#### Abstract

C}_{18} \mathrm{H}_{23} \mathrm{~N}_{2} \mathrm{O}^{+} . \mathrm{I}^{-}, \quad M_{r}=410 \cdot 30\), orthorhombic, $P 2_{12} 2_{1}, a=7.0112$ (9), $b=14.385$ (1), $c=$ 37.213 (2) $\AA, \quad V=3753.2$ (6) $\AA^{3}, \quad Z=8, \quad D_{x}=$ $1.452 \mathrm{~g} \mathrm{~cm}^{-3}, \quad$ Mo $K \alpha, \quad \lambda=0.71073 \AA, \quad \mu=$ $16.9 \mathrm{~cm}^{-1}, \quad F(000)=1648, \quad T=294 \mathrm{~K}$, final $R=$ 0.0458 for 3596 unique observed reflections. The two independent molecules have identical geometries. There are three planar moities, the pyridinium and phenyl rings, and the carbamoyl fragment in which the carbonyl and $N$-methyl groups are in the anti position. In both molecules the $\mathrm{I}^{-}$ion has a short contact with the N atom of the pyridinium ring: $3 \cdot 664$ (8) [molecule (I)] and $3 \cdot 590$ (8) $\AA$ [molecule (II)].

Introduction. In a previous paper we described the crystal structures of 3 -( $N$-methyl- $N$-benzyl)car-bamoyl-1,2,4-trimethylpyridinium iodide (PYR) and of $\quad 3$-[ $N$-methyl $-N-(R)-\alpha$-methylbenzyl]carbamoyl-1,2,4-trimethylpyridinium iodide (PYRM) (Kanters, van der Steen, Bastiaansen \& de Graaf, 1986).

PYR, which crystallizes in space group $P 2_{1} 2_{1} 2_{1}$, was found to contain a dissymmetric molecule and it was concluded that spontaneous resolution had

[^0]occurred on crystallization. The chirality of PYR is caused by the two ring-methyl groups that force the carbonyl group out of the plane of the pyridinium ring, thus causing axial chirality of PYR.

PYR

PYRM

In PYRM additional chirality is introduced by the $\alpha$-methyl group. In both PYR and PYRM the carbonyl group is directed to the $A$ side $\dagger$ of the pyridine ring, and the carbonyl oxygen and $N$-methyl group are in a nearly eclipsed syn conformation. The syn rotamer is preferably formed when the quaternization is carried out at elevated temperature ( 373 K ) in a nonpolar solvent (toluene), whereas the
$\dagger$ The $A$ side of the pyridine ring is the side which faces the observer when the ring is viewed from a direction perpendicular to the plane of the ring and one travels around the ring in a counterclockwise direction when taking the shortest path from the ring N atom to the carboxamide group. The other side is the $B$ side.
© 1989 International Union of Crystallography
anti rotamer is formed by quaternization at low temperature ( 273 K ) in a polar solvent (ethanol) (Bastiaansen, Kanters, van der Steen, de Graaf \& Buck, 1986). Next we prepared the diastereo ( $S$ ) anti rotamer of PYRM by reacting the acid chloride of 2,4-dimethylnicotinic acid with $\quad N$-( $S$ )- $\alpha$-methylbenzylamine followed by treatment of the reaction product with $\mathrm{CH}_{3} \mathrm{I}$ in ethanol at 273 K . Despite numerous attempts, no suitable crystals could be obtained. Therefore we decided to synthesize the analogous 2,4-dimethyl derivative, i.e. 3 - $[N$-methyl-$N$-(S)- $\alpha$-methylbenzyl]carbamoyl-2,4-dimethylpyridinium chloride which could be obtained in crystalline form. The structure analysis showed that this compound was indeed the anti rotamer and the carbonyl was directed to the $B$-side of the pyridine ring (Bastiaansen, Vermeulen, Buck, Smeets, Kanters \& Spek, 1988).

We now report the crystal structure of the anti rotamer of the ( $S$ )-analogue of PYRM which was crystallized by slow evaporation of an ethanolic solution in a desiccator above solid potassium hydroxide at 253 K .

Experimental. A needle-shaped crystal, $0.9 \times 0.13 \times$ 0.03 mm , was used for data collection on an EnrafNonius CAD-4 diffractometer with Zr-filtered Mo $K \alpha$ radiation. Lattice parameters were derived from the angular settings of 25 reflections ( $6 \cdot 69 \leq \boldsymbol{\theta}$ $\leq 13.73^{\circ}$ ). The intensity data of 4600 reflections were collected of which 3596 were above the $2 \cdot 5 \sigma(I)$ level $\left[h 0 \rightarrow 7, k 0 \rightarrow 15, l-39 \rightarrow 39,2 \theta_{\text {max }}=44^{\circ}, \omega-2 \theta\right.$ scan mode with $\left.\Delta \omega=(0.60+0.35 \tan \theta)^{\circ}\right]$. The $h k l$ and $h k \bar{l}$ Bijvoet pairs were not merged in order to determine the absolute configuration. Three periodically measured standard reflections ( $114,120,034$ ) showed r.m.s. deviations of $1.03,0.81$ and $0.68 \%$ respectively. The intensity data were correced for absorption with the DIFABS program (Walker \& Stewart, 1983) (min. and max. transmission factors 0.87 and $1 \cdot 12$, respectively). The structure was solved by Patterson and Fourier methods. H atoms were placed at calculated positions ( $\mathrm{C}-\mathrm{H} 1.00 \AA$ ) riding on their carrier atoms with one general isotropic temperature factor $\left[~ U=0.08\right.$ (2) $\left.\AA^{2}\right]$. Anisotropic, weighted blocked full-matrix refinement on $F$ ( 398 parameters) gave $R=0.0458, w R=0.0409$ with $w=$ $1 \cdot 1777\left[\sigma^{2}\left(F_{o}\right)+0 \cdot 00104 F_{o}^{2}\right]^{-1}, \quad S=1 \cdot 14, \quad(\Delta / \sigma)_{\mathrm{av}}=$ $0.012,(\Delta / \sigma)_{\max }=0.051,(\Delta \rho)_{\max }=0.77,(\Delta \rho)_{\min }=$ -0.73 e $\AA^{-3}$ (around I).
The absolute configuration was ascertained by refinement of the inverted model, resulting in $R=$ 0.0495 and $w R=0.0536$, which established the configuration at $\mathrm{C}(7)$ as $(S)$ in accordance with that of its synthetic precursor $N-(S)-\alpha$-methylbenzylamine. The scattering factors and anomalous-dispersion corrections were taken from International Tables for

X-ray Crystallography (1974). Calculations were performed with SHELX76 (Sheldrick, 1976) (structure determination and refinement) and the EUCLID package (Spek, 1982) (molecular geometry and illustrations).

Discussion. The atomic coordinates and equivalent isotropic thermal parameters of the title compound are listed in Table 1.* The molecular geometries are given in Table 2. A perspective view of one of the independent molecules together with atom numbering is shown in Fig. 1. The independent molecules have similar geometries as follows from the r.m.s. deviations of corresponding distances,

[^1]angles and exocyclic torsion angles involving non- H atoms, which amount to 0.017 (9) $\AA, 1.2$ (8) and $5(3)^{\circ}$, respectively. The fitting by the quaternion transformation method (Mackay, 1984) resulted in r.m.s. deviations of $0 \cdot 188 \AA$ for the $1,2,4$-trimethylpyridinium fragment, $0.078 \AA$ for the $N, N$-dimethyl-

carbamoyl fragment and $0.038 \AA$ for the phenyl fragment respectively.

In contrast to its ( $R$ ) syn rotamer (PYRM), the carbonyl group of the title compound is directed towards the $B$ side of the pyridine ring, and the carbonyl oxygen and $N$-methyl groups now have the anti conformation with torsion angles $\mathrm{C}(8)-\mathrm{N}(1)-\mathrm{C}(9)-\mathrm{O}(1)$ of $180(1)$ and $176 \cdot 0(9)^{\circ}$ for molecules (I) and (II), respectively. In this respect the $(R)$ - and ( $S$-compounds should be considered as diastereomeric rotamers.

The independent molecules each have three nearly planar fragments; the pyridinium, the $N, N$-dimethylcarbamoyl and phenyl groups for which the $\sigma_{\text {plane }}$ values are $0.018,0.017$ and $0.019 \AA$ [molecule (I)] and $0.017,0.024$ and $0.017 \AA$ [molecule (II)] respectively. The bulky pyridinium and phenyl rings are attached to the planar $N, N$-dimethylcarbamoyl fragment in the anti position [torsion angles $\mathrm{C}(7)-\mathrm{N}(1)-\mathrm{C}(9)-\mathrm{C}(10) \quad-170 \cdot 9(8) \quad$ and $-177 \cdot 2$ ( 8$)^{\circ}$ for (I) and (II), respectively] which is much more favourable than the syn position in PYRM where this angle amounts to $0.6(5)^{\circ}$. The differences between the conformations of the title compound and PYRM result in a stretched flattened form for the title compound, and a folded conformation with eclipsing $C(7)$ and $C(10)$ atoms for PYRM. Together with the distinct mode of preparation of the syn and anti rotamers, this conformational difference indicates that the anti rotamer is more stable. As may be expected there is a strong correspondence between the structures of the title compound and the 2,4-dimethylpyridinium chloride analogue mentioned in the Introduction. The two independent molecules in the latter structure also have a flattened form with torsion angles $\mathrm{C}(7)-\mathrm{N}(1)-\mathrm{C}(9)-\mathrm{C}(10)$ of $-171.8(4)$ and $-172.7(3)^{\circ}$, respectively. As in PYRM there are short intermolecular contact distances between $\mathrm{I}^{-}$

Fig. 1. Perspective view and atomic numbering of the title compound. Only one of the independent molecules is shown.
and $\mathrm{N}(2)$ of the pyridinium ring: for molecule (I) the $\mathrm{N}(2) \cdots \mathrm{I}(x, y, z)$ distance is 3.664 (8) $\AA$, for molecule (II) $\mathrm{N}(2) \cdots \mathrm{I}\left(1-x, y-\frac{1}{2}, \frac{1}{2}-z\right)$ is $3 \cdot 590$ (8) $\AA$.

We thank Dr P. van der Sluis for preparation of single crystals and Dr A.J.M. Duisenberg for collecting the crystallographic data.

#### Abstract

C}_{24} \mathrm{H}_{32} \mathrm{NO}_{3} \mathrm{P}, \quad M_{r}=413 \cdot 5\), monoclinic, $P 2_{1} / c, a=9.045$ (4), $b=20.507$ (5), $c=12.571$ (2) $\AA$, $\beta=102 \cdot 60(1)^{\circ}, \quad V=2275 \cdot 6 \AA^{3}, \quad Z=4, \quad D_{x}=$ $1.21 \mathrm{~g} \mathrm{~cm}^{-3}, \quad \lambda(\mathrm{Cu} K \alpha)=1.5418 \AA, \quad \mu=12.4 \mathrm{~cm}^{-1}$, $F(000)=888, \quad T=297 \mathrm{~K}, \quad R=0.057$ for 3178 observed reflections. The oxazaphosphorine ring adopts a conformation midway between a half-chair and a sofa. The phosphoryl $O(2)$ atom occupies an axial position. The tert-butyl and phenyl groups are trans to each other and occupy equatorial positions on the phosphorine ring. The cyclohexyl ring adopts a chair conformation with the N atom $[\mathrm{N}(5)]$ equatorial. The molecular geometry is normal. The molecular packing involves only van der Waals contacts.

Introduction. The title compound was prepared and supplied by M. S. R. Naidu \& Nagaraju, Department of Chemistry, S. V. University, Tirupathi, India. This type of phosphorus heterocycle has been found to possess significant antitumour activity (Chugani Pharmaceutical Co., 1966; Arnold, Bourseaux \& Brock, 1961; Friedman, Papanastassiou \& Levi, 1963) and for this reason its X-ray structure is of great interest to our continuing investigations.

Experimental. Transparent, colourless needle-shaped crystals were grown from ethanol. A specimen with approximate dimensions $0.30 \times 0.40 \times 0.55 \mathrm{~mm}$ was selected. Unit-cell parameters and their e.s.d.'s derived from a least-squares treatment of 25 reflections ( $35<\theta<45^{\circ}$ ), intensity data were collected on an Enraf-Nonius CAD-4 single-crystal X-ray diffractometer, graphite-crystal-monochromatized $\mathrm{Cu} K \alpha$ radiation, $\omega / 2 \theta$ scan mode. Intensities of reflections with $4 \leq 2 \theta \leq 120^{\circ}(h-11 \rightarrow 10, k 0 \rightarrow 24$, $l 0 \rightarrow 15$ ) were measured. Two standard reflections for every 100 observations, $<2 \%$ variation. Of the 3496 independent reflections collected, 3056 were judged significant $[I>3 \sigma(I)]$; intensities not corrected for absorption. Structure by direct methods using MULTAN80 (Main, Fiske, Hull, Lessinger, Germain, Declercq \& Woolfson, 1980). Positional and thermal parameters of non-H atoms refined by fullmatrix least-squares using SHELX76 (Sheldrick, 1976). H atoms were located from a difference Fourier map and not refined. In the final stage of the refinement, weights were introduced resulting in $R=0.057, \quad w R=0.063, \quad w=1 /\left[\sigma^{2}(F)+0.00026 F^{2}\right]$, $S=2 \cdot 9 .(\Delta / \sigma)_{\max }=0.008$. Final difference Fourier map featureless, with $\Delta \rho$ within $\pm 0 \cdot 13$ e $\AA^{-3}$. Atomic scattering factors as provided in SHELX76. Computer programs: PARST (Nardelli, 1983) for (C) 1989 International Union of Crystallography
