Accepted manuscript including changes made at the peer-review stage

***Please check the document version of this publication:***

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

# INSTANCE-LEVEL EXPLANATIONS FOR FRAUD DETECTION

Dennis Collaris, Leo M. Vink, Jarke J. van Wijk

## THE PROBLEM

Fraud detection is a difficult problem that can benefit from predictive modeling. However, the verification of a prediction is challenging; for a single insurance policy, the model only provides a prediction score.

## THE SOLUTION

We designed two novel dashboards combining various state-of-the-art explanation techniques.

### Feature contribution

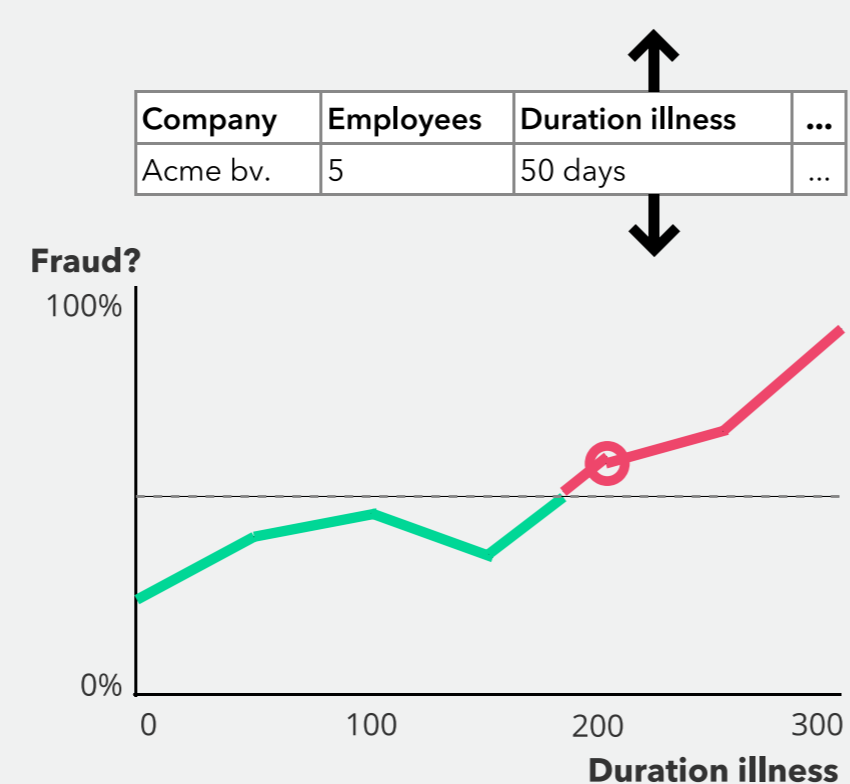

Local increment of feature  $f$ :

$$LI_f^c = \begin{cases} Y_{mean}^c - Y_{mean}^p, & \text{Parent splits on feature } f. \\ 0, & \text{Otherwise.} \end{cases}$$

Contribution of feature  $f$  in decision rule  $R$ :

$$FC_{i,t}^f = \sum_{N \in R_{i,t}} LI_f^N$$

### Partial dependence

### Local rule extraction

Synthetic pruning data set, uniform samples from an  $n$ -ball:

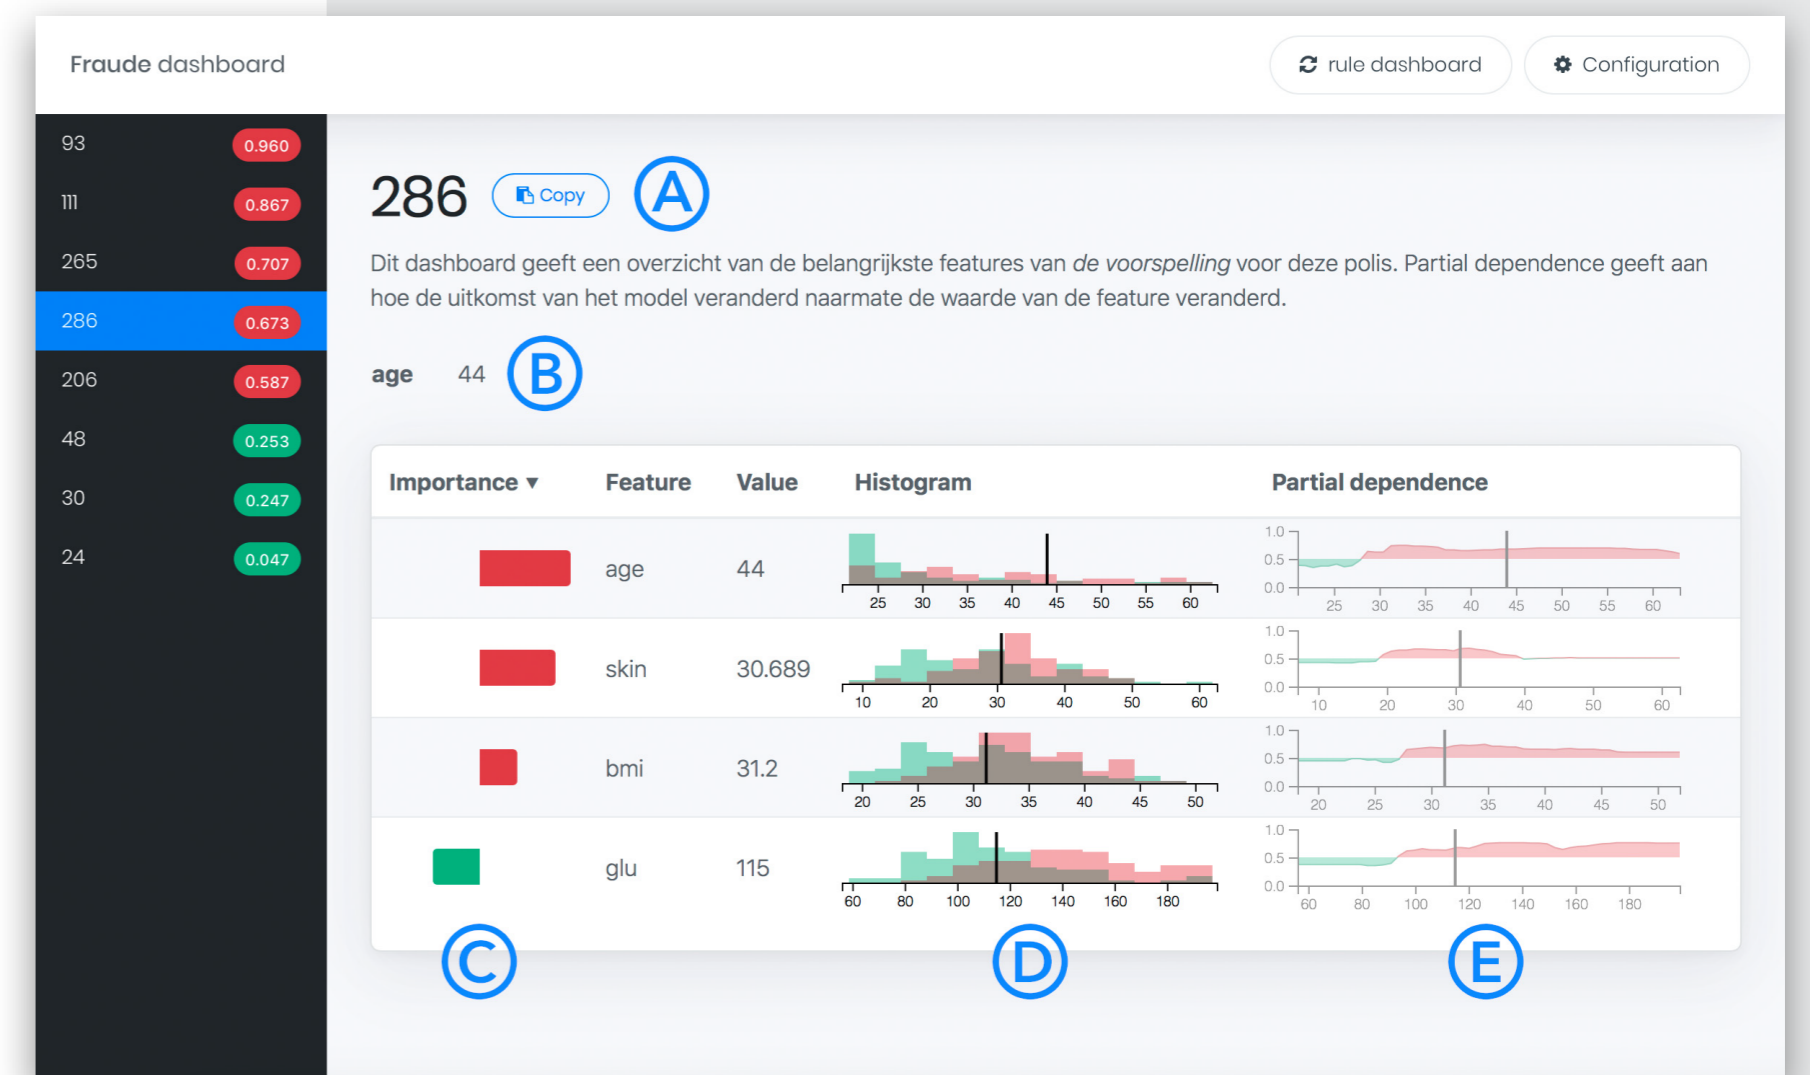

$$n\text{-ball uniform distribution} = \frac{Y * U^{\frac{1}{n}}}{\|Y\|}$$

with  $Y \sim N(0, 1)$  and  $U \sim U(0, 1)$

All decision rules applicable to instance  $i$  are extracted and pruned.

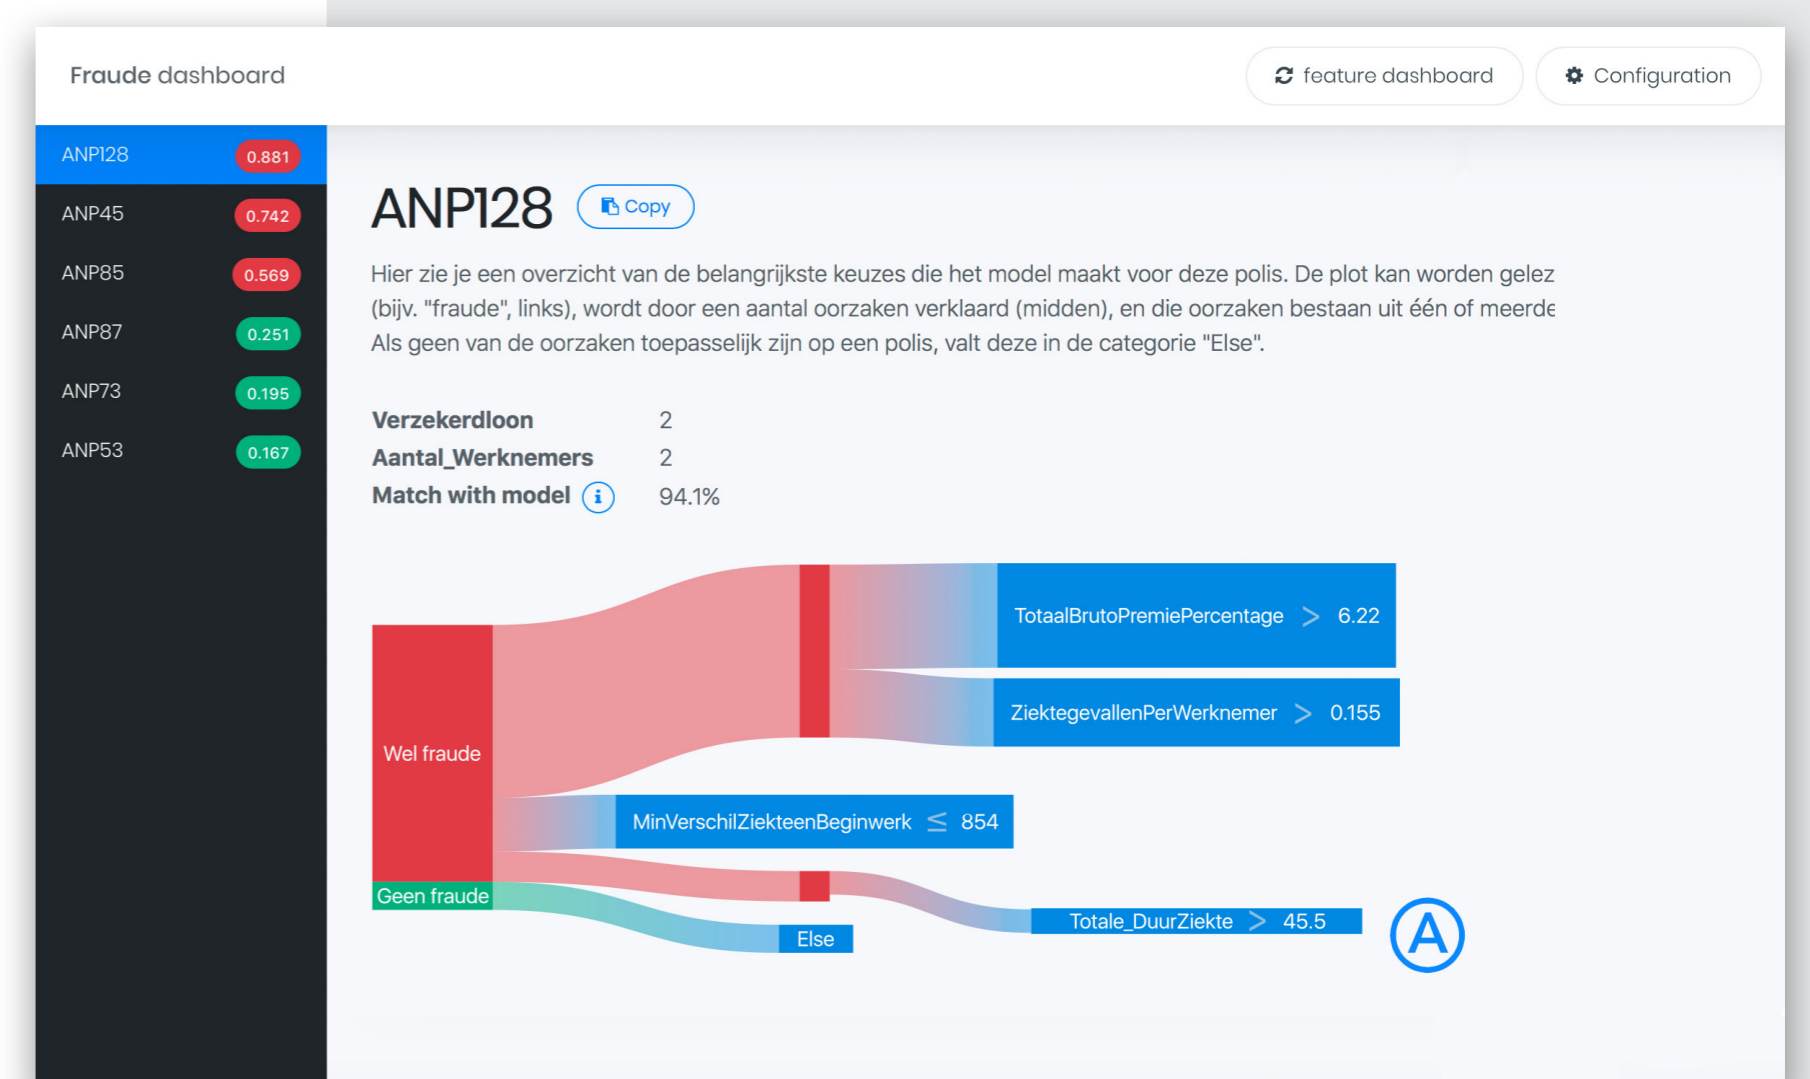

A Regularized Random Forest is trained on binary matrix of applicability of rules on the pruning dataset. Feature importance of that forest constitutes a metric of importance of individual decision rules.

For the example on the right, 1.300.000 rules are reduced to only 4, while still retaining 94.1% of the local fidelity of the reference model.

## FEATURE DASHBOARD

This dashboard shows bar charts (A) expressing the contribution of a feature to the prediction. Additionally, partial dependence plots (B) show the impact of changing the feature value indicated with a vertical line on the prediction.

## RULE DASHBOARD

This dashboard shows a flow diagram (A) representation of locally extracted rules. Four rules are shown, and rule and feature importance is encoded by the width of the edges.
