We consider a model of the real time process algebra of [BAB91,93,92] based on the nonstandard reals. As a subalgebra, we obtain a theory in which the urgent actions of ATP, TiCCS, TeCCS can be modeled.

1. INTRODUCTION.

An important motivation for our work on timed process algebra ([BAB91,93,92]) is that we intend to present a uniform framework, in which all constructs that occur in the literature on timed process algebra can be expressed. In [BAB91], we present our real time absolute time process algebra, in [BAB93] we achieve a unified treatment of absolute time and relative time expressions. In [BAB92], we define many discrete time constructs from the literature, both absolute and relative time ones, in our real time process algebra, and define suitable discrete time subalgebras. This paper is concerned with immediate or urgent actions, as they appear e.g. in TiCCS [MOT90, 92], ATP [NIS91], TeCCS [WAN90], TiCCS [CHE93].

As an example, consider the TiCCS expression $(2).a.b.\mathbf{0}$. Intuitively, this expression denotes the process that, after an initial delay of 2 time units, executes first a and then b instantaneously, and then terminates. Now, in our real time process algebra ACPρ, two actions cannot be executed consecutively at the same point in time, so the process $a(2) \cdot b(2)$ will deadlock after executing the action a at time 2, and b will not be executed. Nevertheless, we can define the process above in an extension of ACPρ. To this end, we extend our time domain to include infinitesimals, and model the TiCCS expression above by a process that first executes a and then b at time points both infinitely close to 2, with the difference of execution times a positive infinitesimal.

This paper describes the extension of ACPρ to a more general time domain, describes the relation of ACPρ over the (standard) positive reals with ACPρ over a time domain including nonstandard reals, and defines suitable subalgebras including urgent actions. Some of these subalgebras correspond to timed process algebras found in the literature.

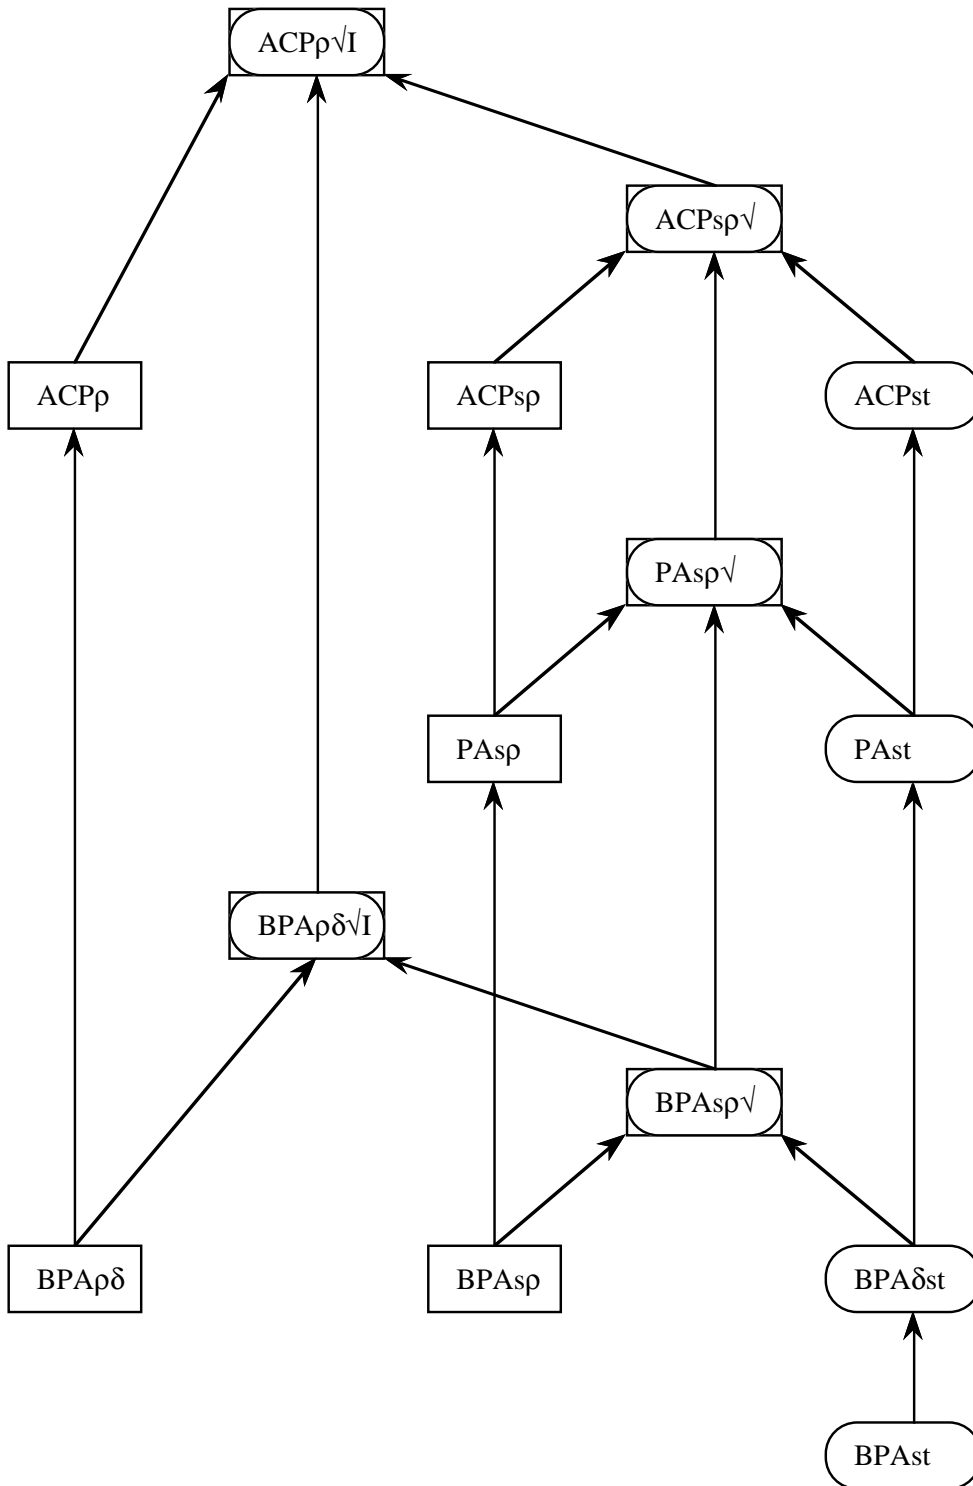

FIGURE 1.

We give an overview of the systems that we will consider. We start with the system BPAρ√I, real time process algebra with initial abstraction and integration. By adding parallel composition and communication, we obtain ACPρ√I. In this system (over a time domain involving nonstandard reals) we can define urgent actions. We can also directly axiomatise algebras based on urgent actions instead of our usual real time actions. In this way, we obtain the absolute time algebras BPAsρ, PAsρ, ACPsρ, and the relative time algebras BPAst, BPAδst, PAst, ACPst. By adding initial abstraction to the absolute time algebras, obtaining BPAsρ√, PAsρ√, ACPsρ√, we can interpret the relative time ones in them. Figure 1 gives an overview of all algebras we consider, and the embedding relations between them. Boxes with rounded corners denote relative time algebras, square boxes denote absolute time algebras.

2. REAL TIME PROCESS ALGEBRA WITH INITIAL ABSTRACTION OPERATOR.

We will first consider the axiom system ACPρ√I. It describes the real time process algebra of [BAB91] as presented in [BAB92]. The reader is assumed to be familiar with [BAB92], as we only indicate the differences with that paper. For ACPρ√I, we have a bisimulation model M_A^* as outlined in [BAB92].

Having available M_A^*, the various operators and constants of urgent time process algebra are defined in it. Then, as a subject, nonstandard real time process algebra reduces to an investigation of certain reducts and subalgebras of M_A^* as well as their axiomatic description.

2.1 TIME DOMAIN.

We assume that we have a time domain T. We have the following requirements on T:

i. T is linearly ordered by $<$
ii. 0 is the smallest element of T
iii. T is closed under addition $+$.

In [BAB91], we used the supremum of a subset of T in de definition of the ultimate delay operator, so we needed completeness of T. We reformulate this operator in this paper (as we did in [BAB93]) so that this requirement is not needed anymore. Examples of time domains satisfying these requirements are $\mathbb{N}$, the naturals, $\mathbb{Q}_{\geq 0}$, the non-negative rationals, $\mathbb{R}_{\geq 0}$, the non-negative reals, or $*\mathbb{R}_{\geq 0}$, the nonstandard non-negative reals. Our prefered time domain, the one we used in [BAB91, 92, 93], is $\mathbb{R}_{\geq 0}$.

2.2 BASIC PROCESS ALGEBRA.

A is the set of (symbolic) atomic actions. The set A is a parameter of the theory. δ denotes inaction. We put $A_\delta = A \cup \{\delta\}$. The set of constants is the set of atomic actions with time parameter, AT, given by

$$AT = \{a(t) \mid a \in A_\delta, t \in T\}.$$

Real Time Basic Process Algebra with Deadlock (BPA$\rho\delta$) has two binary operators $+,\cdot\colon \mathsf{P} \times \mathsf{P} \to$ P; alternative composition (weak choice) and sequential composition, respectively. Moreover, the *initialisation operator* $\gg\colon T\times \mathsf{P} \to \mathsf{P}$. BPA$\rho\delta$ has the axioms given in [BAB91, 92].

2.3 ALGEBRA OF COMMUNICATING PROCESSES.

In order to formulate communication between processes, we assume we have given a *communication function* $\mid$ on A_δ. An axiomatization of parallel composition with communication uses the left merge operator $\mathbb{L}$, the communication merge operator $\mid$, and the encapsulation operator ∂_H of [BEK84]. Moreover, an extra auxiliary operator is needed. In [BAB91,92,93] we used the ultimate delay operator and the bounded initialization operator as auxiliary operators. However, in order to define the ultimate delay of an integral expression, we need the supremum of a subset of T. In the time domain $\mathbb{R}_{\geq 0}$, such a supremum will always exist (or is infinite), but later on, we will consider a time domain where suprema need not exist. For this reason, we will use a different auxiliary operator here. Since the axiomatisation of merge used before only needed expressions of the form $\mathsf{X} \gg \mathsf{U(Y)}$ (with U the ultimate delay and $\gg$ the bounded initialisation), we will have a new binary operator (left strong choice) for this combination. It turns out that this operator is exactly one half of the strong choice operator $\oplus$ of ATP, and that explains the name.

Thus, we have the operator $\underline\oplus\colon \mathsf{P} \times \mathsf{P} \to \mathsf{P}$ (left strong choice) and $\mathsf{X} \underline\oplus \mathsf{Y}$ denotes intuitively that part of X, that can start before an initial action of Y. Notice the similarity of the axioms for the left strong choice operator with the axioms of the unless operator from [BABK86], [BAW90]. The latter binary operator also describes a filtering of the first argument by the second. We call the present version of ACPρ ACP$\rho(\underline\oplus)$. In table 1, we show the axioms that do not appear in [BAB92], that replace the axioms using ultimate delay or bounded initialisation. The axioms for left merge have a condition because they do not hold for processes involving relative time notation. We have $\mathsf{a,b} \in \mathsf{A}_\delta$.

$t < s \ \Rightarrow\ a(t) \underline\oplus b(s) = a(t)$	LSC1
$t \geq s \ \Rightarrow\ a(t) \underline\oplus b(s) = \delta(s)$	LSC2
$\mathsf{X} \underline\oplus \mathsf{Y}{\cdot}\mathsf{Z} = \mathsf{X} \underline\oplus \mathsf{Y}$	LSC3
$\mathsf{X} \underline\oplus (\mathsf{Y} + \mathsf{Z}) = (\mathsf{X} \underline\oplus \mathsf{Y}) + (\mathsf{X} \underline\oplus \mathsf{Z})$	LSC4
$\mathsf{X}{\cdot}\mathsf{Y} \underline\oplus \mathsf{Z} = (\mathsf{X} \underline\oplus \mathsf{Z}){\cdot}\mathsf{Y}$	LSC5
$(\mathsf{X} + \mathsf{Y}) \underline\oplus \mathsf{Z} = (\mathsf{X} \underline\oplus \mathsf{Z}) + (\mathsf{Y} \underline\oplus \mathsf{Z})$	LSC6
$\mathsf{X} = 0 \gg \mathsf{Z} \ \Rightarrow\ a(t) \,\mathbb{L}\, \mathsf{X} = (a(t) \underline\oplus \mathsf{X}) \cdot \mathsf{X}$	ATCM2$\oplus$
$\mathsf{Y} = 0 \gg \mathsf{Z} \ \Rightarrow\ a(t){\cdot}\mathsf{X} \,\mathbb{L}\, \mathsf{Y} = (a(t) \underline\oplus \mathsf{Y}){\cdot}(\mathsf{X}\,\|\,\mathsf{Y})$	ATCM3$\oplus$

TABLE 1. New axioms of ACP$\rho(\underline\oplus)$.

2.4 RELATIVE TIME NOTATION.

We follow the approach to relative time of [BAB92, BAB93]. The basis for this approach to relative time notation is the *initial abstraction operator*. Let for $\mathsf{t} \in T$, $\mathsf{F(t)}$ be a process in P, then $\sqrt{}\mathsf{t.F(t)}$ denotes

a process that, when started at time r, proceeds as $F(r)$. In table 2, we show the new axioms for initial abstraction, that give the relation to the left strong choice operator.

$(\sqrt{t}.F) \oplus X = \sqrt{t}.(F \oplus t \gg X)$	IA13
$X \oplus (\sqrt{t}.F) = \sqrt{t}.(t \gg X \oplus F)$	IA14

TABLE 2. Axioms for initial abstraction and left strong choice.

2.5 INTEGRATION.

We extend our real time process algebra by adding the integral operator, denoting a choice over a subset of T. That is, if V is a subset of T, and v is a variable over T, then $\int_{v \in V} P$ denotes the alternative composition of alternatives $P[t/v]$ for $t \in V$ (expression P with $t \in T$ substituted for variable v). In case the time domain is $\mathbb{R}_{\geq 0}$, this is an uncountable sum, and that explains the use of the notion of an integral. For more information, we refer the reader to [BAB91] and [KLU93].

   In table 3, X is a process (that does not contain free variables), and F,G are process expressions (that may contain free variables). We reformulate INT8: this only applies if the set V has a supremum in T. The theory presented thus far is called ACPρ√I, ACPρ plus integration is ACPρI.

$t = \sup V, t \notin V \implies \int_{v \in V} \delta(v) = \delta(t)$	INT8
$\int_{v \in V} (F \_\oplus X) = (\int_{v \in V} F) \_\oplus X$	INT13
$\int_{v \in V} (X \_\oplus F) = X \oplus (\int_{v \in V} F)$	INT14

TABLE 3. Axioms for integration and left strong choice.

2.6 STRUCTURED OPERATIONAL SEMANTICS.

We obtain a real time transition system $TS(X)$ from a process expression X as indicated in [BAB92]. Here, we just give the SOS rules for the left strong choice operator. We have $t \in T$, $r \in T\text{-}\{0\}$, x,x',y are closed process expressions and $a \in A$. On these transition systems, we define bisimulation as usual. We extend with initial abstraction as in [BAB92].

$\dfrac{\langle x,t\rangle \to \langle x,r\rangle, \langle y,t\rangle \to \langle y,r\rangle}{\langle x \oplus y,t\rangle \to \langle x\_\oplus y,r\rangle}$	$\dfrac{\langle x,t\rangle \xrightarrow{a(r)} \langle x',r\rangle, \langle y,t\rangle \to \langle y,r\rangle}{\langle x \oplus y,t\rangle \xrightarrow{a(r)} \langle x',r\rangle}$

$$\dfrac{\langle x,t\rangle \xrightarrow{a(r)} \langle \sqrt{},r\rangle, \langle y,t\rangle \to \langle y,r\rangle}{\langle x \oplus y,t\rangle \xrightarrow{a(r)} \langle \sqrt{},r\rangle}$$

TABLE 4. Structured operational semantics for left strong choice.

2.7 STANDARD INITIALISATION AXIOMS.

We present some extra axioms that are useful in the calculations to come, that hold in the model, and that can be derived from the theory for all closed process expressions. The numbering of these axioms corresponds to the numbering in [BAB92].

$s \gg X \mathbb{L} r \gg Y = (s \gg X \oplus r \gg Y) \mathbb{L} s \gg r \gg Y$	SI10
$t \gg (X \oplus Y) = t \gg X \oplus t \gg Y$	SI14
$X + (X \oplus Y) = X$	SI15
$a(t) \oplus t \gg X = a(t)$	SI16
$t \gg X \oplus a(t) = \delta(t)$	SI17

TABLE 5. Standard initialisation axioms involving left strong choice.

3. NONSTANDARD REALS.

In this section, we consider two time domains: on the one hand we have the time domain $\mathbb{R}_{\geq 0}$ of non-negative real numbers, on the other hand we consider a subdomain of $^*\mathbb{R}$, the nonstandard model of the real numbers. For more information on nonstandard real numbers, see [ROB66], [LUX62]. We use the following notations: $t \approx s$ means that t, s are infinitely close together, $I = \{s \in {}^*\mathbb{R} \mid s \approx 0, s > 0\}$ is the set of positive infinitesimals and $t^\circ \in \mathbb{R}$ is the standard part of a finite $t \in {}^*\mathbb{R}$, the standard real infinitely close to t. Note that the supremum over a bounded subset of $^*\mathbb{R}$ need not exist.

As the extended time domain we use

$$\mathbb{R}_{\geq 0} + I = \mathbb{R}_{\geq 0} \cup \{p + \varepsilon : p \in \mathbb{R}_{\geq 0}, \varepsilon \in I\}.$$

Note that this set satisfies the requirements of section 2.1. Thus, this domain is linearly ordered, with 0 as least element, and is closed under addition. Also, it is closed under multiplication, and division by a positive standard real. Note that for $t \in \mathbb{R}_{\geq 0} + I$, always t° exists and $t^\circ \leq t$.

$\widetilde{a}[p] = \sqrt{t}. \int_{\varepsilon \in I} a(p + t^\circ + \varepsilon)$
$\widetilde{\delta}[p] = \sqrt{t}. \int_{\varepsilon \in I} \delta(p + t^\circ + \varepsilon)$
$\widetilde{\widetilde{a}} = \widetilde{a}[0]$ $\qquad\qquad\qquad$ $\widetilde{\widetilde{\delta}} = \widetilde{\delta}[0]$
$\widetilde{a}(p) = \widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} a(p + \varepsilon)$ $\qquad$ $\widetilde{\delta}(p) = \widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} \delta(p + \varepsilon)$
$p \gg_s X = \widetilde{\widetilde{\delta}} + p \gg X$
$\sqrt{s} \, p. \, F = \sqrt{t}. \, F[t^\circ/p]$
$\sigma_{\approx}^r(X) = \sqrt{t}. \, (t+r)^\circ \gg X$
$r \gg_{st} X = \sqrt{t}. \, (t+r)^\circ \gg t^\circ \gg_s X$

TABLE 6. Standard time operators.

3.1 DEFINITIONS.

We have the definitions in table 6 in the algebra over the extended time domain $\mathbb{R}_{\geq 0}+I$. We will always have $t,u \in \mathbb{R}_{\geq 0}+I$, $p,q \in \mathbb{R}_{\geq 0}$, $r \in \mathbb{R}_{>0}$, $\varepsilon, \eta \in I$.

The *standard absolute time signature*, $\Sigma(ACP_{s\rho}\sqrt{})$, contains the following ingredients:

$\Sigma(ACP_{s\rho}\sqrt{})$: $\tilde{a}(p) \ (a \in A_\delta), \tilde{\tilde{\delta}}, +, \cdot,$

$\|, \mathbb{L}, \mid, \partial_H (H \subseteq A), \gg_s, \oplus,$

$\sqrt{}_s.$

The *standard relative time signature*, $\Sigma(ACP_{st})$, contains the following ingredients:

$\Sigma(ACP_{st})$: $\tilde{\tilde{a}} \ (a \in A_\delta), +, \cdot, \sigma^r_{\approx},$

$\|, \mathbb{L}, \mid, \partial_H (H \subseteq A), r \gg_{st}, \oplus.$

Since we have $\tilde{a}[0] = \tilde{\tilde{a}}$ and $\tilde{a}[r] = \sigma^r_{\approx}(\tilde{\tilde{a}})$ for all r>0, this signature also contains all constants of the form $\tilde{a}[p]$.

The *standard time signature*, $\Sigma(ST)$, is given by $\Sigma(ST) = \Sigma(ACP_{s\rho}\sqrt{}) \cup \Sigma(ACP_{st})$.

4. STANDARDLY INITIALIZED PROCESSES.

In sections 5 and 6, we will give direct axiomatisations of various subalgebras of $ACP\rho\sqrt{I}$, that are generated by signature elements of in section 3. Many of these axioms are not valid in the full algebra M_A^* over $\mathbb{R}_{\geq 0}+I$. In this section we define the notion of a *standardly initialised process*. The set of standardly initialised processes is closed under all operators of the standard time signature, and all axioms to be presented in sections 6 and 7 will hold in this algebra. We prove these facts at length in this section. We obtain a subalgebra $si-M_A^*$ of M_A^*. Similarly, we have a subalgebra $si-M_A$ of M_A (containing absolute time processes only) and a subalgebra $si-M_A^r$ of M_A^r (containing relative time processes only).

4.1 DEFINITION. Let $X \in P^*$. We say X is a *standardly initialised process*, $X \in SIP$, if

$X = \sqrt{}_s p. \ p \gg_s X.$

4.2 THEOREM. The following statements are equivalent:

i. $X \in SIP$

ii. $X = \sqrt{t}. \ t^\circ \gg_s X$

iii. $X = X + \tilde{\tilde{\delta}} \ \wedge \ X = \sqrt{t}. \ t^\circ \gg X.$

PROOF: i $\Leftrightarrow$ ii: By definition of $\sqrt{}_s$.

ii $\Leftrightarrow$ iii: If $X = \sqrt{t}. \ t^\circ \gg_s X$, then

$t \gg X = t \gg \sqrt{u}. \ u^\circ \gg_s X = t \gg (t^\circ \gg_s X + \tilde{\tilde{\delta}}) = t \gg (t^\circ \gg_s X) + t \gg \tilde{\tilde{\delta}} =$

$= t \gg (\sqrt{u}. \ u^\circ \gg_s X) + t \gg \tilde{\tilde{\delta}} = t \gg X + t \gg \tilde{\tilde{\delta}} = t \gg (X + \tilde{\tilde{\delta}})$. By extensionality (IA5) $X = X + \tilde{\tilde{\delta}}$.

Thus $X = \sqrt{t}. \ t^\circ \gg_s X \implies X = X + \tilde{\tilde{\delta}}$, and $X = X + \tilde{\tilde{\delta}}$ holds in both ii and iii. Using this,

$t \gg \sqrt{u}. \ u^\circ \gg_s X = t \gg (t^\circ \gg X + \tilde{\tilde{\delta}}) = t \gg (t^\circ \gg X) + t \gg \tilde{\tilde{\delta}} =$

$= t \gg t^\circ \gg X + t \gg t^\circ \gg \tilde{\tilde{\delta}} = t \gg t^\circ \gg (X + \tilde{\tilde{\delta}}) = t \gg t^\circ \gg X =$

$= t \gg (\sqrt{u}.\ u^\circ \gg X)$. Again by extensionality (IA5) $\sqrt{t}.\ t^\circ \gg_s X = \sqrt{t}.\ t^\circ \gg X$.

4.3 NOTE: A simple example of a process that is not standardly initialised is $\sqrt{t}.\ a(t+1)$. This process

does satisfy $X = X + \tilde{\tilde{\delta}}$. On the other hand, the process $\sqrt{t}.\ \int\limits_{r \approx t+1} a(r)$ is standardly initialised. We will

nevertheless see that the second process is not in the algebra generated by the signature $\Sigma(ST)$.

We proceed to show that the set of standardly initialised processes is closed under all operators of the standard time signature. Actually, we will show something stronger, viz. that both the condition $X = X + \tilde{\tilde{\delta}}$ and the condition $X = \sqrt{t}.\ t^\circ \gg X$ are preserved by all operators of $\Sigma(ST)$. Thus, the algebra $si\text{-}M_A^*$ is actually the intersection of two other interesting subalgebras of M_A^*. We first list some facts about initial abstraction that are proved as in [BAB92].

4.4 LEMMA. $\sqrt{t}.F + \sqrt{t}.G = \sqrt{t}.(F + G)$, $\sqrt{t}.F = \sqrt{t}.\ t \gg F$, $\sqrt{t}.F \mid \sqrt{t}.G = \sqrt{t}.(F \mid G)$,
$\sqrt{t}.F \mathbin{\mathbb{L}} \sqrt{t}.G = \sqrt{t}.(F \mathbin{\mathbb{L}} G)$, $\sqrt{t}.F \parallel \sqrt{t}.G = \sqrt{t}.(F \parallel G)$, $\sqrt{t}.F \oplus \sqrt{t}.G = \sqrt{t}.(F \oplus G)$.
PROOF: As in [BAB92].

4.5 CONSTANTS.
We start to verify the two conditions of 4.2.iii by looking at the constants of $\Sigma(ST)$.

4.5.1 PROPOSITION: $\tilde{\tilde{\delta}} + \tilde{\tilde{\delta}} = \tilde{\tilde{\delta}}$.
PROOF: A3.

4.5.2 PROPOSITION: $\tilde{\tilde{\delta}} = \sqrt{t}.\ t^\circ \gg \tilde{\tilde{\delta}}$.
PROOF: This was already used in the proof of 4.2. We give a more complete proof:

$$\tilde{\tilde{\delta}} = \sqrt{t}.\ \int\limits_{\varepsilon \in I} \delta(t^\circ+\varepsilon) = \sqrt{t}.\ \int\limits_{\varepsilon \in I} t^\circ \gg \delta(t^\circ+\varepsilon) = \sqrt{t}.\ t^\circ \gg \int\limits_{\varepsilon \in I} \delta(t^\circ+\varepsilon) = \sqrt{t}.\ t^\circ \gg \tilde{\tilde{\delta}}.$$

4.5.3 PROPOSITION: $\tilde{a}(p) + \tilde{\tilde{\delta}} = \tilde{a}(p)$.
PROOF: By definition.

4.5.5 PROPOSITION: $\tilde{a}(p) = \sqrt{t}.\ t^\circ \gg \tilde{a}(p)$.

PROOF: $\tilde{a}(p) = \int\limits_{\varepsilon \in I} a(p+\varepsilon) + \tilde{\tilde{\delta}} = \int\limits_{\varepsilon \in I} a(p+\varepsilon) + \sqrt{t}.\ \int\limits_{\varepsilon \in I} \delta(t^\circ+\varepsilon) =$

$= \sqrt{t}.\ (t \gg \int\limits_{\varepsilon \in I} a(p+\varepsilon) + \int\limits_{\varepsilon \in I} \delta(t^\circ+\varepsilon))$ (IA4).

Now we consider three cases:
i.   if $t \leq p$, then $t \gg a(p+\varepsilon) = a(p+\varepsilon) = t^\circ \gg a(p+\varepsilon)$ for all $\varepsilon \in I$;

ii. if $t° > p$, then $t \gg a(p+\varepsilon) = \delta(t)$ for all $\varepsilon \in I$, so $t \gg \int_{\varepsilon \in I} a(p+\varepsilon) + \int_{\varepsilon \in I} \delta(t°+\varepsilon)) = \int_{\varepsilon \in I} \delta(t°+\varepsilon))$ by ATA3;

iii. if $t = p + \varepsilon$ for some $\varepsilon \in I$, then $t° = p$, so $\sqrt{t}. \ (t \gg \int_{\varepsilon \in I} a(p+\varepsilon) + \int_{\varepsilon \in I} \delta(t°+\varepsilon)) =$

$$= \sqrt{t}. \ (t \gg \int_{\varepsilon \in I} a(p+\varepsilon) + t \gg \int_{\varepsilon \in I} \delta(t°+\varepsilon)) = \sqrt{t}. \ t \gg (\int_{\varepsilon \in I} a(p+\varepsilon) + \int_{\varepsilon \in I} \delta(t°+\varepsilon)) \ (ATB3) =$$

$$= \sqrt{t}. \ (\int_{\varepsilon \in I} a(p+\varepsilon) + \int_{\varepsilon \in I} \delta(t°+\varepsilon)) = \sqrt{t}. \ (t° \gg \int_{\varepsilon \in I} a(p+\varepsilon) + t° \gg \int_{\varepsilon \in I} \delta(t°+\varepsilon)).$$

We see that in all cases, we obtain

$$\tilde{a}(p) = \sqrt{t}. \ (t° \gg \int_{\varepsilon \in I} a(p+\varepsilon) + t° \gg \int_{\varepsilon \in I} \delta(t°+\varepsilon)) = \sqrt{t}. \ t° \gg (\int_{\varepsilon \in I} a(p+\varepsilon) + \int_{\varepsilon \in I} \delta(t°+\varepsilon)) = \sqrt{t}. \ t° \gg \tilde{a}(p).$$

4.5.6 PROPOSITION: $\widetilde{\widetilde{a}} + \widetilde{\widetilde{\delta}} = \widetilde{\widetilde{a}}$.

PROOF: $\widetilde{\widetilde{a}} + \widetilde{\widetilde{\delta}} = (\sqrt{t}. \int_{\varepsilon \in I} a(t°+\varepsilon)) + (\sqrt{t}. \int_{\varepsilon \in I} \delta(t°+\varepsilon)) = \sqrt{t}. \ (\int_{\varepsilon \in I} a(t°+\varepsilon) + \int_{\varepsilon \in I} \delta(t°+\varepsilon))$

(lemma 4.4) $= \sqrt{t}. \ (\int_{\varepsilon \in I} a(t°+\varepsilon) + \delta(t°+\varepsilon))$ (INT5) $= \sqrt{t}. \int_{\varepsilon \in I} a(t°+\varepsilon)$ (ATA4) $= \widetilde{\widetilde{a}}$.

4.5.7 PROPOSITION: $\widetilde{\widetilde{a}} = \sqrt{t}. \ t° \gg \widetilde{\widetilde{a}}$.

PROOF: $\widetilde{\widetilde{a}} = \sqrt{t}. \int_{\varepsilon \in I} a(t°+\varepsilon) = \sqrt{t}. \ t° \gg \int_{\varepsilon \in I} a(t°+\varepsilon) = \sqrt{t}. \ t° \gg \sqrt{u}. \int_{\varepsilon \in I} a(u°+\varepsilon) = \sqrt{t}. \ t° \gg \widetilde{\widetilde{a}}$.

4.6 ALTERNATIVE AND SEQUENTIAL COMPOSITION.
We continue with the operators $+, \cdot$.

4.6.1 PROPOSITION: $(X + \widetilde{\widetilde{\delta}}) + (Y + \widetilde{\widetilde{\delta}}) = (X + Y) + \widetilde{\widetilde{\delta}}$.
PROOF: Easy.

4.6.2 LEMMA: $\widetilde{\widetilde{\delta}} \cdot X = \widetilde{\widetilde{\delta}}$.

PROOF: $\widetilde{\widetilde{\delta}} \cdot X = (\sqrt{t}. \int_{\varepsilon \in I} \delta(t°+\varepsilon)) \cdot X = \sqrt{t}. \int_{\varepsilon \in I} \delta(t°+\varepsilon) \cdot X$ (IA7, INT6) $= \sqrt{t}. \int_{\varepsilon \in I} \delta(t°+\varepsilon)$ (ATA2) $= \widetilde{\widetilde{\delta}}$.

4.6.3 PROPOSITION: $(X + \widetilde{\widetilde{\delta}}) \cdot Y = X \cdot Y + \widetilde{\widetilde{\delta}}$.
PROOF: A4 and lemma 4.6.2.

4.6.4 PROPOSITION: $X = \sqrt{t}.\ t° \gg X \wedge Y = \sqrt{t}.\ t° \gg Y \Rightarrow (X + Y) = \sqrt{t}.\ t° \gg (X + Y)$.

PROOF: Straightforward, use lemma 4.4 and ATB3.

4.6.5 PROPOSITION: $X = \sqrt{t}.\ t° \gg X \Rightarrow X \cdot Y = \sqrt{t}.\ t° \gg X \cdot Y$.

PROOF: Straightforward, use IA7 and ATB4.

4.7 STANDARD INITIALISATION AND LEFT STRONG CHOICE.
We continue with the operators $\gg_s, \oplus$.

4.7.1 PROPOSITION: $p \gg_s X = p \gg_s X + \tilde{\tilde{\delta}}$.

PROOF: By definition.

4.7.2 PROPOSITION: $p \gg_s X = \sqrt{t}.\ t° \gg p \gg_s X$.

PROOF: $p \gg_s X = p \gg X + \tilde{\tilde{\delta}} = p \gg X + \sqrt{t}.\ \int_{\varepsilon \in I} \delta(t°+\varepsilon) = \sqrt{t}.\ (t \gg p \gg X + \int_{\varepsilon \in I} \delta(t°+\varepsilon))\ \ (IA4) =$

$= \sqrt{t}.\ (t \gg t° \gg p \gg X + t \gg t° \gg \int_{\varepsilon \in I} \delta(t°+\varepsilon))\ (SI7) = \sqrt{t}.\ t \gg (t° \gg p \gg X + t° \gg \tilde{\tilde{\delta}})\ (ATB3) =$

$= \sqrt{t}.\ (t° \gg p \gg X + t° \gg \tilde{\tilde{\delta}})\ (\text{lemma } 4.4) = \sqrt{t}.\ t° \gg (p \gg X + \tilde{\tilde{\delta}})\ (ATB3) = \sqrt{t}.\ t° \gg (p \gg_s X)$.

4.7.3 LEMMA: $\tilde{\tilde{\delta}} \oplus \tilde{\tilde{\delta}} = \tilde{\tilde{\delta}}$.

PROOF: $\tilde{\tilde{\delta}} \oplus \tilde{\tilde{\delta}} = \sqrt{t}.\ \int_{\varepsilon \in I} \delta(t°+\varepsilon) \underline{\oplus} \sqrt{t}.\ \int_{\eta \in I} \delta(t°+\eta) = \sqrt{t}.\ \int_{\varepsilon \in I} \delta(t°+\varepsilon) \underline{\oplus} \int_{\eta \in I} \delta(t°+\eta)\ (\text{lemma } 4.4) =$

$= \sqrt{t}.\ \int_{\varepsilon,\eta \in I} \delta(t°+\varepsilon) \underline{\oplus} \delta(t°+\eta)\ (INT13,14) = \sqrt{t}.\ \int_{\varepsilon<\eta} \delta(t°+\varepsilon) + \int_{\varepsilon\geq\eta} \delta(t°+\eta)\ (LSC1,2) =$

$= \sqrt{t}.\ \int_{\varepsilon \in I} \delta(t°+\varepsilon) = \tilde{\tilde{\delta}}$.

4.7.4 PROPOSITION: $X = X + \tilde{\tilde{\delta}} \wedge Y = Y + \tilde{\tilde{\delta}} \Rightarrow X \oplus Y = X \oplus Y + \tilde{\tilde{\delta}}$.

PROOF: Straightforward, use LSC4,6 and lemma 4.7.3.

4.7.5 PROPOSITION: $X = \sqrt{t}.\ t° \gg X \wedge Y = \sqrt{t}.\ t° \gg Y \Rightarrow X \oplus Y = \sqrt{t}.\ t° \gg (X \oplus Y)$.

PROOF: Straightforward, use lemma 4.4 and SI14.

4.8 PARALLEL COMPOSITION AND ENCAPSULATION.
We continue with the operators $\|, \mathbb{L}, |, \partial_H$.

4.8.1 LEMMA: $X = X + \tilde{\tilde{\delta}} \Rightarrow \tilde{\tilde{\delta}} \mathbb{L} X = \tilde{\tilde{\delta}}$.

PROOF: Assume X satisfies $X = X + \tilde{\tilde{\delta}}$. We derive

$$\widetilde{\widetilde{\delta}} \mathbin{\rotatebox[origin=c]{0}{$\Vdash$}} X = (\sqrt{t}.\ \int_{\varepsilon \in I} \delta(t°+\varepsilon)) \mathbin{\rotatebox[origin=c]{0}{$\Vdash$}} X = \sqrt{t}.\ (\int_{\varepsilon \in I} \delta(t°+\varepsilon) \mathbin{\rotatebox[origin=c]{0}{$\Vdash$}} t \gg X) \ (\text{IA8, INT9}) =$$

$$= \sqrt{t}.\ \int_{\varepsilon \in I} (\delta(t°+\varepsilon) \ \underline{\oplus}\ t \gg X)\cdot(t \gg X) \qquad\qquad (\text{since } t \gg X = 0 \gg t \gg X \text{ by SI2}) =$$

$$= \sqrt{t}.\ \int_{\varepsilon \in I} (\delta(t°+\varepsilon) \ \underline{\oplus}\ t \gg (X + \widetilde{\widetilde{\delta}}))\cdot(t \gg X) =$$

$$= \sqrt{t}.\ \int_{\varepsilon \in I} ((\delta(t°+\varepsilon) \ \underline{\oplus}\ t \gg X) + (\delta(t°+\varepsilon) \underline{\oplus}\ t \gg \widetilde{\widetilde{\delta}}))\cdot(t \gg X) =$$

$$= \sqrt{t}.\ \int_{\varepsilon \in I} ((\delta(t°+\varepsilon) \ \underline{\oplus}\ t \gg X) + \delta(t°+\varepsilon))\cdot(t \gg X) =$$

$$= \sqrt{t}.\ \int_{\varepsilon \in I} \delta(t°+\varepsilon)\cdot(t \gg X) \ (\text{SI15}) = \sqrt{t}.\ \int_{\varepsilon \in I} \delta(t°+\varepsilon) \ (\text{ATA2}) = \widetilde{\widetilde{\delta}}.$$

4.8.2 PROPOSITION: $(X + \widetilde{\widetilde{\delta}}) \mathbin{\rotatebox[origin=c]{0}{$\Vdash$}} (Y + \widetilde{\widetilde{\delta}}) = X \mathbin{\rotatebox[origin=c]{0}{$\Vdash$}} (Y + \widetilde{\widetilde{\delta}}) + \widetilde{\widetilde{\delta}}$.

PROOF: Straightforward, use CM4 and lemma 4.8.1.

4.8.4 LEMMA: $\widetilde{\widetilde{\delta}} \mid \widetilde{\widetilde{\delta}} = \widetilde{\widetilde{\delta}}$.

PROOF: $\widetilde{\widetilde{\delta}} \mid \widetilde{\widetilde{\delta}} = \sqrt{t}.\ \int_{\varepsilon \in I} \delta(t°+\varepsilon) \mid \sqrt{t}.\ \int_{\eta \in I} \delta(t°+\eta) = \sqrt{t}.\ \int_{\varepsilon \in I} \delta(t°+\varepsilon) \mid \int_{\eta \in I} \delta(t°+\eta)$ (lemma 4.4) =

$$= \sqrt{t}.\ \int_{\varepsilon,\eta \in I} \delta(t°+\varepsilon) \mid \delta(t°+\eta) \ (\text{INT10, INT11}) = \sqrt{t}.\ \int_{\varepsilon \in I} \delta(t°+\varepsilon) \ (\text{ATC1, ATC2}) = \widetilde{\widetilde{\delta}}.$$

4.8.5 PROPOSITION: $X = X + \widetilde{\widetilde{\delta}} \wedge Y = Y + \widetilde{\widetilde{\delta}} \Rightarrow X \mid Y = X \mid Y + \widetilde{\widetilde{\delta}}$.

PROOF: Straightforward, use CM8, CM9 and lemma 4.8.4.

4.8.6 PROPOSITION: $X = X + \widetilde{\widetilde{\delta}} \wedge Y = Y + \widetilde{\widetilde{\delta}} \Rightarrow X \parallel Y = X \parallel Y + \widetilde{\widetilde{\delta}}$.

PROOF: Straightforward, use CM1 and propositions 4.8.2, 4.8.5.

4.8.7 PROPOSITION: $X = \sqrt{t}.\ t° \gg X \wedge Y = \sqrt{t}.\ t° \gg Y \Rightarrow X \mathbin{\rotatebox[origin=c]{0}{$\Vdash$}} Y = \sqrt{t}.\ t° \gg (X \mathbin{\rotatebox[origin=c]{0}{$\Vdash$}} Y)$.

PROOF: Straightforward, use lemma 4.4 and SI8.

4.8.8 PROPOSITION: $X = \sqrt{t}.\ t° \gg X \wedge Y = \sqrt{t}.\ t° \gg Y \Rightarrow X \mid Y = \sqrt{t}.\ t° \gg (X \mid Y)$.

PROOF: Straightforward, use lemma 4.4 and SI9.

4.8.9 PROPOSITION: $X = \sqrt{t}.\ t° \gg X \wedge Y = \sqrt{t}.\ t° \gg Y \Rightarrow X \parallel Y = \sqrt{t}.\ t° \gg (X \parallel Y)$.

PROOF: Combine the previous propositions.

4.8.10 LEMMA: $\partial_H(\widetilde{\widetilde{\delta}}) = \widetilde{\widetilde{\delta}}$.

PROOF: $\partial_H(\widetilde{\widetilde{\delta}}) = \partial_H(\sqrt{t}. \int_{\varepsilon \in I} \delta(t^\circ + \varepsilon)) = \sqrt{t}. \int_{\varepsilon \in I} \partial_H(\delta(t^\circ + \varepsilon))$ (IA12, INT12) $= \sqrt{t}. \int_{\varepsilon \in I} \delta(t^\circ + \varepsilon)$ (D1) $= \widetilde{\widetilde{\delta}}$.

4.8.11 PROPOSITION: $\partial_H(X + \widetilde{\widetilde{\delta}}) = \partial_H(X) + \widetilde{\widetilde{\delta}}$.

PROOF: Trivial, use D3 and 4.8.10.

4.8.12 PROPOSITION: $X = \sqrt{t}. t^\circ \gg X \implies \partial_H(X) = \sqrt{t}. t^\circ \gg \partial_H(X)$.

PROOF: Straightforward, use IA12 en SI13.

4.9 POSITIVE TIME SHIFT, SHIFTED INITIALISATION.
Next, the operators $\sigma_{\approx}^r$, $r \gg_{st}$.

4.9.1 PROPOSITION: $\sigma_{\approx}^r(X) = \sigma_{\approx}^r(X) + \widetilde{\widetilde{\delta}}$.

PROOF: Note that since $r \in \mathbb{R}_{>0}$, $(t + r)^\circ = t^\circ + r > t^\circ + \varepsilon$ for all $\varepsilon \in I$. Using this,
$\sigma_{\approx}^r(X) = \sqrt{t}. (t+r)^\circ \gg X = \sqrt{t}. ((t+r)^\circ \gg X + \delta((t+r)^\circ))$ (SI5) $=$

$\quad = \sqrt{t}. ((t+r)^\circ \gg X + \delta((t+r)^\circ) + \int_{\varepsilon \in I} \delta(t^\circ + \varepsilon))$ (ATA2) $= \sqrt{t}. ((t+r)^\circ \gg X + \int_{\varepsilon \in I} \delta(t^\circ + \varepsilon)) =$

$\quad = \sqrt{t}. ((t+r)^\circ \gg X) + \sqrt{t}. \int_{\varepsilon \in I} \delta(t^\circ + \varepsilon)$ (lemma 4.4) $= \sigma_{\approx}^r(X) + \widetilde{\widetilde{\delta}}$.

4.9.2 PROPOSITION: $\sigma_{\approx}^r(X) = \sqrt{t}. t^\circ \gg \sigma_{\approx}^r(X)$.

PROOF: $\sigma_{\approx}^r(X) = \sqrt{t}. (t+r)^\circ \gg X = \sqrt{t}. t^\circ \gg (t+r)^\circ \gg X$ (SI2) $= \sqrt{t}. t^\circ \gg \sqrt{u}. (u+r)^\circ \gg X =$

$\quad = \sqrt{t}. t^\circ \gg \sigma_{\approx}^r(X)$.

4.9.3 PROPOSITION: $r \gg_{st} X = r \gg_{st} X + \widetilde{\widetilde{\delta}}$.

PROOF: As in 4.9.1.

4.9.4 PROPOSITION: $r \gg_{st} X = \sqrt{t}. t^\circ \gg (r \gg_{st} X)$.

PROOF: $r \gg_{st} X = \sqrt{t}. (t+r)^\circ \gg t^\circ \gg_s X = \sqrt{t}. t^\circ \gg (t+r)^\circ \gg t^\circ \gg_s X$ (SI7) $=$

$\quad = \sqrt{t}. t^\circ \gg \sqrt{u}. (u+r)^\circ \gg u^\circ \gg_s X = \sqrt{t}. t^\circ \gg (r \gg_{st} X)$.

4.10 STANDARD INITIAL ABSTRACTION.
We consider $\sqrt{}_s$.

4.10.1 PROPOSITION: $F = F + \widetilde{\widetilde{\delta}} \implies \sqrt{}_s p. F = \sqrt{}_s p. F + \widetilde{\widetilde{\delta}}$.

PROOF: $\sqrt{}_s p. F = \sqrt{}_s p. (F + \widetilde{\widetilde{\delta}}) = \sqrt{t}. (F[t^\circ/p] + t^\circ \gg \widetilde{\widetilde{\delta}}) = \sqrt{t}. F[t^\circ/p] + \sqrt{t}. t^\circ \gg \widetilde{\widetilde{\delta}} = \sqrt{}_s p. F + \widetilde{\widetilde{\delta}}$.

4.10.2 PROPOSITION: $F = \sqrt{t}.\ t^\circ \gg F \implies \sqrt{s}p.\ F = \sqrt{t}.\ t^\circ \gg \sqrt{s}p.\ F.$

PROOF: $t \gg \sqrt{s}p.\ F = t \gg \sqrt{u}.\ F[u^\circ/p] = t \gg F[t^\circ/p] = t \gg t^\circ \gg F[t^\circ/p] = t \gg (\sqrt{u}.\ u^\circ \gg F[u^\circ/p]) =$

   $= t \gg (\sqrt{u}.\ u^\circ \gg \sqrt{s}p.\ F).$ Now use IA5.

This finishes the proof that the algebra of standardly initialised processes is closed under all operators of the standard time signature. We proceed to prove additional identities that we will use in the axiomatisations in sections 6 and 7.

4.11 BPA WITH URGENT ACTIONS AND ABSOLUTE TIME.

First, we prove some identities that allow to derive a standard time variant BPAs$\rho\delta$ of BPA$\rho\delta$ as defined in 2.2. The familiar equation $X + \tilde{\tilde{\delta}} = X$ does not hold for all timed processes, as the example $\delta(0) + \tilde{\tilde{\delta}} = \tilde{\tilde{\delta}} \neq \delta(0)$ illustrates. This is one reason to limit ourselves to standardly initialised processes. In each case, we will indicate if we need a condition of standardly initialised processes.

4.11.1 PROPOSITION: $\tilde{\delta}(0) = \tilde{\tilde{\delta}}.$

PROOF: $\tilde{\delta}(0) = \tilde{\tilde{\delta}} + \int_{\varepsilon \in I} \delta(\varepsilon) = (\sqrt{t}.\ \int_{\eta \in I} \delta(t^\circ + \eta)) + \int_{\varepsilon \in I} \delta(\varepsilon) = \sqrt{t}.\ (\int_{\eta \in I} \delta(t^\circ + \eta) + \int_{\varepsilon \in I} t \gg \delta(\varepsilon)).$

If $t \gg \delta(\varepsilon) = \delta(t)$, the summand can be dropped by ATA2 since $t < t^\circ + \eta$ for some $\eta \in I$;

if $t \gg \delta(\varepsilon) = \delta(\varepsilon)$, the summand can also be dropped by ATA2 since $\varepsilon < t^\circ + 2\varepsilon$. In both cases

$\tilde{\delta}(0) = \sqrt{t}.\ (\int_{\eta \in I} \delta(t^\circ + \eta) + \int_{\varepsilon \in I} t \gg \delta(\varepsilon)) = \sqrt{t}.\ \int_{\eta \in I} \delta(t^\circ + \eta) = \tilde{\tilde{\delta}}.$

4.11.2 PROPOSITION: $\tilde{\delta}(p) \cdot X = \tilde{\delta}(p).$
PROOF: Easy.

4.11.3 PROPOSITION: $p < q \implies \tilde{\delta}(p) + \tilde{\delta}(q) = \tilde{\delta}(q).$
PROOF: Easy, from the definition.

4.11.4 PROPOSITION: $\tilde{a}(p) + \tilde{\delta}(p) = \tilde{a}(p).$
PROOF: Straightforward.

4.11.5 PROPOSITION: $X = \sqrt{t}.\ t^\circ \gg_s X \implies \tilde{a}(p) \cdot X = \tilde{a}(p) \cdot (p \gg_s X).$
COMMENT: This is an example of an identity that only holds for standardly initialised processes.
PROOF: $\tilde{a}(p) \cdot X = (\tilde{\tilde{\delta}} + \int_{\varepsilon \in I} a(p+\varepsilon)) \cdot X = \tilde{\tilde{\delta}} \cdot X + \int_{\varepsilon \in I} a(p+\varepsilon) \cdot X \ (\text{INT6}) =$

   $= \tilde{\tilde{\delta}} + \int_{\varepsilon \in I} a(p+\varepsilon) \cdot (p+\varepsilon \gg X) \ (\text{ATA5}) = \tilde{\tilde{\delta}} \cdot (p \gg_s X) + \int_{\varepsilon \in I} a(p+\varepsilon) \cdot (p+\varepsilon \gg p \gg_s X) \ (\text{assumption}) =$

$$= (\tilde{\tilde{\delta}} + \int_{\varepsilon \in I} a(p+\varepsilon)) \cdot (p \gg_s X) \quad (\text{ATA5, INT6}) = \tilde{a}(p) \cdot (p \gg_s X).$$

4.11.6 PROPOSITION: $p \leq q \Rightarrow p \gg_s \tilde{a}(q) = \tilde{a}(q)$.

PROOF: Suppose $p \leq q$, so $p < q + \varepsilon$ for each $\varepsilon \in I$. Then:

$$p \gg_s \tilde{a}(q) = \tilde{\tilde{\delta}} + p \gg (\tilde{\tilde{\delta}} + \int_{\varepsilon \in I} a(q+\varepsilon)) = \tilde{\tilde{\delta}} + p \gg \tilde{\tilde{\delta}} + \int_{\varepsilon \in I} p \gg a(q+\varepsilon) =$$

$$= \tilde{\tilde{\delta}} + \int_{\varepsilon \in I} \delta(p+\varepsilon) + \int_{\varepsilon \in I} a(q+\varepsilon) = \tilde{\tilde{\delta}} + \int_{\varepsilon \in I} (\delta(p+\varepsilon)+a(q+\varepsilon)) = \tilde{\tilde{}} \delta + \int_{\varepsilon \in I} a(q+\varepsilon)) = \tilde{a}(q).$$

4.11.7 PROPOSITION: $p > q \Rightarrow p \gg_s \tilde{a}(q) = \tilde{\delta}(p)$.

PROOF: Suppose $p > q$, so $p > q + \varepsilon$ for each $\varepsilon \in I$ as $p,q \in \mathbb{R}$. Then:

$$p \gg_s \tilde{a}(q) = \tilde{\tilde{\delta}} + p \gg (\tilde{\tilde{\delta}} + \int_{\varepsilon \in I} a(q+\varepsilon)) = \tilde{\tilde{\delta}} + p \gg \tilde{\tilde{\delta}} + \int_{\varepsilon \in I} p \gg a(q+\varepsilon) =$$

$$= \tilde{\tilde{\delta}} + \int_{\varepsilon \in I} \delta(p+\varepsilon) + \int_{\varepsilon \in I} \delta(p) = \tilde{\tilde{\delta}} + \int_{\varepsilon \in I} \delta(p+\varepsilon) + \delta(p) = \tilde{\tilde{\delta}} + \int_{\varepsilon \in I} \delta(p+\varepsilon)) = \tilde{\delta}(p).$$

4.11.8 PROPOSITION: $p \gg_s (X + Y) = (p \gg_s X) + (p \gg_s Y)$.

PROOF: Straightforward.

4.11.9 PROPOSITION: $p \gg_s (X \cdot Y) = (p \gg_s X) \cdot Y$.

PROOF: Straightforward.

4.12 PA WITH URGENT ACTIONS AND ABSOLUTE TIME.
We continue with identities that we will use to axiomatise PAs$\rho\delta$, the standard time variant of process algebra with free merge (merge without communication).

4.12.1 PROPOSITION: $p \leq q \Rightarrow \tilde{a}(p) \oplus \tilde{b}(q) = \tilde{a}(p)$.

PROOF: Straightforward, use INT13, INT14, lemma 4.6.3 and the fact that for each $\varepsilon \in I$, there is a $\eta \in I$ such that $p + \varepsilon < q + \eta$.

4.12.2 PROPOSITION: $p > q \Rightarrow \tilde{a}(p) \oplus \tilde{b}(q) = \tilde{\delta}(q)$.

PROOF: In this case, use that for each $\varepsilon \in I$ $p + \varepsilon < q$.

4.12.3 PROPOSITION: $X = 0 \gg_s Z \Rightarrow \tilde{a}(p) \parallel X = (\tilde{a}(p) \oplus X) \cdot X$.

PROOF: We consider 3 cases:

Case 1: Let $\varepsilon \in I$, $r \geq p + \varepsilon$. Then

$$r \gg (a(p + \varepsilon) \parallel X + \tilde{\tilde{\delta}}) = (r \gg a(p + \varepsilon) \parallel r \gg X) + r \gg \tilde{\tilde{\delta}} = \delta(r) \parallel r \gg X + r \gg \tilde{\tilde{\delta}} =$$

$$= (\delta(r) \oplus r \gg X) \cdot (r \gg X) + r \gg \tilde{\tilde{\delta}} \text{ (since } r \gg X = 0 \gg r \gg X \text{ by SI2)} = \delta(r) \cdot (r \gg X) + r \gg \tilde{\tilde{\delta}} \text{ (SI16)} =$$

$$= \delta(r) + r \gg \widetilde{\widetilde{\delta}} = \delta(r) \cdot X + r \gg \widetilde{\widetilde{\delta}} = (r \gg a(p + \varepsilon)) \cdot X + r \gg \widetilde{\widetilde{\delta}} =$$

$$= r \gg (a(p + \varepsilon) + a(p + \varepsilon) \oplus X) \cdot X + r \gg \widetilde{\widetilde{\delta}} \text{ (SI15)} =$$

$$= r \gg a(p + \varepsilon) \cdot X + r \gg (a(p + \varepsilon) \oplus X) \cdot X + r \gg \widetilde{\widetilde{\delta}} = \delta(r) + r \gg (a(p + \varepsilon) \oplus X) \cdot X + r \gg \widetilde{\widetilde{\delta}} =$$

$$= r \gg (a(p + \varepsilon) \oplus X) \cdot X + r \gg \widetilde{\widetilde{\delta}} = r \gg (a(p + \varepsilon) \oplus X) \cdot X + \widetilde{\widetilde{\delta}}).$$

<u>Case 2:</u> Let $\varepsilon \in I$, $p \le r < p + \varepsilon$. Then

$$r \gg (a(p + \varepsilon) \llcorner X + \widetilde{\widetilde{\delta}}) = (r \gg a(p + \varepsilon) \llcorner r \gg X) + r \gg \widetilde{\widetilde{\delta}} = a(p + \varepsilon) \llcorner r \gg X + r \gg \widetilde{\widetilde{\delta}} =$$

$$= (a(p + \varepsilon) \oplus r \gg X) \cdot (r \gg X) + r \gg \widetilde{\widetilde{\delta}} \text{ (as in case 1)} = a(p + \varepsilon) \cdot (r \gg X) + r \gg \widetilde{\widetilde{\delta}}$$

(since $r \gg X = r \gg (X + \widetilde{\widetilde{\delta}}) = r \gg X + r \gg \widetilde{\widetilde{\delta}} = r \gg X + r \gg \widetilde{\widetilde{\delta}} + \delta(p + 2\varepsilon) = r \gg X + \delta(p + 2\varepsilon)) =$

$$= a(p + \varepsilon) \cdot ((p + \varepsilon) \gg r \gg X) + r \gg \widetilde{\widetilde{\delta}} = a(p + \varepsilon) \cdot ((p + \varepsilon) \gg X) + r \gg \widetilde{\widetilde{\delta}} \text{ (by SI7, since } X = 0 \gg_s Z) =$$

$$= a(p + \varepsilon) \cdot X + r \gg \widetilde{\widetilde{\delta}} = (a(p + \varepsilon) \oplus r \gg X) \cdot X + r \gg \widetilde{\widetilde{\delta}} =$$

$$= r \gg (a(p + \varepsilon) \oplus X) \cdot X + r \gg \widetilde{\widetilde{\delta}} \text{ (SI14)} = r \gg (a(p + \varepsilon) \oplus X) \cdot X + \widetilde{\widetilde{\delta}}).$$

<u>Case 3:</u> Let $\varepsilon \in I$, $r < p$. Then

$$r \gg (a(p + \varepsilon) \llcorner X + \widetilde{\widetilde{\delta}}) = (r \gg a(p + \varepsilon) \llcorner r \gg X) + r \gg \widetilde{\widetilde{\delta}} = a(p + \varepsilon) \llcorner r \gg X + r \gg \widetilde{\widetilde{\delta}} =$$

$$= (a(p + \varepsilon) \oplus r \gg X) \cdot (r \gg X) + r \gg \widetilde{\widetilde{\delta}}. \text{ Now if } a(p + \varepsilon) \oplus r \gg X = a(p + \varepsilon), \text{ then we proceed as in}$$
case 2. Otherwise, by SI15, $a(p + \varepsilon) \oplus r \gg X$ must be an alternative composition of δ's with timestamps less than $p + \varepsilon$. In this case, we proceed as in case 1. We see that we have for all $\varepsilon \in I$, $r \in T$

$$r \gg (a(p + \varepsilon) \llcorner X + \widetilde{\widetilde{\delta}}) = r \gg (a(p + \varepsilon) \oplus X) \cdot X + \widetilde{\widetilde{\delta}}).$$

Now let $r \in T$. Then:

$$r \gg (\widetilde{a}(p) \llcorner X) = r \gg (\widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} a(p+\varepsilon)) \llcorner X) = \int_{\varepsilon \in I} r \gg (\widetilde{} \delta \llcorner X + a(p + \varepsilon) \llcorner X) \text{ (INT2, INT9, IA16)} =$$

$$= \int_{\varepsilon \in I} r \gg (\widetilde{} \delta + a(p + \varepsilon) \llcorner X) \text{ (lemma 4.8.1)} = \int_{\varepsilon \in I} r \gg (a(p + \varepsilon) \_ \oplus X) \cdot X + \widetilde{\widetilde{\delta}}) =$$

$$= r \gg \int_{\varepsilon \in I} (a(p + \varepsilon) \_ \oplus X) \cdot X + \widetilde{\widetilde{\delta}} \cdot X) \text{ (lemma 4.6.2)} =$$

$$= r \gg \int_{\varepsilon \in I} (a(p+\varepsilon) \_ \oplus X) \cdot X + (\widetilde{\widetilde{\delta}} \oplus X) \cdot X) \quad \text{(use lemma 4.7.3 and SI15)} =$$

$$= r \gg ((\int_{\varepsilon \in I} a(p+\varepsilon) + \widetilde{} \delta) \oplus X) \cdot X = r \gg (\widetilde{a}(p) \oplus X) \cdot X.$$

The proposition now follows by extensionality (IA5).

4.12.4 PROPOSITION: $Y = 0 \gg_s Z \Rightarrow \widetilde{a}(p) \cdot X \llcorner Y = (\widetilde{a}(p) \oplus Y) \cdot (X \parallel Y)$.

PROOF: Similar to 4.12.3.

4.13 COMMUNICATION AND ENCAPSULATION.
Next, we add axioms for the communication merge and encapsulation operator, in order to axiomatise ACPsρ, the standard time variant of ACPρ.

4.13.1 PROPOSITION: $p \ne q \Rightarrow \widetilde{a}(p) \mid \widetilde{b}(q) = \widetilde{\delta}(\min(p,q))$.

PROOF: Assume without loss of generality $p < q$. Note that since $p, q \in \mathbb{R}$, for all $\varepsilon, \eta \in I$ we have $p + \varepsilon < q + \eta$. Then

$$\widetilde{a}(p) \mid \widetilde{b}(q) = (\widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} a(p+\varepsilon)) \mid (\widetilde{\widetilde{\delta}} + \int_{\eta \in I} b(q+\eta)) = \widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} \int_{\eta \in I} a(p+\varepsilon) \mid b(q+\eta) \quad (\text{INT}10, 11) =$$

$$= \widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} \int_{\eta \in I} \delta(p+\varepsilon) = \widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} \delta(p+\varepsilon)) = \widetilde{\delta}(p).$$

4.13.2 PROPOSITION: $\widetilde{a}(p) \mid \widetilde{b}(p) = (a \mathbin{\top} b)(p)$.

PROOF: $\widetilde{a}(p) \mid \widetilde{b}(p) = (\widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} a(p+\varepsilon)) \mid (\widetilde{\widetilde{\delta}} + \int_{\eta \in I} b(p+\eta)) = \widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} \int_{\eta \in I} a(p+\varepsilon) \mid b(p+\eta) =$

$$= \widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} \int_{\eta \in I} a \mid b(p+\varepsilon) = \widetilde{\widetilde{\delta}} + \int_{\varepsilon \in I} a \mid b(p+\varepsilon)) = (a \mathbin{\top} b)(p).$$

4.13.3 PROPOSITION: $\widetilde{a}(p){\cdot}X \mid \widetilde{b}(q) = (\widetilde{a}(p) \mid \widetilde{b}(q)) \cdot X$.
PROOF: Similar to 4.13.1, 4.13.2.

4.13.4 PROPOSITION: $\widetilde{a}(p) \mid \widetilde{b}(q){\cdot}X = (\widetilde{a}(p) \mid \widetilde{b}(q)) \cdot X$.
PROOF: Similar to 4.13.1, 4.13.2.

4.13.5 PROPOSITION: $\widetilde{a}(p){\cdot}X \mid \widetilde{b}(q){\cdot}Y = (\widetilde{a}(p) \mid \widetilde{b}(q)) \cdot (X \parallel Y)$.
PROOF: Similar to 4.13.1, 4.13.2.

4.13.6 PROPOSITION: $\partial_H(\widetilde{a}(p)) = (\widetilde{\partial_H(a)})(p)$.
PROOF: Straightforward, using INT12.

4.14 STANDARD INITIAL ABSTRACTION.
We present identities used to axiomatise $\text{ACP}_{s\rho}\sqrt{}$, the standard time variant of $\text{ACP}\rho\sqrt{}$.

4.14.1 PROPOSITION: $\widetilde{a}[p] = \sqrt{}_s\, q.\ \widetilde{a}(p+q)$.

PROOF: $\widetilde{a}[p] = \sqrt{}t.\ \int_{\varepsilon \in I} a(p+t^\circ+\varepsilon) = \sqrt{}_s q.\ \int_{\varepsilon \in I} a(p+q+\varepsilon) = \sqrt{}_s q.\ \int_{\varepsilon \in I} a(p+q+\varepsilon) + \delta(q+\varepsilon) =$

$$= \sqrt{}_s q.\ \int_{\varepsilon \in I} a(p+q+\varepsilon) + \int_{\varepsilon \in I} \delta(q+\varepsilon) = \sqrt{}_s q.\ \int_{\varepsilon \in I} a(p+q+\varepsilon) + \widetilde{\widetilde{\delta}} = \sqrt{}_s q.\ \widetilde{a}(p+q).$$

4.14.2 PROPOSITION: $\sqrt{s}p.F = \sqrt{s}q.F[q/p]$ if q is not free in F.

PROOF: Suppose q is not free in F. Then

$\sqrt{s}p.F = \sqrt{t}. F[t°/p] = \sqrt{s}q. F[t°/p][q/t°] = \sqrt{s}q.F[q/p]$.

4.14.3 PROPOSITION: $p \gg_s \sqrt{s}q.F = p \gg_s F[p/q]$.

PROOF: $p \gg_s \sqrt{s}q.F = p \gg \sqrt{t}. F[t°/q] + \tilde{\tilde{\delta}} = p \gg F[t°/q][p/t] + \tilde{\tilde{\delta}} = p \gg F[p/q] + \tilde{\tilde{\delta}} = p \gg_s F[p/q]$.

4.14.4 PROPOSITION: $\sqrt{s}q. \sqrt{s}p. F = \sqrt{s}q. F[q/p]$.
PROOF: $\sqrt{s}q. \sqrt{s}p.F = \sqrt{t}. \sqrt{u}. F[u°/p][t°/q] = \sqrt{t}. F[u°/p][t°/q][t/u] = \sqrt{t}. F[t°/p][t°/q] =$

$= \sqrt{t}. F[q/p][t°/q] = \sqrt{s}q.F[q/p]$.

4.14.5 PROPOSITION: $X = \sqrt{s}p. X$.
PROOF: $X = \sqrt{t}. X = \sqrt{s}p. X$.

4.14.6 PROPOSITION: $X = \sqrt{t}. t° \gg_s X \wedge Y = \sqrt{t}. t° \gg_s Y \wedge \forall p \in \mathbb{R}_{\geq 0} \ p \gg_s X = p \gg_s Y \implies X = Y$.
PROOF: Suppose the conditions hold. Let $t \in \mathbb{R}_{\geq 0}+I$. Then

$t \gg X = t \gg (\sqrt{u}. u° \gg_s X) = t \gg (t° \gg_s X) = t \gg (t° \gg_s Y) = t \gg (\sqrt{u}. u° \gg_s Y) = t \gg Y$.

Now apply extensionality, IA5.

4.14.7 PROPOSITION: $X = \sqrt{t}. t° \gg_s X \implies (\sqrt{s}p.F) + X = \sqrt{s}p.(F + p \gg_s X)$.
PROOF: $(\sqrt{s}p.F) + X = \sqrt{t}. F[t°/p] + \sqrt{t}. t° \gg_s X = \sqrt{t}. (F[t°/p] + t° \gg_s X) = \sqrt{s}p.(F + p \gg_s X)$.

4.14.8 PROPOSITION: $(\sqrt{s}p.F)\cdot X = \sqrt{s}p.(F\cdot X)$, $\partial_H(\sqrt{s}p.F) = \sqrt{s}p.\partial_H(F)$
PROOF: Directly from IA7, IA12.

4.14.9 PROPOSITION: $X = \sqrt{t}. t° \gg_s X \implies (\sqrt{s}p.F) \mathbb{L} X = \sqrt{s}p.(F \mathbb{L} p \gg_s X)$,
$X \mathbb{L} (\sqrt{s}p.F) = \sqrt{s}p.(p \gg_s X \mathbb{L} F)$, $(\sqrt{s}p.F) \mid X = \sqrt{s}p.(F \mid p \gg_s X)$, $X \mid (\sqrt{s}p.F) = \sqrt{s}p.(p \gg_s X \mid F)$,
$(\sqrt{s}p.F) \oplus X = \sqrt{s}p.(F \oplus p \gg_s X)$, $X \oplus (\sqrt{s}p.F) = \sqrt{s}p.(p \gg_s X \oplus F)$.
PROOF: As 4.14.8, using IA 8,9,10,11,13,14.

4.15 BPA WITH URGENT ACTIONS AND RELATIVE TIME.
Now we present identities that will be used in order to directly axiomatize the relative time algebras in section 7. First, BPA$_{st}$.

4.15.1 PROPOSITION: $\sigma_{\approx}^{r} \circ \sigma_{\approx}^{p}(X) = \sigma_{\approx}^{r+p}(X)$.

PROOF: $\sigma_{\approx}^{r} \circ \sigma_{\approx}^{p}(X) = \sqrt{t}. (t+r)° \gg (\sqrt{u}. (u+p)° \gg X) = \sqrt{t}. (t+r)° \gg ((t+r)°+p)° \gg X) =$

$= \sqrt{t}. (t+r)° \gg (t+r+p)° \gg X = \sqrt{t}. (t+r+p)° \gg X \ (SI2) = \sigma_{\approx}^{r+p}(X)$.

4.15.2 PROPOSITION: $\sigma_{\approx}^{r}(X) + \sigma_{\approx}^{r}(Y) = \sigma_{\approx}^{r}(X + Y)$, $\sigma_{\approx}^{r}(X)\cdot Y = \sigma_{\approx}^{r}(X\cdot Y)$.

PROOF: Straightforward.

4.16 LEFT STRONG CHOICE AND SHIFTED INITIALISATION.

4.16.1 PROPOSITION: $\tilde{\tilde{a}} \oplus \tilde{\tilde{b}} = \tilde{\tilde{a}}$.

PROOF: As 4.12.1, using lemma 4.4.

4.16.2 PROPOSITION: $\tilde{\tilde{a}} \oplus \sigma^r_{\approx}(X) = \tilde{\tilde{a}}$.

PROOF: $\tilde{\tilde{a}} \oplus \sigma^r_{\approx}(X) = \sqrt{t}. \int\limits_{\varepsilon \in I} a(t°+\varepsilon) \oplus \sqrt{t}. (t+r)° \gg X =$

$= \sqrt{t}. \int\limits_{\varepsilon \in I} a(t°+\varepsilon) \oplus (t+r)° \gg X \text{ (lemma 4.4)} = \sqrt{t}. \int\limits_{\varepsilon \in I} a(t°+\varepsilon) \oplus (t°+\varepsilon) \gg (t+r)° \gg X \text{ (SI2)} =$

$= \sqrt{t}. \int\limits_{\varepsilon \in I} a(t°+\varepsilon) \text{ (SI16)} = \tilde{\tilde{a}}.$

4.16.3 PROPOSITION: $\sigma^r_{\approx}(X) \oplus \tilde{\tilde{a}} = \tilde{\tilde{\delta}}$.

PROOF: $\sigma^r_{\approx}(X) \oplus \tilde{\tilde{a}} = \sqrt{t}. (t+r)° \gg X \oplus \sqrt{t}. \int\limits_{\varepsilon \in I} a(t°+\varepsilon) =$

$= \sqrt{t}. (t+r)° \gg X \oplus \int\limits_{\varepsilon \in I} a(t°+\varepsilon) \text{ (lemma 4.4)} = \sqrt{t}. \int\limits_{\varepsilon \in I} (t+r)° \gg X \oplus a(t°+\varepsilon) \text{ (INT14)} =$

$= \sqrt{t}. \int\limits_{\varepsilon \in I} (t°+\varepsilon) \gg (t+r)° \gg X \oplus a(t°+\varepsilon) \text{ (SI2)} = \sqrt{t}. \int\limits_{\varepsilon \in I} \delta(t°+\varepsilon) \text{ (SI17)} = \tilde{\tilde{\delta}}.$

4.16.4 PROPOSITION: $\sigma^r_{\approx}(X) \oplus \sigma^r_{\approx}(Y) = \sigma^r_{\approx}(X \oplus Y)$.

PROOF: $\sigma^r_{\approx}(X) \oplus \sigma^r_{\approx}(Y) = \sqrt{t}. (t+r)° \gg X \oplus \sqrt{t}. (t+r)° \gg Y =$

$= \sqrt{t}. (t+r)° \gg (X \oplus Y) \text{ (lemma 4.4, SI14)} = \sigma^r_{\approx}(X \oplus Y).$

4.16.5 PROPOSITION: $r \gg_{st} \tilde{\tilde{a}} = \sigma^r_{\approx}(\tilde{\tilde{\delta}})$.

PROOF: $r \gg_{st} \tilde{\tilde{a}} = \sqrt{t}. (t+r)° \gg t° \gg_s \tilde{\tilde{a}} = \sqrt{t}. (t+r)° \gg (\tilde{\tilde{\delta}} + \int\limits_{\varepsilon \in I} a(t°+\varepsilon)) =$

$= \sqrt{t}. (t+r)° \gg \tilde{\tilde{\delta}} + \int\limits_{\varepsilon \in I} (t+r)° \gg a(t°+\varepsilon) = \sqrt{t}. \int\limits_{\varepsilon \in I} \delta((t+r)°+\varepsilon)) + \delta((t+r)°) = \sqrt{t}. \int\limits_{\varepsilon \in I} \delta((t+r)°+\varepsilon)) =$

$= \sqrt{t}. (t+r)° \gg \tilde{\tilde{\delta}} = \sigma^r_{\approx}(\tilde{\tilde{\delta}}).$

4.16.6 PROPOSITION: $r \gg_{st} (X + Y) = r \gg_{st} X + r \gg_{st} Y$.

PROOF: Straightforward.

4.16.7 PROPOSITION: $r \gg_{st} (X \cdot Y) = (r \gg_{st} X) \cdot Y$.

PROOF: Straightforward.

4.16.8 PROPOSITION: $X = X + \widetilde{\widetilde{\delta}} \Rightarrow r \gg_{st} \sigma^r_{\approx}(X) = \sigma^r_{\approx}(X)$.

PROOF: $r \gg_{st} \sigma^r_{\approx}(X) = \sqrt{t}.\ (t+r)^\circ \gg t^\circ \gg_s (t+r)^\circ \gg X = \sqrt{t}.\ (t+r)^\circ \gg \widetilde{\widetilde{\delta}} + (t+r)^\circ \gg t^\circ \gg (t+r)^\circ \gg X =$

$\quad = \sqrt{t}.\ (t+r)^\circ \gg \widetilde{\widetilde{\delta}} + (t+r)^\circ \gg X$ (SI7, SI2) $= \sqrt{t}.\ (t+r)^\circ \gg (\widetilde{\widetilde{\delta}} + X) = \sqrt{t}.\ (t+r)^\circ \gg X = \sigma^r_{\approx}(X)$.

4.16.9 PROPOSITION: $p > r \Rightarrow p \gg_{st} \sigma^r_{\approx}(X) = \sigma^r_{\approx}((p-r) \gg_{st} X)$.

PROOF: $p \gg_{st} \sigma^r_{\approx}(X) = \sqrt{t}.\ (t+p)^\circ \gg t^\circ \gg_s (t+r)^\circ \gg X = \sqrt{t}.\ (t+p)^\circ \gg \widetilde{\widetilde{\delta}} + (t+p)^\circ \gg t^\circ \gg (t+r)^\circ \gg X =$

$\quad = \sqrt{t}.\ (t+p)^\circ \gg \widetilde{\widetilde{\delta}} + (t+p)^\circ \gg (t+r)^\circ \gg X$ (SI7) $= \sqrt{t}.\ (t+p)^\circ \gg (t+r)^\circ \gg_s X =$

$\quad = \sqrt{t}.\ (t+r)^\circ \gg (t+p)^\circ \gg (t+r)^\circ \gg_s X$ (SI7) $= \sqrt{t}.\ (t+r)^\circ \gg \sqrt{u}.\ (u+p-r)^\circ \gg u^\circ \gg_s X = \sigma^r_{\approx}((p-r) \gg_{st} X)$.

4.17 FREE MERGE.
Next we derive some equations for the left merge in relative standard time, used to axiomatise PA_{st}.

4.17.1 PROPOSITION: $X = \sqrt{t}.\ t^\circ \gg_s X \Rightarrow \widetilde{\widetilde{a}} \mathbin{\rule[-0.1ex]{0.4pt}{1.6ex}\rule[-0.1ex]{0.4pt}{1.6ex}} X = \widetilde{\widetilde{a}} \cdot X$.

PROOF: Assume (equivalently) that X satisfies $X = X + \widetilde{\widetilde{\delta}} \ \wedge\ X = \sqrt{t}.\ t^\circ \gg X$.

Note that $\widetilde{\widetilde{a}} = \sqrt{t}.\ \int_{\varepsilon \in I} a(t^\circ + \varepsilon) = \sqrt{t}.\ \int_{\varepsilon \in I} t \gg a(t^\circ + \varepsilon) = \sqrt{t}.\ \int_{\varepsilon \in I} a(t + \varepsilon)$. We derive

$\widetilde{\widetilde{a}} \mathbin{\rule[-0.1ex]{0.4pt}{1.6ex}\rule[-0.1ex]{0.4pt}{1.6ex}} X = (\sqrt{t}.\ \int_{\varepsilon \in I} a(t+\varepsilon)) \mathbin{\rule[-0.1ex]{0.4pt}{1.6ex}\rule[-0.1ex]{0.4pt}{1.6ex}} X = \sqrt{t}.\ \int_{\varepsilon \in I} a(t+\varepsilon) \mathbin{\rule[-0.1ex]{0.4pt}{1.6ex}\rule[-0.1ex]{0.4pt}{1.6ex}} t \gg X$ (IA8) $= \sqrt{t}.\ (\int_{\varepsilon \in I} a(t+\varepsilon) \ \underline{\oplus}\ (t \gg X)) \cdot (t \gg X) =$

$\quad = \sqrt{t}.\ (\int_{\varepsilon \in I} a(t+\varepsilon) \ \underline{\oplus}\ (t \gg X + t \gg \widetilde{\widetilde{\delta}})) \cdot (t \gg X) = \sqrt{t}.\ (\int_{\varepsilon \in I} a(t+\varepsilon) \ \underline{\oplus}\ (t \gg X + t \gg \widetilde{\widetilde{\delta}} + \delta(t+2\varepsilon))) \cdot (t \gg X) =$

$\quad = \sqrt{t}.\ (\int_{\varepsilon \in I} a(t+\varepsilon) \ \underline{\oplus}\ (t \gg X) + a(t+\varepsilon) \underline{\oplus} \delta(t+2\varepsilon)) \cdot (t \gg X) =$

$\quad = \sqrt{t}.\ (\int_{\varepsilon \in I} a(t+\varepsilon) \ \underline{\oplus}\ (t \gg X) + a(t+\varepsilon)) \cdot (t \gg X) = \sqrt{t}.\ \int_{\varepsilon \in I} a(t+\varepsilon) \cdot (t \gg X)$ (SI15) $=$

$\quad = \sqrt{t}.\ \int_{\varepsilon \in I} a(t+\varepsilon) \cdot (t \gg t^\circ \gg X)$ (by assumption) $= \sqrt{t}.\ \int_{\varepsilon \in I} a(t+\varepsilon) \cdot ((t+\varepsilon) \gg t \gg t^\circ \gg X)$ (ATA5) $=$

$\quad = \sqrt{t}.\ \int_{\varepsilon \in I} a(t+\varepsilon) \cdot ((t+\varepsilon) \gg t^\circ \gg X)$ (SI7) $= \sqrt{t}.\ \int_{\varepsilon \in I} a(t+\varepsilon) \cdot ((t+\varepsilon) \gg X)$ (by assumption, $(t+\varepsilon)^\circ = t^\circ$) $=$

$\quad = \sqrt{t}.\ \int_{\varepsilon \in I} a(t+\varepsilon) \cdot X$ (ATA5) $= (\sqrt{t}.\ \int_{\varepsilon \in I} a(t+\varepsilon)) \cdot X$ (INT6, IA7) $= \widetilde{\widetilde{a}} \cdot X$.

4.17.2 PROPOSITION: $Y = \sqrt{t}.\ t^\circ \gg_s Y \Rightarrow (\widetilde{\widetilde{a}} \cdot X) \mathbin{\rule[-0.1ex]{0.4pt}{1.6ex}\rule[-0.1ex]{0.4pt}{1.6ex}} Y = \widetilde{\widetilde{a}} \cdot (X \parallel Y)$.

PROOF: Similar to the previous proposition.

4.17.3 PROPOSITION: $\sigma_{\approx}^r(X) \mathbin{\mathbb{L}} \sigma_{\approx}^r(Y) = \sigma_{\approx}^r(X \mathbin{\mathbb{L}} Y)$.

PROOF: $\sigma_{\approx}^r(X) \mathbin{\mathbb{L}} \sigma_{\approx}^r(Y) = (\sqrt{t}.\,(t+r)^\circ \gg X) \mathbin{\mathbb{L}} (\sqrt{t}.\,(t+r)^\circ \gg Y) = \sqrt{t}.\,((t+r)^\circ \gg X) \mathbin{\mathbb{L}} ((t+r)^\circ \gg Y)) =$

$\quad = \sqrt{t}.\,(t+r)^\circ \gg (X \mathbin{\mathbb{L}} Y) = \sigma_{\approx}^r(X \mathbin{\mathbb{L}} Y)$.

4.17.4 PROPOSITION: $Y = \sqrt{t}.\,t^\circ \gg_{\mathsf{s}} Y \implies \sigma_{\approx}^r(X) \mathbin{\mathbb{L}} Y = (\sigma_{\approx}^r(X) \mathbin{\underline{\oplus}} Y) \mathbin{\mathbb{L}} (r \gg_{\mathsf{st}} Y)$

PROOF: $\sigma_{\approx}^r(X) \mathbin{\mathbb{L}} Y = (\sqrt{t}.\,(t+r)^\circ \gg X) \mathbin{\mathbb{L}} Y = \sqrt{t}.\,((t+r)^\circ \gg X \mathbin{\mathbb{L}} t \gg Y)$ (IA8) $=$

$\quad = \sqrt{t}.\,((t+r)^\circ \gg X \mathbin{\underline{\oplus}} t \gg Y) \mathbin{\mathbb{L}} (t+r)^\circ \gg t \gg Y$ (SI10) $=$

$\quad = \sqrt{t}.\,(t \gg (t+r)^\circ \gg X \mathbin{\underline{\oplus}} t \gg Y) \mathbin{\mathbb{L}} (t+r)^\circ \gg t \gg t^\circ \gg_{\mathsf{s}} Y$ (SI2, assumption) $=$

$\quad = \sqrt{t}.\,(t \gg \sigma_{\approx}^r(X) \mathbin{\underline{\oplus}} t \gg Y) \mathbin{\mathbb{L}} (t+r)^\circ \gg t^\circ \gg_{\mathsf{s}} Y$ (SI7) $=$

$\quad = \sqrt{t}.\,t \gg (\sigma_{\approx}^r(X) \mathbin{\underline{\oplus}} Y) \mathbin{\mathbb{L}} t \gg (r \gg_{\mathsf{st}} Y)$ (SI14) $=$

$\quad = \sqrt{t}.\,t \gg ((\sigma_{\approx}^r(X) \mathbin{\underline{\oplus}} Y) \mathbin{\mathbb{L}} (r \gg_{\mathsf{st}} Y)$ (SI8) $= (\sigma_{\approx}^r(X) \mathbin{\underline{\oplus}} Y) \mathbin{\mathbb{L}} (r \gg_{\mathsf{st}} Y)$ (lemma 4.4, IA4).

4.18 MERGE WITH COMMUNICATION.
Now we consider identities concerning parallel composition with communication in relative time, to be used in order to axiomatise ACP_{st}.

4.18.1 PROPOSITION: $\widetilde{\widetilde{a}} \mid \widetilde{\widetilde{b}} = a \overset{\approx}{\mid} b$.

PROOF: $\widetilde{\widetilde{a}} \mid \widetilde{\widetilde{b}} = \sqrt{t}.\displaystyle\int_{\varepsilon \in I} a(t^\circ + \varepsilon) \mid \sqrt{t}.\int_{\eta \in I} b(t^\circ + \eta)) =$

$\quad = \sqrt{t}.\displaystyle\int_{\varepsilon \in I} a(t^\circ + \varepsilon) \mid \int_{\eta \in I} b(t^\circ + \eta) \qquad\qquad$ (lemma 4.7.3) $=$

$\quad = \sqrt{t}.\displaystyle\int_{\varepsilon \in I} \int_{\eta \in I} a(t^\circ + \varepsilon)) \mid b(t^\circ + \eta) \qquad\qquad$ (INT10, INT11) $=$

$\quad = \sqrt{t}.\displaystyle\int_{\varepsilon \in I} \int_{\eta \in I} \delta(t^\circ + \varepsilon) + (a \mid b)(t^\circ + \eta) + \delta(t^\circ + \eta) \qquad\qquad$ (ATC1, ATC2, INT2) $=$

$\quad = \sqrt{t}.\displaystyle\int_{\eta \in I} (a \mid b)(t^\circ + \eta) \qquad\qquad$ (ATA3, INT2) $= a \overset{\approx}{\mid} b$.

4.18.2 PROPOSITION: $(\widetilde{\widetilde{a}} \cdot X) \mid \widetilde{\widetilde{b}} = (\widetilde{\widetilde{a|b}}) \cdot X$, $\widetilde{\widetilde{a}} \mid (\widetilde{\widetilde{b}} \cdot X) = (\widetilde{\widetilde{a|b}}) \cdot X$, $(\widetilde{\widetilde{a}} \cdot X) \mid (\widetilde{\widetilde{b}} \cdot Y) = (\widetilde{\widetilde{a|b}}) \cdot (X \parallel Y)$.
PROOF: Similar to the proof of 4.18.1.

4.18.3 PROPOSITION: $\widetilde{\widetilde{a}} \mid \sigma_{\approx}^r(X) = \widetilde{\widetilde{\delta}}$.

PROOF: $\tilde{\tilde{a}} \mid \sigma_{\approx}^{r}(X) = \sqrt{t}.\int_{\varepsilon \in I} a(t°+\varepsilon) \mid \sqrt{t}.\ (t+r)° \gg X = \sqrt{t}.\int_{\varepsilon \in I} a(t°+\varepsilon) \mid (t+r)° \gg X$ (lemma 4.4) $=$

$$= \sqrt{t}.\int_{\varepsilon \in I} a(t°+\varepsilon) \mid (t°+\varepsilon) \gg (t+r)° \gg X \text{ (SI2)} = \sqrt{t}.\int_{\varepsilon \in I} \delta(t°+\varepsilon) \text{ (SI12)} = \tilde{\tilde{\delta}}.$$

4.18.4 PROPOSITION: $\sigma_{\approx}^{r}(X) \mid \tilde{\tilde{a}} = \tilde{\tilde{\delta}}$, $(\tilde{\tilde{a}}\cdot X)|\sigma_{\approx}^{r}(Y) = \tilde{\tilde{\delta}}$, $\sigma_{\approx}^{r}(X) \mid (\tilde{\tilde{a}}\cdot Y) = \tilde{\tilde{\delta}}$.

PROOF: Similar to the proof of 4.18.3.

4.18.5 PROPOSITION: $\sigma_{\approx}^{r}(X) \mid \sigma_{\approx}^{r}(Y) = \sigma_{\approx}^{r}(X|Y)$.

PROOF: $\sigma_{\approx}^{r}(X) \mid \sigma_{\approx}^{r}(Y) = \sqrt{t}.(t+r)° \gg X \mid \sqrt{t}.(t+r)° \gg Y = \sqrt{t}.(t+r)° \gg X \mid (t+r)° \gg Y$ (lemma 4.4) $=$

$$= \sqrt{t}.(t+r)° \gg (X \mid Y) \text{ (SI9)} = \sigma_{\approx}^{r}(X|Y).$$

4.19 ENCAPSULATION.
We continue with equations for the encapsulation operator in relative time, to be used for ACP$_{st}$.

4.19.1 PROPOSITION: $\partial_H(\tilde{\tilde{a}}) = \tilde{\tilde{a}}$ if $a \notin H$.

PROOF: $\partial_H(\tilde{\tilde{a}}) = \partial_H(\sqrt{t}.\int_{\varepsilon \in I} a(t°+\varepsilon)) = \sqrt{t}.\ \partial_H(\int_{\varepsilon \in I} a(t°+\varepsilon))$ (IA12) $=$

$$= \sqrt{t}.\int_{\varepsilon \in I} \partial_H(a(t°+\varepsilon)) \text{ (INT12)} = \sqrt{t}.\int_{\varepsilon \in I} a(t°+\varepsilon) \text{ (D1)} = \tilde{\tilde{a}}.$$

4.19.2 PROPOSITION: $\partial_H(\tilde{\tilde{a}}) = \tilde{\tilde{\delta}}$ if $a \in H$.

PROOF: $\partial_H(\tilde{\tilde{a}}) = \partial_H(\sqrt{t}.\int_{\varepsilon \in I} a(t°+\varepsilon)) = \sqrt{t}.\ \partial_H(\int_{\varepsilon \in I} a(t°+\varepsilon))$ (IA12) $=$

$$= \sqrt{t}.\int_{\varepsilon \in I} \partial_H(a(t°+\varepsilon)) \text{ (INT12)} = \sqrt{t}.\int_{\varepsilon \in I} \delta(t°+\varepsilon) \text{ (D2)} = \tilde{\tilde{\delta}}.$$

4.19.3 PROPOSITION: $\partial_H(\sigma_{\approx}^{r}(X)) = \sigma_{\approx}^{r}(\partial_H(X))$.

PROOF: $\partial_H(\sigma_{\approx}^{r}(X)) = \partial_H(\sqrt{t}.(t+r)° \gg X) = \sqrt{t}.\ \partial_H((t+r)° \gg X)$ (IA12) $= \sqrt{t}.(t+r)° \gg \partial_H(X)$ (SI13) $=$

$$= \sigma_{\approx}^{r}(\partial_H(X)).$$

4.20 EMBEDDING STANDARD RELATIVE TIME INTO STANDARD ABSOLUTE TIME WITH INITIAL ABSTRACTION.
We finish this section with some identities that are used to embed BPA$_{\delta st}$ into BPA$_{s\rho\sqrt{}}$, PA$_{st}$ into PA$_{s\rho\sqrt{}}$ and ACP$_{st}$ into ACP$_{s\rho\sqrt{}}$.

4.20.1 PROPOSITION: $\tilde{\tilde{a}} = \sqrt{s}p.\ \tilde{a}(p)$.
PROOF: From the definition.

4.20.2 PROPOSITION: $\sigma_{\approx}^{r}(X) = \sqrt{s}p. \ (p+r) \gg_s X$.

PROOF: $\sigma_{\approx}^{r}(X) = \sqrt{t}. \ (t+r)^\circ \gg X = \sqrt{t}. \ (\delta((t+r)^\circ) + (t+r)^\circ \gg X)$ (SI5) =

$$= \sqrt{t}. \ (\int_{\varepsilon \in I} \delta(t^\circ + \varepsilon) + \delta((t+r)^\circ) + (t+r)^\circ \gg X) = \sqrt{t}. \ (\int_{\varepsilon \in I} \delta(t^\circ + \varepsilon) + (t+r)^\circ \gg X) =$$

$$= \sqrt{t}. \ (\tilde{\tilde{\delta}} + (t+r)^\circ \gg X) = \sqrt{s}p. \ (\tilde{\tilde{\delta}} + (p+r \gg X)) = \sqrt{s}p. \ (p+r) \gg_s X.$$

4.20.3 PROPOSITION: $r \gg_{st} X = \sqrt{s}p. \ (p+r) \gg_s p \gg_s X$.

PROOF: $r \gg_{st} X = \sqrt{t}. \ (t+r)^\circ \gg t^\circ \gg_s X = \sqrt{t}. \ \delta((t+r)^\circ) + (t+r)^\circ \gg t^\circ \gg_s X$ (SI5) =

$$= \sqrt{t}. \ \int_{\varepsilon \in I} \delta(t^\circ + \varepsilon) + \delta((t+r)^\circ) + (t+r)^\circ \gg t^\circ \gg_s X = \sqrt{t}. \ \tilde{\tilde{\delta}} + (t+r)^\circ \gg t^\circ \gg_s X =$$

$$= \sqrt{t}. \ (t+r)^\circ \gg_s t^\circ \gg_s X = \sqrt{s}p. \ (p+r) \gg_s p \gg_s X.$$

5. STANDARDISED PROCESSES.

In section 2, we have sketched a theory ACPρ√I and a model M_A^* that contain both standard real time and nonstandard real time processes. In section 4, we concentrated on the subalgebra of standardly initialised processes. In this section, we will concentrate on the further subalgebra and the model generated by the standard time processes. For this reason, we introduce the standardisation operator S.

5.1 DEFINITION.

First of all, we define standardisation as an operator on P^*. We have the axioms in table 7.

$$\begin{array}{l} S(a(t)) = \tilde{a}(t^\circ) \\[4pt] S(X + Y) = S(X) + S(Y) \\[4pt] S(X \cdot Y) = S(X) \cdot S(Y) \\[4pt] S(\displaystyle\int_{v \in V} F) = \displaystyle\int_{v \in V} S(F) \\[4pt] S(\sqrt{t}. \ F) = \sqrt{t}. \ S(F) \end{array}$$

TABLE 7. Standardisation.

We give some examples:

1. $S(\delta) = \tilde{\tilde{\delta}}$ 2. $S(\tilde{a}[p]) = \tilde{a}[p]$ 3. $S(\tilde{a}(p)) = \tilde{a}(p)$.

In the model, $S(p)$ is obtained by replacing each transition $\langle s, t \rangle \xrightarrow{a(r)} \langle s', r \rangle$ by transitions $\langle s, t \rangle \xrightarrow{a(v)} \langle s', v \rangle$ for each $v > t$ of the form $v = r^\circ + \varepsilon$ for some $\varepsilon \in I$, and if $\langle s, t \rangle$ is a state without outgoing transitions and $s \neq \sqrt{}$, then we add transitions $\langle s, t \rangle \rightarrow \langle s, r \rangle$ for each $r > t$ of the form $r = t^\circ + \varepsilon$ for some $\varepsilon \in I$ and also transitions $\langle s', t' \rangle \rightarrow \langle s, r \rangle$ (for the same r's) for each transition $\langle s', t' \rangle \rightarrow \langle s, t \rangle$.

5.2 PROPERTIES.
1. S does not distribute over $\|$, $\mathbb{L}$, $|$.
2. S is a projection: $S(S(X)) = S(X)$.
3. $S(\partial_H(X)) = \partial_H(S(X))$

PROOF: 1. Consider $\|$. Let $\varepsilon \in I$.

$S(a(1+\varepsilon) \| b(1+2\varepsilon)) = S(a(1+\varepsilon) \cdot b(1+2\varepsilon)) = \tilde{a}(1) \cdot \tilde{b}(1) = \tilde{a}(1) \cdot \tilde{\tilde{b}}$, but

$S(a(1+\varepsilon)) \| S(b(1+2\varepsilon)) = \tilde{a}(1) \| \tilde{b}(1) = \tilde{a}(1) \cdot \tilde{b}(1) + a \curlyvee b(1) + \tilde{b}(1) \cdot \tilde{a}(1) =$
$\quad = \tilde{a}(1) \cdot \tilde{\tilde{b}} + a \curlyvee b(1) + \tilde{b}(1) \cdot \tilde{\tilde{a}}$.

2,3. These proofs go by induction on term structure.

5.3 DEFINITION.

We say that a process X is *standardised*, $X \in$ SIS, if $S(X) = X$. Also, we define this concept directly on the model M_A^*. Let $f \in M_A^*$. Then f is standardised, $f \in S(M_A^*)$, if:

i.   for all $t \in \mathbb{R}_{\geq 0}+I$, all actions of $f(t)$ have a timestamp not in $\mathbb{R}_{\geq 0}$.

ii.   for all $t \in \mathbb{R}_{\geq 0}+I$ we have the following: let $\langle p,v \rangle \xrightarrow{a(r)} \langle q,r \rangle$ be a transition in $f(t)$. Then:

   a. for each $r' = r + \varepsilon$ for some $\varepsilon \in I$ there is a q' with $\langle p,v \rangle \xrightarrow{a(r')} \langle q', r' \rangle$ and $\langle q, r' \rangle \leftrightarrow \langle q', r' \rangle$.

   b. for each r' with $r = r' + \varepsilon$ for some $\varepsilon \in I$ and $r' > v$ there is a q' with $\langle p,v \rangle \xrightarrow{a(r')} \langle q', r' \rangle$ and $\langle q, r \rangle \leftrightarrow \langle q', r \rangle$.

ii.   similarly for idle transitions: let $\langle p,v \rangle \rightarrow \langle q,r \rangle$ be a transition in $f(t)$. Then:

   a. for each $r' = r + \varepsilon$ for some $\varepsilon \in I$ there is a q' with $\langle p,v \rangle \rightarrow \langle q', r' \rangle$ and $\langle q, r' \rangle \leftrightarrow \langle q', r' \rangle$.

   b. for each r' with $r = r' + \varepsilon$ for some $\varepsilon \in I$ and $r' > v$ there is a q' with $\langle p,v \rangle \rightarrow \langle q', r' \rangle$ and $\langle q, r \rangle \leftrightarrow \langle q', r \rangle$.

5.4 PROPOSITION.

1. $\tilde{a}(p), \tilde{a}[p] \in$ SIS, $a(t) \notin$ SIS.
2. $X \in$ SIS $\Rightarrow \partial_H(X), \sigma_{\approx}^r(X), r \gg_{st} X \in$ SIS.
3. $X, Y \in$ SIS $\Rightarrow X + Y, X \cdot Y, X \| Y, X \mathbb{L} Y, X | Y, X \oplus Y \in$ DIS.
4. for all $v \in V$ $F \in$ SIS $\Rightarrow \int_{v \in V} F \in$ SIS.
5. $X \in$ SIS $\Rightarrow X \in$ SIP
6. $\sqrt{t}. a(t°+1) \in$ SIP - SIS.

PROOF: For 1, see 5.1.
2-5: By induction on term structure.

6. $S(\sqrt{t}. a(t°+1)) = \sqrt{t}. S(a(t°+1)) = \sqrt{t}. \tilde{a}(t°+1) = \tilde{a}[1] \neq \sqrt{t}. a(t°+1)$. For the positive result, see 4.3.

NOTE: 5 ensures that all equations in section 4 hold for all standardised processes. Also notice that a deadlock possibility may not be preserved by standardisation: the process $a(1+\varepsilon) + \delta(1+2\varepsilon)$ ($\varepsilon \in I$) has a deadlock possibility, but its standardisation does not.

5.5 A GRAPH MODEL WITH ACTIONS AND TIME SEPARATED.

Consider $S(M_A^*)$, the collection of processes that satisfy $S(X) = X$. This collection of processes is also closed under all elements of the standard time signature. This indicates the existence of an interesting subalgebra with domain $S(M_A^*)$ of the reduct of M_A^* to the standard time signature.

We obtain a subalgebra (of a reduct of) M_A^* with domain $S(M_A^*)$ and signature $\Sigma(ST)$. In the following section 6, we will discuss a direct axiomatisation of this algebra. In section 7, we will present a direct axiomatisation of the elements of this algebra that have only relative time notation (a further restriction to the signature $\Sigma(ACP_{st})$). Here, we present a simplified presentation of the subalgebra using transition systems with actions and time separated. This is the model G_A^* that we will use in sections 6 and 7.

We define a set of process graphs as in [BAW90] with labels from $A \cup \mathbb{R}_{>0}$ satisfying two extra conditions:

i.   every node has *at most one* outgoing s-labeled edge ($s \in \mathbb{R}_{>0}$);

ii. an s-labeled edge ($s \in \mathbb{R}_{>0}$) may not lead to a termination node.

Let G_A^* be the set of such process graphs with cardinality $\leq 2^{\aleph_0}$. To state this precisely, an element of G_A^* is a quadruple $\langle N, E, r, T \rangle$ where N is the set of *nodes*, $E \subseteq N \times A \cup \mathbb{R}_{>0} \times N$ is the set of *edges*, $r \in N$ is the *root node*, and $T \subseteq N$ is the set of *termination nodes*. We will always have that a termination node has no outgoing edges. A node without outgoing edges that is not a termination node is called a *deadlock node*.

We define a mapping from $S(M_A^*)$ to G_A^* by defining a mapping ϕ from real time transition systems to process graphs. Let R be a real time transition system. For simplicity, we assume that R is actually a tree, so each node has at most one incoming transition. The set of states of $\phi(R)$ consists of those states of R with time coordinate in $\mathbb{R}_{\geq 0}$. The root of $\phi(R)$ is the root of R. Now we consider the transitions. If $\langle s, t \rangle \rightarrow \langle s', t' \rangle$ is a transition in R and $t'^\circ - t^\circ = p > 0$, then we have a transition $\langle s, t^\circ \rangle \xrightarrow{p} \langle s', t'^\circ \rangle$ in $\phi(R)$. If $\langle s, t^\circ \rangle \xrightarrow{a(t)} \langle s', t \rangle$ is a transition in R (note that for standardised processes always $t^\circ < t$ for any $a(t)$-transition), then we have a transition $\langle s, t^\circ \rangle \xrightarrow{a} \langle s', t^\circ \rangle$ in $\phi(R)$.

This describes ϕ. We then obtain a mapping from $S(M_A^*)$ to G_A^* by mapping a representative of $f \in S(M_A^*)$ to $R(f(0))/\underline{\leftrightarrow}$.

The inverse mapping can be defined along the same lines. We leave the verification that this indeed defines an isomorphism to the reader.

5.6 NOTE: Thus, we have obtained a series of algebras M_A^*, si-M_A^*, $S(M_A^*)$, G_A^*. We can also consider the subalgebras obtained if we look at absolute time notation processes only, i.e. processes X satisfying $X = 0 \gg Z$ for some Z. This restriction gives us algebras M_A, si-M_A, $S(M_A)$, G_A. On the other hand, we can look at processes involving relative time notation only. We do this as in [BAB92].

5.7 DEFINITION: We have the *positive time shift operator* σ_+^r introduced in [FOK92] with the equations of [BAB92], e.g. $\sigma_+^r(a(t)) = a(t+r)$. On M_A^*, this operator is obtained by incrementing each time stamp of a state or an action in a transition system by r.

5.8 DEFINITION: A process X is *translatable* if for all $r \geq 0$ we have $r \gg X = \sigma_+^r(0 \gg X)$. A process X is *standardly translatable* if for all $r \in \mathbb{R}_{>0}$ we have $r \gg_s X = \sigma_+^r(0 \gg_s X)$.

5.9 REMARKS: 1. Let X be translatable and let $t = r + s$. Then $t \gg X = \sigma_+^r(\sigma_+^s(X)) = \sigma_+^r(s \gg X)$.

2. $\tilde{a}(p)$ is not standardly translatable, since $2 \gg_s \tilde{a}(5) = \tilde{a}(5)$ but $\sigma_+^2(0 \gg_s \tilde{a}(5)) = \sigma_+^2(\tilde{a}(5)) = \tilde{a}(7)$.

3. $\tilde{a}[p]$ is standardly translatable, since $r \gg_s \tilde{a}[p] = \tilde{a}[p+r] = \sigma_+^r(\tilde{a}(p)) = \sigma_+^r(0 \gg_s \tilde{a}[p])$.

4. $X \in \text{si-}M_A^*$, then X is translatable iff X is standardly translatable.

5.10 ALGEBRAS.

We obtain four more algebras. M_A^r is the subalgebra of M_A^* consisting of all translatable processes, $\text{si-}M_A^r$ is the subalgebra of $\text{si-}M_A^*$ consisting of all standardly translatable processes, $S(M_A^r)$ is the subalgebra of $S(M_A^*)$ consisting of all its standardly translatable processes, G_A^r is the subalgebra of G_A^* consisting of all its standardly translatable processes. G_A^r is a model for ACP_{st}, the theory of relative time standard time process algebra (to be defined in 7.13), while all laws used to axiomatise ACP_{st} are valid in $\text{si-}M_A^r$. We give an overview of all algebras introduced in fig. 2. Again, rectangular boxes denote absolute time, boxes with rounded corners denote relative time.
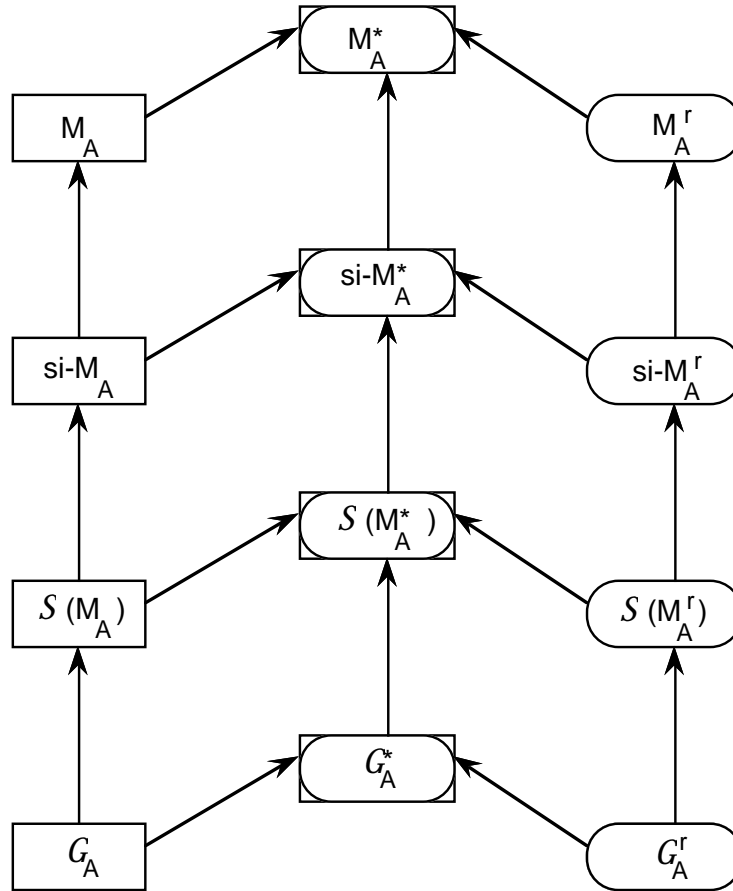

FIGURE 2.

6. STANDARD REAL TIME PROCESS ALGEBRA: ABSOLUTE TIME.

6.1 BASIC PROCESS ALGEBRA.

The process $\tilde{a}(p)$ can let time progress up to and including p, will then execute action a at time p, and then terminate successfully. The process $\tilde{\delta}(p)$ can also let time progress up to and including p, but then nothing more is possible (in particular, time cannot progress anymore).

Standard Real Time Basic Process Algebra with Deadlock (BPAs$\rho\delta$) is the variant of BPA$\rho\delta$ with urgent actions. BPAs$\rho\delta$ has the axioms from table 8 ($a \in A_\delta$). The time domain is $\mathbb{R}_{\geq 0}$, so we only allow standard real numbers.

- constants $\tilde{\tilde{\delta}}$ inaction
              $\tilde{a}(p)$ action ($a \in A \cup \{\delta\}$)
- functions $+: P \times P \to P$ alternative composition
              $\cdot: P \times P \to P$ sequential composition
              $\gg_s: \mathbb{R}_{\geq 0} \times P \to P$ standard initialisation

$X + Y = Y + X$	A1
$(X + Y) + Z = X + (Y + Z)$	A2
$X + X = X$	A3
$(X + Y)\cdot Z = X\cdot Z + Y\cdot Z$	A4
$(X\cdot Y)\cdot Z = X\cdot(Y\cdot Z)$	A5
$X = X + \tilde{\tilde{\delta}}$	A6
$\tilde{\tilde{\delta}}\cdot X = \tilde{\tilde{\delta}}$	A7
$\tilde{\delta}(0) = \tilde{\tilde{\delta}}$	UTA1
$\tilde{\delta}(p) \cdot X = \tilde{\delta}(p)$	UTA2
$p < q \Rightarrow \tilde{\delta}(p) + \tilde{\delta}(q) = \tilde{\delta}(q)$	UTA3
$\tilde{a}(p) + \tilde{\delta}(p) = \tilde{a}(p)$	UTA4
$\tilde{a}(p) \cdot X = \tilde{a}(p) \cdot (p \gg_s X)$	UTA5
$p \leq q \Rightarrow p \gg_s \tilde{a}(q) = \tilde{a}(q)$	UTB1
$p > q \Rightarrow p \gg_s \tilde{a}(q) = \tilde{\delta}(p)$	UTB2
$p \gg_s (X + Y) = (p \gg_s X) + (p \gg_s Y)$	UTB3
$p \gg_s (X \cdot Y) = (p \gg_s X) \cdot Y$	UTB4

TABLE 8. BPAs$\rho\delta$.

6.2 OPERATIONAL SEMANTICS.

The operational semantics is defined on the domain of process graphs defined in 5.5. We have action rules with two types of transitions:

$$\text{idle} \subseteq P \times \mathbb{R}_{\geq 0} \times \mathbb{R}_{> 0} \times P \times \mathbb{R}_{\geq 0}, \text{ notation } \langle x, p \rangle \xrightarrow{r} \langle x', p' \rangle$$

$$\text{step} \subseteq P \times \mathbb{R}_{\geq 0} \times A \times P \times \mathbb{R}_{\geq 0}, \text{ notation } \langle x, p \rangle \xrightarrow{a} \langle x', p' \rangle.$$

If $\langle x, p \rangle \xrightarrow{r} \langle x', p' \rangle$, then $r > 0$, $x = x'$ and $p' = p + r$; if $\langle x, p \rangle \xrightarrow{a} \langle x', p' \rangle$, then $a \in A$ and $p' = p$.

$$\langle \tilde{a}(p), p \rangle \xrightarrow{a} \langle \sqrt{}, p \rangle$$

$$q + r \leq p \implies \langle \tilde{a}(p), q \rangle \xrightarrow{r} \langle \tilde{a}(p), q + r \rangle$$

$$q + r \leq p \implies \langle \tilde{\delta}(p), q \rangle \xrightarrow{r} \langle \tilde{\delta}(p), q + r \rangle$$

$$\frac{\langle x, p \rangle \xrightarrow{a} \langle x', p \rangle}{\langle x + y, p \rangle \xrightarrow{a} \langle x', p \rangle, \langle y + x, p \rangle \xrightarrow{a} \langle x', p \rangle}$$

$$\frac{\langle x, p \rangle \xrightarrow{a} \langle \sqrt{}, p \rangle}{\langle x + y, p \rangle \xrightarrow{a} \langle \sqrt{}, p \rangle, \langle y + x, p \rangle \xrightarrow{a} \langle \sqrt{}, p \rangle}$$

$$\frac{\langle x, p \rangle \xrightarrow{r} \langle x, p + r \rangle}{\langle x + y, p \rangle \xrightarrow{r} \langle x + y, p + r \rangle, \langle y + x, p \rangle \xrightarrow{r} \langle y + x, p + r \rangle}$$

$$\frac{\langle x, p \rangle \xrightarrow{a} \langle x', p \rangle}{\langle x \cdot y, p \rangle \xrightarrow{a} \langle x' \cdot y, p \rangle} \qquad \frac{\langle x, p \rangle \xrightarrow{r} \langle x, p + r \rangle}{\langle x \cdot y, p \rangle \xrightarrow{r} \langle x \cdot y, p + r \rangle}$$

$$\frac{\langle x, p \rangle \xrightarrow{a} \langle \sqrt{}, p \rangle}{\langle x \cdot y, p \rangle \xrightarrow{a} \langle y, p \rangle}$$

$$q + r \leq p \implies \langle p \gg_s x, q \rangle \xrightarrow{r} \langle p \gg_s x, q + r \rangle$$

$$\frac{\langle x, q \rangle \xrightarrow{a} \langle x', q \rangle, q \geq p}{\langle p \gg_s x, q \rangle \xrightarrow{a} \langle x', q \rangle} \qquad \frac{\langle x, q \rangle \xrightarrow{a} \langle \sqrt{}, q \rangle, q \geq p}{\langle p \gg_s x, q \rangle \xrightarrow{a} \langle \sqrt{}, q \rangle}$$

$$\frac{\langle x, q \rangle \xrightarrow{r} \langle x, q + r \rangle}{\langle p \gg_s x, q \rangle \xrightarrow{r} \langle p \gg_s x, q + r \rangle}$$

TABLE 9. Operational semantics of BPAs$\rho\delta$.

6.3 PARALLEL COMPOSITION.

In a setting with urgent actions, it makes sense to define parallel composition without communication, as urgent actions composed in parallel will show interleaving. Thus, $a(2) \parallel b(2)$ forces synchronisation, but we have $\tilde{a}(2) \parallel \tilde{b}(2) = \tilde{a}(2) \cdot \tilde{b}(2) + \tilde{b}(2) \cdot \tilde{a}(2)$. In table 10, $H \subseteq A$, $a,b \in A_\delta$.

$p \le q \ \Rightarrow\ \tilde{a}(p) \oplus \tilde{b}(q) = \tilde{a}(p)$	LSCU1
$p > q \ \Rightarrow\ \tilde{a}(p) \oplus \tilde{b}(q) = \tilde{\delta}(q)$	LSCU2
$X \oplus Y \cdot Z = X \oplus Y$	LSC3
$X \oplus (Y + Z) = (X \oplus Y) + (X \oplus Z)$	LSC4
$X \cdot Y \underline{\oplus} Z = (X \underline{\oplus} Y) \cdot Z$	LSC5
$(X + Y) \underline{\oplus} Z = (X \underline{\oplus} Z) + (Y \underline{\oplus} Z)$	LSC6
$X \parallel Y = X \, \mathbb{L} \, Y + Y \, \mathbb{L} \, X$	M1
$X = 0 \gg_s Z \ \Rightarrow\ \tilde{a}(p) \, \mathbb{L} \, X = (\tilde{a}(p) \oplus X) \cdot X$	UTCM2
$Y = 0 \gg_s Z \ \Rightarrow\ \tilde{a}(p) \cdot X \, \mathbb{L} \, Y = (\tilde{a}(p) \oplus Y) \cdot (X \parallel Y)$	UTCM3

TABLE 10. Additional axioms of PAs$\rho\delta$.

$$\frac{\langle x,p\rangle^a \to \langle x',p\rangle, p=0 \vee \langle y,0\rangle^p \ \to \langle y,p\rangle}{\langle x \parallel y,p\rangle^a \to \langle x' \parallel y,p\rangle, \langle y \parallel x,p\rangle^a \ \to \langle y \parallel x',p\rangle, \langle x \, \mathbb{L} \, y,p\rangle^a \ \to \langle x' \parallel y,p\rangle}$$

$$\frac{\langle x,p\rangle^a \to \langle \surd,p\rangle, p=0 \vee \langle y,0\rangle^p \ \to \langle y,p\rangle}{\langle x \parallel y,p\rangle^a \to \langle y,p\rangle, \langle y \parallel x,p\rangle^a \ \to \langle y,p\rangle, \langle x \, \mathbb{L} \, y,p\rangle^a \ \to \langle y,p\rangle}$$

$$\frac{\langle x,p\rangle^r \to \langle x,p+r\rangle, \langle y,p\rangle^r \ \to \langle y,p+r\rangle}{\langle x \parallel y,p\rangle^r \to \langle x \parallel y,p+r\rangle, \langle x \, \mathbb{L} \, y,p\rangle^r \ \to \langle x \, \mathbb{L} \, y,p+r\rangle}$$

$$\frac{\langle x,p\rangle^a \to \langle x',p\rangle, p=0 \vee \langle y,0\rangle^p \ \to \langle y,p\rangle}{\langle x \oplus y,p\rangle^a \ \to \langle x',p\rangle}$$

$$\frac{\langle x,p\rangle^a \to \langle \surd,p\rangle, p=0 \vee \langle y,0\rangle^p \ \to \langle y,p\rangle}{\langle x \underline{\oplus} y,p\rangle^a \ \to \langle \surd,p\rangle}$$

$$\frac{\langle x,p\rangle^r \to \langle x,p+r\rangle, \langle y,p\rangle^r \ \to \langle y,p+r\rangle}{\langle x \underline{\oplus} y,p\rangle^r \ \to \langle x \underline{\oplus} y,p+r\rangle}$$

TABLE 21. Additional operational rules of ACP_{st}.

7.5 REMARK: Consider the axiom system ACP_{st}, and omit all signature elements refering to timing, i.e. omit the operators $\sigma_{\approx}^r, r \gg_{st}, \gg_s, \oplus$. The remaining signature is exactly the signature of the untimed theory ACP of [BEK84, BAW90] (interpreting $\tilde{\tilde{a}}$ as a, $\tilde{\tilde{\delta}}$ as δ), and the axioms over this signature are exactly the axioms of ACP. Thus, the untimed theory ACP is obtained from ACP_{st} by throwing away all timing information, or, put another way, ACP_{st} over the one-point time domain $T = \{0\}$ gives the untimed theory ACP.

8. TRANSLATIONS.

This section is based on [KLU93]. We provide interpretations of the timing constructs of other process algebras, involving urgent actions, into our real time process algebra. $[\![.]\!]$ denotes the interpretation function. More information, involving the treatment of parallel composition and the modeling of maximal progress, can be found in [KLU93].

8.1 ATP [NIS91].

$[\![0]\!] = \qquad \tilde{\tilde{\delta}}$

$[\![\delta]\!] = \qquad \tilde{\delta}[\infty] = \int\limits_{p \geq 0} \tilde{\delta}[p]$

$[\![\dot{a}P]\!] = \qquad \tilde{\tilde{a}} \cdot [\![P]\!]$

$[\![\tilde{a}P]\!] = \qquad \int\limits_{p \geq 0} \tilde{a}[p] \cdot [\![P]\!]$

$[\![P \oplus Q]\!] =$ $\quad ([\![P]\!] \oplus [\![Q]\!]) + ([\![Q]\!] \oplus [\![P]\!])$ $\qquad$ (strong choice)

$[\![P \overset{d}{\triangleleft} Q]\!] =$ $\quad ([\![P]\!] \oplus \tilde{\delta}[d]) + (d \gg_{st} [\![Q]\!]).$

8.2 TCCS OF WANG YI [WAN90].

$[\![\text{NIL}]\!] =$ $\qquad \tilde{\tilde{\delta}}[\infty] = \int_{p \geq 0} \tilde{\delta}[p]$

$[\![\tau]\!] =$ $\qquad \tilde{\tilde{\tau}}$

$[\![a.P]\!] =$ $\qquad \int_{p \geq 0} \tilde{a}[p] \cdot [\![P]\!]$ $\qquad (a \neq \tau)$

$[\![\varepsilon(r).P]\!] =$ $\qquad \sigma_{\approx}^{r}([\![P]\!]).$

$[\![P + Q]\!] =$ $\qquad ([\![P]\!] \underline{\oplus} [\![Q]\!]) + ([\![Q]\!] \underline{\oplus} [\![P]\!])$ $\qquad$ (strong choice).

Note that [WAN90] uses a maximal progress assumption. In order to model this, we need to use a priority operator, as in [BAB93]. This has been worked out in [KLU93].

8.3 TCCS OF MOLLER & TOFTS [MOT90, MOT92].

$[\![\mathbf{0}]\!] =$ $\qquad \tilde{\tilde{\delta}}$

$[\![\mathbf{0}]\!] =$ $\qquad \tilde{\delta}[\infty] = \int_{p \geq 0} \tilde{\delta}[p]$ $\qquad$ (only in [MOT92])

$[\![a.P]\!] =$ $\qquad \tilde{\tilde{a}} \cdot [\![P]\!]$

$[\![\underline{a}.P]\!] =$ $\qquad \int_{p \geq 0} \tilde{a}[p] \cdot [\![P]\!]$ $\qquad$ (only in [MOT92])

$[\![(r).P]\!] =$ $\qquad \sigma_{\approx}^{r}([\![P]\!])$

$[\![\delta.P]\!] =$ $\qquad \int_{r \geq 0} \sigma_{\approx}^{r}([\![P]\!] \oplus \tilde{\tilde{\delta}})$ $\qquad$ (only in [MOT90])

$[\![P +\!\!+ Q]\!] =$ $\qquad ([\![P]\!] \underline{\oplus} [\![Q]\!]) + ([\![Q]\!] \underline{\oplus} [\![P]\!])$ $\qquad$ (strong choice; denoted **+** in [MOT90])

$[\![P + Q]\!] =$ $\qquad [\![P]\!] + [\![Q]\!]$ $\qquad$ (weak choice; denoted $\oplus$ in [MOT90]).

8.4 CHEN [CHE93].

$[\![\text{NIL}]\!] =$ $\qquad \tilde{\delta}[\infty] = \int_{p \geq 0} \tilde{\delta}[p]$

$[\![a(p)|_{e}^{b}.P]\!] =$ $\qquad \int_{p \in [b,e]} \tilde{a}[p] \cdot [\![P]\!] + \tilde{\delta}[e]$

$[\![P + Q]\!] =$ $\qquad [\![P]\!] + [\![Q]\!]$ $\qquad$ (weak choice)

$[\![(r).P]\!] =$ $\qquad \sigma_{\approx}^{r}([\![P]\!]).$

9. CONCLUSION.

We have modeled urgent actions in our real time process algebra, by extending the time domain to include nonstandard real numbers, and interpreting urgent actions as an alternative composition of normal timed actions of ACPρ. In this way, process calculi involving urgent actions can be interpreted in ACPρ. Also, we have indicated subalgebras that allow an operational semantics where actions and time are separated.

We conclude that our real time process algebra provides a general framework, in which many features occurring in the literature can be modeled.
