## Introduction

- The need to design and build explainable recommender interfaces is increasing rapidly.
- Explanations have been shown to be useful for obtaining system transparency and trust [1].
- Little is known about how to design explanation interfaces for **casual (non-expert) users** to achieve different explanatory goals.
- We conducted an international (across 13 countries) online survey of 14 active users of a social recommender system.
- This study captures user feedback in the field and frames it in terms of design principles and opportunities.

## Initial Analysis

### Survey Question:

How can an explanation function help you perceive system...

#### 1. Transparency

#### 2. Scrutability

#### 3. Trust

#### 4. Persuasiveness

#### 5. Effectiveness

#### 6. Efficiency

#### 7. Satisfaction

## Methodology: International Online Survey

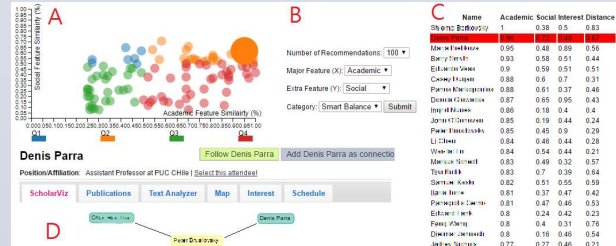

- We **conducted** an online survey to collect necessary demographic information and self-reflection about how to design an explanation function in **seven explanatory goals** [2].
- We targeted the users who had created an account and casually (not frequently) interacted with the Conference Navigator system [3].
- We sent out 89 letters, and a total of 14 participants (7 female) replied to create the pool of participants for the user study.
- The participants were from 13 different countries; their ages ranged from 20 to 40 (M=31.36, SE=5.04).

## Discussion & Design Opportunity

- The explanatory goals are not independent of each other but are context-dependent.
- The user always prefers a visualized explanation, but **this** may not be reflecting on better usability.
- The tunable/inspectable interface can be used as explanation functions.
- The explanation is not always beneficial, e.g., it may prolong (delay) the decision process.

**Design Sample 1:** The design of the Relevance Tuner: (a) Relevance Slides; (B) Stackable Score Bar; (C) User Profiles. The user can inspect the recommendations with multi-relevance dimensions while controlling the weightings.

**Design Sample 2:** The design of Scatter Viz: (A) Scatter Plot; (B) Control Panel; (C) Ranked List; (D) User Profile Page. The user can select (or inspect) the recommendations with two relevance dimensions in the scatter plot.
