

On the interpretation of CO₂ collective scattering in terms of fluctuations and gross plasma motion

Citation for published version (APA):

Schram, D. C., Pots, B. F. M., & Andel, van, H. W. H. (1982). On the interpretation of CO₂ collective scattering in terms of fluctuations and gross plasma motion. *Bulletin of the American Physical Society*, 27(A15), 820.

Document status and date:

Published: 01/01/1982

Document Version:

Publisher's PDF, also known as Version of Record (includes final page, issue and volume numbers)

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

A 15 On the Interpretation of CO₂ Collective Scattering in terms of Fluctuations and Gross Plasma Motion. D.C. SCHRAM, B.F.M. POTS, Eindhoven University of Technology, and H.W.H. VAN ANDEL, Université de Montréal -- Collective scattering of infrared laser light (CO₂ and FIR) is used in several laboratories to obtain detailed information on density fluctuations in terms of the spectral density function $S(k, \omega)$. Measurements in magnetised plasmas have generally shown strong fluctuation levels for perpendicularly propagating disturbances. An important question which remains is whether the obtained signal signifies the presence of waves or turbulence, or is merely the result of gross plasma motion through the scattering volume. Measurements along a central chord pertain to poloidally directed k , for example of drift waves, while those along outside chords correspond to radial k . It is well possible that these latter measurements are mainly due to gross motion which moves plasma in and out of the scattering volume. In this presentation we will show from results obtained in a test experiment, in which independent information on the macroscopic plasma motion was available, that measurements along the central chord relate to drift waves, whereas the measurements along peripheral chords can be explained by macroscopic plasma motion.
