Welcome Message

Greetings, and *Selamat Datang* (welcome) to Sarawak, the Land of the Hornbills!

The indigenous communities of Sarawak consider it auspicious when a hornbill flies over their homes. Hornbills are rainforest birds, characterized by their unique large curved beaks. While certainly decorative, these beaks are extremely functional, and having evolved binocular vision, the hornbills are able to see and to handle their food with **precision**.

Precision is the hallmark of surgical practice. The right intervention, for the right reasons, for the right patient at the right time - delivered with skill and accuracy by the right practitioner - is a mantra for all healthcare practitioners. Surgeons, who have to navigate an increasingly challenging landscape, must balance arduous and long training for acquisition of complex technical skills with concurrent development of humanistic skills. The cost of cutting edge treatments must be weighed against the shrinking budgets of healthcare systems. We need to avoid driving patients into catastrophic health expenditure without any discernible improvements in quality of life. With a plethora of therapeutic options to choose from, a rapidly evolving evidence base, and changes in expectations from an increasingly diverse patient population, surgeons must have precision in every aspect of navigating the patient journey, not just in performing operations.

It is appropriate, therefore, that the theme of Coloproctology 2023, the 21st Annual Scientific Congress of the Malaysian Society of Colorectal Surgeons (MSCRS), is '**Beyond Precision**'.

The Organising Committee has crafted a scientific programme to pull together what it means to go beyond precision in the 21st century. While many of the symposia are disease-focused, the panels are diverse, in keeping with decision-making needs for individualized patient care. Technological developments in diagnostics and therapeutics are addressed, while also paying attention to the perspectives of ostomates, cancer survivors and allied health professionals.

However, in addition to precision in clinical care, we must also apply the same rigour to training the next generation of surgeons, as well as to research, to further refine existing paradigms, or even create new ones. Thus, we have a dedicated track for core topics, highly suited to general surgical trainees and colorectal fellows, but also useful for experienced surgeons wishing to update their knowledge.

While the metaverse, and its related tools, has become the norm for interactions in the COVID-era, their place in the surgical world continues to evolve. The Presidential panel will discuss how this, and other factors, may impact screening of colorectal cancer, in what I am sure will be a lively debate!

Nevertheless, while virtual platforms have their uses, 2023 sees a welcome return to a fully in-person Coloproctology. The value of informal interactions afforded by face-to-face activities is priceless, allowing the establishment of long-lasting collaborations and friendships. I hope you will be able to take advantage of the social activities we have planned, including the Gala Dinner, aptly themed '**Contemporary Tradition**', where the fashion-forward among us will get the opportunity to show off our artistic flair. Should you have the time to extend your stay, there are plenty of attractions in Kuching and the surrounding area, from beaches to rainforests and everything in between.

See you soon!

INTRODUCTION

Rectoanal intussusception is an invagination of the rectal wall into the lumen of the rectum. It is very rare to present as mass protruding from the anus.

METHODS

We report a case of very rare presentation of adult rectoanal intussusception.

RESULTS

A 54 years-old healthy lady with presenting complain of mass protruding from the anus and per rectal bleeding for one day prior. Clinical examination revealed prolapsed anal mass with carpet like polyp and abundance of mucus discharge. There was no abdominal mass or tenderness. Mass was successfully reduced manually. Colonoscopy showed polypoidal growth at the rectum at 8cm from anus and biopsy was taken. We proceed with low anterior resection and intraoperatively noted rectoanal intussusception. Histopathological examination did showed tubulovillous adenoma with low grade dysplasia. Post-operative course complicated with anastomotic leak which required laparotomy, washout and drainage. She was then discharged well on post-operative day 13.

CONCLUSION

Rectoanal intussusception can present as prolapse through the anus in adults on rare occasions and should be investigated before definitive treatment. To preserve sphincter function, an initial reduction of colorectal intussusception should be attempted before surgery.

OBSTRUCTED PEDUNCULATED JEJUNAL GASTROINTESTINAL STROMAL TUMOR DISGUISE AS PELVIC MASS - A CASE REPORT

INTRODUCTION

Obstructed pedunculated jejunal gastrointestinal stromal tumours (GISTs) are very rare and can be misdiagnosed as gynaecological masses.

OBJECTIVE

We are describing a rare case of small bowel obstruction caused by a jejunal GIST misdiagnosed as an ovarian mass.

REPORT

A 70-year-old lady presented with abdominal pain, vomiting, and no bowel movement for three days prior. Clinical abdominal examination reveals a palpable mass at the level of the umbilicus, which was unable to feel the lower border of it. Contrasted CT Abdomen revealed a solid cystic mass in the pelvis, suspected to be ovarian in origin and associated with small bowel dilatation. The patient was subjected to exploratory laparotomy, which revealed a 12x13cm pedunculated mass from the jejunum 115cm from the duodenojejunal junction. The lesion was twisted and caused small bowel dilatation. The lesion was resected at the base of the peduncle using a linear stapler. Pathology was confirmed to be a high-risk GIST with a clear margin. The patient's postoperative course was uneventful, and she was discharged on the third postoperative day. The patient is currently receiving adjuvant imatinib therapy.

CONCLUSION

Obstructed pedunculated jejunal GIST is a very rare disease and challenging to diagnose. It should be considered in patients with small bowel obstruction and pelvic mass. Resection at the peduncle base is safe and provides a clear oncological resection margin.
