Abstrak

Penelitian ini bertujuan untuk menghasilkan instrumen Project Based Learning terintegrasi etnosains yang valid dan reliabel pada materi Hukum Newton. Jenis penelitian ini adalah penelitian pengembangan dengan model 4D. Sampel penelitian berasal dari 2 orang dosen pendidikan fisika dan guru fisika SMA Negeri 4 Kerinci. Teknik pengumpulan data berasal dari observasi, wawancara dan angket validasi. Instrumen dalam penelitian ini adalah lembar validasi dengan menggunakan skala likers. Analisis data yang digunakan adalah teknik analisis kualitatif dan kuantitatif dengan bantuan aplikasi SPSS versi 21. Hasil penelitian menunjukkan nilai rata-rata validasi instrumen etnosains sebesar 0,710 dengan kriteria sangat valid dan nilai reliabilitas sebesar 0,845 dengan kriteria tinggi. Temuan ini menjelaskan bahwa instrumen etnosains yang diintegrasikan dengan pembelajaran berbasis proyek sangat layak untuk dikembangkan dalam pembelajaran fisika materi Hukum Newton.

Development of Ethnoscience-Based Critical Thinking Instrument in Physics Learning

Abstract

This study aims to find out to produce a valid and reliable Project Based Learning integrated ethnoscience instrument in Newton's Law material. This type of research is a development research with 4D model. The research sample came from 2 physics education lecturers and physics teachers of SMA Negeri 4 Kerinci. Data collection techniques come from observation, interviews and validation questionnaires. The instrument in this study was a validation sheet using a likers scale. Data analysis is qualitative and quantitative analysis techniques with the help of the SPSS version 21 application. The results show the average validation value of ethnoscience instruments of 0.710 with very valid criteria and a reliability value of 0.845 high criteria. This finding explains that the ethnoscience instrument integrated with project-based learning is very feasible to be developed in learning physics material on Newton's Law.

Keywords: *Instrument, Critical Thinking, Ethnoscience, Science Learning, Physics*

Introduction

Critical thinking is an ability that students must have in facing the 21st century (Untari et al., 2020; Suharyat et al., 2022; Suryono et al., 2023). Critical thinking is necessary for students to solve a problem (Kurniahtunnisa et al., 2016; Ludwig & Charbel, 2023; Shaw et al., 2019; Rahman et al., 2023). Ariani (2020) Critical thinking skills help students be more creative and active in learning. In addition, critical thinking encourages students to think at a higher level in the learning process (Farisi et al., 2017; Amin et al., 2020; Yustiana et al., 2022; Cahyono et al., 2021; Suharyat et al., 2022; Elfira & Santosa, 2023). Students who have critical thinking skills find it easier to understand the subject matter (Prihono et al., 2020; Ichsan et al., 2023)

Students' science critical thinking skills in Indonesia are still low (Hidayati et al., 2022; Rahmatia & Fitria, 2021; Oktarina et al., 2021; Sofianora et al., 2023). This can be seen from the 2018 PISA Research which shows the critical thinking skills of Indonesian students in the field of science obtained a score of 396 ranked 72 out of 78 members (Zulkifli et al., 2022; Rahman et al., 2023; Karim et al., 2023; Nurtamam et al., 2023). In teaching and learning activities teachers still use conventional methods (Ejin, 2017), so that students are less active in learning. Kono & Mamu (2016) stated that teachers who use consensual learning models have not been able to improve students' critical thinking skills. in addition, teachers have not been able to direct students to work on questions that lead students to think critically. So, there is a need for instruments that can encourage students to think critically in physics learning..

Physics is a compulsory subject for high school students that must be completed with grades in accordance with

the Teaching Completeness Criteria. Physics learning leads students to be able to think critically in order to provide solutions to problems (Rahman & Ristiana, 2020). Research results by Rofiah et al., (2013) stated that the development of physics instruments helps teachers to improve higher order thinking skills. In addition, the instrument can help teachers in evaluating student learning outcomes (Sari et al., 2018). Research results Sulistiyo et al., (2019) stated that the development of instruments in physics learning evaluates students' attitudes and responsibilities. The development of ethnoscience-based critical thinking instruments helps students introduce their local wisdom (Fitria & Widi, 2015; Subali, 2020; Hallatu & Palittin, 2021; (uhaimi et al., 2022).

Previous research by Amarila et al., (2014) stated that the development of a valid critical thinking instrument will shape the quality of students' thinking in learning physics. Penelitian oleh Putri et al., 2016) explains the development of instruments related to proper physics learning will be able to measure students' critical thinking skills. However, the reality is that teachers have not been able to make the right instruments that direct students to think critically. Desiriah & Setyarsih (2021) The development of valid and reliable instruments is able to measure students' high-level thinking skills. Based on the above problems, this research aims to produce valid and reliable ethnoscience-based critical thinking instruments in physics learning.

Methods

This research is a type of Research & Development research using the 4D model. This research was conducted at SMA Negeri 4 Kerinci. The research sample

came from 2 physics education lecturers and 1 physics teacher of SMA Negeri 4 Kerinci. Data collection techniques in this study were observation, interview and questionnaire. Instruments in the form of tests and validation sheets. The test consists of 10 multiple choice questions related to critical thinking in learning physics material Newton's law, while the validation sheet is used to measure the feasibility of questions in learning physics material newton's law. Criteria for validation and reliability of questions can be seen (Tables 1 and 2). The data analysis technique is quantitative analysis with the help of the SPSS version 16 application with the criteria for critical thinking skills can be seen in Table 1.

Table 1. Criteria for Question Validity

Angka	Criteria
0.80 – 1.00	Very High
0.60 – 0.80	High
0.40 – 0.60	Simply
0.20 – 0.40	Low
0.00 – 0.20	Very Low

Source: (Hamidah & Wulandari, 2021)

Table 2. Reliability criteria

Angka	Kriteria
0.80 – 1.00	Very High
0.60 – 0.79	High
0.40 – 0.59	Simply
0.20 – 0.39	Low
0.00 – 0.19	Very Low

Source: (Hamidah & Wulandari, 2021)

Table 3. Critical Thinking Ability Interpretation Criteria

Angka	Criteria
81- 100	Very Good
61 – 80	Good
41 – 60	Simply
21 – 40	Less
< 20	Very Less

Result

The results of the development of ethnoscience-based critical thinking instruments in learning physics newton's law material. The first stage of needs analysis, curriculum analysis and analysis of student evaluation questions in ecology and environmental materials. The second stage makes the design of critical thinking instruments in accordance with the Basic Competencies and Core Competencies of newton's law material. Furthermore, the third stage is Develop. At this stage, the instrument was validated by content validation, language validation and material validation by physics education lecturers and physics teachers. The results of the validation of critical thinking instruments in learning newton's law material can be seen in Table 3.

Table. 3 HOTS Instrument Validation Results

No	Validation	Skor	Peresentase (%)	Criteria
1	Content	49	86 %	Very Valid
2	Languange	41	80 %	Valid
3	Material	45	88 %	Very Valid
Average				Valid

Based on Table. 3 explains that the content validation value obtained a score of 49 with very valid criteria valid, language validation score 451, material validation score 47 and the average value of the validity test obtained a score of 45 with very valid criteria valid. This shows that ethnoscience-based critical thinking instruments are suitable for use in learning biology class X SMA Negeri 4 Kerinci newton's law material. The next stage is implementation. At this stage the instrument that has been validated by experts and revised is then carried out a limited trial on students by giving Higher Order Thinking Skills (HOTS) questions. The

Resul and Discussion

results of the limited trial validation can be seen in Table 4.

Table 4. Student Critical Thinking Interpretation Results

Index	Criteria	Limited Product Trial	
		Frequency	Total
0.81 - 1.00	Very High	4	40
0.61 - 0.80	High	4	40
0.41 - 0.60	Simply	1	10
0.21 - 0.40	Low	1	10
0.00 - 0.20	Very Low	0	0
Total		10	100

Based on Table 4. Shows the results of limited instrument trials of critical thinking in physics learning there are 4 (40%) questions that have very high validation, 8 (40%) questions have high validity, 4 (40%) questions have sufficient validity and 1 (10%) has low validity. From the results of the limited trial, the Higher Order Thinking Skills (HOTS) instrument in physics learning is very feasible to be used in learning newton's law material. Furthermore, from the limited test results of the HOTS instrument, the lowest rcount was 0.220 with low criteria while the highest rcount was 0.820 with very high validity. With an average score of 0.710 with valid criteria. Furthermore, the results of the HOTS instrument reliability test in learning newton's physics can be seen in Table 5.

Table 5. Reliability Test Results

Product Trial	α	Criteria
Uji Coba Produk Terbatas	0.845	High

Based on Table 5. Explaining the results of the HOTS instrument reliability test in the limited product trial obtained $\alpha = 0.972$ with very high criteria. This shows that this ethnossian-based critical thinking instrument is very valid and reliable to be developed in learning newton's law physics.

Discussion

The development of ethnoscience-based critical thinking instruments in learning physics newton's law material is very feasible to develop. Ethnocentric-based critical thinking instruments are very important for teachers in developing students' critical thinking skills in learning (Fitriani, 2020; Rahman et al., 2023). The development of valid and reliable ethnoscience-based critical thinking instruments will encourage students' critical and creative thinking skills in learning. (Agustin et al., 2018; Novitra et al., 2021).

In developing ethnoscience-based critical thinking instruments for physics learning, questions must refer to critical thinking indicators so that students can think critically. Fradila et al., (2021) stated that ethnoscience-based critical thinking instruments that have good validity, reliability and difficulty index values will result in appropriate use to measure students' critical thinking skills. From the validity test results obtained an average score of 0.710 and reliability of 0.845 with very high criteria. The use of appropriate critical thinking instruments in biology learning will be able to be used in evaluating the quality of student learning (Shaw et al., 2019). (Al-fikry & Syukri, 2018) stated that the development of ethnoscience-based critical thinking instruments can encourage students to more easily solve a problem related to physics learning questions.

Conclusion

Based on this research, it can be concluded that ethnoscience-based critical thinking has a validation value of 0.710 with decent criteria, reliability of 0.845 high criteria. These findings explain that the critical thinking instrument is very valid and reliable to use in newton's law material. So, the ethnoscience-based

critical thinking instrument is very feasible to be developed in physics learning at school.
