Document status and date:

Published: 01/01/2010

Document Version:

Publisher's PDF, also known as Version of Record (includes final page, issue and volume numbers)

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

Looking into the skin: Towards better understanding of skin layer mechanics

L.-C. Gerhardt¹, G.W.M. Peters², F.P.T. Baaijens¹, C.W.J. Oomens¹

¹ Department of Biomedical Engineering, TU Eindhoven, The Netherlands

² Department of Mechanical Engineering, TU Eindhoven, The Netherlands

Background & Motivation

Human skin is our protective “living envelope” and largest organ, covering a surface area of 1.6 to 2 m² in adults. Skin can be considered a multilayer composite (Fig. 1) and demonstrates highly non-linear elastic, anisotropic, viscoelastic material properties similar to those of soft elastomers [1, 2].

Fig. 1. Structure of human skin

Until now, there is limited understanding on how the different skin layers and appendages (e.g. hairs) contribute to the global mechanical response of human skin.

Knowledge on skin layer mechanics is a prerequisite to improve and optimise surfaces and materials in contact with skin (tools, sport equipment, clothing, consumer products), and to develop realistic mechanical skin models.

Experimental strategy

A systematic parameter study on the bio-mechanical and bio-rheological properties of *ex vivo* human skin and skin layers will be carried out using recently developed histological preservation methods [1], mechanical testing, as well as imaging techniques. In particular, rheometer measurements are used to determine linear and non-linear viscoelastic regimes of skin under various experimental

conditions (Fig. 2). Laser scanning microscopy will be performed to image the micro-architecture of deformed skin tissue (Fig. 3).

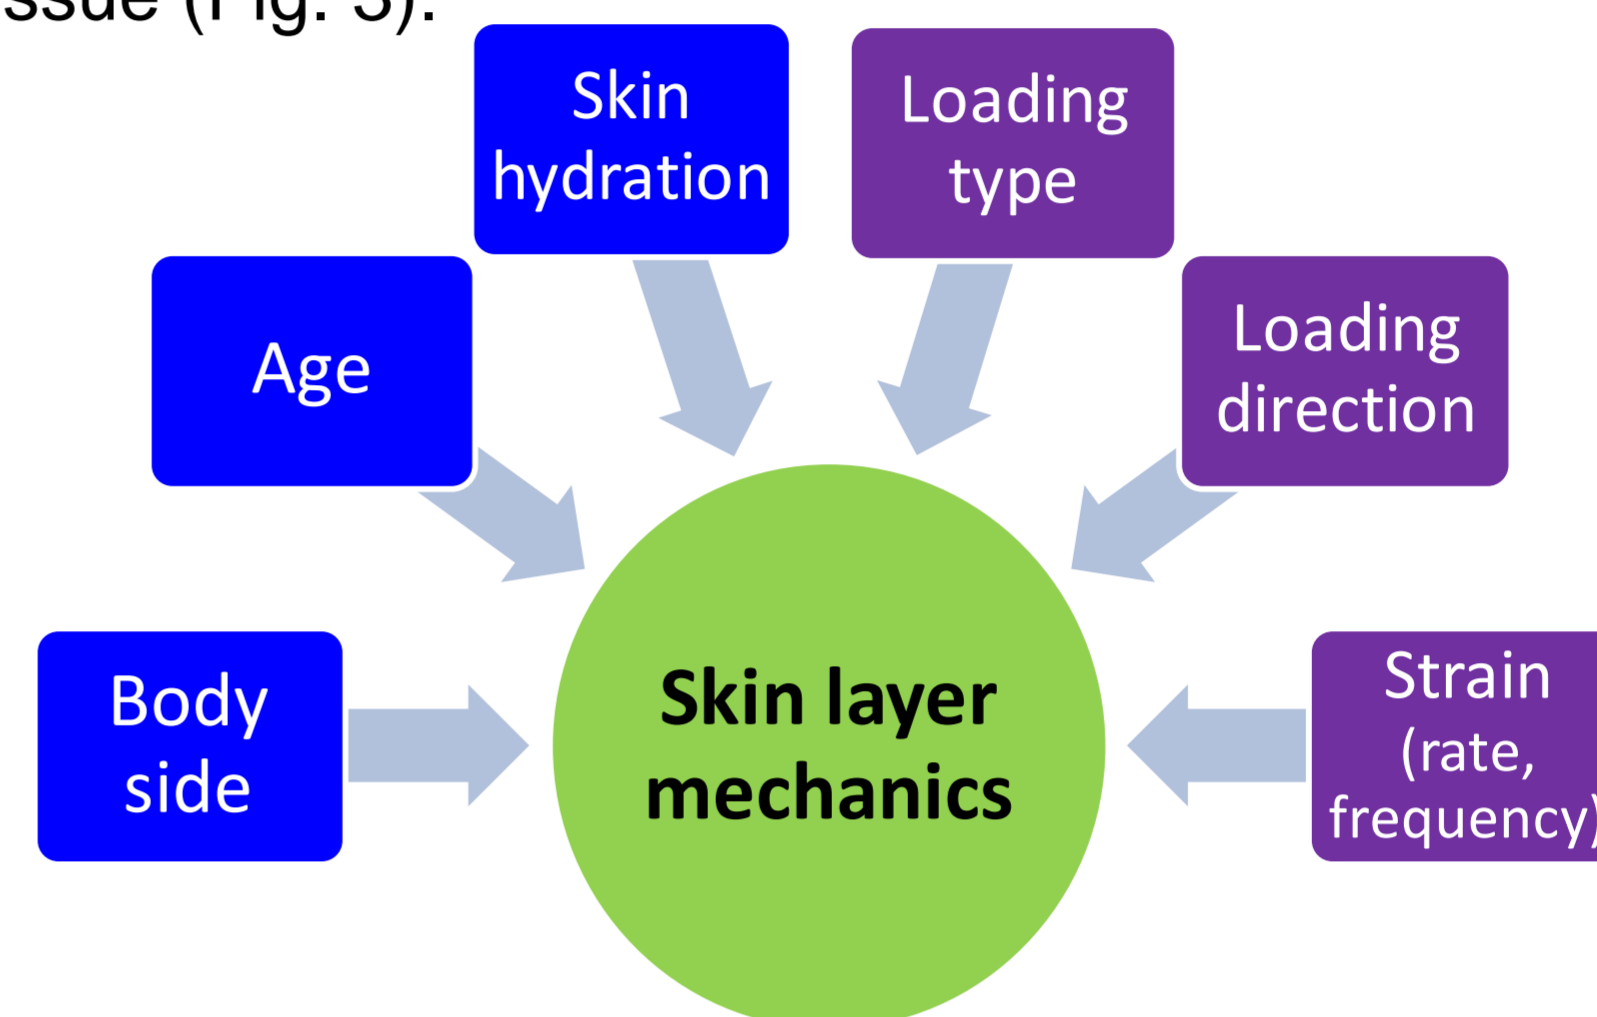

Fig. 2. Factors influencing the mechanical properties of skin

Specific research objectives

The overall goal is to gain new insights in the relationship between mechanical loading and structural/morphological changes of human skin.

- Mechanical and rheological characterisation of human skin under oscillating shear loading.
- Visualisation and quantification of skin deformation behaviour at macro- and micro-scale.
- Application of experimental results in theoretical models.
