July 02, 2015

10th OpenFOAM Workshop June 29 – July 2, 2015 in Ann Arbor, Michigan, USA

Introduction & Motivation I

What is coming up?

イロト 不同 トイヨト イヨト ヨヨ わなや

Today's Objectives

Executive Overview of

Numerical Modeling

(Allen-Cahn and Cahn-Hilliard in unified model framework)

- Consistent coupling to incompressible two-phase Navier-Stokes equations
- Enforcement of phase-volume conservation and boundedness (AC)
- Treatment of moving contact lines

Equation Discretization and Solution

- Enforcement of phase-volume conservation and boundedness (CH)
- Treatment of moving contact lines
- Implementation into FOAM

Numerical Results

- Validation & Verification
- Wetting Physics (Xuan Cai, KIT Karlsruhe)

< ロ > < 団 > < 豆 > < 豆 > < 豆 > < 豆 = < の < 0</p>

Introduction & Motivation III

Diffuse Interface Models – Characteristics

Phase-field methods rely on diffuse interface models

- connection to thermodynamics by a phenomenological free energy functional (model).
- evolution of phase field governed by dissipative minimization of free energy.
- Diffuse interface represented as a finite thickness transition layer
 - $\triangleright~$ characterized by capillary width $\epsilon>0$ (related to interfacial thickness)
 - > diffusion of phase constituents within thin transition layer
 - Fluid mixing (even for immiscible fluids) and interface evolution controlled by chemical potential
 - ▷ fluid properties vary rapidly but smoothly between fluids
- Phase-field methods for two-phase flow
 - pioneering work: Jacqmin^{[1}
 - ▷ two 'flavors': Cahn-Hilliard ^[2] or Allen-Cahn ^[3]

^[2] J.W. Cahn and J.E. Hilliard, J. Chem. Phys. 28 (1957).

[3] S.M. Allen and J.W. Cahn, Acta Metall. 27 (1979).

Introduction & Motivation IV

Diffuse Interface Models – Characteristics

Free energy

Free energy density model for mixing of the two-phase system

$f(\boldsymbol{\chi}) = \underbrace{\frac{\lambda}{2} |\nabla \boldsymbol{\chi}|^2}_{\text{'gradient energy'}} + \underbrace{\frac{\lambda}{\epsilon^2} \Psi(\boldsymbol{\chi})}_{\text{bulk energy}}$

where

- $\triangleright \ \Psi(\chi) = (\chi^2 1)^2/4 \text{: bulk energy density} \\ \text{(Ginzburg-Landau double-well functional)}$
- $\triangleright \ \Psi'(\chi) = \chi(\chi^2 1) \text{: derivative of } \Psi \text{ w.r.t. } \chi$
- $\rhd \ \Phi(\chi) = \delta F/\delta\chi,$ with $F = \int_\Omega f d{\bf x}$: chemical potential (Cahn, 1961)
- Competition between bulk and capillary/interfacial (gradient) contribution 'controlling' surface tension and interfacial thickness.

Numerical Modeling I

Derivation of Governing Phase-Field Transport Equations

イロト 不同 トイヨト イヨト ヨヨ わなや

◆□▶ ◆□▶ ◆三▶ ◆三▶ ◆□≥ ��

TECHNISCHE UNIVERSITÄT DARMSTADT

Starting Point: Generic structure of the phase-field equation ^[4,5]

$$\partial_t \left(\rho \chi \right) + \nabla \cdot \left(\rho \chi \mathbf{v} + \mathbf{J}_{\chi} \right) = \xi_{\chi}.$$

This can be specified into Allen-Cahn- (AC) or Cahn-Hilliard-type (CH) models via choice of either the production rate ξ_χ or flux J_χ being non-zero

 $\mathbf{J}_{\chi} \neq 0$ and $\xi_{\chi} = 0$ (CH) and $\mathbf{J}_{\chi} = 0$ and $\xi_{\chi} \neq 0$ (AC)

Volume-Averaging yields governing equations with $C \equiv \overline{c} := \alpha_2 - \alpha_1$.

Numerical Modeling II

i

Coupling to Navier-Stokes Equation

イロト 不同 トイヨト イヨト ヨヨ わなや

 Cahn-Hilliard momentum equation with (non-standard) relative density flux due to diffusion of components ^[6,7]

$$\partial_t (\alpha_1 \,\overline{\rho}^k) + \nabla \cdot (\alpha_1 \,\overline{\rho}^k \,\overline{\mathbf{u}}) = -\nabla \cdot \mathbf{J}_k \quad \Leftrightarrow \quad \partial_t \alpha_1 + \nabla \cdot (\alpha_1 \,\overline{\mathbf{u}}) = -\nabla \cdot \left(\frac{\mathbf{J}_k}{\overline{\rho}^k}\right)$$

 \triangleright From summation of the right equation for k = 1, 2, exploiting $\alpha_1 + \alpha_2 \equiv 1$

$$\frac{\mathbf{J}_1}{\overline{\rho}^1} + \frac{\mathbf{J}_2}{\overline{\rho}^2} = 0, \qquad \text{where } \mathbf{J}_k := \alpha_1 \, \overline{\rho}^1 \big(\, \overline{\mathbf{u}}^1 - \overline{\mathbf{u}} \, \big) + \, \overline{\mathbf{J}_{\chi}} \,,$$

i.e., insisting on volume conservation in the volume-averaged model, the volumetric diffusion fluxes are required to match – in the spirit of Cahn and Hilliard.

 $\triangleright\,$ Then, however, from summation of the left equation for k=1,2, the continuity equation becomes

$$\partial_t \,\overline{\rho} + \nabla \cdot (\overline{\rho} \,\overline{\mathbf{u}}) =: D_t \,\overline{\rho} = -\nabla \cdot (\mathbf{J}_1 + \mathbf{J}_2) \neq 0 \qquad \text{in cases where } \overline{\rho}^1 \neq \overline{\rho}^2$$

Numerical Modeling III

Coupling to Navier-Stokes Equation (cont'd)

イロト 不同 トイヨト イヨト ヨヨ わなや

- Cahn-Hilliard momentum equation with (non-standard) relative density flux due to diffusion of components
- ▷ Linear momentum equation (l.h.s.), using $\nabla \cdot \overline{\mathbf{u}} = 0$,

 $\partial_t(\bar{\rho}\,\bar{\mathbf{u}}) + \nabla \cdot (\bar{\rho}\,\bar{\mathbf{u}}\,\bar{\mathbf{u}}) = \bar{\rho}\,(\partial_t\,\bar{\mathbf{u}} + \bar{\mathbf{u}}\cdot\nabla\,\bar{\mathbf{u}}) - \nabla \cdot [\,\bar{\mathbf{u}}\,(\mathbf{J}_1 + \mathbf{J}_2)] + (\mathbf{J}_1 + \mathbf{J}_2)\cdot\nabla\,\bar{\mathbf{u}}\,,$

which allows for an objective ^[8] momentum flux tensor on r.h.s.

 $\boldsymbol{\sigma} := \tilde{\boldsymbol{\sigma}} + \overline{\mathbf{u}} \left(\mathbf{J}_1 + \mathbf{J}_2 \right) = -p\mathbf{I} + \tau$

⊳ Then,

 $\partial_t(\overline{\rho} \,\overline{\mathbf{u}}) + \nabla \cdot (\overline{\rho} \,\overline{\mathbf{u}} \,\overline{\mathbf{u}}) - \overline{\mathbf{u}} \left[D_t \,\overline{\rho} \right] = -\nabla p + \nabla \cdot \tau - (\mathbf{J}_1 + \mathbf{J}_2) \cdot \nabla \overline{\mathbf{u}}$

 $\Leftrightarrow \partial_t(\bar{\rho}\,\bar{\mathbf{u}}) + \nabla \cdot (\bar{\rho}\,\bar{\mathbf{u}}\,\bar{\mathbf{u}}) = -\nabla p + \nabla \cdot \tau - \nabla \cdot (\bar{\mathbf{u}}\,(\mathbf{J}_1 + \mathbf{J}_2))$

^[8] H. Abels, H. Garcke and G. Grün, Math. Models Methods Appl. Sci. 22/3 (2012).

- Cahn-Hilliard momentum equation with (non-standard) relative density flux due to diffusion of components
- ▷ Linear momentum equation (l.h.s.), using $\nabla \cdot \overline{\mathbf{u}} = 0$,

 $\partial_t(\bar{\rho}\,\bar{\mathbf{u}}) + \nabla \cdot (\bar{\rho}\,\bar{\mathbf{u}}\,\bar{\mathbf{u}}) = \bar{\rho}\,(\partial_t\,\bar{\mathbf{u}} + \bar{\mathbf{u}}\cdot\nabla\,\bar{\mathbf{u}}) - \nabla \cdot [\,\bar{\mathbf{u}}\,(\mathbf{J}_1 + \mathbf{J}_2)] + (\mathbf{J}_1 + \mathbf{J}_2)\cdot\nabla\,\bar{\mathbf{u}},$

which allows for an objective [8] momentum flux tensor on r.h.s.

 $\boldsymbol{\sigma} := \tilde{\boldsymbol{\sigma}} + \overline{\mathbf{u}} \left(\mathbf{J}_1 + \mathbf{J}_2 \right) = -p\mathbf{I} + \tau$

⊳ Then,

 $\partial_t(\bar{\rho}\,\bar{\mathbf{u}}) + \nabla \cdot (\bar{\rho}\,\bar{\mathbf{u}}\,\bar{\mathbf{u}}) - \bar{\mathbf{u}}\,[D_t\,\bar{\rho}] = -\nabla p + \nabla \cdot \tau - (\mathbf{J}_1 + \mathbf{J}_2) \cdot \nabla \,\bar{\mathbf{u}}$

 $\Leftrightarrow \partial_t(\bar{\rho} \, \bar{\mathbf{u}}) + \nabla \cdot (\bar{\rho} \, \bar{\mathbf{u}} \, \bar{\mathbf{u}}) = -\nabla p + \nabla \cdot \tau - \nabla \cdot (\bar{\mathbf{u}} \, (\mathbf{J}_1 + \mathbf{J}_2))$

^[8] H. Abels, H. Garcke and G. Grün, Math. Models Methods Appl. Sci. 22/3 (2012).

Numerical Modeling III

Coupling to Navier-Stokes Equation (cont'd)

- Cahn-Hilliard momentum equation with (non-standard) relative density flux due to diffusion of components
- Linear momentum equation (l.h.s.), using $\nabla \cdot \overline{\mathbf{u}} = 0$,

 $\partial_t(\overline{\rho}\,\overline{\mathbf{u}}) + \nabla \cdot (\overline{\rho}\,\overline{\mathbf{u}}\,\overline{\mathbf{u}}) = \overline{\rho}\,(\partial_t\,\overline{\mathbf{u}} + \overline{\mathbf{u}}\cdot\nabla\,\overline{\mathbf{u}}) - \nabla \cdot [\overline{\mathbf{u}}\,(\mathbf{J}_1 + \mathbf{J}_2)] + (\mathbf{J}_1 + \mathbf{J}_2)\cdot\nabla\,\overline{\mathbf{u}},$

which allows for an objective [8] momentum flux tensor on r.h.s.

 $\boldsymbol{\sigma} := \tilde{\boldsymbol{\sigma}} + \overline{\mathbf{u}} \left(\mathbf{J}_1 + \mathbf{J}_2 \right) = -p\mathbf{I} + \tau$

Then.

 $\partial_t(\overline{\rho} \,\overline{\mathbf{u}}) + \nabla \cdot (\overline{\rho} \,\overline{\mathbf{u}} \,\overline{\mathbf{u}}) - \overline{\mathbf{u}} [D_t \overline{\rho}] = -\nabla p + \nabla \cdot \tau - (\mathbf{J}_1 + \mathbf{J}_2) \cdot \nabla \overline{\mathbf{u}}$

 $\Leftrightarrow \partial_t(\overline{\rho} \,\overline{\mathbf{u}}) + \nabla \cdot (\overline{\rho} \,\overline{\mathbf{u}} \,\overline{\mathbf{u}}) = -\nabla p + \nabla \cdot \tau - \nabla \cdot (\overline{\mathbf{u}} \,(\mathbf{J}_1 + \mathbf{J}_2))$

Implementation into FOAM III

Top-level: Client/user interface

Relative density flux due to diffusion of components (with matching volumetric diffusion fluxes – in the spirit of Cahn and Hilliard) as consequence of solenoidal condition (\nabla • u = 0):

> $\partial_t (\overline{\rho} \ \overline{\mathbf{u}}) + \nabla \cdot (\overline{\rho} \ \overline{\mathbf{u}} \ \overline{\mathbf{u}})$ = $-\nabla p + \nabla \cdot \tau - \nabla \cdot (\overline{\mathbf{u}} (\mathbf{J}_1 + \mathbf{J}_2))$

 Consistency of the Allen-Cahn diffuse interface model requires a source term in the pressure equation.

Closing I Summary & Outlook

TECHNISCHE UNIVERSITÄT DARMSTADT

Summary

- Consistent coupling to incompressible two-phase Navier-Stokes equations.
- Enforcement of phase-volume conservation and boundedness.
- Quantitative validation of phase-field methods based on Allen-Cahn and Cahn-Hilliard diffuse interface models.
- Quantitative verification on phase-volume conservation and boundedness properties (ongoing work).

Outlook

Release of the source to foam-extend.

Holger Marschall^{1,*} Xuan Cai², Martin Wörner², Olaf Deutschmann², Mathematical Modeling and Analysis, Center of Smart InterfacesphaseFieldFoam - Development and Implementation 19/20
