Publisher's PDF, also known as Version of Record (includes final page, issue and volume numbers)

***Please check the document version of this publication:***

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

## Our mission

Our mission is to encourage healthier lifestyles using IT solutions. Specifically, the aim is to effectively promote **physical activity** and **healthy dietary intake**. Our research aims to uncover the fundamental building blocks of mHealth tools to effectively promote these behaviors. We believe that impactful mHealth tools bring **joy**, and implement **personalisation strategies**. Hence, engagement and personalisation strategies in mHealth are the areas of our main interest.

## Our challenge

Essentially, what we aim to evoke is **behavioural change**. Theory suggests that behaviour emerges when one has the *ability, motivation*, and *opportunity* to perform the behaviour. Hence, we try to improve your ability, motivation (by analysing your **psychosocial state**), and opportunity (by analysing your **direct environment**) to engage in more physical activity and to improve your dietary intake. At the same time, we evaluate what strategies were most effective for this purpose.

## Our research tool: GameBus

We use the mHealth tool GameBus to design, implement and evaluate our health promotion campaigns. The platform allows for employing multiple behavior change strategies. At its heart, GameBus empowers users to *share their healthiest moments with their relatives*. Additionally, the platform rewards these healthy moments in *health challenges*, and has build-in functionality to automatically track these moments using wearables.

We conduct *real-world, large-scale, semi-controlled experiments* to objectively evaluate what behaviour change strategies work best in encouraging healthier lifestyles, within two areas of interest:

## Research area: Rewards & direct feedback

We have collected empirical evidence on the impact of different frames of *anticipated rewards* and *feedback messages* on user engagement (see Nuijten et al., 2019a; and D'Hondt, Nuijten, & Van Gorp, 2019c). In future studies we will evaluate the impact of unforeseen (i.e., surprising) rewards and feedback on user engagement.

## Research area: Challenges & social comparison

We have gathered empirical evidence on the effective configuration of our health challenges, e.g., by exploring the *impact of role models* in this setting. Furthermore, we have explored possibilities for *personalizing these challenges* (see Nuijten et al. 2019b), and are currently running a trial on the impact of personalisation of these challenges.
