Intelligent feedforward : increasing performance and extrapolation capabilities with iterative learning control. In *2nd DSPE Conference on Precision Mechatronics, 1-2 October 2014, Sint Michielsgestel, The Netherlands* (pp. 127-128)

Document status and date:

Published: 01/01/2014

Document Version:

Publisher's PDF, also known as Version of Record (includes final page, issue and volume numbers)

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

Motion stages are the key components that often determine the throughput and production accuracy. Examples include robotic arms, printing systems, pick and place machines, electron microscopes, wafer stages, and additive manufacturing machines. To enhance the performance of these systems, the development of *intelligent* control techniques that automatically optimize the performance *per system* is highly promising, [1,2].

The majority of all motion systems have to perform repetitive tasks and can benefit from control techniques such as Iterative Learning Control (ILC). A key assumption in ILC is that the task of the system is invariant under the repetitions. As a consequence, the learned command signal is optimal for the specific task only.

This poster presents a new ILC algorithm that possesses extrapolation capabilities with respect to the task, see [1]. Significantly improved performance with respect to pre-existing techniques is demonstrated for a medium-loading drive of an Océ large format printer [3], see Figures 1 and 2.

Acknowledgments

This PhD research (2011-2015) is in collaboration with Océ Technologies (Venlo, The Netherlands). Printing systems are a prime example where learning control can effectively compensate for repetitive disturbances and tasks.
