Accepted manuscript including changes made at the peer-review stage

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

Abstract: Accurately modelling nonlinearities is becoming increasingly important in the many high-tech sectors of mechanics, in particular in the context of model-based control design. During the nonlinear modelling process, a key step is the determination of the physical locations of the nonlinearities. The present work aims at developing a data-driven approach to nonlinearity location based on analysing nonparametric frequency response functions (FRFs). To achieve this objective, measurement locations in mechanical systems are interpreted as an arrangement of nodes in a dynamic network, and linearisation techniques are applied to the FRFs constructed from node to node. Illustrative results obtained on a numerical three-degree-of-freedom mechanical system demonstrate the effectiveness of the proposed approach.

Keywords: Mechanical systems; nonlinearity; experimental data; dynamic networks; linearisation; nonlinear data-driven modelling; nonlinear system identification.
