## A note on ordered bipartite graphs

## Citation for published version (APA):

Bruijn, de, N. G. (1974). A note on ordered bipartite graphs. (Eindhoven University of Technology : Dept of Mathematics : memorandum; Vol. 7403). Technische Hogeschool Eindhoven.

## Document status and date:

Published: 01/01/1974

## Document Version:

Publisher's PDF, also known as Version of Record (includes final page, issue and volume numbers)

## Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

## A note on ordered bipartite graphs

by N.G. de Bruijn.

The result explained in this note is implicit in a paper by M. Aigner [1].

Let ( $A, B, Z$ ) be a bipartite graph, i.e. $A$ and $B$ are sets, and $Z$ is a subset of $A \times B$. A matching is a subset $M$ of $Z$ with the property that if $(a, b) \in M,(c, d) \in M$ then $a \neq c$ and $b \neq d . M$ is not necessarily maximal.

Now assume both $A$ and $B$ linearly ordered. By recursion we define an algorithm for obtaining a matching:

Algorithm 1. If $Z=\emptyset$, we take $M_{1}=\emptyset$. If $Z \neq \emptyset$, let $a_{1}$ be the first (first in the sense of the linear order) element of A for which there exists $b \in B$ with $(a, b) \in Z ;$ let $b_{1}$ be the first $b$ with $\left(a_{1}, b\right) \in Z$. Take $Z^{*}=Z \backslash\left\{\left(U_{a \in A}\left(a, b_{1}\right)\right) \cup\left(U_{b \in B}\left(a_{1}, b\right)\right)\right\}$. Apply the algorithm to (A,B, $\left.Z^{*}\right)$; this produces a matching $M^{\star}$. Now take

$$
M=M^{*} \cup\left\{\left(a_{1}, b_{1}\right)\right\}
$$

We also consider
Algorithm 2. The definition is the same as the one of algorithm 1 but for the definition of $\left(a_{1}, b_{1}\right)$. We now take $b_{1}$ to be the first element of $B$ for which an $a \in A$ exists with $\left(a, b_{1}\right) \in Z$, and $a_{1}$ the first $a$ with $\left(a, b_{1}\right) \in Z$.

Theorem, Algorithm 1 and algorithm 2 produce the same $M$.
Sketch of proof. Induction with respect to $|Z|$. The case $|Z|=0$ is trivial. Take $|Z|>0$. It is easy to show that there is a pair $\left(a_{0}, b_{0}\right) \in Z$ such that

$$
\left(\forall_{b \in B}\left(a_{0}, b\right) \in Z \Rightarrow b \geq b_{0}\right) \wedge\left(\forall_{a \in A}\left(a, b_{0}\right) \in Z \Rightarrow a \geq a_{0}\right)
$$

Take
$\hat{z}:=z \backslash\left\{\left(V_{a \in \mathbb{A}}\left(a, b_{0}\right)\right) \cup\left(V_{b \in B}\left(a_{0}, b\right)\right)\right\}$.

Applying Algorithm 1 to ( $A, B, \hat{Z}$ ) we get $\hat{M}_{1}$. It can be shown that application of Algorithm 1 to $(A, B, Z)$ produces $M_{1}=\hat{M}_{1} \cup\left\{\left(a_{0}, b_{0}\right)\right\}$. And we can show $a$ similar thing with algorithm 2 and $\hat{M}_{2}, M_{2}$. By induction hypothesis $\hat{M}_{1}=\hat{M}_{2}$. Hence $M_{1}=M_{2}$.
