## TABLES OF SIGNED GRAPHS

F.C. Bussemaker, P.J. Cameron, J.J. Seidel, S.V. Tsaranov

### A. ABSTRACT

1. The nonisomorphic switching classes of signed graphs of the orders  $n \leq 6$  are enumerated, and exposed in terms of ( the upper right half of) a representing adjacency matrix  $E$ . The eigenvalues of each  $E$  are given.
2. The connected Coxeter signed graphs are exposed. The graphs from 1. are distinguished into classes having the same determinant  $\det(2I+E)$  and the same signature  $\text{sig}(2I+E)$ . For each class the related Coxeter graph (if present) is given.
3. The operation of local switching (which is not an equivalence relation) generates a subdivision of the classes found in 2. Local switching relates certain pairs of signed graphs within the connected subclasses. We expose these relations. In the standard cases we indicate the Coxeter graph of the subclass.
4. The signed graphs in the clusters associated with the root lattices of type  $A_k$ ,  $D_k$ ,  $E_k$  are given for  $k \leq 8$ .

AMS (MOS) subject classification, 05C25, 05C30, 05C50, 20F32.

### B. DEFINITIONS

#### 1. SIGNED GRAPH.

A graph  $\Gamma = (V, E)$  consists of an  $n$ -set  $V$ , the vertices, and a set  $E$  of pairs from  $V$ , the edges of  $\Gamma$ . A signed graph  $(\Gamma, f)$  is a graph  $\Gamma$  with a signing  $f: E \rightarrow \{\pm 1\}$  of the edges.

## 2. SWITCHING OF A SIGNED GRAPH.

For any subset  $X \subseteq V$ , let  $f_x$  denote the signing obtained from  $f$  by reversing the sign of each edge having one vertex in  $X$ . This defines an equivalence relation, called switching, on the signings since

$$f = f_\emptyset, f = (f_x)_x, (f_x)_y = f_{x \Delta y}.$$

The equivalence classes  $\{f_x : X \subseteq V(\Gamma)\}$  are the signed switching classes of  $(\Gamma, f)$ . The present Report provides the tables of the nonisomorphic signed switching classes of the graphs on  $n = 4, 5, 6$  vertices. The unsigned graphs have been enumerated in [Cv Pe] and [CDGT]. The numbers are as follows:

|                          |   |   |    |     |      |      |
|--------------------------|---|---|----|-----|------|------|
| vertices :               | 2 | 3 | 4  | 5   | 6    | 7    |
| graphs :                 | 2 | 4 | 11 | 34  | 156  | 1044 |
| connected graphs:        | 1 | 2 | 6  | 21  | 112  | 853  |
| signed graphs:           | 2 | 5 | 18 | 100 | 1242 | ?    |
| connected signed graphs: | 1 | 3 | 12 | 79  | 1123 | ?    |

## 3. ADJACENCY MATRIX

Any signed graph is represented by its adjacency matrix  $E$ , which for any  $i, j \in V$  is defined by the entry

$$E_{ij} = f(\{i, j\}) \text{ for } \{i, j\} \in E, E_{ij} = 0 \text{ otherwise.}$$

Switching with respect to  $X \subseteq V$  transforms  $E$  into  $DED$ , where  $D$  is the diagonal matrix with entries  $-1$  at the positions corresponding to  $X$ , and  $1$  at the positions of  $V - X$ . The eigenvalues of  $E$  and  $DED$  are the same, and we call them the spectrum (the eigenvalues and their multiplicities) of the signed switching class. These spectra are given in the tables, for  $n = 4, 5, 6$ . We mention the nonisomorphic signed switching classes which are cospectral, that is, which have the same spectrum.

## 4. INTERSECTION MATRIX, SIGNATURE.

If  $E$  is the adjacency matrix of a signed graph, then  $2I+E$  is a symmetric  $n \times n$  matrix with entries  $2$  on the diagonal and  $0, +1, -1$  elsewhere. We call  $2I+E$  an intersection matrix, cf. [Slo]. Let  $2I+E$  have signature  $(p, q, n-p-q)$ , that is, have  $p$  positive,  $q$  negative and  $n-p-q$  zero eigenvalues. Then  $2I+E$  may be viewed as the Gram matrix of the inner products of  $n$  vectors in the indefinite space  $\mathbb{R}^{p,q}$  with the inner products

$$(x, y) = x_1 y_1 + x_2 y_2 + \dots + x_p y_p - x_{p+1} y_{p+1} - \dots - x_{p+q} y_{p+q}.$$

## 5. STANDARD INTERSECTION MATRIX.

We call  $2I+E$  standard if its signature reads  $\epsilon++\dots+$ ,  $\epsilon \in \{+1, -1, 0\}$ , so if  $p=n$ , or  $p=n-1, q=1$ , or  $p=n-1, q=0$ . Otherwise the matrix  $2I+E$  is called nonstandard.

6. COXETER SIGNED GRAPH

We are particularly interested in signed graphs with a signing  $-$ , that is, for which the adjacency matrix  $E$  has entries 0 and -1 only. Such signed graphs will be called Coxeter signed graphs, since they correspond to the fundamental bases for Coxeter groups.

7. LOCAL SWITCHING.

This is an operation on the set of the switching classes of signed graphs of order  $n$ , which we now explain. Let  $(\Gamma, f)$  denote a switching class of signed graphs. In  $\Gamma$  we select any vertex  $i$ , and call  $V(i)$  the set of its neighbours. We take  $f(i, x) = +$  for all  $x \in V(i)$  (by switching). The rims of  $V(i)$  are the connected components of the graph which on  $V(i)$  is induced by the edges of  $(\Gamma, f)$  with sign  $-$ . We select any union  $J$  of rims, write  $V(i) = J \cup K$  (and notice that the edges from  $J$  to  $K$  have sign  $+$ ). Local Switching w.r.t.  $(i, J)$  is the following operation:

- (i) Change the signs of the edges from  $i$  to  $J$  from  $+$  to  $-$ .
- (ii) Delete the edges from  $J$  to  $K$ , and replace the nonedges by edges with sign  $-$ .

In the following example we select  $i=1$ . The rims are  $\{2, 3\}$  and  $\{4\}$ . We select  $J=\{4\}$ , hence  $K=\{2, 3\}$ . Local switching w.r.t.  $(i, J)$  transforms the signed graph 49 into a signed graph which is switched to the signed graph 74.

8. CLUSTERS

Local switching is applied to any vertex  $i$  and any union  $J$  of its rims. The operation is symmetric, but not transitive on the set  $\Omega_n$  of the switching classes of signed graphs of order  $n$ , whose intersection matrix has a given signature and determinant. Thus local switching partitions  $\Omega_n$  into mutually connected switching classes, which we call clusters.

This is illustrated for  $n=4$  by two examples, each led by a Coxeter graph:

A4: from 8 via 9 to 16.

D4: from 5 via 13 to 12

9.  $A_k, D_k, E_k$ 

The symbols  $A_k, D_k, E_k$  are abbreviations for the Coxeter-Dynkin diagrams of the corresponding types. Their intersection matrices are positive definite (i.e. have signature  $(k,0)$ ) and have determinants as follows:

$$\begin{array}{cccccc} A_k & D_k & E_6 & E_7 & E_8 \\ \det: & k+1 & 4 & 3 & 2 & 1 \end{array}$$

The intersection matrices of the extended Coxeter-Dynkin diagrams  $\tilde{A}_k, \tilde{D}_k, \tilde{E}_k$  are positive semi-definite with standard signature (and have  $\det = 0$ ). The graphs  $K_k, K_k$  minus edge,  $K_k$  minus wedge, where  $K_k$  is the complete graph on  $k$  vertices and wedge = , also represent the clusters of  $A_k, D_k, E_k$  respectively. We denote these clusters by  $cl(A_k)$ , etc.

10. ROOT LATTICES AND ROOT BASES.

To each signed graph  $(\Gamma, f)$  we attach a root lattice  $L(\Gamma, f)$ . It is defined by the intersection matrix  $2I+E$  considered as the Gram matrix of some root basis  $B$ . Then  $\det(2I+E)$  is the discriminant of  $L(\Gamma, f)$ . The type of the lattice (definite, semidefinite or indefinite (hyperbolic)) is determined by the signature  $\text{sig}(2I+E)$ .

Switching means changing signs of some vectors in the basis  $B$ . Local switching w.r.t.  $(i, J)$  transforms  $B$  by  $e_j^i = e_j - e_i$  for  $j \in J$ , preserving the  $(2; 0, 1, -1)$  shape of the Gram matrix. Each cluster contains equivalent bases of the lattice, transformed into each other by chains of local switchings.

The cluster containing  $A_k, D_k$  or  $E_k$  consists of the Coxeter-Dynkin graphs of all root bases of the lattice. In particular, it contains the Carter diagrams [Car] of the lattice.

### C. ANNOUNCEMENT OF THE TABLES

#### Table 1. SWITCHING CLASSES OF SIGNED GRAPHS.

Identification, upper half of the adjacency matrix eigenvalues.

Cospectral graphs.

#### Table 2. PARTITION BY DET AND SIG, COXETER GRAPHS.

The connected Coxeter graphs: identification, adjacency matrix  $\det = \det(2I+E)$ ; eigenvalues.

For given det and signature, the graphs from Table 1 and the Coxeter signed graphs.

#### Table 3. PARTITION BY LOCAL SWITCHING.

For given det and sig, the signed graphs of the clusters, and the connected pairs of signed graphs in the clusters.

#### Table 4. CLUSTERS FOR $A_k, D_k, E_k, k=7,8$

Identification, upper half of the adjacency matrix.

For the actual Tables we refer to the appendices in F.

### D. COMPILATION ON CLUSTERS

We summarise the information from Tables 1-3 in one table, and from Table 4 in another.

For  $n= 3, 4, 5, 6$  we arrange the data from the Tables according to the clusters. Each column represents one cluster, and contains the following data from the Tables:

sig = signature of  $2I+E$ ; in code: pos, neg; if blanc then read first symbol to the left;

det = determinant of  $2I+E$ ;

no = the number of switching classes of signed graphs in the cluster;

cox = the identification number of the Coxeter signed graph in the cluster (if any).

#### ORDER 3.

|     |       |               |  |  |  |  |  |  |  |  |  |  |       |     |
|-----|-------|---------------|--|--|--|--|--|--|--|--|--|--|-------|-----|
| sig | 3,0   | 2,0           |  |  |  |  |  |  |  |  |  |  | 3,0 ≡ | +++ |
| det | 4     | 0             |  |  |  |  |  |  |  |  |  |  | 2,0 ≡ | ++0 |
| no  | 2     | 1             |  |  |  |  |  |  |  |  |  |  |       |     |
| cox | $A_3$ | $\tilde{A}_2$ |  |  |  |  |  |  |  |  |  |  |       |     |

The sizes of the clusters for  $A_k$ ,  $D_k$ ,  $E_k$  for  $k \leq 8$  are as follows (cf. Table 4):

| $k$ :                   | 3 | 4 | 5  | 6  | 7   | 8    |
|-------------------------|---|---|----|----|-----|------|
| $  \text{cl} (A_k)  $ : | 2 | 3 | 4  | 11 | 23  | 47   |
| $  \text{cl} (D_k)  $ : | 2 | 3 | 11 | 29 | 70  | 185  |
| $  \text{cl} (E_k)  $ : | - | - | -  | 32 | 233 | 1242 |

## E. REFERENCES.

Finite graphs are symmetric relations on finite sets. They are described by  $(0,1)$ -matrices. Equivalently, one can use  $(+,-)$ -matrices, and interpret the graph as a signed complete graph. This leads to switching, switching classes of graphs, equiangular lines and two-graphs [BMS]. A further step is to consider arbitrary signed graphs and their switching classes [Ca We]. Important examples are provided by the root systems, for instance those on sets of lines at  $90^\circ$  and  $60^\circ$ . Root lattices are integral lattices generated by roots (vectors  $r$  of norm  $(r,r)=2$ ). The reflections in hyperplanes orthogonal to roots provide automorphisms of the integral lattices. These have been studied extensively by many authors [Cox, CoSl, Vin, Nik]. They found application in various branches of mathematics: graphs and two-graphs in Coxeter groups and generalizations [Bou, SeTs], signed graphs in cohomology [CaWe], Euclidean root systems in combinatorics [CGSS, BCN], vanishing lattices in singularity theory [Eb, Ja, Lo], intersection matrices in Lie algebras [Slo]. The various bases of such lattices, which are related to the conjugacy classes of the Weyl group [Car, Voi], are expressed by signed graphs. The transition of bases is governed by the local switching of the signed graphs. This operation, which goes back to Cohen [Co], was developed by Gabrielov [Gab], Ebeling [Ebe], Humphries [Hum] and others; it will also occur in [RC Si Vi]. Local switching may be phrased in terms of reflections, and in terms of signed graphs. The algorithm explained in B.7 above is more general, and was developed especially for the purpose of the present tables.

For the conclusions from the results of the tables we refer to D. above, and to the companion article [Ca Se Ts].
