bar{c}$ ) do not occur in $W$.

We have $p_{1} \vartheta_{1} \ldots \vartheta_{k} \vartheta^{\prime}=p_{1} \sigma_{2} \ldots \sigma_{m}$ (note that $x \notin \operatorname{var}\left(p_{1}\right)$ ). From this and $c_{1}^{\prime} \cdot \alpha^{\prime} \in \mathcal{D} \llbracket P_{1} ; p_{1} \vartheta_{1} \ldots \vartheta_{k} \vartheta^{\prime} \rrbracket(W)$ we infer that

$$
\sigma_{2}^{I} \ldots . \sigma_{m}^{I} \cdot c_{1}^{\prime} \cdot \alpha^{\prime} \in \mathcal{D} \llbracket P_{1} ; p_{1} \rrbracket(W)
$$

Now we apply the induction hypothesis yielding

$$
\sigma_{2}^{I} \ldots \sigma_{m}^{I} \cdot c_{1}^{\prime} \in \text { Closure }_{V, W}\left(\bar{c}_{1}\right)
$$

(it is not difficult to check that the conditions for applying the induction hypothesis are indeed satisfied). We conclude

$$
c^{\prime} \in \operatorname{Closure}_{V, W}\left(\sigma_{1}^{I} \ldots \ldots \sigma_{m}^{I} \cdot c_{1}^{\prime}\right) \subseteq \text { Closure }_{V, W}(\bar{c})
$$

$\bar{c}=\{x / t\}^{O} \bar{c}_{1}:$ we distinguish the following three cases:

1. We have

$$
c^{\prime} \in \operatorname{Closure}_{V, W}\left(\vartheta_{1}^{I} \ldots \vartheta_{k}^{I}, c_{1}^{\prime}\right)
$$

such that $\vartheta_{1} \ldots \vartheta_{k}(x)=t \vartheta^{\prime}$, with $\vartheta^{\prime}=\left(\vartheta_{1} \ldots \vartheta_{k}\right)_{\mid d o m\left(\vartheta^{\prime}\right)}$, and $c_{1}^{\prime} . \alpha \in \mathcal{D} \llbracket P_{1} ; p_{1} \vartheta_{1} \ldots \vartheta_{k} \rrbracket\left(W^{\prime}\right)$, for some $W^{\prime} \subseteq W$. This case is treated in a similar way as above, making additionally use of P1.
2. We have

$$
c^{\prime} \in \operatorname{Closure}_{V, W}\left(\vartheta_{1}^{I} \ldots \vartheta_{k-1}^{I} \vartheta_{k}^{O} \cdot c_{1}^{\prime}\right)
$$

with $\vartheta_{k}(x)=t \vartheta_{1} \ldots \vartheta_{k-1}$ and $c_{1}^{\prime} \cdot \alpha^{\prime} \in \mathcal{D} \llbracket P_{1} ; p_{1} \vartheta_{1} \ldots \vartheta_{k} \rrbracket\left(W^{\prime}\right)$, for some $W^{\prime} \subseteq W$, as above we actually have $W^{\prime}=W$. Let $\vartheta^{\prime}=\{x / t\}$. It then follows by successive applications of P2

$$
\vartheta_{1}^{I} \ldots \vartheta_{k-1}^{I} \cdot \vartheta_{k}^{O} \cdot c_{1}^{\prime} \in \operatorname{Closure}_{V, W}\left(\vartheta^{\prime}{ }^{O} . \vartheta_{1}\left[\vartheta^{\prime}\right]^{I} \cdot \vartheta_{2}\left[\vartheta^{\prime} \vartheta_{1}\right]^{I} \ldots \vartheta_{k-1}\left[\vartheta^{\prime} \vartheta_{1} \ldots \vartheta_{k-2}\right]^{I} . c_{1}^{\prime}\right)
$$

Furthermore we have $p_{1} \vartheta_{1} \ldots \vartheta_{k}=p_{1} \vartheta_{1}\left[\vartheta^{\prime}\right] \ldots \vartheta_{k-1}\left[\vartheta^{\prime} \vartheta_{1} \ldots \vartheta_{k-2}\right]$. This we can prove as follows:

$$
\begin{aligned}
& \left(\vartheta_{1} \ldots \vartheta_{k}\right)_{\mid \operatorname{Var} \backslash\{x\}}= \\
& \vartheta_{1}\left[\vartheta_{k}\right] \ldots \vartheta_{k-1}\left[\vartheta_{k}\right]= \\
& \vartheta_{1}\left[\vartheta^{\prime} \vartheta_{1}\right] \ldots \vartheta_{i}\left[\vartheta^{\prime} \vartheta_{1} \ldots \vartheta_{i}\right] \ldots \vartheta_{k-1}\left[\vartheta^{\prime} \vartheta_{1} \ldots \vartheta_{k-1}\right]= \\
& \vartheta_{1}\left[\vartheta^{\prime}\right] \ldots \vartheta_{i}\left[\vartheta^{\prime} \vartheta_{1} \ldots \vartheta_{i-1}\right] \ldots \vartheta_{k-1}\left[\vartheta^{\prime} \vartheta_{1} \ldots \vartheta_{k-2}\right]
\end{aligned}
$$

The last equation follows from the following observation: Let $\vartheta_{i}=\left\{y / t^{\prime}\right\}$. Now, if $x \in$ $\operatorname{var}\left(t^{\prime}\right)$ then $y \notin \operatorname{var}\left(\vartheta_{1} \ldots \vartheta_{i-1}\right)$. From $p_{1} \vartheta_{1} \ldots \vartheta_{k}=p_{1} \vartheta_{1}\left[\vartheta^{\prime}\right] \ldots \vartheta_{k-1}\left[\vartheta^{\prime} \vartheta_{1} \ldots \vartheta_{k-2}\right]$ and $c_{1}^{\prime} \cdot \alpha^{\prime} \in \mathcal{D} \llbracket P_{1} ; p_{1} \vartheta_{1} \ldots \vartheta_{k} \rrbracket(W)$ we derive

$$
\vartheta_{1}\left[\vartheta^{\prime}\right]^{I} \ldots \vartheta_{k-1}\left[\vartheta^{\prime} \vartheta_{1} \ldots \vartheta_{k-2}\right]^{I} \cdot c_{1}^{\prime} \cdot \alpha^{\prime} \in \mathcal{D} \llbracket P_{1} ; p_{1} \rrbracket(W)
$$

Now we apply the induction hypothesis (again, it is not difficult to verify that the conditions for applying the induction hypothesis are satisfied) yielding

$$
\vartheta_{1}\left[\vartheta^{\prime}\right]^{I} \ldots \vartheta_{k-1}\left[\vartheta^{\prime} \vartheta_{1} \ldots \vartheta_{k-2}\right]^{I} . c_{1}^{\prime} \in \text { Closure }_{V, W^{\prime}}\left(\bar{c}_{1}\right)
$$

From which we derive

$$
c^{\prime} \in \operatorname{Closure}_{V, W}\left(\vartheta^{\prime O} . \vartheta_{1}\left[\vartheta^{\prime}\right]^{I} \ldots \vartheta_{k-1}\left[\vartheta^{\prime} \vartheta_{1} \ldots \vartheta_{k-1}\right]^{I} . c_{1}^{\prime}\right) \subseteq \text { Closure }_{V, W}(\bar{c})
$$

3. We have

$$
c^{\prime} \in \operatorname{Closure}_{V, W}\left(\vartheta_{1}^{I} \ldots \vartheta_{m}^{I} \cdot \operatorname{Dec}\left(\sigma^{O}\right) \cdot c_{1}^{\prime}\right)
$$

with $\vartheta_{1} \ldots \vartheta_{m}(x)=t \vartheta^{\prime} \sigma$ for some $\vartheta^{\prime}$ such that $\vartheta^{\prime}=\left(\vartheta_{1} \ldots \vartheta_{m}\right)_{\operatorname{dom}\left(\vartheta^{\prime}\right)}\left(\right.$ note that $\operatorname{dom}\left(\vartheta_{1} \ldots \vartheta_{m}\right) \cap$ $\operatorname{dom}(\sigma)=\emptyset$ ). Furthermore, we have $c_{1}^{\prime} . \alpha \in \mathcal{D} \llbracket P_{1} ; p_{1} \vartheta_{1} \ldots \vartheta_{m} \sigma \rrbracket\left(W^{\prime}\right)$, for some $W^{\prime} \subseteq W$ (again, we have actually $W^{\prime}=W$ ). Let $\sigma_{1}, \ldots, \sigma_{k}$ such that $\sigma_{1}=\{x / t\}$ and $\sigma_{1} \ldots \sigma_{k} \sigma=$ $\vartheta_{1} \ldots \vartheta_{m} \sigma$. We first show that

$$
\vartheta_{1}^{I} \ldots \vartheta_{m}^{I} \cdot \operatorname{Dec}\left(\sigma^{O}\right) \cdot c_{1}^{\prime} \in \operatorname{Closur}_{V, W}\left(\sigma_{1}^{O} \cdot \sigma_{2}^{I} \ldots \sigma_{k}^{I} \cdot \operatorname{Dec}\left(\sigma^{I}\right) \cdot c_{1}^{\prime}\right)
$$

By P2 we have

$$
\sigma_{2}^{I} \ldots \sigma_{k}^{I} \cdot \sigma_{1}\left[\sigma_{2} \ldots \sigma_{k}\right]^{O} \cdot \operatorname{Dec}\left(\sigma^{I}\right) \cdot c_{1}^{\prime} \in \text { Closure }_{V, W}\left(\sigma_{1}^{O} \cdot \sigma_{2}^{I} \ldots \sigma_{k}^{I} \cdot \operatorname{Dec}\left(\sigma^{I}\right) \cdot c_{1}^{\prime}\right)
$$

Note that $\sigma_{1}\left[\sigma_{2} \ldots \sigma_{k}\right]=\left\{x / t \vartheta^{\prime}\right\}$. Applying $\mathbf{P} 3$ gives us

$$
\sigma_{2}^{I} \ldots \sigma_{k}^{I} \cdot\left\{x / t \vartheta^{\prime} \sigma\right\}^{I} \cdot \operatorname{Dec}\left(\sigma^{O}\right) \cdot c_{1}^{\prime} \in \operatorname{Closure}_{V, W}\left(\sigma_{2}^{I} \ldots \sigma_{k}^{I} \cdot \sigma_{1}\left[\sigma_{2} \ldots \sigma_{k}\right]^{O} \cdot \operatorname{Dec}\left(\sigma^{I}\right) \cdot c_{1}^{\prime}\right)
$$

Finally an application of P5 gives us

$$
\vartheta_{1}^{I} \ldots \vartheta_{m}^{I} \cdot \operatorname{Dec}\left(\sigma^{O}\right) \cdot c_{1}^{\prime} \in \operatorname{Closure}_{V, W}\left(\sigma_{2}^{I} \ldots \sigma_{k}^{I} \cdot\left\{x / t \vartheta^{\prime} \sigma\right\}^{I} \cdot \operatorname{Dec}\left(\sigma^{O}\right) \cdot c_{1}^{\prime}\right)
$$

Next we observe that $p_{1} \vartheta_{1} \ldots \vartheta_{m} \sigma=p_{1} \sigma_{2} \ldots \sigma_{m} \sigma$, from this and $c_{1}^{\prime} . \alpha \in \mathcal{D} \llbracket P_{1} ; p_{1} \vartheta_{1} \ldots \vartheta_{m} \sigma \vartheta^{\prime} \rrbracket\left(W^{\prime}\right)$ we obtain

$$
\sigma_{2}^{I} \ldots \sigma_{k}^{I} \cdot \operatorname{Dec}\left(\sigma^{I}\right) \cdot c_{1}^{\prime} \cdot \alpha \in \mathcal{D} \llbracket P_{1} ; p_{1} \rrbracket(W)
$$

Applying the induction hypothesis (again, it is not difficult to verify that the conditions for applying the induction hypothesis are indeed satisfied) gives us

$$
\sigma_{2}^{I} \ldots \sigma_{k}^{I} \cdot \operatorname{Dec}\left(\sigma^{I}\right) \cdot c_{1}^{\prime} \in \text { Closure }_{V, W^{\prime}}\left(\bar{c}_{1}\right)
$$

From which we derive

$$
c^{\prime} \in \operatorname{Closure}_{V, W}\left(\sigma_{1}^{O} \cdot \sigma_{2}^{I} \ldots \sigma_{k}^{I} \cdot \operatorname{Dec}\left(\sigma^{I}\right) \cdot c_{1}^{\prime}\right) \subseteq \operatorname{Closure}(\bar{c})
$$

Proposition 7.4 If $c \in$ Closure $_{\bar{A}_{1}, V_{1}}\left(c^{\prime}\right)$ then $\bar{c}^{\prime} \in$ Closure $_{\bar{A}_{2}, V_{2}}(\bar{c})$, where $V_{1} \cap V_{2}=\emptyset$ and $V_{1} \cup V_{2}=$ Var.

Proof Straightforward induction by the number of applications of the closure conditions, making use of the fact that the conditions mirror themselves in the following sense: if $c$ is derived from $c^{\prime}$ by an application of, say, $\mathbf{P} 1$ then $\bar{c}^{\prime}$ can be derived from $\bar{c}$ using $\mathbf{P} 1$ again. In this way it is easy to see that P1, P2 and P5 mirror themselves. On the other hand, P3 and P4 mirror each other.

Finally, we can prove the main theorem:
Theorem 7.5 (Full abstractness of $\mathcal{D}$ ) For arbitrary initialized programs $P_{1} ; \bar{A}_{1}$ and $P_{2} ; \bar{A}_{2}$ if

$$
\mathcal{D} \llbracket P_{1} ; \bar{A}_{1} \rrbracket \neq \mathcal{D} \llbracket P_{2} ; \bar{A}_{2} \rrbracket
$$

then there exists a $P ; \bar{A}$, a distinguishing context, with no predicates in common with $P_{1} ; \bar{A}_{1}$ and $P_{2} ; \bar{A}_{2}$, such that

$$
O b s\left(P \cup P_{1} ; \bar{A}, \bar{A}_{1}\right) \neq O b s\left(P \cup P_{2} ; \bar{A}, \bar{A}_{2}\right)
$$

Proof Suppose that $\mathcal{D} \llbracket P_{1} ; \bar{A}_{1} \rrbracket(V) \neq \mathcal{D} \llbracket P_{2} ; \bar{A}_{2} \rrbracket(V)$, for some $V$. Without loss of generality we may assume that $\operatorname{var}\left(\bar{A}_{1}\right)=\operatorname{var}\left(\bar{A}_{2}\right)$. Let $c . \alpha \in \mathcal{D} \llbracket P_{1} ; \bar{A}_{1} \rrbracket(V) \backslash \mathcal{D} \llbracket P_{2} ; \bar{A}_{2} \rrbracket(V)$. Let $W$ consist of the variables of $\bar{A}_{1}$ and the variables introduced by input substitutions of $c$. Furthermore, let $P ; \bar{A}=C(c . \alpha, W)$ and $\left(W_{1}, W_{2}\right)=\operatorname{Part}(\operatorname{Var} \backslash W)$. For arbitrary renaming $\rho \in V \rightarrow W_{2}$ we have $\rho(\bar{c}) . \alpha^{\prime} \in \mathcal{D} \llbracket P ; \bar{A} \rrbracket\left(W_{1}\right)$ and $\rho(c) . \alpha \in \mathcal{D} \llbracket P_{1} ; \bar{A}_{1} \rrbracket\left(W_{2}\right)$, where

$$
\begin{aligned}
\alpha^{\prime} & =s s & & \text { if } \alpha \in\{s s, \text { ff, dd }\} \\
& =\text { ff } & & \text { otherwise }
\end{aligned}
$$

So we have

$$
\begin{aligned}
\rho\left(\text { Result }_{W}\left(\text { c. } \alpha \| \bar{c} . \alpha^{\prime}\right)\right) & \in \operatorname{Result}_{W}\left(\mathcal{D} \llbracket P ; \bar{A} \rrbracket\left(W_{1}\right) \| \mathcal{D} \llbracket P_{1} ; \bar{A}_{1} \rrbracket\left(W_{2}\right)\right) \\
& =\operatorname{Result}_{W}\left(\mathcal{D} \llbracket P \cup P_{1} ; \bar{A}, \bar{A}_{1} \rrbracket\right) \\
& =\operatorname{Obs}\left(P \cup P_{1} ; \bar{A}, \bar{A}_{1}\right)
\end{aligned}
$$

Now suppose that for some $\rho: V \rightarrow W_{2}$ we have $\rho\left(\operatorname{Result}_{W}\left(c . \alpha \| \bar{c} . \alpha^{\prime}\right)\right) \in \operatorname{Obs}\left(P \cup P_{2} ; \bar{A}, \bar{A}_{2}\right)$. So there exist $c^{\prime} . \alpha \in \mathcal{D} \llbracket P_{2} ; \bar{A}_{2} \rrbracket\left(W_{2}\right)$ and $\bar{c}^{\prime} \cdot \alpha^{\prime} \in \mathcal{D} \llbracket P ; \bar{A} \rrbracket\left(W_{1}\right)$ such that $\rho\left(\operatorname{Result}_{W}\left(c . \alpha \| \bar{c} . \alpha^{\prime}\right)\right)=$ Result $_{W}\left(c^{\prime} . \alpha \| \bar{c}^{\prime} . \alpha^{\prime}\right)$. Furthermore we may assume without loss of generality that the variables introduced by input substitutions of $\bar{c}^{\prime}$ which are not visible in the resulting substitution (thatis, they do not occur in $\vartheta_{\bar{c}^{\prime} \mid W}$ ) do not occur in $\rho(\bar{c})$. It follows that $\vartheta_{\bar{c}^{\prime} \mid W}=\vartheta_{\rho(\bar{c}) \mid W}$ and $\operatorname{Visible}\left(W, \bar{c}^{\prime}\right)=\operatorname{dom}\left(\vartheta_{\bar{c}^{\prime}}\right)$. By proposition 7.3 (note that $\bar{c}^{\prime} \cdot \alpha^{\prime} \in \mathcal{D} \llbracket C\left(\rho(c) . \alpha, W \rrbracket\left(W_{1}\right)\right)$ we then have that $\bar{c}^{\prime} \in$ Closure $_{W, W_{1}}(\rho(\bar{c}))$. So by proposition 7.4 we derive $\rho(c) \in$ Closure $_{W, W_{2}}\left(c^{\prime}\right)$. So we have $\rho(c) . \alpha \in \mathcal{D} \llbracket P_{2} ; \bar{A}_{2} \rrbracket\left(W_{2}\right)$. From which it is not difficult to deduce that $c . \alpha \in \mathcal{D} \llbracket P_{2} ; \bar{A}_{2} \rrbracket(V)$, contradicting our initial assumption.

## 8 Conclusion

We have studied in this paper the asynchronous nature of the communication in Concurrent Logic Languages. We have shown that to obtain a fully abstract semantics for these languages a quite different approach is required than for the imperative concurrent languages like CCS. One of the main differences consist in the description of deadlock behaviour. In Concurrent Logic Languages deadlock depends upon the past behaviour of a process, whereas in languages like CCS deadlock essentially depends upon the current state of the system as described by the failure sets.

A future research topic consist of generalizing the result to Concurrent Constraint Programming Languages. Another interesting line of research is to define a framework to study asynchronous communication in a more abstract setting.

[^0]:    "Part of this work was supported by the ESPRIT BRA project "Intergration"

[^1]:    ${ }^{1}$ The term deadlock is used here with its classical meaning in the theory of concurrency. In concurrent logic programming, this kind of deadlock can correspond both to failure or to suspension (whilst, in the current terminology, it is associated only to suspension). In example 1.1 it correspond to suspension.
