# The D.C. Freeway Revolt and the Coming of Metro

**By Richard F. Weingroff**  
**Federal Highway Administration**

While writing "Busting the Trust: Unraveling the Highway Trust Fund 1968-1978," posted on the Highway History Web site ([https://www.fhwa.dot.gov/highwayhistory/busting\\_the\\_trust.pdf](https://www.fhwa.dot.gov/highwayhistory/busting_the_trust.pdf)), I kept coming back to the story of freeways in the Washington area. I told as much of the story as I needed to in the article, but decided to write a separate monograph on the complex subject.

It took longer than expected, but having moved to Washington in 1973, I was interested to learn the story behind the area's transportation system. Many large cities had similar battles, but the District of Columbia's constitutional status made the DC Freeway Revolt unique because of frequent congressional involvement that no other city experienced routinely.

## The D.C. Freeway Revolt and the Coming of Metro

By Richard F. Weingroff  
Federal Highway Administration

“Washington’s transportation problems are—in one form or another—a microcosm of our Nation’s transportation problems.”

Secretary of Transportation Alan S. Boyd  
September 26, 1967

### Introduction

#### A Template for Cities

On April 27, 1939, President Franklin D. Roosevelt submitted a report to Congress called *Toll Roads and Free Roads*. At the request of Congress, the Bureau of Public Roads (BPR) had examined the feasibility and cost of three east-west and three north-south toll superhighways. BPR concluded that the toll superhighways were not financially feasible, but offered an alternative: a master plan for a network of toll-free express highways.

The need to improve the primary interstate portions of the Nation’s road network was clear, but BPR was especially interested in the alignment of expressways to help solve problems in metropolitan areas. The report explained that “the new facilities most urgently required are belt-line distribution roads around the larger cities and bypasses around many of the smaller cities and towns.” Through traffic, however, was only a small part of the congestion problem:

By far the greater part is originated in or destined to points in the city and largely points near its center or customarily reached by traveling through the center. Bypass routes, therefore, may not be regarded as means for the relief of congestion on the highway-connecting streets of large cities.

Belt-line distribution roads with control of access were needed for all large cities and many smaller ones to allow traffic not bound for the city to bypass it and to serve as a transfer route among the radial highways serving the city. An inner belt-line should also be built “generally somewhere within the ring of decadent property surrounding the central business area.” The property had been abandoned by the middle and upper class residents who had moved to new suburban housing, usually still within the city limits, and they had been replaced by residents with lower or no income. The report explained:

Such a belt line, connecting at appropriate points with radial arteries extending out of the city, may avoid the cutting of a new route directly through the business sections, and may either serve as a substitute or supplement for the outer belt line.

An outer belt-line was needed to serve similar purposes at a distance from downtown. This belt-line could be built within the outer limits of city boundaries where possible, or just beyond the

boundary. [*Toll Roads and Free Roads*, Message from the President of the United States, House Document No. 272, 76<sup>th</sup> Congress, 1<sup>st</sup> Session, April 27, 1939, page 95-98]

In April 1941, President Roosevelt appointed a National Interregional Highway Committee to investigate the need for a national highway system to improve the facilities now available for interregional transportation and to advise on the character of such improvements. Thomas H. MacDonald, Commissioner of Public Roads, served as chairman, while Herbert S. Fairbank of the Public Roads Administration (PRA, as BPR was known in the 1940s) was secretary and primary author. Harland Bartholomew of St. Louis, one of the Nation's leading urban planners, was an active non-PRA member of the committee.

The committee essentially completed its work in 1941, but the report was held during World

War II while PRA and State highway officials focused on defense highway needs. Moreover, its release could be delayed until near war's end because constructing the interregional network was seen as a source of jobs for the returning soldiers after victory. President Roosevelt transmitted *Interregional Highways* to Congress on January 12, 1944.

It outlined a proposed National System of Interregional Highways, but with special emphasis on segments in metropolitan areas. For the largest urban areas, the report prescribed a series of circumferentials. One would encircle the central business district, a second would be located further out but within or near the city boundary, and a third (or more) would be located at a greater distance. All would serve bypass traffic while providing links among the radials for local traffic. [*Interregional Highways*, Message from the President of the United States, House Document No. 379, 78<sup>th</sup> Congress, 2d Session, January 12, 1944, pages 64-65, 71-74]

Full control of access in urban areas, the report stated, "may require the raising or lowering of extended sections of the interregional route above or below the adjoining ground level, in order to carry it over or under frequent cross streets or over some and under others." Crowding an elevated highway "into the narrow space generally afforded by existing surface streets will usually result in unsatisfactory design of the express route and impairment of the utility of the surface street for local service." A wider right-of-way was needed, with one option being to acquire properties on one side of the street. "In general, the Committee considers elevation of the express routes a solution acceptable only in a commercial or business environment." The committee agreed with the "widely held opinion opposing the cutting of such facilities through residential areas."

By comparison, the committee preferred depressed expressways if obstacles could be overcome. Depression of the express highway would "usually require extensive reconstruction of underground facilities, such as water mains, sewers, and electric conduits." As a result, achieving full depression within the right-of-way of an existing street would rarely be possible. However, where the obstacles could be overcome, the depressed expressway "may be considered by many, more pleasing to the eye and more consonant with a gracious improvement of the urban environment than any other solution of the express-highway problem." [*Interregional Highways*, page 80]

In the Federal-Aid Highway Act of 1944, Congress directed the Federal Works Agency, which included PRA, to consult with the State highway agencies to designate a 40,000-mile National System of Interstate Highways. PRA asked the State highway agencies to propose mileage for inclusion in the Interstate System.

### **The Comprehensive Plan for the District**

The District of Columbia is unique among cities because it is not part of a State, but rather is a separate entity created under a provision of the Constitution. Section 8, which lists the powers of Congress, includes the following:

To exercise exclusive legislation in all cases whatsoever, over such District (not exceeding ten miles square) as may, by cession of particular states, and the acceptance of Congress, become the seat of the government of the United States, and to exercise like authority over all places purchased by the consent of the legislature of the state in which the same shall be, for erection of forts, magazines, arsenals, dockyards, and other needful buildings . . .

After President George Washington identified the location for the capital city, officials created a diamond-shaped District out of Maryland and Virginia centered on the Potomac River and including the existing cities of Georgetown, Maryland, and Alexandria, Virginia. After the central government moved to the ill-prepared District in 1800, Congress exercised varying levels of control over the years. (In 1846, Congress returned the Virginia portion of the District to the Commonwealth of Virginia.)

The District committees in Congress were the real power over virtually every aspect of civic life, including highways and parks. The District did not have a vote in Congress.

By the 1920s, Washington was searching for a template.

On June 6, 1924, President Calvin Coolidge signed legislation creating the National Capital Park Commission. The legislation authorized the commission to acquire land in the District, Virginia, and Maryland for parks and playgrounds, with advice from the Commission of Fine Arts. For this purpose, the legislation authorized \$1.1 million a year. In particular, the commission was to turn its attention to “Rock Creek and the Potomac and Anacostia Rivers . . . and to provide for the comprehensive, systematic, and continuous development of park, parkway, and playground systems of the National Capital.” [Gutheim, Frederic, and Lee, Antoinette J., *Worthy of the Nation: Washington, DC, from L’Enfant to the National Capital Planning Commission*, 2<sup>nd</sup> Edition, The Johns Hopkins University Press, 2006, page 178]

Congress expanded the role of the commission and changed its name in legislation that President Coolidge signed on April 30, 1926. The amendment directed the new National Capital Park and Planning Commission to prepare, develop, and maintain “a comprehensive, consistent and coordinated plan” for the National Capital and its Maryland and Virginia suburbs, as well as coordinating the plans of Federal and District agencies. The legislation also abolished the 1895

District Highway Commission and transferred its powers to the new commission. [Gutheim and Lee, page 180]

According to Frederic Gutheim's and Antoinette J. Lee's history of planning in the Washington area, the chairman of the commission, Frederic A. Delano, was not a trained planner but was "a longtime activist in planning in Washington, having been "a prime organizer of the *Regional Plan of New York and Its Environs*, which was published in 1928." (Delano was future President Franklin Delano Roosevelt's uncle.) [Gutheim and Lee, pages 170, 194]

Frederick Law Olmsted, Jr., "made substantive contributions to the Planning Commission in its early years, taking on much of the work himself." He "had established his own reputation distinct from that of his famous father," the leading landscape architect of his generation, and had "Secure lines of communication with influential people." Staff member Charles W. Eliot II, at 27 years old, was the commission's initial "City Planner." He was the "nephew and namesake" of a famous landscape architect who had helped prepare the 1893 Boston Metropolitan Park System, "a model which many Washingtonians admired." Eliot II had trained in Harvard's Graduate School of Landscape Architecture, which offered city planning, and had worked for Olmsted in Massachusetts. Eliot, according to Gutheim and Lee, "saw his job as the function of 'allowing for necessary municipal growth, yet preserving as much as . . . I can of the flavor of the past.'" [Gutheim and Lee, page 194]

Colonel Ulysses S. Grant III was the executive officer. At the time, he was Director of the independent Office of Public Buildings and Public Parks of the National Capital, which had an *ex officio* seat on the commission. Eliot said that Colonel Grant had excellent contacts with President Herbert Hoover, crediting the executive officer with "managing the White House" on policies affecting planning the city. [*Worthy of a Nation*, page 195]

Unlike other commission officials, Colonel Grant would be involved in transportation issues in a variety of roles well into the 1960s. The grandson of the Civil War hero and President (1869-1877), Colonel Grant graduated from West Point in 1903 and was commissioned a 2<sup>nd</sup> Lieutenant in the U.S. Army Corps of Engineers. He began his first stint in Washington in August 1909 when he became Superintendent of the State, War, and Navy Buildings. He held the post through May 1913. After service in other parts of the country and in Europe during and after World War I, he returned to Washington as Director of the Office of Public Buildings and Public Parks in 1925, receiving his promotion to Lt. Colonel in 1926.

This assignment was the start of his activities in city planning. According to a summary of his career by the Columbia Historical Society:

In this capacity he had responsibility for the construction, maintenance, care, custody, policing, upkeep, and repair of public buildings, parks, monuments, and memorials in the District of Columbia . . . . Additional duties were added: he was Executive and Disbursing Officer of the Rock Creek and Potomac Parkway Commission, the Lincoln Memorial Commission, the Arlington Memorial Bridge Commission, and the Ericsson Memorial Commission; member and Executive Disbursing Officer of the National

Capital Park and Planning Commission and the Public Buildings Commission;  
Coordinator of Motor Transport in the District of Columbia; etc., etc.

After graduating from the Army War College in Washington in June 1934, he was assigned to posts outside the District. He was commissioned Colonel later that year and Brigadier General in October 1940. In June 1942, General Grant became War Department Representative on the Board of Civil Protection, Office of Civilian Defense in Washington.

After Delano asked to be relieved of his post of chairman of the National Capital Park and Planning Commission, his nephew, President Roosevelt, asked General Grant to take the position. It was, the President wrote to Grant, an “urgent job,” especially “in times like these when the pressure to meet quickly the wartime needs for office buildings, housing and public services of all kinds tends to push planning aside.” He wanted the commission “to take a strong role and exercise real leadership to expedite these facilities and at the same time build toward a well planned National Capital.”

On September 11, 1942, General Grant became chairman. In 1944, President Roosevelt relieved General Grant of his military duties so he could devote full time to the commission. He retired from the army in July 1946 after 43 years.

General Grant’s term as chairman ended in April 1949, but he remained active in Washington planning for the rest of his life in a variety of roles, such as president of the American Planning and Civic Association and one of the original trustees of the National Trust for Historic Preservation as well as Vice-Chairman (1950-1954). As will be discussed, he would be involved in most battles over highways and bridges affecting the area’s monuments, National Mall, and parks until his death on August 28, 1968, at the age of 87. [Rubincam, Milton, “Major General U.S. Grant, 3<sup>rd</sup>, 1881-1968, *Records of the Columbia Historical Society*, Published by the Society, 1969, pages 387-400]

While in Washington, he lived in homes at several addresses, including 1868 Columbia Road, 1929 Q Street, 1135 21<sup>st</sup> Street, NW., and, finally, 1255 New Hampshire Avenue, NW. [*Congressional Directory*, various years]

The commission unveiled its comprehensive plan on January 17, 1930, in a presentation at Constitution Hall. Governor Albert C. Ritchie of Maryland, Governor John Garland Pollard of Virginia, Secretary of the Treasury Andrew W. Mellon, and Members of Congress attended the event. The Virginia General Assembly attended in a body along with other officials from the two States and the District.

President Hoover was unable to attend but sent a letter to Chairman Delano saying that creation of the revitalized commission was “one of the fundamental steps taken in national recognition of our need and opportunity to build the most effective and most beautiful capital city in the world.” The 1926 legislation ensured that the city would have “the advantage of the diversity of skill and experience in this renaissance of the City of Washington through our new undertaking for the expansion and revision of our Capital city.”

The first necessity was a “continuous study of the character and probable growth of this city, with intelligent anticipation of such growth.” President Hoover listed problems to be addressed such as “the scores of problems of transportation, of abolition of slum areas, development of park and recreation facilities,” and issues related to schools and other concerns. He concluded:

It is our national ambition to make a great and effective city for the seat of our Government, with a dignity, character, and symbolism truly representative of America. As a nation we have resolved that it shall be accomplished. To succeed in the fullest measure we have need for planning not only within the District of Columbia, but also for co-operation from the adjacent States.

Colonel Grant presented the plan. A comprehensive plan can never be complete, he said, “any more than a single suit can be patterned to permanently clothe a growing child,” but plans for the District, Maryland, and Virginia must be “a single seamless garment, so that we may have here a region that is a living, growing organism, each part of which fits into and collaborates with adjacent parts.”

*The Plan for the National Capital and Its Environs* was in sections: highways, railroads, water terminals, airports, parks within the district, and regional parks. For highways, Colonel Grant said:

Because highways constitute the most important contribution made at public expense to the individual’s life, because they are the arteries through which the life-blood of the community must circulate and finally because they are the specific part of the city in which the conditions have changed most in a very short time, the ‘battle of the streets’ commands our full attention. City planning studies naturally begin with a consideration of the highway system and the work done in the past—that is, existing conditions—is found to set certain limitations upon what can be done in the future.

The plan that Pierre L’Enfant devised at the city’s creation “was originally laid out on a scale amply adequate for a large city,” and subsequent generations continued the plan despite great increases in population after the Civil War and other changes:

But this highway plan was for the days of animal-drawn transportation and to meet traffic conditions incident thereto. With the advent of the automobile and motor truck traffic(,) conditions and requirements have changed. The need for differentiating between streets according to their use and purpose, just as telephone lines, sewer lines and other public works are designed to meet their special purposes economically, is being more and more generally appreciated. The differentiation between thoroughfares or traffic arteries and the secondary streets or system of veins to pick up local traffic and bring it into the thoroughfares permits curvilinear location of the latter, their relation to the natural contours of the land and the preservation of attractive features of the topography of trees and of the natural surface soil, as well as the lengthening of blocks and other variations which not only add measurably to the individuality and interest of each residential neighborhood, but also save materially in both the first cost of development and in the annual cost of maintenance and administration.

With 29.3 percent of the city's usable surface devoted to streets and alleys, the best use of such land deserves "the most careful study, and which should not be left to be solved by the method of appropriation in compliance with the loudest expressed local demands."

Accordingly, the comprehensive plan must include a major thoroughfare plan that was in development. Some thoroughfare work was underway, such as straightening Michigan Avenue and upgrading B Street, NW. (future Constitution Avenue), to "a great cross-town artery from the Capitol to the Rock Creek and Potomac Parkway and the Virginia road system."

In addition, high-level crossings of Rock Creek Park were needed, "at least one immediately to stop the danger and prevent the waste of time and traction incident to carrying all cross-town traffic 140 feet down hill and then again up the same height on the other side." They would be built at intervals of about a mile at Aspen Street, Military Road and Utah Avenue leading to Madison and Kennedy Streets, and Tilden/Upshur Streets.

The commission's study of urban growth in the past decade revealed an octopus-like growth "based on transportation facilities." To the extent that such facilities could be fitted into the topography and existing developments, "the general growth of the region will be better balanced and distributed":

This has been a major consideration in the location on our map of proposed radial roads leading into the adjacent area of Maryland and Virginia; that is, the foreseeing of a system which will make possible as nearly equivalent transportation facilities in every direction available for residential or commercial development. Of course, as far as possible this system has been based on existing roads and their widening and extension as necessary and justified from time to time. The distribution of this inflow and outflow of traffic around the perimeter of the congested part of the city has also been cared for.

Colonel Grant cited examples such as connecting Massachusetts Avenue with the Maryland road system and linking Arlington Memorial Bridge with the Virginia road network "so that the solution may be arrived at which most nearly meets the best interest of all concerned, and reconciling any conflict of interest that may be found to exist." The cooperation of State and local officials in resolving such conflicts had been "most gratifying."

However, "a good system of radial highways is not enough." The area also needed "cross-connections, not only to permit easy exchange of traffic from one radial to another and for local hauling, but also to permit the by-passing of congested areas." As an example, he cited traffic moving between Baltimore and Richmond that had to pass through the District's "congested business center and out over one of the most heavily traveled bridges," the Highway Bridge at 14<sup>th</sup> Street carrying U.S. 1, the East Coast's main road, across the Potomac River. Colonel Grant considered that "the direct connection with our nearest metropolitan neighbors on the north and on the south—Baltimore and Richmond—are of first and special interest."

A solution of "great mutual advantage" would be "a broad and adequate boulevard over which [a motorist] can pass by the crowded city streets, skirting the hills of Montgomery County and at the same time obtain, perhaps, various impressive and inspiring views of the Capital City, then over

a bridge near Great Falls or near Little Falls and connecting with a good road in Virginia which will permit him to go on his way without being entangled in the most congested local developments near the river or overloading the terminals of the city bridges even if they were to be improved.”

He discussed railroads, waterways, parks, and other aspects of the regional plan, including rail and water terminals:

A plan which considers only questions of beautification and public projects having an aesthetic value, such as our great public buildings program [in what is now known as the Federal Triangle, authorized by the Public Buildings Act of 1926], even though it may be artistically splendid, will not be complete economically in so far as it fails to provide for the less attractive and perhaps less inspiring, but equally or more important, utilitarian and commercial needs of the community.

He also emphasized that the city must not be influenced by the tall buildings being erected elsewhere:

Washington also had been most fortunate in having had since 1910 a law preventing the construction of buildings higher than 130 feet, for to the constantly more accentuated crowding of the land [by construction of skyscrapers] in most of our cities we must attribute a large part of their traffic congestion, which is gradually throttling the circulation essential to their economic life. This commission believes that present conditions in this city already justify the contention that even the 130-foot limit is too high, and that the 110-foot limit originally established by the Zoning Commission should have been adhered to.

He admitted to favoring height restrictions in part for “the sentimental one of preserving the dominance of the dome of the Capitol as the chief characteristic of the National Capital, just as the dome of St. Peter’s dominates Rome.”

At present, traffic was within the limits that the L’Enfant plan could handle “without recourse to such expensive public works as subways, double-deck streets, overhead pedestrian crossings, etc.” These were common ideas for city planning at the time, and Colonel Grant thought they might be needed some day, but not at present.

Colonel Grant concluded his presentation:

For the perfection of the plan as here laid before you, and for the work of keeping it up-to-date and further fitting it to the needs and best interests of the entire region, the National Capital Park and Planning Commission begs your sympathetic understanding, your criticism and advice, your collaboration and help, so that we may all have a hand in constructing the edifice, in finding what is America’s highest attainment in the art of city building. [“Hoover Pledges Nation’s Aid For Greater Capital,” *The Evening Star*, January 19, 1930; “Rock Creek Park High Level Bridge Plan Is Explained,” *The Sunday Star*, February 2, 1930]

An editorial in *The Evening Star* said of the event:

After a hundred years or so of pitiful neglect of the American capital, such meetings as those held last night come as inspiring reassurance that the renaissance of the last twenty-five years gains in strength and that the ideals so nobly expressed by the fathers in their original conception of the American Capital are becoming the ideals of the Nation. ["The Nation's City," *The Evening Star*, January 18, 1930]

### **Major Thoroughfares**

By "thoroughfare," Colonel Grant did not mean the urban expressway that would come in later generations. The thoroughfare might be designed to carry more traffic than a regular street, but it typically had access points from private properties along the way and at-grade intersections that undermined the free flow of traffic. It was designed to pull through-traffic away from congested areas, such as the downtown business district.

The idea of major thoroughfare plans was not unique to Washington. Cities had been developing such plans since early in the 20<sup>th</sup> century in response to the growth of the automobile. For example, the October 1918 issue of *The American City* carried an article on "Principles of Design for a Complete System of City Thorofares" [sic] by Robert H. Whitten, City Plan Advisor of the Cleveland City Plan Commission. "The traffic problem in all large cities," Whitten began, "is leading to a demand for more radial streets coming from the periphery of the city into and thru the central business section":

Unless heroic measures are taken to provide an adequate thorofare system, the traffic problem will be the limiting factor in the growth of many of our big cities . . . . The present crisis has largely arisen from reliance on a few main thorofares converging at or near a central square. The remedy lies in provision of more streets of adequate width coming from the outskirts of the city into and thru the central business section and out to the city boundaries on the opposite side.

Whitten explained that, "The mixing of vehicles of different kinds, widths, motive power, uses and speeds multiplies difficulties and increases accidents." He believed, therefore, that the thoroughfare system "should be laid out in pairs so as to secure a better segregation of traffic." One route would carry street cars and trucks while the other would carry automobiles. At the same time, the thoroughfares must provide for rapid-transit routes from the outskirts to the central business district. "In order that a rapid-transit route shall be financially self-sustaining, it is essential that it be so located as to secure a large amount of non-rush hour and short-haul traffic."

Whitten recognized the difficulties inherent in change:

After streets are built up solidly with business buildings and apartments, it becomes almost prohibitively expensive to alter greatly the general street plan. Yet it is apparent that the limited number of thru traffic routes that many cities now possess will be absolutely inadequate for traffic needs twenty-five, fifty or one hundred years hence.

Unless measures are taken in time, growth will suddenly stop and the city may be faced with the alternative of permanent ruin or back breaking financial burdens that could have been avoided by a little vision in the planning of the city.

As Professor Robert M. Fogelson discussed in his history of downtowns, planners developed city plans that included new streets, widened existing roads, and crosstown highways, as well as inner and outer belts, to divert traffic not destined for downtown. Some critics feared that such plans were self-defeating because the new streets would lead to increased traffic and worsened congestion. Nevertheless, cities embarked on costly construction programs as a result of which, “the street systems were able to handle far more motor vehicles in the late 1920s than in the early 1900s.” [Fogelson, Robert M. *Downtown: Its Rise and Fall, 1880-1950*, Yale University Press, 2001, pages 256-257]

Eliminating nonessential traffic from central business districts was equally important, but more difficult because it involved costly construction. A few crosstown highways were built to allow passage from one part of a city to another without entering downtown and some cities began building inner belts around the central business district and outer belts for traffic destined for distant locations. Their effectiveness in reducing congestion was limited, according to Fogelson:

But these crosstown highways and inner and outer belts made up only a small fraction of the major thoroughfares, most of which still converged on the central business district, funneling in tens of thousands of automobiles en route elsewhere.

He also explored why so few of these roads were constructed in the 1920s:

The answer is that the authorities could not build all the proposed bypasses and radial highways without raising property taxes to unacceptable levels. Given the choice, most downtown businessmen favored radial highways over bypasses. So did the many motorists who worked and shopped downtown. And though many planners and engineers thought bypasses were the most economical way to relieve traffic congestion, they also believed radial highways were necessary to make the central business district “directly accessible” to all the other parts. [Fogelson, page 258.]

Some attempts were made to segregate traffic, such as construction of rail-highway grade separation structures and parkways that excluded commercial traffic. However, construction of separate street systems faced financial and political hurdles that officials had difficulty overcoming. Construction “would have been prohibitively expensive” while banning automobiles from commercial thoroughfares “would have been very unpopular—and probably unenforceable.” [Fogelson, page 259]

These initial efforts to address urban congestion in the automobile era failed to solve the problem. As Fogelson put it, “By the late 1920s more automobiles were pouring into the central business district than ever, far more than would have been possible if the authorities had not opened new streets and widened existing ones.” Despite the diversion of some traffic, “traffic congestion was as bad as ever.” He cited a few examples:

“Despite every scheme of traffic control so far devised,” midtown Manhattan still “ties itself up in a knot twice a day,” wrote the *New Republic* in 1928. Broadway had traffic jams seventy-five years ago. “It has them still.” Although Baltimore spent millions of dollars on street widening after the great fire of 1904, traffic conditions downtown were just as bad twenty years later, a special committee informed the mayor. Despite the efforts of Harland Bartholomew, chief planner for St. Louis, traffic downtown “moves slowly and irregularly,” wrote the president of the St. Louis street railway system in 1926. “Conditions are bad in the middle of the day, and in the morning rush, but are well nigh intolerable in the evening rush.” Conditions were very bad in downtown Los Angeles too, the city’s traffic commission acknowledged in 1930, a decade after it had been formed by downtown business interests and civic and commercial groups to solve the city’s traffic problem.

Although some observers remained optimistic, many others were skeptical:

As they saw it, the cities were caught in “a vicious circle.” To relieve traffic congestion, the authorities opened and widened streets; but the new streets attracted more traffic, the additional traffic generated more congestion, and eventually every street system reached what Minneapolis engineers called “a saturation point,” a state of “almost but not quite intolerable congestion,” to quote Frederick Law Olmsted, Jr., and two of his associates. Another planner, George A. Damon of Los Angeles, went even further. “Every possible cure seems to be worse than the original disease,” he wrote. [Fogelson, pages 259-260]

The National Capital Park and Planning Commission’s leaders and staff were well aware of these efforts. They developed the comprehensive plan for the Washington area in the context of city planning initiatives around the country. The planners also were well aware of how the automobile created new impacts for the Washington area. Commission member J. C. Nichols, who had worked in city planning in Kansas City, expressed concern in 1928 about the effect of the automobile on cities, as Gutheim and Lee stated:

He observed that, contrary to public notions about city planning’s ornamental results, “the growing acuteness of automobile congestion in all our population centers . . . is forcing upon the public . . . the dire need of better planning to meet the rapidly changing conditions in the size and number of our transportation units.” This enlarged physical dimension of the city increased the “tendency of business to move from downtown districts to suburban neighborhood shopping centers, accentuated by the building of outlying apartments and kitchenettes, neighborhood picture shows, filling stations and chain stores.” [Gutheim and Lee, pages 195, 197]

On January 21, Eliot addressed the Washington Board of Trade’s committee on streets and avenues. He explained the proposal for a major thoroughfare plan, pointing out that such a plan would result in savings from two new ideas in city planning that Colonel Grant had mentioned during his Constitution Hall presentation. One was the use of longer blocks in purely residential sections where traffic did not need a cross street every 400 or 500 feet. This idea would save money on paving costs. The other was the use of curvilinear streets that conform to the natural

contour of the land rather than a predetermined gridiron street pattern. This process would reduce the cost of grading and filling.

The commission had agreed on a tentative major thoroughfare plan. One of the immediate projects in the city planners' proposal was to realign Harvard Street between 13<sup>th</sup> and 16<sup>th</sup> Streets on a straight course as part of a cross-town link. It would carry eastbound traffic while westbound traffic would use parallel Columbia Road. Eliot invited the committee to study the system and provide opinions to the commission. ["Highway Changes Urged By Eliot," *The Evening Star*, January 21, 1930]

By mid-April, the Board of Trade committee had submitted its recommendations, developed in conjunction with Eliot. The commission approved the thoroughfare plan on May 21. ["Heads Are named In Traffic Survey," *The Evening Star*, April 18, 1930; "Commission Approves Thoroughfare Plan," *The Evening Star*, May 21, 1930]

The commission's first annual report discussed the plan:

This plan for major streets proposes the improvement of a comprehensive system of wide, direct arteries in which the vital traffic flow of the community may freely move. To develop such a system requires an acceptance of the principle that all streets are not of equal importance in the circulation scheme, that some are of much greater value to the community than others, and that it is advantageous to select these community routes and work consistently upon them until they function as a system.

There is in Washington and vicinity urgent need for the promotion of the major thoroughfare idea. If streets of this type can be set apart from all others in the popular mind and in the minds of officials, a notable step will have been taken toward the creation of a more perfect Capital City.

The plan was important to other modes of transportation, including franchises for streetcar and bus routes, which "cannot be discussed intelligently without a major thoroughfare plan." Street lighting, traffic signals, paving specifications, school and playground sites, the location of neighborhood store centers and fire and police stations, tree planting, and even deed restrictions on private property – "all are dependent upon a designation of major thoroughfares."

Developers of subdivisions would be "in the dark" without knowing where the major thoroughfares would be. "It will be increasingly helpful to all [of] Washington to have an official major thoroughfare plan."

The report thanked the Washington Board of Trade's special committee for its suggestions for revising the thoroughfare plan. "As a result of those suggestions some additions to the thoroughfare plan have been made by the commission (notably the extension of New Hampshire avenue), and the plan as a whole has been brought up to date."

The 70<sup>th</sup> Congress had helped with the plan by approving the straightening of Michigan Avenue in the vicinity of Soldiers' Home and Trinity College. The project had been completed and the commission staff had prepared a plan for eliminating a dangerous crossing of the Baltimore and

Ohio Railroad tracks just beyond the end of the straightened section. Other work underway on the plan included studies for the east-west pair of Columbia Road and Harvard Street; for a high-level bridge across Rock Creek Park upstream from the Calvert Street Bridge; and a plan to extend Vermont Avenue to Georgia Avenue at Trumbull Street. [“Major Highways Plan Advocated in Annual Report,” *The Evening Star*, December 27, 1930]

Around this time, Edward M. Bassett, a New York City zoning expert, addressed the National Conference on City Planning about a new kind of thoroughfare that would be similar to a parkway in that it had control of access, but that allowed commercial traffic that was excluded from parkways. He coined a term to describe his concept: “freeway.” He said:

This word is short and good Anglo-Saxon. It connotes freedom from grade intersections and from private entrance ways, stores and factories. It will have no sidewalks and will be free from pedestrians. In general, it will allow a free flow of vehicular traffic. It can be adapted to the intensive parts of great cities for the uninterrupted passage of vast numbers of vehicles. [Bassett, Edward M., “The Freeway - A New Kind of Thoroughfare,” *The American City*, February 1930, page 95]

Through the 1930s and 1940s, the District, Maryland and Virginia, and the National Capital Park and Planning Commission attempted to keep up with motor vehicle demand, but during the Depression and World War II could never do so. After World War II, the commission found that the challenges accelerated with population growth, suburbanization, and an explosion of automobile use.

General Grant discussed these challenges in a 1948 article that indicated the city was facing a sudden population increase and a postwar building boom that “threatens to destroy many of the amenities secured by the carefully planned developments of the past twenty years.” Demands for “housing, slum clearance, schools, additional reservoirs, permanent government buildings, and the relief of traffic congestion” were creating “a new crisis in the city’s growth.”

The impact of the automobile “raised new and acute problems”:

By extending in a single generation the radius of convenient urban development from approximately five miles to nearly twenty-five miles, and thus increasing the area available for land subdivision from 75 square miles to 1875, or 25 times, it has encouraged the growth of scattered suburban developments outside the original city limits on cheap ground usually carrying a lesser burden of local taxes, increasing the cost of municipal services such as water, sewerage and roads to serve these new dispersed communities, and at the same time throwing a new load of traffic on the city streets. The consequent congestion of traffic in the central business district has itself become so acute in many instances that it tends to choke the circulation necessary for the transaction of business itself.

In an echo of Nichols’s words from 20 years earlier, General Grant continued:

The result is that retail trade, moving picture theaters and other commercial enterprises, which are a convenience to the suburban communities, tend to move there as soon as it appears likely to be profitable to do so, and thus drain away the substance of the central business district.

The commission wanted to counter these “centrifugal forces” by increasing demand east of the Capitol to shift the focus away from the west side where at the time, permanent Federal buildings were clustered along the National Mall and Pennsylvania Avenue adjacent to the central business district. This goal could be accomplished by disbursing permanent Federal office buildings east of the Capitol, thereby creating demand for housing and businesses in the area while reducing the traffic load on the streets north and west of the present central district, which were “now so over congested by employees working in temporary war buildings.”

(During World War I and II, temporary office buildings were constructed in the city’s open spaces, including the National Mall. Between B Street, NW., and the Reflecting Pool in front of the Lincoln Memorial, two tempos, as they were called, were built during World War I, one for Army Staff, the other for Navy staff. Three tempos were built on the south side of the Reflecting Pool, with pedestrian bridges across the water, and three more tempos were built just west of the Washington Monument. Two tempos were on Constitution Avenue between 12<sup>th</sup> and 14<sup>th</sup> Streets, with others located on the grounds of Fort McNair, near the site of today’s Robert F. Kennedy Memorial Stadium, and on the site of the future Smithsonian Museum of Air and Space along Independence Avenue, SW, among others.

(Despite the end of the wars they were built to serve, the tempos remained in place. Even after the Pentagon opened in 1943 the “leaky, hot-in-summer, cold-in-winter tempos still thrummed with office life,” according to *Post* local columnist John Kelly. A canvass in the 1950s counted 54 tempos around the city, “housing such agencies as the Veterans Administration, the State Department, the Federal Aviation Administration and the Civilian Aeronautics board.” The tempos remained in service until 1964, when demolition began on two tempos at the museum site. The final demolition occurred in 1970 when the Navy and Munitions Buildings, the two structures built in 1918 north of the reflecting pool, were razed. Constitution Gardens is located where they had been for over 50 years.

(Kelly reported that only two tempos remained as of early 2017. Built in 1919, the Liberty Loan Building at 401 14<sup>th</sup> Street, SW., across from the Tidal Basin processed war bonds. It was upgraded to three floors in 1927. Kelly wrote that the building, now called the Liberty Center Building, “houses something called the Bureau of Fiscal Service” of the U.S. Department of the Treasury. The other survivor, dating to 1944, at 425 Second Street, NW., originally housed the Reconstruction Finance Corporation. Today, it is a homeless shelter operated by the Community for Creative Non-Violence. [Kelly, John, “Answer Man Remembers the ‘Temporary’ Office Buildings That Once Blighted D.C.,” John Kelly’s Washington, *The Washington Post*, January 8, 2017; Kelly, John, John Kelly’s Washington, “Tempo: More Good and Bad Times of Their Lives,” John Kelly’s Washington, *The Washington Post*, January 15, 2017])

General Grant cited another key component:

In addition, construction of the Fort Drive as an express parkway is recommended, to provide a circumferential route of high traffic capacity outside the congested area to receive and quickly distribute traffic coming in or going out of the city along arterial streets and to join together residential areas within the District between which exchange of traffic is now inconvenient and time consuming.

(Fort Drive, an intermediate circumferential that would link the circle of Civil War forts just within the District border, will be discussed later.)

Space, he said, must be made for parking all the automobiles arriving in the central and government districts, but “it is a physical impossibility to provide . . . all the automobile parking space desired.” As a result, making public mass transportation “as expeditious and convenient as possible” was “of utmost importance.” He added:

Much can be done at little expense to increase the usable capacity of existing streets by reducing on-street parking and loading, and by inducing a natural segregation of through-traffic into especially favored streets, leaving the other streets for local traffic use.

The commission had promoted a major thoroughfare plan in the 1930s to keep through-traffic out of the central area. Now, General Grant said, it favored the modern variant:

An inner belt thoroughfare around the congested area is also an obvious need to receive and distribute traffic or by-pass the most congested streets.

He emphasized that city planning was not simply about beautification. “It is a reconciliation of all the requirements and interests, often competing and conflicting, of utilitarian and social needs to the best advantage of all the inhabitants as a whole, so that the city will be a good place in which to live, to work, and to raise a family.” [Grant, Ulysses S. 3<sup>rd</sup>, “Planning the Nation’s Capital,” *Confidential – From Washington*, The Georgetown Washington Victory Council, The George Washington University, March 1948, No. 44, pages 6-7]

### **The District Creates an Expressway Plan**

The Federal-Aid Highway Act of 1938, which asked BPR for a report on toll superhighways, also contained a provision making the District of Columbia eligible for Federal-aid highway funds under the same terms and conditions as if it were a State starting with FY 1940:

*Provided*, That the system of roads on which Federal-aid apportionments to the District of Columbia shall be expended may be determined and agreed upon by the highway department of the said District and the Secretary of Agriculture [home of BPR] without regard to the limitations in section 6 of the Federal Highway Act (42 Stat. 213) respecting the selection and designation of such system of roads; and, when the system first determined and agreed upon shall have been completed, additions thereto may be made in like manner as funds become available for the construction of such additions.

Previously, the District had received emergency highway funds and grade-crossing funds for FY 1938 and 1939, but not formula Federal-aid highway funds.

Under the Federal Highway Act of 1921, BPR and the States had designated two classes of highways: primary or interstate and secondary or intercounty, with the total limited to 7 percent of the rural road mileage within each State. These were the only roads that would be eligible for Federal-aid highway funds. Unlike the States, the District of Columbia did not have urban and rural or intercounty components; it was entirely urban. The 1938 Act, therefore, exempted the District from the Section 6 limitation to rural mileage.

This change in eligibility also meant that, as in the States, 1½ percent of the District's annual highway allocation must be spent for "surveys, plans, engineering and economic investigations," as provided for in the Hayden-Cartwright Act of 1934 and continued in later Federal-aid legislation. BPR and the State highway agencies had used the funds for highway surveys that provided the data used in preparing *Toll Roads and Free Roads*.

Now, under the 1938 Act, the District was included in the national planning program of assembling information, analyzing and interpreting traffic data, and using the data to develop plans for highway development. The District Department of Highways established a Highway Planning Survey Unit to carry out the function.

According to a 24-year highway department history, the unit accumulated data "from a survey of the parking demand in the General Area of Washington, from a study of the use made of urban routes in and about Rock Creek Park, from interviews with motorists on Trans-Washington trips, and from a study of the travel habits of all employees in the central business and governmental areas."

Captain Herbert C. Whitehurst, District Director of Highways, released a preliminary report on the study during a presentation to the Washington Board of Trade on April 24, 1941. The unit's findings and recommendations had several impacts. First, the results "were of such significance that they were utilized by the Department of Highways to institute a long-range program of highway developments proposed for subsequent years."

Second, in view of the "critical nature of the parking situation in the business and Government districts," Congress authorized a Motor Vehicle Parking Agency for the District in legislation approved on February 16, 1942:

The Act conferred broad powers upon the Commissioners. It authorized the acquisition, creation and operation of public off-street parking facilities in the District, as a necessary measure to insure the free circulation of traffic in the public interest.

The District activated the agency in 1946.

Third, the unit's preliminary report, released on April 24, 1941, resulted in "engineering studies which were aimed directly at the preparation of Washington's highway system to bear the impact of vastly increased traffic pressures engendered by accelerated Federal activities in the approaching war." These studies led to a series of improvements:

Briefly, they consist of major thoroughfare reconstruction on radial trunk highways connecting the central district to outlying residential and suburban areas in Maryland and

Virginia. They also include such major projects as grade separation structures at congested, multiple intersections in the general central area which encircles the business and Government districts. Where structures of this type were not feasible for one reason or another, the faulty intersections were redesigned and channelized on the surface. The narrow streets of the distributor type, which were considered essential to the proper dispersion of heavy traffic streams entering the central area via high-volume radial highways, were widened and repaved.

Fourth, the expanded program required additional funds. Captain Whitehurst called for Congress to approve a 2-cent increase in the gas tax. "It is our considered judgment that the rate in the District of Columbia should be increased to 4 cents and an earnest endeavor made to meet the traffic and transportation situation with an adequate solution of the problem." [*Twenty-Four Years of Progress in Highway Development 1924-1948*, The Department of Highways, Washington, D.C., 1948, pages 62-66]

The report called for five radial trunk highways at a total estimated cost of \$10,175,000, as described in the *Star*:

1. To Southeast and Southwest East of Anacostia River – From South Capitol street and Independence avenue south on South Capitol street across the Anacostia River;
2. To Northeast-K Street Route – From Seventh and K streets N.W. to Florida avenue and K street N.E. with connections at Sixth street to new Ninth street overpass across terminal yards at West Virginia avenue to New York avenue at Florida avenue to Fifteenth street and Benning road;
3. To Northwest Section West of Wisconsin Avenue and Key Bridge – From Connecticut avenue and K street N.W. to Key Bridge, thence via Canal road to Foxhall road and Conduit road;
4. To Northwest Section East of Wisconsin Avenue and West of Rock Creek Park – a. Rock Creek and Potomac parkway connections and extensions. b. Additional highway facilities east of Rock Creek and west of Connecticut avenue through north and south streets to connect Constitution avenue and Massachusetts avenue.
5. To Northwest East of Rock Creek Park - This area, the most thickly populated in the District and carrying the highest registration of motor vehicles, is now served by several north and south streets directly from the central areas, namely, Sixth, Ninth, Eleventh, Thirteenth and Sixteenth streets. As these streets reach the old City of Washington limits [Florida Avenue], they can be made to provide connections with main thoroughfares in such manner as to permit the spread of traffic to all points in this area;

Major projects in the plan included an elevated highway along K Street between Rock Creek Park and Francis Scott Key Bridge, a tunnel under the Potomac River between Alexandria, Virginia, and Shepherds Landing, S.E., in the District (with two lanes, one in each direction), and a bridge to connect South Capitol Street with the area on the other side of the Anacostia River.

(District Commissioner Melvin C. Hazen had been promoting a bridge between Alexandria and Shepherds Landing for several years as part of a bypass of the Nation's capital. Hazen, a Virginia native who had lived in the District for a quarter century, was a bank director, horse

breeder, member of the Board of Trade, and District Surveyor in the engineering department. President Roosevelt appointed Hazen to his post as Commissioner in October 1933.

(On May 2, 1938, in an address to the Congress Heights Progressive Citizens' Association, Hazen said, "We must have a by-pass." He explained that Shepherds Landing south and east of the city was a better location for it than Chain Bridge on the west. Building a bypass to Chain Bridge was objectionable because it would have to go through residential areas in Chevy Chase and northwest Washington. The Shepherds Landing bridge would be ideal for north-south travelers on U.S. 1, the East Coast's main highway from Maine to Florida, as well as motorists bound for Shenandoah Valley in Virginia. Moreover, the Potomac River was at its narrowest point south of the District at Alexandria. Hazen described a bypass route through southeast Washington to Bladensburg or possibly further north to meet U.S. 1. ["By-Pass Bridge Urged By Hazen," *The Evening Star*, May 3, 1938])

The report considered other problems. For example, it recommended that every streetcar loading zone be replaced with a platform:

These death traps should be replaced in the immediate future even at the sacrifice of other work. The number of street car loading points or stops should be reduced to the minimum consistent with proper service. Generally speaking, there are too many stops for both buses and street cars to permit expeditious mass transportation service.

The Whitehurst report also recommended "construction of pedestrian islands of an improved type at intersections on all arterial highways or boulevard streets with a roadway width of 60 feet or more." The report also found that Chain Bridge across the Potomac River in the Palisades area near the western District/Maryland line "is not being utilized to anywhere near its useful capacity, probably due in large part to inadequate approaches and roads leading thereto, particularly on the Virginia side."

The report contained a section on terminal facilities that addressed short-time and long-time parkers in the central business district. Whitehurst wanted to give priority to short-time parkers, such as shoppers and theater-goers who stimulated the local economy. They have access to only 10,000 of the 36,000 parking spaces in the central area. To help them, the report proposed installing parking meters that would discourage long-time parkers.

For long-time parkers, such as government employees, the report adopted an idea recommended in *Toll Roads and Free Roads*, namely parking lots or garages near but not in the central area plus short-line buses to convey the parkers closer to their destination. (As discussed in BPR's report, the inner loop was a terminal where parking facilities would keep traffic out of the central district.) Revenue from the parking meters installed for short-time parkers would pay for the lots or garages serving long-time parkers. The report rejected proposals to provide underground parking facilities in the downtown area for long-time parkers as "economically unsound." ["\$44,450,000 Street, Bridge Program Proposed to Ease Traffic," *The Evening Star*, April 25, 1941; this edition included several articles describing the report]

Speaking after Whitehurst released the report, PRA Commissioner of Public Roads MacDonald addressed the Washington Board of Trade. He put the study in the context of the highway planning surveys that provided the basis for *Toll Roads and Free Roads*:

We developed the fact that cities have become the focus of traffic problems. They are undergoing a migration of values. There is a depreciation of values in the central areas due to congestion of traffic, and the failure of cities to serve newly developed traffic and to meet new conditions.

The findings of the national survey were not the point, he said. The Whitehurst report “comes closer home to you, and attacks the interests of business in the community.” He acknowledged that, “there may be some who will take exception to part of it.” However, if members of the board had confidence in the facts behind the report, “I feel certain you can support its findings”:

If these recommendations are followed through, with reasonable support of the Federal Government, they will attack the disease of cities, which we have found epidemic throughout the Nation.

You will set a model for other cities of the Nation. [“Mitigating ‘Downtown Disease’ Seen in Highway program,” *The Evening Star*, April 25, 1941]

Chairman Delano of the National Capital Park and Planning Commission also praised the Whitehurst report as a “comprehensive and important piece of work.” He had not had a chance to review it in detail, but said, “One thing is certain, and that is that Washington has got to have better transportation facilities.” He doubted that the parking problem could be solved by private parking lots as long as the city provided free parking on city streets. “Automobile owners will not pay for parking as long as they can find free space in the city streets.” At present, he said, Washington transportation facilities were “very backward,” mainly because of the “glut of private motorcars.” [“Delano Praises Whitehurst Road Survey,” *The Evening Star*, April 26, 1941]

Whitehurst made clear that he wanted the report to be presented at a public hearing. He and Engineer Commissioner David McCoach announced that the public hearing would take place on May 20, 1941, in the board room of the District Building.

(Under the District’s form of government at the time, the President appointed three commissioners as the District’s governing body. One was an Engineer Commissioner from the U.S. Army Corps of Engineers. Lt. Colonel David McCoach, Jr., who came to Washington from New York City where he was district engineer, took his oath of office on September 7, 1938, saying, “I never believe in upsetting a going concern, and I have been advised that the municipal government here is one of the best in the country.” [Warren, Don S., “Lt. Col. M’Coach Assumes Duties As District Head,” *The Evening Star*, September 7, 1938])

Shortly before the announcement of the public hearing, Whitehurst had appeared at a meeting of the traffic committee of the Board of Trade. During the meeting, Washington I. Cleveland of the American Automobile Association (AAA) asked Whitehurst about the revenue he expected the

2-cent increase in the gas tax to generate. He estimated it would yield \$3 million a year. With funds already available, the District would have about \$5 million available for a 12-year program of road improvements. If the gas tax were increased only by 1 cent, the city would have about \$3.5 million:

It all depends on how quickly you want this program completed. But I venture to say that if every man and woman in this city were convinced that this plan would make Washington streets safe they wouldn't complain about having a 2 or even 3 cent increase in the gas tax.

Colonel E. G. Bliss, chairman of the board's Statistics and Accident Prevention Subcommittee, said that, "We have got the city so crowded with human targets and automobiles that now it's not merely a matter of enforcing present traffic regulations but a question of a possible cure for traffic congestion." He added that the Whitehurst report "points the way for this cure."

John F. Victory asked Whitehurst about removing all streetcar tracks in the central business district. Whitehurst did not agree. "We are very dependent on mass transportation into the central area and buses alone can't take care of the crowds and [removing all the tracks] would merely increase congestion."

The traffic committee endorsed the Whitehurst plan "in principle" and commended Captain Whitehurst and F. W. Lovejoy of the PRA, which had collaborated with District highway officials on the plan. ["Public Hearing Set on Highway Program," *The Evening Star*, April 29, 1941]

### **The 1941 Plan**

In advance of the public hearing, the *Star* carried a series of articles about the Whitehurst report. The goal of the proposed radial highway system was to eliminate bottlenecks from principal streets to provide a more regular flow of traffic during peak periods. Captain Whitehurst said the goal was not to speed traffic but to eliminate congestion and make traffic safer. He had considered the solution adopted in Manhattan, which built freeways along the edges of the island but in that city, traffic was primarily north-south. A different solution would be needed in the District because traffic moved in all directions, particularly during peak periods.

The city considered elevated or depressed routes, but dismissed the idea because of cost:

The District's problem, it was decided, did not warrant such a large outlay as would be entailed in either elevated or subway transportation, either of which would cost many times more than that of the system finally selected . . . . The department concluded that highly expensive features should be resorted to only if reasonable success could not be obtained by use of surface and depressed highways, with the aid of appropriate grade separations, channelized intersections and light control.

To keep costs down, the District wanted to use existing routes to the extent possible within the current traffic pattern:

In selecting the various trunk routes, the problem was to choose as near as possible the most direct connection with the outlying residential areas and to select streets along which traffic could be made to flow most freely.

For this reason, the department had decided to upgrade K Street instead of M Street as the radial line east of Key Bridge:

M street already was highly congested, it was not wide enough for a depressed highway and it was undesirable because of the business interests involved. As still another bad feature, its roadway was heavily loaded with underground construction and, to avoid a bottleneck in Georgetown, a subway would be necessary.

The department also rejected construction of a bypass north of M Street because “it would require expensive property acquisition, because it would border a residential area and because the eastern terminus would bring the congestion back into Pennsylvania avenue and M street at Twenty-ninth street. Moreover, there would be no connection with Key Bridge.”

By contrast, K Street had “a wide right-of-way and involves virtually no property acquisition,” while connecting with other main highways, “which would make its usefulness much greater.” It also would relieve congestion on New York and Rhode Island Avenues. The city was planning an elevated structure in the K Street corridor.

To serve the greatest percentage of population, which lived west of Rock Creek in the northwest section of the city, the report recommended improving traffic flow on five thoroughfares. They would be widened, with grade separations at intersections, and in some cases, extended to improve connections. The department considered the alternative of building an elevated highway between blocks as far north as Florida Avenue, but the cost was prohibitive. “The conclusion was reached at last that improvements should be made in existing highways, and that grade separations and other relief should be provided at the points of worst congestion.”

In some cases, roads would be depressed, with structures carrying cross roads over them. For example, K Street would be depressed west of Connecticut Avenue to west of 24<sup>th</sup> Street, NW., passing under Washington Circle. “Capt. Whitehurst explained that the costly structures and the grade separations had been decided upon only in instances where no more satisfactory and less costly method was considered feasible. [Jones, Pat, “Radial Street Plan Designed To Eliminate ‘Bottlenecks’ Here,” *The Evening Star*, May 4, 1941]

The city had chosen to build a two-lane tunnel across the Potomac River between Shepherds Landing and Alexandria after considering three alternatives. Aviation concerns prompted rejection of a high-level bridge with a 135-foot clearance. “A two-lane tunnel such as that proposed will cost twice as much as a four-lane bridge, it is estimated, but it is understood the War Department would not approve the additional barrier [that] a bridge would be to planes landing and taking off at nearby Gravelly Point, the Naval Air Station and Bolling Field.” (Gravelly Point, the location of Ronald Reagan Washington National Airport, was named because of the large amount of gravel deposited nearby inside a big bend in the Potomac River. The gravel has been used for construction projects throughout the area, including the nearby

Pentagon. [Kelly, John, “Gravelly Point Park’s moniker is one that shouldn’t just be shoved aside,” John Kelly’s Washington, *The Washington Post*, February 6, 2018]

The city also rejected a low-level bridge because it would require a draw span that would have to be opened so often that it would constitute a serious obstruction for highway traffic:

The proposed tube would extend under the river from Alexandria to Shepherds Landing, a point at which the stream is approximately 3,500 feet wide, and would cost approximately \$9,500,000. It would form part of a suggested bypass route linking Virginia roads with the highways north and west of the District, but its greatest benefit would be in the relief of the immediate traffic load now taxing the Highway Bridge [in the 14<sup>th</sup> Street corridor].

The proposed program included replacing the Highway Bridge at some point, but not immediately; the current bridge had many years of life left in it. However, Captain Whitehurst had been surprised by the amount of inbound traffic revealed by meter check. “The source of this traffic is not wholly known, he added, but an effort will be made to locate it in the hope that there also will be found the reason why Highway Bridge is so much more heavily taxed than [Arlington] Memorial Bridge.” Of the four existing Potomac River crossings, the Highway Bridge was the only one “carrying anywhere near its capacity load.”

The “most important bridge” in the program was the structure across the Anacostia River at South Capitol Street. At the time, South Capitol Street’s southern terminus was P Street, SE., the northern border of Fort Humphreys (renamed Fort Leslie J. McNair in 1948). The nearest bridge across the Anacostia River was at 11<sup>th</sup> Street, NE., with a terminus at the intersection of Good Hope Road and Nichols Avenue:

This [South Capitol Street] bridge, it is expected, would take a good part of the traffic off Anacostia Bridge, now badly overloaded, and would relieve congestion on Nichols avenue and Good Hope road. Moreover, it would provide an important link in the trunk highway to the Southeast and would connect with a new system of streets planned in the Southeast area east of the river. [Jones, Pat, “Potomac Tube to Alexandria Held Best of 3 Possibilities,” *The Evening Star*, May 5, 1941]

(The South Capitol Street Bridge, now called the Frederick Douglass Memorial Bridge, opened on January 14, 1950. Engineer Commissioner Gordon R. Young called it one of the most important public works projects in the District since he took office. Twin sisters Della and Mary Randall of Forest Hills, Maryland, 12 years old, cut the ribbon across one of the eastern approaches to the bridge, after which a motorcade of more than 100 cars crossed the bridge. In brief remarks, General Young said the city’s public works deficiencies were caused by the lack of construction during World War II, coupled with a 40-percent increase in population.

(The new bridge was expected to open up about one-third of the land east of the Anacostia River to direct access to the central city while stimulating growth in nearby Maryland. It would relieve congestion on the 11<sup>th</sup> Street Bridge and, to some extent, the Pennsylvania Avenue Bridge across the river to the north. “The next urgent project is to get one more bridge across the Anacostia

River.” He acknowledged the impatience of residents east of the river who felt they had been neglected, but said that feeling was not justified. “Your area has run away from us so fast that it took longer to catch up.” Young favored placing the bridge at East Capitol Street, but some staff members of the National Capital Park and Planning Commission preferred Massachusetts Avenue for the bridge. “I hope the location will be settled soon so we can go ahead with the construction. [“South Capitol Bridge Opened by Gen. Young,” *The Sunday Star*, January 15, 1950]

(City officials broke ground on February 13, 2018, on a \$441 million project to build a replacement structure.)

Grade separations were included in the proposed program only where no other solution was possible:

“In the interest of safety, where two heavy streams of traffic are always present and roadway capacity is insufficient, to permit effective light installation, there remains only one solution to the problem—separation of grades,” Capt. Whitehurst said. “In some instances, streets can be widened to obtain more reservoir, but not in all.”

The intersection of 14<sup>th</sup> Street and Maine Avenue in the southwest part of the city was a good example:

Possibly the city’s worst congestion point, according to a recent survey, is at Fourteenth street and Maine avenue. This intersection averages 51,000 vehicles daily, heavily augmented on special occasions such as the Cherry Blossom Festival. Cars sometimes are held up there as long as 30 minutes.

To correct this situation, it is proposed that Fourteenth street be raised above Maine avenue and East Potomac Park at that point. A low-level bridge will be constructed across Tidal Basin to handle park traffic, thus making it possible to segregate entirely what may be called through or commercial traffic and park traffic. There also will be interchange roads between Maine avenue and Fourteenth street, providing access in all directions.

Another particularly bad intersection was the six-street junction of Florida and Maryland Avenue, 15<sup>th</sup> and H Streets, and Benning and Bladensburg Roads, NW. (Bladensburg and Maryland Avenue were part of U.S. 50.) This intersection was hazardous to motorists and pedestrians, who could not cross the 126 feet from curb to curb before a change in the traffic light:

Capt. Whitehurst admitted that the situation there is so extreme that no specific plan has been agreed upon. Maryland avenue and Bladensburg road constitute the line of heaviest travel, and it is evident that a grade separation of some nature, possibly an underground tunnel for these two streets, will be necessary.

As noted, the city had already decided on an elevated structure for K Street as a bypass for M Street in Georgetown. “The present grade separation structure at K street and Rock Creek was

designed to take a superstructure that would give access to an elevated highway.” [Jones, Pat, “Grade Separation Projects Urged Only as a Last Resort,” *The Evening Star*, May 7, 1941]

The fringe parking plan was based on a total cost for commuters of 15 cents a day (10 cents for parking all day and 5 cents for a short-haul bus to the destination). This fee structure would cost \$3.75 a month or \$45 a year. Whitehurst thought the lots or garages should have a capacity of 400 to 500 cars; beyond that would lead to congestion at entrances/exits during peak periods. “The cheapest structure to operate, he said, is the three-story parking plaza type.” Land values within the central business district were too high for parking lots to be profitable for the city.

The District could subsidize the parking areas, but “has no authority to proceed with subsidization for Virginia and Maryland car owners, who comprise a major portion of the motorists involved.” Given the complexities of location and coordination, Whitehurst recommended establishing a motor vehicle parking agency with four public officials and three citizens comprising the leadership:

But whatever is done, Capt. Whitehurst is emphatic in his warning that no single individual should be placed at the head to say how the problem should be solved. “I do not believe any one man,” he said, “knows enough about the situation and would give proper enough consideration to all the factors involved to bring about a satisfactory solution . . . .”

The situation was grave, but Whitehurst’s report did not recommend a solution. “That must be worked out with time. What we have tried to do is show the way toward a solution.” [Jones, Pat, “Fringe Parking Plan Is Aimed At 15-Cent Daily Cost,” *The Evening Star*, May 8, 1941]

(As mentioned earlier, Congress authorized a Motor Vehicle Parking Agency for the District in 1942.)

Another issue to be considered was the city’s parkland. Development of roads in Rock Creek Park and the National Zoological Park was vitally important, Whitehurst said, but he understood that park officials might disagree. “The automobile is here to stay, and it is up to us to keep pace with transportation trends. I realize, however, that the co-operation of agencies controlling park land must be secured before park roads can be adjusted to suit the city’s traffic needs.” He knew from experience that the National Park Service (NPS), which controlled Rock Creek Park, and the Smithsonian Institution, which was responsible for roads in the zoological park, wanted the roads preserved for scenic and recreational purposes:

“I don’t blame them in the least for looking at it in that light,” the highway director said, “especially when you consider that the land originally was set aside for park purposes alone. I have become convinced in recent years, nevertheless, that the increased demand for highway facilities makes it imperative that certain park roads be expanded and improved to fit into the general highway picture.”

For that reason, the preliminary report included \$5.7 million for park road development, including \$3.75 million for improvements in Rock Creek Park and the Zoo.

At present, narrow park roads and inadequate bridges resulted in congestion. Whitehurst thought that extending the Rock Creek and Potomac Parkway northward through the zoo would be a prime remedy of a significant obstacle to north-south park traffic. He also recommended a road along the western border of the park north of the zoo connecting with Oregon Avenue and Military Road. The result would be that existing roads within the parklands north of Blagden Avenue-Broad Branch Road could be reserved for park use.

He was concerned, too, about bridges in Rock Creek Park, some of which were only 19 feet wide and had a load limit of 12,000 pounds. Despite this limit, vehicles weighing as much as 30,000 sometimes used the bridges. “Wouldn’t it be a terrible thing if a bus-load of children crashed through one of those bridges?”

Highway surveys demonstrated that only 10 percent of the vehicles entering Rock Creek Park turned off the principle routes while still in the park. “This knowledge led those making the study to the conclusion that since the vast majority of drivers use the roads in the park as a means of traveling on the north-south axis, first-rate thoroughfares or possibly freeways ought to be provided for their convenience.” He explained, “The first thing to consider in making a traffic survey is demand. Roads should be built or improved to accommodate these demands.”

The *Star* reporter reminded Whitehurst of a 10-year old plan to build high-level bridges across narrow parts of Rock Creek Park for cross-traffic between Tilden and Upshur Streets; Military Road/Utah Avenue to 16<sup>th</sup> Street; and Oregon Avenue near Wise Road to Aspen Street at 16<sup>th</sup> Avenue. Whitehurst replied that the proposal offered a “right-angle solution to a diagonal problem.” The heaviest traffic was southwest-northeast, followed by southeast-northwest. The suggested bridges would be almost due east-west, thus not addressing the heaviest need.

The remaining \$2 million in the preliminary report for park roads was to extend and broaden Independence Avenue west of 14<sup>th</sup> Street, NW., and to complete the Fort Drive roadway:

Fort Drive is needed to provide a complete circumferential around the eastern margin of Washington, with interchanges with the major radial highways intersecting it, Capt. Whitehurst said. He explained that Fort Drive would intersect Michigan avenue, Stanton road, Good Hope road, Naylor road, Kansas avenue, Massachusetts avenue, Ridge road, East Capitol street, and Benning road. “It is essential to the general highway plan of Washington,” he declared.

Whitehurst added that Fort Drive would provide another approach to Arlington Memorial Bridge:

“Traffic bottlenecks don’t develop on the bridge itself,” he emphasized, “but on the roads leading into it. Take some of the traffic load away from Constitution avenue and you will hear less talk about the need for another bridge between Arlington and the District.” [Mustin, Henry A., “Park Roadway Developments Face Utilitarian Objections,” *The Evening Star*, May 9, 1941; the series included an article about street improvements (May 6) and safety devices (May 10)]

## Rock Creek Park

Because Rock Creek Park would be a major factor in the transportation debate in coming decades, a brief look at its road network would be helpful.

According to an NPS historic resource study, the park's origins can be traced to Senate interest after the Civil War in providing a new residence for the President to replace the aging presidential mansion situated in an unhealthy part of the city:

The Washington City Canal, which once ran along what today is Constitution Avenue was an open sewer by the 1860s. In 1866 the outlet for this waterway into the nearby Potomac River was located just below the Executive mansion (the Potomac Flats were not reclaimed until the 1880s), at Seventeenth Street. President and Mrs. Lincoln often removed to a cottage at the Soldier's Home to escape the stench, heat, and contagion of the city.

(Soldier's Home, a summer home to several Presidents and their families, is located at 140 Rock Creek Church Road, NW., on one of the highest points in the District. It is near the Petworth and Park View neighborhoods between North Capitol Street and New Hampshire Avenue.)

In 1866, the House and Senate adopted resolutions calling for a study to identify a tract of land of not less than 300 acres for a park and site for the mansion "which shall combine convenience of access, healthfulness, good water, and capability of adornment."

President Ulysses S. Grant vetoed the plans, preferring to retain the existing historic mansion, but the idea of acquiring land for a park "had more permanence." The idea languished until the 1880s:

The renewal of interest in the creation of a major urban park in Washington in the 1880s was also a product of growing public health concerns. Eradication of waterborne diseases, especially typhoid, was a vigorous reform movement in all major American cities in this decade. In 1879 the sewers in Georgetown and Northwest Washington emptied into Rock Creek. By 1889 the pollution of Rock Creek was considered a serious threat to public health . . . . [Bushong, William, *Rock Creek Park*, Historic Resource Study, National Park Service, U.S. Department of the Interior, 1990, pages 63-66]

After much debate and controversy, Congress passed legislation authorizing and funding the park. President Benjamin Harrison approved it on September 27, 1890:

The law establishing Rock Creek Park set a limit of 2,000 acres for the land area with an appropriation of \$1,200,000, equal portions to be paid out of District revenues and the U.S. Treasury. A rough southern boundary was established at Klinge Ford Bridge, and the law specified limits of 600 to 1200 feet for the park's width below Broad Branch and Blagden Mill Roads. This provision accounts for the reservation's parkway character in the neck of land that today forms the southern tip of the park. The width of the park's remaining boundaries was left to the discretion of the Rock Creek Park Commissioners. These officials were the Chief of Engineers, United States Army, the Engineer

Commissioner of the District of Columbia, and three citizens appointed by the president with the advice and consent of the Senate. The remaining sections of the act explained the duties of the commission and outlined condemnation, appraisal, and benefit assessment procedures. The final provision placed the new park under the joint control of the D.C. Commissioners and the Chief of Engineers of the U.S. Army, “whose duty it shall be as soon as practicable, to lay out and prepare roadways and bridle paths . . . .” [Bushong, pages 72-73]

On January 1, 1895, after the park commissioners had completed their work, the Rock Creek Board of Control assumed responsibility for the new park, which consisted of 1,605,976 acres purchased for \$1,740,511.45. The NPS assumed responsibility for Rock Creek Park on August 10, 1933. [Bushong, pages 77, 101]

Under the Capper-Cramton Act of May 29, 1930, the Maryland-National Capital Park and Planning Commission acquired property to extend the park into Montgomery County. (The Capper-Cramton Act will be discussed later.) The NPS remains responsible for Rock Creek Park in the District, but the Maryland commission owns and operates the Maryland portion of the park.

The agitation for park roads began early, as described in an NPS history of the Rock Creek Park roadway network:

The first campaign to compel the government to expand the park’s road network was spearheaded by the Brightwood Citizens’ Association, whose influential members resided in the rapidly developing area on the east side of the park. At a widely reported October 6, 1896 meeting, the association adopted a resolution urging Congress and the District Commissioners to provide \$100,000 for the development of roads and paths in Rock Creek Park. Observing that six years had passed since Congress authorized the park, the group’s president W. W. Cox inveighed, “Yet so far as I am aware, not a single dollar has been spent in making it accessible to the people for whose recreation it was purchased.”

Captain Lansing H. Beach, assistant to the Chief of the U.S. Army Corps of Engineers, was largely responsible for the park’s development beginning in 1896. A native of Dubuque, Iowa, Beach graduated from the U.S. Military Academy at West Point in 1882, was commissioned in the U.S. Army Corps of Engineers, and had worked to improve navigation in the Ohio River Valley and on a commission to settle the boundary between the United States and the Indian Territory (now part of Oklahoma) before arriving in Washington in 1884.

In the absence of appropriations for road improvement, Captain Beach began in 1897 employing chain gangs of prisoners to improve existing roads, reclaim sections of road that had been abandoned, and clear brush adjacent to the paths. With an appropriation of \$24,000 for 1899, Beach focused on improving and macadamizing a road from Blagden Mill Road to Military Road along Rock Creek north of the National Zoological Park:

The completed driveway—7,000’-long, with gently winding curves and an almost undetectable rise of 60’ over the distance between Blagden Mill Road and Military

Road—was widely praised as an engineering feat, as an artistic accomplishment, and as a long-awaited response to the need for enhanced access to Rock Creek Park . . . . The completion of Rock Creek Drive, as it was originally called, not only exposed the beauties of the creek to popular view, it eliminated the need for backtracking or breaking the trip into east and west portions combining park roads and ordinary city streets.

Rock Creek Drive cost \$15,000, with Captain Beach using the remainder of the appropriation on other roads.

On November 20, 1901, Rock Creek Park’s Board of Control honored Captain Beach for his work improving the park’s roads. The board changed the name of Rock Creek Drive to “The Beach Driveway,” soon shortened to Beach Drive, the name the road north of National Zoo still bears. [*Rock Creek Park Road System*, Historic American Engineering Record No. DC-55, National Park Service, pages 37-44; Kelly, John, “The resourceful man who helped make Rock Creek Park more accessible,” John Kelly’s Washington, *The Washington Post*, December 31, 2017]

Despite limited appropriations for park roads, officials gradually improved Beach Drive to meet changing needs as the automobile began to dominate traffic in the District of Columbia. In the 1930s, as the Maryland-National Capital Park and Planning Commission extended the park beyond the District line, park officials planned extension of Beach Drive to Maryland. The Maryland planning commission had begun work on the 1.2-mile Maryland section of Beach Drive to East-West Highway in early 1931. Construction began on March 30.

General Grant, then still Director of Public Buildings and Public Parks, began surveying the District extension in the spring of 1931:

The new three-quarter mile long roadway wound along the southwest bank of Rock Creek from the bridge leading to Kalmia Road to the District line, where it connected with the park drive already constructed by the M-NCPC. This part of Rock Creek had previously been accessible only by foot and bridle paths.

The extension of Beach Drive in the District portion of Rock Creek Park opened to traffic on June 25, 1932:

Completion of this segment enabled motorists to drive along Rock Creek all the way from the National Zoo into Maryland. The Maryland section of the park road system provided an intersection with East-West Highway, the primary route between Bethesda and Silver Spring. These links to the rapidly growing suburbs of Montgomery County helped fuel the transformation of Beach Drive from an isolated park drive into a busy commuter thoroughfare playing an increasingly prominent role in the transportation system of the Washington Metropolitan area. [*Rock Creek Park Road System*, pages 76-77]

The Rock Creek and Potomac Parkway served traffic south of the zoo. President William Howard Taft, on his last day in office, approved the Public Buildings Act on March 4, 1913.

Section 22 authorized a commission “for the purpose of preventing the pollution and obstruction of Rock Creek and of connecting Potomac Park with the Zoological Park and Rock Creek Park.”

Construction began in the 1920s, but land disputes and funding issues delayed progress. The last segment, the bridge over Rock Creek at P Street, was completed on June 4, 1936.

The Rock Creek and Potomac Parkway is 2.5 miles long, from the Lincoln Memorial to the National Zoo. Meanwhile, the Maryland-National Capital Park and Planning Commission had opened its connector road in June 1932 between East-West Highway and the District line. With completion of the parkway in the District, motorists could “drive from the Lincoln Memorial to Maryland without leaving an attractive tree-lined setting.”

An NPS brochure about the parkway explained that the first federally authorized parkway was “conceived as a pleasure route for recreational drivers, but it soon became a major commuter artery for traffic from Washington’s northwest suburbs.” In recognition of its use as a commuter route, NPS instituted one-way use, southbound during the morning peak period, northbound in the afternoon, a change in effect to this day. [*Rock Creek and Potomac Parkway*, Highways in Harmony, National Park Service, 1992; Krakow, Jere L., *Rock Creek and Potomac Parkway, George Washington Memorial Parkway, Suitland Parkway, Baltimore-Washington Parkway*, Historic Resource Study, National Park Service, January 1990, pages 29-36]

Although motorists could drive from the Lincoln Memorial to East-West Highway, they ran into a bottleneck at the National Zoological Park because of sharp curves and periodic high water levels. The NPS history of the Rock Creek Park road system explained the problem:

Following the completion of Rock Creek and Potomac Parkway, District transportation officials continued their efforts to increase the flow of traffic through Rock Creek valley. The first major obstacle—though ultimately one of the last issues to be settled—was the creation of a permanent, all-weather connection between the north end of Rock Creek and Potomac Parkway and Beach Drive in Rock Creek Park. Until the current tunnel was completed in 1966, parkway traffic entered the zoo grounds through a ford located several hundred yards west of the current bridge. Traffic then followed the zoo roads across another ford before joining Beach Drive on the north side of the zoo. Since the zoo grounds were only open during daylight hours, and the fords were impassable during high water, motorists were often forced to take a roundabout route through surface streets to get from Beach Drive to Rock Creek and Potomac Parkway. [*Rock Creek Park Road System*, page 106]

As early as 1933, highway advocates proposed a tunnel link to carry traffic through the area.

Also by the 1930s, pressure began for an all-purpose highway through the valley. The NPS history of Rock Creek Park stated:

In addition to the tunnel project, highway proponents over the years have advocated construction of a highway through the Rock Creek Valley. In 1938 District Commissioner Melvin C. Hazen favored the construction of a highway connection from

the Rock Creek and Potomac Parkway through the zoo grounds and Rock Creek Park to the East-West Highway in Maryland. Opponents stalled the project and World War II delayed serious consideration of Hazen's proposal. [*Rock Creek and Potomac Parkway*; Bushong, pages 145-146]

### **The Public Speaks**

The board room of the District Building was crowded on May 20, 1941, for the public hearing on the Whitehurst plan. While speakers generally supported the plan in principle, they differed on the proposed gas tax increase. The Washington Board of Trade, the Federation of Citizens' Associations, and the Keystone Automobile Club opposed any tax increase. They and others thought the Federal Government should provide more funds for the city's transportation needs, as the trade board explained in a statement:

We desire to call attention to the fact that the Federal Government now is studying ways and means of levying the heaviest taxes which ever have been levied on the people of this country. This it is necessary to do in order to finance the defense programs.

The board anticipated that the Federal excise tax on gasoline, instituted in 1932 as a deficit-fighting measure with no link to Federal-aid highway funding, would be increased as would taxes on individuals and businesses:

We therefore recommend against increasing the gasoline tax until after we have seen what new taxes will be levied by the Federal Government during this session of Congress.

Some groups, including the District division of AAA, favored a 1-cent gas tax increase. ["Citizens Oppose Hike in D.C. Gas Tax for Highway Program," *The Evening Star*, May 20, 1941; "Commissioners Study Mass of Testimony On Whitehurst Plan," *The Evening Star*, May 21, 1941]

(By an act approved on December 26, 1941, Congress approved an increase in the District's gas tax from 2 to 3 cents. Because of wartime rationing of gasoline and tires beginning in 1942, revenues declined despite the increase, prompting a second increase to 4 cents a gallon.)

To consider all options, District highway officials decided to study the feasibility of relieving congestion by construction of "lower-level street or tunnel systems, as a means of diverting excess traffic, particularly mass transportation vehicles, into underground channels. Congress authorized the study by joint resolution approved March 7, 1942, directing the District commissions to study the feasibility of a subway system.

The Director of Highways conducted the study, reporting preliminary findings on June 24, 1942. The study contained three basic conclusions. "(1) That rapid transit subway lines to the outlying sections of the District of Columbia are not warranted or necessary; (2) that a system of streetcar tunnels and underpasses, including appropriate terminal facilities in the central congested area, is feasible and, in many cases, warranted; (3) that the construction of grade separation structures and depressed highways within and beyond the central area is necessary and logical."

The National Capital Park and Planning Commission, in a companion report, “expressed itself in favor of grade separation structures, or localized subways, in the heavily congested multiple intersections caused by the convergence of several arterial streets into overtaxed rotaries, such as Thomas and Scott Circles, and at 14<sup>th</sup> Street, S.W., and Maine Avenue.” [*Twenty-Four Years of Progress*, pages 66-68; underlining in original]

### **Refining a Plan**

In October 1944, the Department of Highways received a report from the consultant firms of J. E. Greiner Company and DeLeuw, Cather and Company. “The report is mainly concerned with a discussion of a master plan for the correction and future development of transportation facilities in the Central Area of the District of Columbia.” The goal was to improve accessibility to the central area’s retail and Federal districts:

In their analysis of conditions in the congested downtown district, the consultants again advanced the proposal of lower-level streets [tunnels] as the only positive means of reducing the conflicts between fixed-wheel mass transportation vehicles [i.e., streetcars] and free-wheel traffic on surface pavements. The contemplated relocation of streetcar lines, which now operate on Connecticut and Pennsylvania Avenues and Fourteenth Street, to underground tunnels in the critical downtown area, is a project which appears to be amply justified.

A subway system of streetcars would serve the greatest number of people with minimum mileage; extend the benefits of rapid transit to all parts of the city; remove streetcars from surface streets in the most congested areas; allow for coordination of rail and bus routes on the surface; and allow for expansion. “It was further pointed out that the flow of buses, after subways were built, would be reduced to the extent that patrons would be attracted to the faster underground routes.”

The consultants also proposed “extensive improvements in the existing street layout through the construction of grade separation structures and channelized connections, to form convenient inner and outer belt line distributor routes around the central portion of the city.” They recommended K Street, “on the northern rim of this area,” for improvement as part of the inner belt route and as a surface distributing artery. For overloaded rotaries at Dupont Circle and elsewhere, the report recommended underpasses to separate heavy traffic flows.

The reference to inner and outer beltline distributors was not unusual, as urban planners had adopted the concept as described in *Toll Roads and Free Roads*. Urban planners would adapt the idea as they developed thoroughfare plans for cities around the country.

The October 1944 report made clear that the District needed major improvements:

The population and traffic volume curves have been on the rise . . . but without a corresponding expansion of the highway system to absorb excess traffic movements in the Central Area. Hazardous conditions, increased cost of motor vehicle operation, delay and inaccessibility of

vital regions located in this area are the wasteful and unproductive results suffered each day by a large segment of the population. [*Twenty-Four Years of Progress*, pages 71-74]

One issue remaining to be resolved was replacement of the Highway Bridge at 14<sup>th</sup> Street, NW.

### **The Highway Bridge**

Today's 14<sup>th</sup> Street Bridge complex is the modern incarnation of the Highway Bridge, itself an incarnation of the Long Bridge, which had been authorized by a law that President Thomas Jefferson approved on February 8, 1808. The toll Long Bridge, which opened in May 1809, was a 1-mile long pile structure with draw span to allow ships to pass. President James Madison was the first to cross the \$100,000 bridge, crossing in his carriage to Alexandria (then part of the capital city) where residents entertained him with a dinner. The bridge included a broad carriageway and pedestrian paths on both sides.

Twenty years later, the bridge sustained damage from floodwaters. When the bridge company was unable to pay for repairs, Congress intervened to finance a new bridge. President Andrew Jackson and his Cabinet celebrated the opening of the new \$130,000 Long Bridge in October 1835 by walking across to Alexandria. They returned in carriages. In later years, flooding and ice flows continually damaged the bridge.

By the 20<sup>th</sup> century, the Long Bridge, now controlled by the Pennsylvania Railroad, was primarily used by railroads and an interurban trolley line. It was replaced by a double-tracked railroad bridge that opened on August 25, 1904 (2,529 feet long with 11 fixed truss spans and a swing span). It included a swing draw span to allow ships to pass on the river.

The old Long Bridge remained in use for road traffic until it was replaced 2 years later. On February 12, 1906, officials inspected the completed through-truss Highway Bridge, although the approaches would not be ready until later in the year. The bridge, which cost \$1,196,000, was 2,667 feet long, 40 feet wide, and 21 feet above the normal river level. It included a swing span similar to the new Pennsylvania Railroad bridge's swing span so they could be synchronized to allow the passage of ships.

Commissioner H. B. F. Macfarland called the new structure "a fine bridge," but added:

My only regret about the two new bridges across the Potomac is that the War Department was not able to carry to success its suggestion that the bridges should be made beautiful as well as useful, which could have been done, the department believed, with little or no additional expense.

Following the inspection, the Alexandria and Mount Vernon Railway Company's trolleys were able to use the new bridge from their District terminus at 14<sup>th</sup> Street and Maryland Avenue.

The Long Bridge was finally closed on December 15 and all nonrailroad traffic shifted to the Highway Bridge. A few weeks later, the engineer in charge, Captain Spencer Crosby, reported:

A careful census of that traffic shows a daily average of 111 electric trains, 822 double teams, 301 single teams, 3 equestrians and 523 pedestrians. These figures apply to the daily traffic in good weather. There is practically no business traffic on Sundays and holidays. The greater part of the travel outside of the electric trains consists of the two-horse teams going to and from the brick yards in Virginia.

[Emery, Fred A., "Washington's Historic Bridges," *Records of The Columbia Historical Society of Washington, D.C.*, Volume 1938, pages 58-60; Cohen, Robert, "History of the Long Railroad Bridge Crossing Across the Potomac River," Washington DC Chapter, National Railway Historical Society, <http://www.dcnrhs.org/learn/washington-d-c-railroad-history/history-of-the-long-bridge>; Proctor, John Claggett, "Old and New Bridges Spanning the Potomac," *The Sunday Star*, March 24, 1946; "New Highway Bridge," *The Evening Star*, February 12, 1906; "Over Highway Bridge," *The Evening Star*, January 19, 1907]

The Highway Bridge was still in operation in the 1940s, when officials began debating how to replace it. With World War II underway, District officials began planning a replacement for the Highway Bridge as a post-war project. Quickly, though, officials split on what was needed, as the *Star* reported on April 20, 1944:

After more than nine months of conferences, District officials are holding out for two one-way bridges of four traffic lanes each in preference to a counterproposal for single six-lane bridge. The latter plan, however, is tied in to a large extent with a scheme to build at some future date another cross-river bridge at Alexandria to by-pass traffic into the Anacostia area.

PRA and the Commission of Fine Arts supported the District's view. The support by PRA was a strong point in favor of the two-bridge option because Congress, which would have to resolve the dispute, usually deferred to PRA. The basis for the District's and PRA's position was that two bridges with eight lanes would be able to carry present and future traffic. According to the *Star*:

The weight of evidence is so overwhelmingly in favor of two bridges, Commissioner Thomas H. MacDonald has pointed out in correspondence on the matter, that it would be most difficult, if not impossible, to approve the single plan if submitted for Federal participation.

The District conceded that its two-bridge plan would cost more than a single span, but contended any bridge that was inadequate for future traffic would be too expensive.

The National Capital Park and Planning Commission and NPS supported the single-span option. Commission Chairman Grant said the commission's preferred option was consistent with studies by Frederic Law Olmsted, Jr. With the Highway Bridge carrying interstate U.S. 1 traffic that did not have any reason to be in the District other than to use the bridge to cross the river, by the time traffic volumes exceeded the capacity of the single span, other crossings would be available, General Grant pointed out, particularly a crossing at Alexandria, Virginia, from Shepherds landing:

Aside from the additional cost of two bridges, he sees no justification for eight lanes of traffic feeding into the six lanes on the Fourteenth street overpass at Maine avenue. The funnel of southbound traffic actually becomes smaller as it enters Fourteenth street, he claimed, by reason of the streetcar tracks.

Gen. Grant contended also that aside from the additional cost of two bridges, the public would be paying also a real loss in the harm that would follow to the appearance and background of the new Jefferson Memorial.

Supporters of the single span also pointed out that with planned post-war dispersal of Federal offices to East Capitol Street, the Pentagon, and Suitland, Maryland, many workers who used the Highway Bridge would no longer have to do so.

Secretary of the Interior Harold I. Ickes strongly agreed with General Grant and his department's own NPS. He had written to the District commissioners in support of the single-span option. He also reminded them that NPS held title to parklands that would be needed for approaches. "He simply asked, however, to be advised before bridge appropriations are sought from Congress and before a final decision is reached, so that he might have an opportunity to present the views of the Park Service."

The Fine Arts Commission supported the two-bridge option, which was surprising in view of its usual consideration of aesthetics in its decisionmaking:

It has emphasized the importance of avoiding an axial relationship between the bridge, or bridges, and the memorial. Nor does the fine arts group subscribe to the view of the Planning Commission that a "regrettable impression" would be creating by building two passenger bridges across the Potomac paralleling the railroad bridge.

The District could ignore the planning commission's view, which was merely advisory, as PRA's MacDonald noted in a letter to General Grant on January 12, 1944:

It is recognized that the District of Columbia and the Public Roads Administration could proceed to design a facility on any basis they might select. It is also recognized that your Commission carries sufficient weight to aid or delay the accomplishment of a civic improvement. [Authorizing the Construction of Two Four-Lane Free Highway Bridges Across the Potomac River to Replace Existing Highway Bridge at or Near Fourteenth Street, Washington, D.C., Committee on Interstate and Foreign Commerce, U.S. House of Representatives, 79<sup>th</sup> Congress, 2d Session, Report No. 2346, June 26, 1946, pages 10-12]

In short, the commission and the Interior Department were influential with Congress and Washington area decisionmakers. [Shepard, Nelson M., "Four Agencies Split Over 6-Lane Bridge For 14<sup>th</sup> Street," *The Evening Star*, April 20, 1944]

On July 21, 1944, the District commissioners approved the two-bridge plan. A statement explained:

The provision of four lane capacity in each direction can be most adequately provided by two bridges of four lanes each, and such facility will not detract from the Jefferson Memorial.

A single six-lane bridge will not meet the prospective traffic needs, and any economy in present construction costs will be more than balanced by the cost of another crossing in the future.

Present access routes in the District and Virginia would be sufficient for traffic using the new bridges.

The statement pointed out that the National Capital Park and Planning Commission, which opposed the two-bridge plan, had “never expressed the opinion that future traffic demands will not require the eight lanes of capacity.” To demonstrate that eight lanes were needed, the commissioners cited a PRA study ordered by MacDonald, who reported:

An analysis leads to the conclusion that the facility should be designed for a peak load of 5,000 vehicles in each direction for a period of time in excess of an hour . . . . The 1960 (probably not more than 10 years after completion) average daily traffic is estimated to be 89,000 vehicles. A normal distribution of the expected average daily traffic for 1960 would result in numerous one-way peak loads in excess of 5,000 vehicles per hour, but the observed distribution at Highway Bridge is such that it would be safe to design for that figure.

Regarding the National Capital Park and Planning Commission’s idea that sufficient traffic would be diverted to the Alexandria-Shepherds Landing bridge to require only six lanes at

14<sup>th</sup> Street, MacDonald said that, “it is my considered judgment that it would be unwise to construct a facility of inadequate capacity with the hope that such an act would cause the building of an additional facility at another location, and that the two combined would solve the problem.”

The District commissioners awarded a contract to the New York City consulting firm of Howard, Needles, Tammen and Bergendoff to prepare working drawing for the bridges, which the *Star* described:

The new crossing will consist of two identical bridges about 400 feet apart and each with four-lane traffic capacity. There will be 15 steel deck girder spans, each approximately 160 feet in length, residing on stone faced piers. Navigation features will have to be passed upon by the War Department, but openings for river traffic are planned for each structure. [Crist, Bainbridge, “Two Four-Lane Spans Approved to Replace 14<sup>th</sup> Street Bridge,” *The Evening Star*, July 21, 1944]

By January 1945, America could anticipate the end of the war. Planning for post-war construction took on urgency, causing the debate over replacing the Highway Bridge to intensify.

The chairman of the House District Committee, Representative Jennings Randolph (D-WV), introduced several bills at the request of the District commissioners, including H.R. 541:

“Authorizing and directing the Commissioners of the District of Columbia to construct two four-lane bridges to replace the existing Fourteenth Street or Highway Bridge across the Potomac River, and for other purposes.” The bill authorized \$7 million for the two bridges.

Senator Theodore G. Bilbo (D-Ms.), chairman of the Senate District Committee, introduced companion bills, again at the commissioners’ request. As for the Potomac River crossing, he thought two tunnels might be better than any bridge. Two tunnels, he said, would put an end to complaints that a bridge or bridges would “mar the beauty” of the area or handicap navigation. He also thought the tunnels would be cheaper than the bridge alternatives, but admitted that despite his comments, he did not have the “question settled in my own mind.”

On January 13, Chairman Randolph released sharply conflicting statements he had received from public officials on the bridge issue; he had sent the statements to Chairman Clarence F. Lea (D-Ca.) of the Committee on Interstate and Foreign Commerce, who indicated he would hold a hearing on the bridge legislation. Secretary Ickes’s statement said the two-bridge option would cost too much and “do violence” to the approach to the Nation’s capital. It also would overburden area streets. The National Capital Park and Planning Commission’s concerns were “based on sound economy and modern city planning.” In view of his preferred options, he said, “Sooner or later, another bridge should be constructed crossing the Potomac at Alexandria. This bridge would provide a by-pass for the passenger vehicles and trucks which do not have occasion to enter downtown Washington.”

Major Philip B. Fleming, administrator of PRA’s home, the Federal Works Agency, said that the assertion that the two-span, eight-lane proposal would overload the street was “not in agreement with the traffic facts.” His agency had considered the national commission’s views, “but the conclusion reached was that neither traffic nor the interests of the District would be served by a bridge which soon would be unable to accommodate the traffic that inevitably would use the structure.” Traffic studies demonstrated the need for eight lanes to support probable growth.

Secretary of War Henry L. Stimson also had commented on the dispute. “I know of no objection to the favorable consideration” of the District’s twin-bridge project. [“Ickes and FWA Clash Over Plans for Spans Across Potomac,” *The Sunday Star*, January 14, 1945]

In December 1945, Representative Virgil M. Chapman (D-Ky.), chairman of the Subcommittee on Bridges of the Committee on Interstate and Foreign Commerce, held a hearing on the debate. On December 11, Chairman Grant of the National Capital Park and Planning Commissioner released a previously confidential report that consulting engineers Sverdrup and Parcel had prepared for the War Department in 1941. He quoted the “pertinent and important” section of the report on the bridge situation:

The very thorough study of highway traffic in the Washington area presented in the special report of the Director of Highways for the District of Columbia, indicates (a) a vehicular crossing at Alexandria to relieve the congestion on the Fourteenth Street Bridge and (more particularly) the city streets leading to it is a present necessity, and, that (b) a reconstruction of the Fourteenth Street Bridge and a revision of the approach roads, to increase traffic capacity, may become a necessity in the reasonably near future.

The report estimated that a six-lane bridge would cost \$4,694,000, while the Alexandria bridge would cost \$3,510,000, for a total cost of \$8,504,000. The two spans the city favored for the Highway Bridge location would cost \$7 million. [Two Four-Lane Highway Bridges Across the Potomac River, Washington, D.C., Hearing on H.R. 541 Before the Bridge Committee of the Committee on Interstate and Foreign Commerce, U.S. House of Representatives, 79<sup>th</sup> Congress, 1<sup>st</sup> Session, page 20]

General Grant also argued that the city had “violated” traffic estimating principles to show the need for four lanes of Washington-bound traffic instead of three lanes. The bridge could not carry the predicted 6,700 vehicles per hour because they would be “poured into the Fourteenth street bottleneck,” which could not be relieved because of the impracticability of removing the Maine Avenue overpass.

He regretted that for the first time, as far as he knew, the commission had to appear before a congressional committee in opposition to a District proposal. “But, unfortunately, they are recommending to you what past experience and sound planning show will inevitably prove an unduly costly and harmful project, to the city, as well as to the Federal Government, which will pay half of this cost and presumably half of that of the future, more expensive remedial measures.” In view of the “dire effects” of the city’s twin-bridge proposal on the central area park system, he was surprised that PRA was advocating a project that would “deluge the Jefferson Memorial with a congestion of trucks and business traffic.”

In a statement introduced for the record, Chairman Gilmore D. Clarke of the Commission of Fine Arts argued that twin bridges would provide a more dignified approach to the Jefferson Memorial area at the edge of the Tidal Basin. In a letter to General Grant, Clarke had written that the issue regarding one versus two bridges is “debatable, since it is based upon esthetics and, in that area of thought, there may be as many answers as there are persons to debate.”

Secretary Ickes, appearing before the subcommittee on December 18, denounced the District’s plan for two four-lane bridges because they would jeopardize the beauty of the Jefferson Memorial along the Tidal Basin. Referring to the appearance of vehicles instead of trees, he said, “I can only compare such a backdrop to the mechanical ducks which move across the back of every two-bit shooting gallery in the country.” He supported General Grant’s claims, arguing that the additional traffic from the eight lanes would require additional funds to depress or elevate roads throughout downtown Washington.

The *Star* summarized another aspect of Secretary Ickes’ attack:

Mr. Ickes charged Public Roads Commissioner Thomas H. MacDonald had taken the position that if the District built a single six-lane, two-way bridge, no Federal funds would be forthcoming for the project.

“I believe I would find it difficult to avoid arriving at the same conclusion as the District Commissioners after Mr. MacDonald had said in effect, ‘Do it my way or else.’

“I believe that Mr. MacDonald misconceives his role as a Federal official, efficient and high minded as he may be. It would seem to me his function is to build the roads that policy-making agencies may determine upon,” Mr. Ickes said.

Secretary Ickes also questioned PRA’s “curious” conclusion that the 89,000 vehicles that would use the crossing to enter Washington would cause no more congestion downtown than the 44,500 using it in 1941. “The two-bridge plan would have sad consequences in the downtown business district.”

He also criticized Clarke for saying that the issue about two bridges was “debatable, since it is based upon esthetics.” Secretary Ickes said he was surprised to hear that “educated judgment” on aesthetics, “which might include his own - is to be taken with a grain of salt.”

Even before Secretary Ickes testified, District officials had threatened to “blow off the lid” in the controversy, promising to present statistics that would conclusively rebut his views. [“Ickes Will Be Horatio for a Single Bridge,” *The Washington Post*, December 12, 1945]

Captain Whitehurst, who followed the Secretary at the witness table, told the subcommittee that the 1941 classified report that General Grant had released was misleading. It had, Whitehurst said, covered only the war emergency and covered not only vehicular but rail traffic. The *Star* summarized his 21 typed pages of testimony:

1. At least four lanes and more are available on both the District and Virginia sides for service to the bridges.
2. By minor changes additional facilities can be provided.
3. If in future still further capacity is necessary, it can be provided without undoing existing improvements and at a relatively small cost.
4. It would be uneconomical to provide less than four-lane capacity bridges in each direction.
5. Bridge facilities of less capacity than that proposed by the District Commissioners would be inadequate.
6. Any facility of whatever cost would prove expensive if inadequate.

On the final day of the hearing, PRA’s Fairbank testified with a mass of data in response to General Grant’s claims. He disputed the idea that the Alexandria bridge would divert any more than 5 percent of the traffic using the Highway Bridge. Based on PRA surveys, he said that most of the traffic was local, with the center of destination at Third and G Streets, NW., for cars and Union Station for trucks.

General Grant had bolstered the commission’s claims of authority by pointing out that the 1944 report to Congress, *Interregional Highways*, had favored giving planning commissions a voice in the design of bridges. Fairbank said that was incorrect. “I wrote the report,” he told the subcommittee and it favored giving planning bodies a role only in the location of bridges.

He also disputed a claim by John Nolen, Jr., the commission’s planning director, who said he had observed 3,000 cars an hour using Arlington Memorial Bridge without difficulty. Fairbank

reported that surveys the past week indicated the bridge was crammed to capacity when volume reached 3,000 vehicles, leaving cars to move at about 10 miles per hour.

The District's traffic director, William H. Van Duzer, disagreed with General Grant's bottleneck argument. He said the District end had enough outlets for traffic from Virginia to avoid the problem. Building a six-lane, two-way bridge would be only a "palliative." Van Duzer said he had never heard of a highway project that had been overbuilt.

Colonel Joseph D. Arthur, assistant to Engineer Commissioner Young, said, "It is neither good economy nor good planning to build a bridge of insufficient capacity at Fourteenth street in order to justify a second bridge at Alexandria." He also disputed the claim by Secretary Ickes that PRA's MacDonald had coerced the city. Colonel Arthur said he had been unable to find any statement by MacDonald along those lines.

General Grant was not willing to recant his claims despite the Fairbank data. Statistics, he said, could be used equally by both sides. ["Twin Bridge Plan Denounced As Too Costly," *The Evening Star*, December 11, 1945; "Ickes Attacks Twin Bridges As Unsightly," *The Evening Star*, December 18, 1945; "House Hearings On Twin Bridge Proposal End," *The Evening Star*, December 19, 1945]

The *Star* editors were particularly skeptical of Secretary Ickes' presentation, preferring Clarke's acknowledgement that appearances were at least "debatable." Regarding the Secretary's reference to mechanical ducks, the editorial said:

To Mr. Ickes, the automobiles are not merely mechanical ducks but ugly ducklings as well. To others, however, they are the chariots which carry busy little taxpayers to and from work, and pictured in this light they are things of beauty and a joy forever. They transport the busy little taxpayers who pay the cost of that coldly austere pile of white marble erected to the memory of Thomas Jefferson, and their movement gives it needed warmth and life. They pay the salary of one-bridge Ickes, the expenses for the two-bridge Fine Arts Commission, the salary of two-bridge Public Roads Commissioner Thomas H. MacDonald and the salary of one-bridge Major General Ulysses S. Grant, 3d.

The purpose of the bridges (or bridge) to be built after the experts are through disagreeing, is to get these busy little taxpayers back and forth across the river. And one cause of the present controversy is that too many people like Mr. Ickes are thinking of them as mechanical ducks, interfering with the appearance of the Jefferson Memorial, instead of as busy little taxpayers who have to get to work in the morning and back home in the evening with a minimum of delay and inconvenience. ["Useful Little Ducks," *The Evening Star*, December 20, 1945]

Secretary Ickes did not appreciate the *Star*'s views. In a letter to the editor, he called the editorial the newspaper's version of the "widows and orphans" fiction that was often cited as the need for action. As for those "busy little taxpayers," he asked, what about those taxpayers "who want a beautiful setting for the Jefferson Memorial for which they helped to pay and who can't quite see the sense of pouring through eight lanes of highway traffic that Washington is not prepared to

handle.” The editors apparently did not “grasp the issues,” and he would not point them out “because I doubt if you would be interested.” He continued:

The thought occurs to me that the “busy little taxpayer” could get back and forth much more quickly if it were not for the circuitous roads around the Lincoln Memorial. So, if Mr. MacDonald, whose ability is unquestionable but whose zeal to use power improperly is as clear as day so far as these proposed bridges are concerned, should want to demolish the Lincoln Memorial in order to build wider and straighter roads I would expect The Star to join in the acclaim.

Asserting that there is “more to human life than mere utilitarianism,” he thought that “beauty and perspective” were also important. But by the *Star*’s standards, why not get rid of the District’s traffic circles and trees that interfere with traffic and “why should there be any inhibitions against the unlimited vehicular use of Rock Creek Park, which now is little more than a glorified boulevard, and of other areas that our childish-minded predecessors thought might be both appropriate and fitting as a frame for what ought to be a lovelier Capital City than it is?” [“My Ickes Replies to Editorial on ‘Useful Little Ducks,’” Letters to The Star, *The Evening Star*, January 1, 1946]

The problem with responding to editorials is that the editors always have the final say. An editorial the same day said that Secretary Ickes “dodges the issues.” After explaining the support for the two-bridge plan, the editorial applauded Secretary Ickes “for his interest in safeguarding the beauties of Washington.” However, the editorial did not concede “that this beauty is enhanced by ignoring the realities of modern traffic needs”:

A few more mistakes by city planners unconcerned with traffic, like their location of a Chinese Wall of Government buildings south of Pennsylvania avenue, closing off such important north-south thoroughfares as Thirteenth, Eleventh and Sixth streets, and the beauties of Washington will be more obscured than they are now by snarled traffic. The problem of constructing an adequate bridge facility should be approached on the basis of facts and not irrelevant rhetoric. [“My Ickes and the Bridge,” *The Evening Star*, January 1, 1946]

### **Elevating the Battle of the Bridge**

On January 14, 1946, Secretary Ickes arranged for President Harry S. Truman to join a group that went to the top of the Washington Monument to observe the site of the dispute. The *Star* reported that in so doing, President Truman became “the first President ever to ascend the shaft, according to records of the National Capital Park Service.”

In addition to Secretary Ickes, President Truman was accompanied by General Grant; Arthur E. Demaray, associate NPS director and a member of the national planning commission; T. Sutton Jett, NPS chief of national and memorial and historical areas; and Edward J. Kelly, administrative assistant to the superintendent of National Capital Parks. They spent a half hour atop the monument discussing the proposal. They also discussed the post-war public buildings program, including removal of the temporary buildings on park property, as well as “new State

and Navy Department buildings, an Interior Department annex, extension of the Treasury annex and two new Smithsonian Institution museums, all within view of the top of the shaft.”

(According to the *Post*, “He spent an hour visiting the Jefferson Memorial, Lincoln Memorial and topped it off with a trip to the top of the Washington Monument.”)

After leaving the Washington Monument, the group took a car across the Highway Bridge into Virginia. They returned via Arlington Memorial Bridge:

In this way he had an opportunity to drive over some of the principal approaches to the crossing; approaches which advocates for twin bridges contend are adequate and which opponents have said are inadequate.

The *Star* reported:

It was reliably understood today that the President did not commit himself on the bridge proposal, allowing these three officials to do most of the talking. [“Truman Views D.C. Bridge Sites From Washington Monument,” *The Evening Star*, January 15, 1946]

Secretary Ickes submitted his resignation on February 13, indicating that he wanted to complete pending business before leaving office on March 31. He decided to resign following a dispute resulting from his unfavorable testimony about a Truman nominee for Under Secretary of the Navy. President Truman accepted the resignation, but made it effective February 15, in view of the Secretary’s statement that the Truman Administration expected him to commit perjury to support the nominee.

On the final day of Secretary Ickes’ 13-year tenure at the Department of the Interior, the *Star* reported:

The Secretary, as had been his custom for years, drove in from his estate near Olney, Md., and was at his desk by 8:30 o’clock. There he found a great stack of mail from people in all walks of life, from national leaders to file clerks in the Interior Department, expressing regret over his departure. [Baird, Joseph H., “Ickes Rushes to Clear Office; Cabinet Meets Without Him,” *The Evening Star*, February 15, 1946]

(The estate was called Headwaters Farm at 11 Shallow Brook Court in Olney.)

Ickes’ successor would be Julius A. Krug, a longtime government servant who had recently been Chief of the War Production Board. He took office on March 18, 1946.

Representative Chapman indicated that before the subcommittee reported on the Randolph bill, members would visit the site of the Highway Bridge and also might follow President Truman’s example by ascending the Washington Monument for a “bird’s eye view” of the area. They also planned to visit the site of the Alexandria-Shepherds Landing bridge. [“House Unit Plans Span Site Tour Before Report,” *The Evening Star*, February 20, 1946]

The tour did not occur until May 14, 1946, just as the committee was finally planning to consider the bill. All five members of the Chapman subcommittee took the tour along with Chairman Grant; Captain Whitehurst; Superintendent Irving C. Root of National Capital Parks and his assistant, Harry T. Thompson; and PRA's H. E. Hilts, C. E. Swain, and E. H. (Ted) Holmes. The group did not ascend the Washington Monument, but did tour the approaches to the Highway Bridge on both sides of the river and inspected the site of the proposed Alexandria-Shepherds Landing bridge. The subcommittee members did not express their views, but according to the *Star*, "asked many questions." ["House Group to Press For Action on Bridges After Tour of Sites," *The Evening Star*, May 14, 1946]

On June 6, with the Randolph bill still in committee, the White House let the District and other parties to the debate know the President's views. Matthew J. Connelly, Secretary to the President, wrote to John Russell Young, president of the District Board of Commissioners:

The President has directed that I advise you that he favors the two-bridge plan for replacement of the present Highway Bridge across the Potomac River.

He has also directed that a copy of this letter be sent to the National Park and Planning Commission and the Bureau of Public Roads. [Authorizing the Construction of Two Four-Lane Free Highway Bridges Across the Potomac River to Replace Existing Highway Bridge at or Near Fourteenth Street, page 2-3]

The brief letter did not explain the basis for his decision, but the *Star* hoped that "the President's candid indorsement of the plan to build twin bridges . . . will produce some action from the subcommittee" on the Randolph bill:

The President's support of the two-bridge plan shows that he is in agreement with the Public Roads Administration, the District Highway Department, the Commission of Fine Arts and others who have taken the view that within a few years one bridge would be incapable of handling the growing volume of traffic and that long-range economy and sound traffic engineering make two one-way structures advisable. ["Get It Started," *The Evening Star*, June 8, 1946]

The President's decision did prompt House action. On June 14, members of the Chapman subcommittee ascended the Washington Monument to survey the area. Chairman Chapman and two other committee members were accompanied by General Grant, Demaray, Whitehurst, and Hilts. As the *Star* explained, the accompanying officials were split among one-bridge and two-bridge men (in contrast to the all one-bridge officials accompanying the President).

The officials were at the top of the monument for an hour, with each side citing familiar arguments. General Grant and Demaray argued that a single bridge would enhance the view of the Jefferson Memorial for tourists approaching the city. If needed, a second, smaller bridge could be built at some future date, but the likelihood of congestion was a long way off. General Grant predicted that completion of the one-bridge project would take 6 years from approval of authorizing legislation.

Captain Whitehurst and Hilts said construction of the twin spans would take half that time. Captain Whitehurst said the northbound span would give tourists a fine view of the Jefferson Memorial. The Highway Bridge was in such poor condition that it could not be used for long as one of the twin spans.

Chairman Chapman said he thought the Alexandria-Shepherds Landing bridge would be needed as a bypass before long. He said it would “divert more traffic from downtown Washington than we think.” Hilts replied that the new bridge at Morgantown, West Virginia, carrying U.S. 19-119, combined with new roads connecting it to the U.S. numbered system would provide a direct bypass for north-south traffic.

General Grant and Demaray questioned whether the economy-minded Congress would go along with the higher cost for the two-bridge solution; perhaps Congress would approve the two spans, but not appropriate funds for the second span. Captain Whitehurst and Hilts pointed out that the financing had been worked out on a 50-50 Federal-District basis under the Federal-aid highway program.

After descending from the Washington Monument, the group crossed the Highway Bridge into Virginia and returned to the city on Arlington Memorial Bridge to compare views. [Kauffman, Rudolph II, “Committee Visits Monument for New Span Study,” *The Evening Star*, June 14, 1946]

On June 26, the House Committee on Interstate and Foreign Commerce reported the Randolph bill authorizing \$7 million for two four-lane bridges to replace the Highway Bridge. The committee report included extensive correspondence from officials arguing both sides of the long debate. The House approved the bill unanimously on July 3, with limited debate.

The Senate District Committee approved the bill on July 5 without amendment. The committee’s acting chairman, Senator Clyde R. Hoey (D-NC), introduced the bill on the Senate floor on July 7. He requested unanimous consent for consideration of the bill. It then passed unanimously without debate, and was sent to the President for signature. [“\$450 School Pay Raise And Bridge Measure Approved by Senate,” *The Evening Star*, July 10, 1946]

President Truman approved the legislation on July 17, 1946 [P.L. 79-516]. As soon as the President signed the law, Captain Whitehurst said, he “pulled the trigger” to approve a contract with the engineering firm of Howard, Needles, Tammen and Bergendoff, which had previously been selected to prepare plans and specifications. He predicted that the first span would be ready in a year and a half. At that point, all traffic would be shifted to the new span, which would carry two lanes of traffic in both directions until the second span was completed. [“Signing of Bill Launches Plans To Build Spans,” *The Evening Star*, July 17, 1946]

On May 9, 1950, officials dedicated the first span of the new 14<sup>th</sup> Street Bridge. Miss Mary Jane Hayes, Miss Washington of 1949, snipped the red ribbon before a crowd of about 300 people. After the ceremony, an official motorcade crossed the bridge into Virginia, then returned to the District along with the vehicles that had been waiting in Virginia for the opening.

On October 19, 1958, an Act of Congress officially named the span the Rochambeau Memorial Bridge to honor the Comte de Rochambeau, of France. The *Star* explained, “Last year was the 175<sup>th</sup> anniversary of the time when Gen. Rochambeau crossed the Potomac near the site of the present bridge on the way to aid Gen. Washington’s forces in the Battle of Yorktown,” which essentially ended the Revolutionary War. During the bridge ceremony, “French Ambassador Herve Alphanb declared the dedication bound more closely the historic ties of friendship between his country and the United States.”

Contrary to Captain Whitehurst’s original plan, the new bridge, with a double-leaf draw span for openings, would carry four lanes of District-bound traffic while the Highway Bridge would carry traffic from the District to Virginia until January 27, 1962, when the four-lane George Mason Memorial Bridge opened and became the southbound roadway. District, Virginia, and Federal officials gathered for the ceremony, which included unveiling a plaque honoring Mason, a Virginia plantation owner and politician, friend of George Washington, and an influential participant in the Constitutional Convention who refused to sign the document because it lacked a Bill of Rights similar to one he had drafted for Virginia. The Highway Bridge could finally be removed.

In 1983, Air Florida Flight 90 crashed while taking off from Washington National Airport in a snowstorm, damaging the Rochambeau Memorial Bridge. The bridge was renamed as a posthumous honor for Arland Williams, Jr., a heroic passenger who lost his life helping others escape the airplane. The original name was shifted to a bridge opened in 1972 to carry high occupancy vehicles.

Today, the 14<sup>th</sup> Street Bridge or Bridges carrying I-395 across the Potomac River consists of (west to east):

- George Mason Memorial Bridge (1962),
- Rochambeau Memorial Bridge (1972), carrying express lanes for high occupancy vehicles.
- Arland D. Williams Jr Bridge (1950).
- Charles R. Fenwick Bridge carrying Metro rapid transit trains (1983, named for a Virginia State legislator), and
- The 1904 Long Bridge, which was restored during World War II, continues in railroad service.

As the *Post* pointed out in its *Weekend* article on District bridges, the structures comprising the 14<sup>th</sup> Street Bridge “possess no visual distinction.” [Bisbort, page 9]

### **Postwar Thinking**

World War II had a major impact on Washington, as the District highway department’s 24-year history explained:

After five years in the role of the world’s war-time capital, Washington was bursting at the seams under the pressure of its swollen population. New groups of military and

civilian personnel, engaged in the accelerated functions of a Government waging war on a global scale, had, by 1946, overflowed into the adjoining counties of Maryland and Virginia in such numbers that transportation problems were no longer limited to the city of Washington. A metropolitan area, composed of vast new housing developments, had sprung up to form a populous and exceedingly active fringe on all sides of the District of Columbia. [*Twenty-Four Years of Progress*, page 74]

With morning and afternoon peak periods “filled with danger and delay to the shuttling motorist,” the Department of Highways decided that “a revision of long-range highway programs to include expressways” was essential.

Once again, the department called in J. E. Greiner Company and De Leuw, Cather and Company to conduct the study and submit recommendations. Their December 1946 report contained:

. . . broad recommendations which emphasized the necessity of consolidating and enlarging past proposals for improvements in the District of Columbia’s highway system, to include a system of expressways serving all parts of the District and connecting with existing and proposed highways of this type in Maryland and Virginia. A network of arterials, improved at irregular, multiple and high volume intersections through the construction of grade separation structures, channelization, and the use of effective signalization and other control measures were also recommended. [*Twenty-Four Years of Progress*, pages 74-75]

In 1946, Engineer Commissioner Young presented a plan for post-war highway improvements to take the District to the threshold of the 21<sup>st</sup> century. The plan, an update of the 1941 pre-war plan, included several expressways serving all parts of the District and linking with Maryland and Virginia proposals. These included:

Mid-City Expressway was “designed to relieve the shopping district of through traffic destined for the Federal Triangle, the Southwest Mall and other points beyond the Central Area.” The expressway “would extend from Canal Street in the vicinity of Independence Avenue across the Mall, along Third Street as a depressed highway, west of Griffith Stadium [located at Georgia Avenue and 5th Street, and between W Street and Florida Avenue NW.], under the hill north of Howard University, along the west edge of the Soldier’s Home, through a hill east of Rock Creek Cemetery and thence northeast to the District line.”

Capitol Hill Expressway would involve “two one-way drives depressed east of Capitol Hill, through which they would be carried in tunnels, and merging in the Mall east of Third Street, from which point they would be carried at-grade, on the approximate alignment of the present Madison and Jefferson Drives.” This expressway would connect with the proposed Baltimore-Washington Parkway, the Anacostia River highway crossings, and 17<sup>th</sup> Street, NW.

The consultants suggested that mass transportation vehicles could operate on the expressways on express schedules “to attract and induce a greater portion of the population to use public transportation.” [*Twenty-Four Years of Progress*, page 75-77]

In addition, the plan included “somewhat lesser scale” improvements, such as a road through Rock Creek Park to connect with U.S. 240 to Frederick in Maryland, the K Street Elevated Highway, widening of Canal Road, the Whitehaven Parkway serving densely populated areas west of Wisconsin Avenue, the Anacostia-Kenilworth Freeway as part of a circumferential, and “the opening of the valley along Arizona Avenue as a parkway to connect Canal Road with Wisconsin Avenue.” The 1946 plan was consistent in many ways with the 1941 plan, but studies since then had “changed the plan to some extent, in that the Arizona Avenue Parkway has been approved as a substitute for the formerly proposed improvement of Foxhall Road as the ‘major arterial highway’ to serve the area west of Connecticut Avenue . . . .” [*Twenty-Four Years of Progress in Highway Development*, pages 74-76]

The District Highway Department released a draft of its highway development program in March 1947. The plan included depressed expressways through congested areas connecting with existing and proposed highways in surrounding jurisdictions; an inner loop around the central business district and one just within the city limits known as Fort Drive; and additional bridges across the Potomac River at Alexandria and across the Anacostia River at Massachusetts Avenue. The plan also called for subsurface streetcar tracks along downtown sections of F and 14<sup>th</sup> Streets and Pennsylvania Avenue. [Mustin, Henry A., “Commissioners Slate Hearing March 26 on Vast Highway Plan,” *The Evening Star*, March 16, 1947]

At a public hearing on the plan, the National Capital Park and Planning Commissioners attacked the city’s draft. General Grant called for a “go slow” attitude toward the expressways and underground streetcars. The commission’s director of planning, John Nolen, Jr., criticized the plan for not taking into account other phases of city development. He suggested that the city should be working with its adjacent jurisdictions on a regional plan.

The commission’s major criticism focused on the expressway plan. First, traffic expected by 1965 would not justify the cost. Second, the expressways, which were far in excess of traffic needs, would make it easier to get to downtown from the suburbs, thereby hastening the shift of taxpayers to the Maryland suburbs. However, Nolen’s statement said, “It should be borne in mind that the opposite effect may well be produced on residential areas in the District which supply three-fourths of the District’s real estate tax income.”

The commission also was highly critical of plans for underground streetcars, except where doing so would relieve congestion as in Dupont Circle. Creating a rigid system of tracks that could not be easily changed with population and employment shifts was an old-fashioned way of thinking about transit. The trend around the country was to abandon streetcars in favor of streamlined bus systems that could easily adjust to such changes.

In addition to criticizing the city’s plan, the commission offered its own ideas on overhauling the District’s street system. The plan was the latest version of the thoroughfare plan the commission

had been promoting, without success, since 1927. [Kauffman, Rudolph II, "Planners Blast Road Program, Urge Substitute," *The Evening Star*, March 26, 1947]

### **The Interstate System for the District**

On August 2, 1947, the Federal Works Agency and PRA designated the rural mileage of the National System of Interstate Highways plus extensions to carry each route through the cities in its path. According to a press release:

This network, comprising 37,681 miles of the 40,000-mile eventual extent of the entire system, includes 2,892 miles in cities, forming the principal extensions into and through the connected cities. The remainder of 2,319 miles has been reserved to permit addition in the larger cities of distribution and circumferential routes, essential as terminal connections of the system; designation of this further mileage in cities, now under way, requires the close cooperation of city, State, and Federal authorities.

At the time, the rural designations were widely understood to refer to the existing U.S. numbered highway in each corridor rather than to a new freeway that would be built parallel to the inadequate existing road.

In the District, which did not have rural segments, the principal extensions into the District of Columbia totaled about 22 miles and involved extensions of U.S. Routes 1, 50, 211, and 240. The *Star* listed the street extensions of those routes included in the new network:

- Wisconsin avenue from Georgetown to the District line;
- Massachusetts avenue from Wisconsin avenue to Twenty-second street;
- Twenty-second and Twenty-third streets from Massachusetts avenue to K street N.W.;
- K street from Wisconsin avenue to West Virginia avenue N.E. plus sections of New York avenue and Bladensburg road extending north from West Virginia avenue;
- Constitution avenue from Third street to Twenty-third street N.W.;
- Virginia avenue from Constitution avenue to Twenty-third street;
- Fourteenth street from Constitution avenue to Highway Bridge;
- Third street N.W. from K street south to Maryland avenue;
- C and D streets S.W. from Maryland avenue to Fourteenth street, and Key, Arlington and Highway Bridges and their approaches.

The newspaper speculated that several District routes would likely be approved later:

A bypass route using such streets as Nebraska avenue, Military road, Missouri avenue, Riggs road, South Dakota avenue, Benning road and Minnesota avenue, plus the proposed Arizona avenue Expressway, Fort Drive and Anacostia Expressway, if they are built, is likely to be approved later.

The first grouping, from Nebraska Avenue to Minnesota Avenue would serve as a bypass for the downtown business district. ["New U.S. Highway Net To Speed City Traffic, Aid Defense

Centers,” *The Evening Star*, August 3, 1947; “22 Miles in District in U.S. Highway Plan,” *The Washington Post*, August 3, 1947]

PRA had been working with State and local officials to determine the location of the metropolitan segments based on the concepts outlined in *Interregional Highways*, but more work was needed. To determine rural interstate road needs, officials had used origin-and-destination surveys in the mid to late 1930s to gather traffic data by stopping vehicles and questioning drivers. Such surveys were impractical in large metropolitan areas with heavy traffic volumes. Therefore, PRA worked with the Census Bureau to develop a sampling technique that was similar to the methods employed by polling organizations. After the August 1947 designation of rural segments, PRA/BPR continued to work with State and local officials to develop an express highway network in each metropolitan area.

The District Highway Department’s 24-year history concluded with a section on “Plans for the Future” that included a discussion of expressways. Traffic engineers were “turning to this admittedly [sic] expensive measure as the only one capable of achieving the desired results” of congestion relief. Washington was particularly suited to limited-access expressways because the predominant traffic flow in the morning is toward the central business and government districts, with comparable exit traffic in the evening:

[The department] has reached the conclusion in consultation with several engineering firms, which were retained to study the traffic problem in Washington’s Metropolitan Area, that a system of expressways will probably become necessary in the not too distant future. These high-speed traffic channels should be depressed in order to preserve as much of the remaining pavement area, which is already at a premium, at grade level to serve local movements. Further studies and investigations are being made in this field.

While congestion relief and safety were the primary concerns in considering expressways, they would have other benefits:

It has been the experience of other large metropolitan centers, plagued with the same troubles, that expressways have had a revitalizing effect on run-down residential neighborhoods which usually form an exceedingly unattractive ring around the business area. It is a well known fact that rehabilitated slum areas have a tax potential far beyond the values which are placed upon them in their present condition.

Suitably interconnected with the street system at grade, expressways would also serve as protection for the valuable properties which occupy the retail business district by opening up new connecting arteries and speeding up the circulation of local surface traffic. Although it is extremely doubtful for example [sic], that F Street will ever be abandoned while the major federal installations with their thousands of highly-paid workers remain within walking distance of its shops, it is nevertheless essential and prudent to adopt measures which will forestall any further encroachment of the “downtown disease” upon its high tax-yield properties in the heart of the city. The slums can and should be eradicated before reaching unmanageable proportions. Highway facilities of the expressway type can very well mean the restoration of arteries through which new blood,

in the form of healthier commercial activities, could be pumped to revive the stagnant neighborhoods. [*Twenty-Four Years of Progress in Highway Development*, pages 125-127]

*Toll Roads and Free Roads* and *Interregional Highways* made the same points about the urban segments of what became the Interstate System. In practice, building urban Interstates, even through “slums,” proved very difficult. In Washington, the main example was in the southwest quadrant, as will be discussed later.

### **Washington Present and Future**

Harland Bartholomew, born in 1889, had long been influential in highway planning for the District of Columbia. He had developed Washington’s zoning ordinance of 1920 and proposed a planning commission to coordinate zoning with changes in the city’s land use. When the National Capital Park and Planning Commission was established in 1926, Bartholomew served as a consultant on highways. He would continue in this role until President Eisenhower appointed him to chair the commission, effective September 1, 1953 (term to expire on April 30, 1959). He continued to live at 6228 Westminister Place in St. Louis where his consulting business was based. He was the third of the four most recent chairmen who did not live in the Washington area. [“Eisenhower Appoints Harland Bartholomew To Planning Body,” *The Evening Star*, August 6, 1953]

For the initial plan developed in the 1920s, Bartholomew studied the evolution of roads in the Washington area as the basis for a concept that Gutheim and Lee described in their history of planning in the District of Columbia:

Outside the District’s boundaries, Bartholomew studied the commuting zones within Prince George’s, Montgomery, Arlington, and Fairfax counties. Because of the limited construction of county highways and heavy use of streetcar and railroad lines, the commuting zone resembled spokes about the hub of the L’Enfant federal city. Bartholomew recommended the strengthening of radial highways already largely defined by preautomobile transportation routes. To adapt these radials to the automobile, the routes were to be dramatically widened. To connect these radials and fill in the spokes, Bartholomew drew up a series of bypass routes resembling many belt roads encircling the District. The intersection of the radials with the belt roads was intended to be located at extant county towns to maintain the already developed points of concentration. Thus the configuration of highways outside the District would resemble a vast built spiderweb. [Gutheim and Lee, page 198]

When the District of Columbia Redevelopment Act of 1945 called for a new comprehensive plan for the Washington area over a 25-year period, Bartholomew would again take the lead in projecting the area’s highway network. He coordinated with the area’s State and local officials, but also with PRA’s origin-and-destination and sampling surveys of the metropolitan area, which began in 1948.

Developing such a plan was not unusual. With the data collected during the PRA surveys and the work of consultants such as New York's Robert Moses, many cities established boards or commissions to develop an expressway network. Many of those cities hired Harland Bartholomew and Associates as a consultant in the work. In the case of the National Capital Park and Planning Commission, Bartholomew was already on board.

*Washington Present and Future*, which Commission Chairman William W. Wurster transmitted to President Truman on April 3, 1950, found that jobs were too concentrated in the city:

The present pattern of job locations is highly concentrated. In 1947, 84 percent of *all* jobs were inside the District, 9 percent in Virginia, and 7 percent in Maryland. This means that, while practically all those living in the District work there too, most of those living in Maryland and Virginia must travel considerable distances to jobs in the District.

This lack of balance and excessive distances between home and work is a tremendous force for traffic congestion, overloading transit facilities, and requiring great expense for new bridges and superhighways. There should be a definite policy to locate as many as possible of the required new employment places away from the center, and actually to remove most of the existing temporary workplaces. Since the Federal Government itself is the major employer, it holds the key to the solution to this problem.

To the greatest extent possible, "basic employment centers should be distributed throughout the metropolitan area in balance with existing and potential residential areas and transportation facilities." The soundness of the proposed comprehensive highway plan depended on "the new balance of work places." [*Washington Present and Future: A General Summary of the Comprehensive Plan for the National Capital and Its Environs*, Monograph No. 1, National Capital Park and Planning Commission, April 1950, page 10]

Bartholomew believed, as did MacDonald and Fairbank, in using the new freeways to direct metropolitan growth patterns. The solution he devised to serve the Washington area's shifting population involved a network of radials and circumferentials:

A major aim of the comprehensive plan is moving 2 million people, their supplies and other goods, wherever they need to go—quickly, safely, and economically . . . . There are three attacks on the problem, which must all be used at once. Most basic: Cut down on the amount of travel needed, by getting home and work closer together. This is one of the major purposes of the comprehensive plan, to be attained by spreading Federal employment centers throughout the metropolitan region. Second, and cheapest, but possibly only as the third step is undertaken: Make public transportation so quick and convenient that more people will use it to go to work and fewer will drive. Third, most costly, but also necessary in spite of what can be done through the first and second: Create a system of collector and distributor roads, both radial and circumferential in function, that will redistribute traffic through the region and diminish the volume demand within the central area. This will entail cutting through modern highways, widening certain old ones, building some new bridges, and providing new parking facilities. [*Washington Present and Future*, page 27]

The thoroughfare portion of the plan called for “an integrated network of radial and circumferential routes designed to function in combination and to serve all major movements of traffic—now and in the future.” The thoroughfares must be carefully designed:

These new and improved main highways must be modern—at least divided highways, and preferably freeways for all types of traffic, or parkways for passenger cars only and in certain cases express busses [sic, here and throughout the report], with no cross traffic, no driveways or parking, no traffic lights, and only a few designated points of access.

The thoroughfare plan was based on concepts of desirable future land use, and the location of government facilities and employment centers:

They must be laid out in line with land use plans—serving residential areas, but not smashing through home neighborhoods. For maximum traffic capacity and safety, they must be built to high standards of curves, grades, and pavement width. Main routes in the metropolitan area, inside the District and outside, must be coordinated into a single network of arteries, for trucks as well as passenger cars and busses. [*Washington Present and Future*, page 27]

The goal was an “integrated network of radial and circumferential routes designed to function in combination and to serve all major movements of traffic—now and in the future.” The plan recognized the role of circumferentials “that will arise in the future when employment is more widely distributed and when a larger city is spread over a far greater land area.” The plan described the circumferentials:

There would be three complete circumferential routes in the plan. The first of these would be located about 1 mile from the White House; its most important function would be to carry traffic around and through the central area, relieving this congested section of unnecessary volumes. The second would be between 3 and 5 miles from the White House, following the route of Fort Drive through much of its length. The third, an outer bypass route, would follow new alignment; it would be between 6 and 10 miles from the White House. [*Washington Present and Future*, page 29]

The Fort Drive concept can be traced to the early 20<sup>th</sup> century, but after World War I it was seen as a key part of a plan to convert Civil War forts into parks linked by a ring road just inside the city boundaries. In the 1920s, the National Capital Park and Planning Commission asked Congress for funds for construction of Fort Drive as a “single and unified project,” but funding never materialized. Gutheim and Lee explained that the idea “never captured the imagination of Congress”:

By 1926 the land required for the drive lay too close to the built-up city, so that the cost of this land would be much inflated over possible parkland farther out. Additional inertia in realizing the Fort Drive dream may be attributed to the circular drive’s being unique to Washington and not an element of City Beautiful prescriptions. In the next forty years

. . . planning issues related to the city's fort system gradually shifted away from circulation to open space and recreational uses extending through residential neighborhoods.

Congress provided funds for some fort revitalization, but Fort Drive was still on the drawing board at the time of the 1950 plan and survived in planners' thinking into the 1960s without being constructed. "Yet, however reinterpreted, even as a circumferential highway, Fort Drive failed to win sufficient support to be realized." [*Worthy of a Nation*, page 205]

Linking the circumferentials would be a network of radial routes including expressways, express highways, express parkways, and "dominant thoroughfares," defined as, "Wide major streets or highways with divided directional roadways and with grades separated at major intersections when volumes warrant such treatment." The report identified many of the radial routes:

Important among these would be: The Northwest Freeway and George Washington Memorial Parkway to the northwest, the Northern Freeway to the north, the Baltimore-Washington Parkway to the northeast, the Annapolis Freeway and Suitland Parkway to the east, the Indian Head Highway and Mount Vernon Memorial Highway to the south, Shirley Memorial Highway to the southwest, and Lee Boulevard to the west. These routes would not just give direct access to the central area but, by means of the ring routes, provide for distribution to outer and inner residential areas and dispersed employment centers.

A map showed the existing, planned, and proposed express highways and parkways, including the proposed inner loop around the central area and an outer circumferential. Radials included:

- Annapolis Freeway – Parallels U.S. 50.
- Suitland Parkway – an existing parkway linking Bolling Field in Washington and Andrews Field in Maryland. An expressway extension would carry travelers to U.S. 301 in the vicinity of Upper Marlboro, Maryland.
- Baltimore-Washington Parkway – a planned parkway to Fort Meade; Maryland would provide an expressway extension into Baltimore as the city's link to the new Friendship International Airport. The map shows the parkway extending into the District along the New York Avenue corridor.
- Columbia Freeway – north of the Prince George's/Montgomery County line, this route appears to be the equivalent of today's I-95 between Washington and Baltimore. It begins at the outer circumferential.
- Northern Freeway – The freeway begins at the circumferential a short distance west of the Columbia Freeway, just beyond the northern tip of Washington. The map does not show the northern destination, but the next significant city on a straight line to the north would be Harrisburg, Pennsylvania.
- Northwest Freeway – Joins the outer circumferential near the Potomac River beyond the city limits in Montgomery County. It would circle around to U.S. 240 and follow that road to Frederick, Maryland. Construction on U.S. 240 was underway, having begun in the Frederick area while decisions were made on connections in the Washington area. As the *Star* pointed out, this roundabout route was selected because a direct route via reconstructed U.S. 240 "would have gone through the Landon school property and many

estates in which much money had been invested.” Landon School is a private school on 75 acres in Bethesda, Maryland. [Kennedy, George, “Frederick Superhighway Goes Nowhere and Most Motorists Don’t Know It Exists,” *The Evening Star*, November 14, 1951]

- George Washington Memorial Parkway – The parkway was planned for both sides of the Potomac River. On the Maryland side, the parkway connected with the District’s inner loop.
- Virginia’s circumferential was unclear on the thoroughfare map, but it appears to loosely follow the current alignment.
- Lee Boulevard – From a small inner loop surrounding Arlington National Cemetery and Fort Myer across the Potomac River from the District, this boulevard carried the U.S. 50 designation at the time (since shifted to Arlington Boulevard). In today’s configuration, it would be the equivalent of I-66 between Washington and the Shenandoah Valley.
- Shirley Memorial Highway – Built to serve the new Pentagon, this route (today’s I-95/I-395) continued north of the Arlington Cemetery loop to connect with the inner loop in the District.
- Mount Vernon Memorial Highway – This route extended from the Arlington National Cemetery loop along the Potomac River to connect with U.S. 1 south of Mount Vernon (in the vicinity of I-95 on today’s map). It was eventually incorporated into the George Washington Memorial Parkway.
- Fort Foote Parkway – This parkway would carry traffic on the eastern side of the Potomac River between Fort Drive and Fort Foote, built in 1862-1863 during the Civil War in Maryland along the river south of the city. The parkway linked with Indian Head Highway.
- Indian Head Highway – This existing highway, Maryland Route 224 at the time (now Maryland Route 210), connected with Suitland Parkway. The road ends at Indian Head, Maryland, on the Potomac River near Indian Head Naval Surface Warfare Center. This appears to be an extension of Fort Drive.

Within the city, radial routes would carry traffic between the Fort Drive circumferential and the inner loop:

- Potomac and Arizona Drive Expressways to connect with K Street.
- Massachusetts Avenue would be a dominant thoroughfare.
- Rock Creek and Potomac Parkway would be extended to Connecticut Avenue at about Quebec Street and to 16<sup>th</sup> Street at Colorado Avenue.
- 13<sup>th</sup> Street would be a dominant thoroughfare serving residential areas between Rock Creek Park and Soldiers’ Home.
- North Capitol Street would be extended north on the east side of Soldiers’ Home and Park Place would be extended on the west side.
- Rhode Island Avenue would be developed as a dominant thoroughfare.
- K Street would be connected with the New York Avenue extension to meet the Baltimore-Washington Parkway and the Annapolis Freeway.
- Constitution Avenue and Independence Avenue would become expressways east of the Capitol to connect with the parkway to Baltimore.

- Massachusetts Avenue would be a dominant thoroughfare extended through the grounds of Gallinger Hospital (District of Columbia General Hospital) and a new bridge over the Anacostia River.
- South Capitol Street would connect with the Third Street side of the inner loop and with Suitland Parkway. On the Anacostia side, the road would be an expressway link to Indian Head Highway. [*Washington Present and Future*, pages 27-31; *Moving People and Goods: A Portion of the Comprehensive Plan for the National Capital and Its Environs*, Monograph No. 5, National Capital Park and Planning Commission, March 1951, page 24]

The Comprehensive Plan recognized that expressways and other improved roads cannot solve the congestion problem by themselves. The city required places for vehicles to park at the end of a trip:

A few expressways cannot solve the problem, nor can a system limited to radial routes or circumferential routes. The individual will make many trips involving many combinations of types and kinds of routes.

To keep the streets open for moving traffic and to assure cars a place to stop at the end of the trip, more offstreet parking must be created. New zoning regulations should see to it, in areas where such regulations are equitable, that all new buildings, whether apartments, stores, or offices, provide their own parking. The Federal Government should do as much as is practical to take the lead. Every new Federal building should have parking space for its own employees and official visitors, varying with the type of activity and location.

The change was vital to congestion relief because the streets could not be freed of parked vehicles unless off-street parking was provided. [*Washington Present and Future*, pages 31-32]

Public transportation at the time consisted of streetcars and buses, but the report pointed out that their passengers “suffer most from traffic congestion” since both types of vehicles depended on the same roads as automobiles:

If more people used public transit, there would be fewer private cars using the streets and therefore less congestion. Transit itself would become quicker and more comfortable, and the public would not be required to spend so heavily for new street and bridge improvements to handle such volumes of automobiles. The problem is to persuade people, by transit improvements, to reverse or at least check the trend away from transit riding toward use of private autos.

A subway or elevated rail line would offer the “quickest mass transportation” because they would not be dependent on surface streets, but such facilities did not seem feasible in the Washington area “because sound operation demands much heavier mass riding to support subways than present and future population densities would produce.” The plan’s short section on public transit concluded:

Bus traffic would benefit from a well-planned thoroughfare system. Freeways and parkways would make possible express bus service to suburban areas almost as fast as rail rapid transit. Within the central area, however, bus operation is sure to be slowed down by auto traffic. The Commission nevertheless recommends gradual replacement of streetcars with busses. It urges study of traffic rules, to speed up bus movements downtown—perhaps setting aside certain lanes for busses only, or even prohibiting private cars and delivery trucks entirely on certain streets in the rush hours. Since a bus carries about 30 times as many people as an auto, it is fair and reasonable to delay as many as 30 autos in order to speed up each bus. The goal is to move people, not vehicles. [*Washington Present and Future*, page 32]

A monograph released on March 21, 1951, as a supplement to the report elaborated on the transit question. *Moving People and Goods* explained that:

To effectively compete with the private automobile the transit system must offer fast service. This will be possible through the general amelioration of traffic conditions that will come about through the street improvements heretofore proposed and through use of the expressways and express parkways. A system of rush hour limited-stop “express” service should be established on these routes. In some cases all-day express service might be justified.

The need for fast service did not mean rail rapid transit:

Neither the existing nor the probable future population pattern contains sufficiently high population densities over a large enough area to warrant the extremely high cost involved in the development of a rapid transit system.

Streetcars were “the backbone of the transit system here,” but were likely to disappear in coming decades. “Any transit plan should provide for substitution of busses for streetcars.” [*Moving People and Goods*, pages 25-26]

The plan had only a limited impact, in part because of changes in the commission. Wurster, who was chairman for only about a year, returned to the University of California. The new chairman would be Bartholomew, who was, as Gutheim and Lee noted, “a long-time Truman associate” in Missouri:

Harland Bartholomew . . . began immediately to show that association with the commission and the city since 1920 did not prevent him from reaching independent judgments. Bartholomew’s most immediate past service to the commission was in directing the development of the 1950 Comprehensive Plan, and this, too, he was willing to jettison in tune with the times.

The city was evolving beyond its status as a Federal city:

The federal government also represented a diminishing share of the total employment in the area because a large private sector had developed separate from, if not independent of the federal establishment. [*Worthy of a Nation*, page 243]

The National Capital Planning Act of 1952, approved July 19, 1952, resulted in additional changes. It reorganized the commission and changed its name to the National Capital Planning Commission (NCPC), dropping the park component. It became a Federal Agency receiving funds through congressional appropriations acts. Given the importance of highway development, BPR was designated an *ex officio* member.

The new commission was responsible for the “appropriate and orderly development and redevelopment of the National Capital and the conservation of the important natural and historical features thereof.” It was to “correlate the efforts among the various agencies” and prepare a comprehensive plan, including a new regional thoroughfare plan. When agencies proposed new development or construction, they were to consult with the commission on how it would affect the Comprehensive Plan. The commission could then “take action in accordance with its legal responsibilities and authority.”

The 1952 Act also established the National Capital Regional Planning Council as the central planning agency for the Federal Government in the capital region. Each jurisdiction in the area appointed a member of the council, but NCPC provided technical and clerical staff. The legislation charged the council to periodically adopt “a general plan for the development of the region, to serve as a general framework or guide of development within which each part of the region may be more precisely planned by the appropriate planning agency or agencies.” The general plan was to include a land-use plan for regional development, other elements “to provide for the proposed major movements of people and goods throughout the region,” and the development and conservation of natural resources.

Bartholomew, after becoming NCPC chairman, recommended that NCPC and the National Capital Regional Planning Council, on which he also served, conduct a transportation study to supplement the 1950 plan, but Congress did not provide the funds until 1955. The Second Supplemental Appropriations Act of 1955 provided \$200,000 for the two agencies to “jointly conduct a survey of the present and future mass transportation needs of the National Capital region . . . and to report their findings and recommendations to the President.”

## **Part 1**

### **Revolt of the Agencies**

Although a citizen revolt against freeways would occur in the 1960s and 1970s, the 1950s saw several revolts among government officials and the affluent during the formative years of the freeway network. Officials understood the importance and especially the permanence of the freeways and bridges they were debating, leading to long battles that are largely forgotten today.

In the 1950s, one of those battles was over the need for another central area bridge across the Potomac River linking the District and Virginia. At the time, traffic crossed the Potomac River on Chain Bridge, Francis Scott Key Bridge, Arlington Memorial Bridge, and the 14<sup>th</sup> Street Bridge. The origin of the 14<sup>th</sup> Street Bridge was discussed earlier, but a brief history of the other crossings may be useful because they would be part of the debates of coming years.

### **Central Area Bridge**

**Chain Bridge** carried traffic across the Potomac River at Little Falls, a cataract in Washington. As early as 1738, cross-river traffic, initially by ferry, was important for commercial development in the area. The Georgetown Bridge Company opened a toll bridge in 1797; it lasted only 7 years before the rotted wooden superstructure fell from its stone abutments. A second wooden bridge was destroyed by fire after only a few months in operation. The company built a third bridge that opened in 1810. It was a suspension span supported by chains, giving it the name that structures at the site have retained even though they lack the support chains. In the 1870s, the U.S. Army Corps of Engineers replaced the chain-supported bridge with a bridge of seven iron trusses.

After a March 1936 flood partially submerged the bridge, the crossing was out of service until the opening of a steel-girder bridge that the District of Columbia, not the Federal Government or private interests, built. The three-lane bridge, with pedestrian walkways on both sides, opened on June 17, 1938, connecting with Canal Road in Washington and providing access to Arlington and Fairfax Counties, Virginia. “It will stand as a monument,” District Commissioner Hazen said, “to those who fought so long and so hard for a modern new structure.” [Emery, Fred A., “Washington’s Historic Bridges,” *Records of The Columbia Historical Society of Washington, D.C.*, Volume 39, 1938, pages 54-55; Horne, Robert C., “Bridges Across the Potomac,” *Records of The Columbia Historical Society of Washington, D.C.*, Volumes 53-56, 1959, pages 249-251; “Dedication Opens New Chain Bridge,” *The Evening Star*, June 18, 1938]

The **Francis Scott Key Bridge** was built to replace the Aqueduct Bridge. Construction of the Aqueduct Bridge began in 1833 to carry road traffic on its lanes and Chesapeake and Ohio Canal boats on a flume. By the 20<sup>th</sup> century, the bridge was deteriorating. On May 20, 1916, President Woodrow Wilson signed legislation authorizing a replacement bridge. It was named after Francis Scott Key who lived in Georgetown at 3518 M Street during the time he wrote the words to “The Star Spangled Banner” (1808 to 1828). The U.S. Army Corps of Engineers built the bridge, which opened on January 17, 1923, at a cost of \$2,500,000, including the approaches. In the 1992 *Weekend* feature on the bridges of Washington by Alan Bisbort, *The Washington Post* called Key Bridge “a crown jewel—with its aesthetics, convenience and user-friendliness.”

Motorists southbound on the George Washington Memorial Parkway are rewarded “with a view of the bridge that, no matter how familiar, is still capable of taking one’s breath away.” [Emery, pages 55-57; Bisbort, Alan, “The Draw of Bridges,” Weekend, *The Washington Post*, April 10, 1992, page 9]

**Arlington Memorial Bridge** spans the Potomac River to connect the Lincoln Memorial grounds with Arlington National Cemetery. Long before the Lincoln Memorial was planned, legislation approved on May 24, 1886, authorized the Secretary of War to study the feasibility of a bridge “from a point at or near the foot of New York Avenue or New Hampshire Avenue, on the public grounds, across the Potomac River and Anolostan Island [Roosevelt Island] to a point on the United States National Cemetery grounds at Arlington . . . .” Debate about the location and height of what was initially called the “Lincoln-Grant Memorial Bridge” delayed construction.

After authorizing the Lincoln Memorial in 1911 (opened in 1922), Congress approved the Public Buildings Act in 1913 that appropriated funds for a commission to investigate how to link Arlington National Cemetery to the tribute to the 16<sup>th</sup> President. (As noted earlier, the Public Buildings Act also provided funds for the Rock Creek and Potomac Parkway, approved by President Taft on March 4, 1913.)

On December 18, 1922, the commission met with President Warren G. Harding, who approved the plan. He had become a strong supporter of the need for a new bridge on November 11, 1921, while on his way to Arlington National Cemetery for the dedication of the Tomb of the Unknown Soldier. His automobile became trapped in what the Associated Press called “the worst traffic jam the National Capital has seen in many years.” The traffic jam, apparently started when a small touring car ran out of gas on the Highway Bridge, kept thousands from reaching the ceremony. The *Star* described how President Harding made it to the cemetery:

The President’s car left the White House on schedule . . . . When the machine, preceded by secret service men and policemen mounted on motor cycles [sic], reached the outskirts of the jam, it left the road three times and cut across the grass [of Potomac Park], reaching points ahead where the road was comparatively clear.

At times the secret service men in the car got out and walked ahead, clearing space for the White House car [getting it across the Highway Bridge]. When the presidential party reached the [Agriculture Department’s] Arlington experiment station the car was driven off the roadway and through the lanes which cut through the farm.

The *Post* added that the President’s crossing of the bridge was possible “only by the assistance of a flying squadron of special policemen.” [“Auto Causes Huge Tangle In Traffic,” *The Evening Star*, November 11, 1921; Associated Press, “Traffic Jam Blocks Roads to Arlington,” *The Washington Post*, November 12, 1921]

The bridge, which was designed by the influential architectural firm of McKim, Mead, and White, was built low to reduce impacts on the view of the Lincoln Memorial.

Officials arranged the opening of the Arlington Memorial Bridge in 1932 to coincide with the opening of the Mount Vernon Memorial Highway, even though neither was completed. In 1928, President Coolidge approved legislation authorizing construction of the highway as part of the celebration in 1932 of the 200<sup>th</sup> anniversary of the birth of George Washington. BPR designed and built the 15-mile road as a parkway from Washington's home at Mount Vernon to Arlington Memorial Bridge, then under construction.

While work on the highway was underway, the Capper-Cramton Act of May 29, 1930, to be discussed later, authorized funds for construction of the George Washington Memorial Parkway on the Maryland and Virginia sides of the Potomac River. BPR would administer design and construction contracts for the parkway, which would be owned and operated by NPS. Mount Vernon Memorial Highway was incorporated into the parkway.

On January 16, 1932, a motorcycle escort of U.S. Park Police and a caravan of 12 automobiles carrying President Hoover, his wife, and others, left the White House at about 3 p.m. for the short trip to Arlington Memorial Bridge. The *Star* captured the moment:

Arriving at the bascule draw span, which was drawn apart, the party left the automobiles. A battery of cameramen took countless photographs of the party and then, to the tune of shrieking sirens that are part of the bascule draw span equipment, the two great leaves of the mid-bridge were lowered. President Hoover and his party walked at a rapid rate for the rest of the length of the bridge, almost to Columbia Island.

With the eye of an experienced engineer, the President surveyed the bridge project over which he had been many times before, and noted the spacious boulevard that keeps company with the Potomac River for many miles, until it terminates at the old home of George Washington. Two engineers of note accompanied the Chief Executive and Mrs. Hoover—Lieut. Col. U.S. Grant, 3d, executive officer of the Arlington Memorial Bridge Commission, and Thomas H. MacDonald, chief of the Bureau of Public Roads of the Department of Agriculture, under whose jurisdiction the highway has been built.

The presidential party then took to their automobiles again, after glancing at the quartet of giant eagles that sit atop the great pylons looking down upon the future Great Circle that is planned for Columbia Island. The file of automobiles then turned to the left and moved on to the Mount Vernon Memorial Highway on the island, passing then under the highway and railroad bridges and on down to Alexandria in a thin cloud of dust.

Once the caravan reached the straight stretches of the highway, the party traveled at speeds of 30 to 35 miles an hour on the sunlit day:

At Mount Vernon President Hoover and his fellow commissioners posed again for photographs, with the historic estate in the background. The party glanced at the parking spaces that will accommodate numerous automobiles and saw the landscaping plans for the terminus of the magnificent highway.

The party returned to the White House at around 5 p.m. “The President and Mrs. Hoover appeared well pleased with their riverside ride and with the bridge and the boulevard development. They conversed with Col. Grant and Mr. MacDonald about various features of the two projects.”

Neither the bridge nor the highway had lighting. Officials had not agreed on “the final design of illumination, in keeping with the dignity of the project.” The Commission of Fine Arts would determine the design for the bridge. In the meantime, the bridge and highway were open only during daylight hours on weekends.

Bisbort, in the *Post*, commented:

Considered by many Washington’s most beautiful bridge, its structure is relatively simple: eight neoclassical arches. The monumentality derives from all the extras, including eight-foot-bas-relief eagles atop 35-foot pylons, eight-foot bison (by Paul C. Jennewein), a pair of gold figures (by Leo Friedlander) and the elegant white stone (North Carolina granite). One curious note: It has a draw span, a rarely used 216-foot marvel of American engineering that was designed by Joseph B. Strauss, who later engineered the Golden Gate Bridge. [Emery, pages 57-58; Horne, pages 255-257; Bisbort, page 8]

(NPS opened the Mount Vernon Memorial Highway to daylight traffic late in March 1932, and to 24-hour traffic on May 3, after lighting had been installed. [Report of the Chief of the Bureau of Public Roads, September 1, 1932, page 35])

### **The E Street Bridge Controversy**

In the late 1940s and 1950s, the city’s top priority for another Potomac River crossing was a span at E Street over Theodore Roosevelt Island. The island had been remodeled in the 1930s as a tribute to former President Roosevelt and was and remains under the jurisdiction of the NPS.

(The island had first been named Anacostine Island in 1682. In 1792, John Mason inherited what became known as Mason’s Island. The Mason family owned the island until 1833. In 1790, the island was included in the Federal capital, part of Washington County. (The District of Columbia was divided into three autonomous governments: Washington City, Georgetown, and the County. Under the Constitution, Congress was the overseer of the three governments.) By that time, the island also was called Analostan Island. The island went through several hands, before the Washington Gas Light Company acquired it in 1913. The company allowed vegetation to grow wild.

(The Theodore Roosevelt Memorial Association acquired the island in 1931 with the goal of erecting a monument to the former President. Congress, in 1932, passed legislation authorizing the statue, but did not appropriate funds for it until 1960. In 1935, the Civilian Conservation Corps began clearing what they found was an “almost impenetrable jungle.” [Curry, Mary E., “Theodore Roosevelt Island: A Broken Link to Early Washington, D.C. History,” *Records of the Columbia Historical Society 1971-1972*, The University Press of Virginia, 1973, pages 14-18,

also page 396, footnote 6, for three-part city in William M. Maury's "Alexander R. Shepherd and the Board of Public Works," same collection])

Like Commissioner Hazen before them, District commissioners in the 1950s favored a bridge from the District to Alexandria at Shepherds Landing or Jones Point as well as a crossing to Arlington at Nebraska Avenue extended.

(Jones Point is at the southern tip of the District of Columbia and the location of the first of 40 boundary stones identifying the original location. At the request of President George Washington, Andrew Ellicott and Benjamin Baneker, a free black with knowledge of mathematics and astronomy, surveyed the boundary, 10 miles on a side, placing stones at one-mile intervals. According to a history of the boundary stones:

In order to include then existing Alexandria and Georgetown, Jones Point was chosen as the starting point. On April 15, 1791, with proper Masonic toasts and ceremony, the South Stone was set in place. Subsequently the Jones Point Lighthouse was built and the stone was encased in a seawall but forty years later this condition was corrected and the stone exposed. [Nye, Edwin Darby, "Revisiting Washington's Forty Boundary Stones, 1972," *Records of the Columbia Historical Society 1971-1972*, pages 740-741])

In August 1952, the *Star* described the top priority:

The E Street Bridge would connect E street and New Hampshire avenue N.W., and the Rock Creek and Potomac Parkway, on the district side of the river, with the George Washington Memorial Parkway, Arlington boulevard, Wilson boulevard and U.S. Route 1, on the Virginia side.

The bridge, along with the Francis Scott Key Bridge and the Arlington Memorial Bridge, would carry 82 percent of traffic across the river; that traffic "cannot be diverted to outlying bridges." A six-lane E Street Bridge "would provide the greatest convenience for users and the most useful peak-hour capacity," carrying 48,500 vehicles per day. The proposed bridge would have a 63-foot clearance for vessels and "would pass over Roosevelt Island at a height of 40 feet." The city estimated that the bridge, itself, would cost \$9.1 million and take a little over 3 years to build, but with expenditures for right-of-way, approaches, and other needs, the total cost would be \$22.3 million.

The Shepherds Point Bridge was a high priority as well. It would serve as part of a bypass for traffic that did not need to go through Washington as through traffic had to do at the time. It would "draw almost entirely from the Highway Bridge [on Shirley Highway], relieving it of 15,206 vehicles on an average a day." The bridge would carry four lanes of traffic, with a swing span in the middle about 50 feet above water. That height would allow most vessels to pass under the bridge without an opening. The bridge would cost about \$8 million, but with approaches and other needed work, the total cost would be \$21.4 million. Construction would take a little over 4 years.

The lowest priority was a bridge that would connect an extension of Nebraska Avenue “with a planned network of highways on the Virginia side”:

Two additional connections on the District side also would be needed. These are the extension of the Whitehaven parkway, from MacArthur boulevard to Massachusetts avenue, and a connection between Canal road and Nebraska avenue. The bridge would make available a west side by-pass, connecting U.S. Route 240 on the District side with U.S. Routes 29, 211 and 50 on the Virginia side.

The District commissioners anticipated a four-span steel arch bridge, with four traffic lanes, that would cost \$5 million. The extensions, approaches, and related work would increase the cost to \$8.5 million. The reason for the low priority: “The bridge would do little to relieve the peak-hour traffic in the central section.” (This bridge would not be built.). [“How Three Proposed Bridges Would Serve Area Traffic,” *The Evening Star*, August 28, 1952]

In August 1952, the District commissioners and NCPC released competing consultant reports on the subject. The District’s report, prepared by the consulting firm of Modjeski and Masters, called for immediate construction of the E Street Bridge to relieve congestion.

NCPC’s report, prepared by Harland Bartholomew and Associates, rejected the E Street Bridge:

The additional traffic load which would be imposed upon the street system in the vicinity of its approaches in the District, as well as in Virginia, would aggravate an already critical situation during the peak traffic periods . . . .

Washington rapidly is approaching a crisis. Congestion in the central area of the city is becoming critical at many points, and the situation grows worse daily.

A decision soon must be made whether to attempt further saturation of the central area by introduction of endless numbers of vehicles or whether to accept, implement and carry out a basic, integrated transportation plan. The location of future bridges across the Potomac River is a fundamental part of such a plan.

NCPC opposed construction of any more bridges that would lead traffic into the center of the city. The *Star* explained that NCPC “recommended immediate work on the long-range highway plan for the District, which contemplates express highways around the perimeter of the central business and government section of the city.” NCPC also favored “a good public transportation system, which would move people rather than vehicles”:

This perimeter or ring route highway system would involve construction of the other two bridges—the Alexandria crossing and the Nebraska Avenue bridge, the report said.

General Bernard L. Robinson, the District’s Engineer Commissioner, said the District would have to decide how to proceed and work it out with NCPC before asking Congress for the funds. [Hendley, Jr., Coit, “Reports Clash on Location of 3 New Bridges,” *The Evening Star*, August 28, 1952]

A Truman appointee, Robinson had succeeded General Young on June 1, 1951. At the time of his appointment, then-Colonel Robinson had been division engineer for the South Atlantic Division of the U.S. Army Corps of Engineers, with extensive experience in flood control and river and harbor improvements. [“Col. Robinson Takes Oath as New D.C. Commissioner,” *The Evening Star*, June 1, 1951] With President-elect Eisenhower preparing for his inauguration, General Robinson left office on December 31, 1952, giving way to General Louis W. Prentiss, who took office on January 2, 1953. General Prentiss had been Assistant Chief of Engineers on the staff of the Chief Engineer, General Lewis A. Pick.

NPS Director Conrad L. Wirth opposed the bridge crossing of Theodore Roosevelt Island, as did the Theodore Roosevelt Memorial Association. The association had deeded the island to the Federal Government in 1932, specifying in the deed that the Federal Government must not do anything inconsistent with park use and development of a wildlife refuge.

Wirth had come to Washington in May 1938 as a landscape architect with the National Capital Park and Planning Commission. He transferred to NPS in 1931 and became its director on December 31, 1951. As Director, he automatically was a member of the National Capital Park and Planning Commission. Wirth’s last day as NPS director was January 9, 1964, but President Lyndon B. Johnson appointed him to be a citizen member of NCPC. During the 1950s, he lived on Leland Street in Chevy Chase, Maryland. During the 1960s, he lived on East Bexhil Drive in Kensington, Maryland, a suburb that began in 1894 at the intersection of the Rockville-to-Bladensburg Road and the Baltimore and Ohio Railroad. Extended Connecticut Avenue cuts through the Montgomery County town. [Wirth, Conrad L., *Parks, Politics, and the People*, University of Oklahoma Press, 1980, pages 15, 35, 285, 350-351]

Wirth asked Interior Department Solicitor Clarence A. Davis for legal guidance on the requirements related to the title transferred from the Theodore Roosevelt Memorial Association. On August 7, 1953, Davis released his opinion. He agreed with District Corporation Counsel Vernon E. West that Congress, and only Congress, could authorize construction of the bridge:

There can be no doubt that a bridge across the island would be a use inconsistent with the purpose of the donation and dedication of the Roosevelt Memorial Association . . . . By the clear terms of the dedication and of the congressional act of acceptance, the Memorial Association retains an interest in the island for the taking of which the United States would be obligated to make just compensation. [“Congress Can Authorize Span, Interior Rules,” *The Evening Star*, August 8, 1953]

On September 24, 1953, NCPC formally considered an alternative prepared by staff planner Charles Conrad and NCPC Executive Secretary Blair Lee III. They proposed construction of two Potomac River bridges that they claimed could be built jointly and at less cost than the E Street Bridge: (1) a six-lane Southwest Bridge leaving Virginia downriver from the 14<sup>th</sup> Street railroad bridge and crossing the Potomac River and Washington Channel on a line with 10<sup>th</sup> Street, SW., to tie in with the Southwest Freeway planned for the F Street corridor; and (2) a four-lane bridge upriver of the Key Bridge linking the District’s Arizona Avenue with Virginia’s Spout Run.

The Southwest Bridge would emerge as the primary alternative to the E Street Bridge. Conrad explained that it could be built at low cost because it would involve federally owned land in Virginia and would tie in with street plans developed for the revitalized southwest. By linking with Shirley Highway, U.S. 1, and Arlington Boulevard, the bridge would provide a good alternative for Virginia commuters. He also contended that with a six-lane bridge in the corridor, District officials would not need to follow through on their plan to replace the 14<sup>th</sup> Street trestle-topped bridge, known as the Highway Bridge, carrying three lanes of one-way Virginia-bound traffic; a companion bridge opened in May 1950 carried traffic in the other direction. (The Shirley Memorial Highway had been built during World War II as part of the Pentagon Road Network and named for Henry G. Shirley, the head of the Virginia Department of Highways since 1922 who died during construction of the network.)

As for the E Street Bridge, Lee pointed out that there was strong opposition to crossing Theodore Roosevelt Island. Further, the structure would interfere with big apartment projects on both sides of the river, and District streets would be overwhelmed by the traffic.

Engineer Commissioner Prentiss disagreed with the cost comparison. He contended that the two-bridge plan would cost about \$4 million more than the E Street Bridge. According to S. R. Harrison, District highway engineer, the Southwest Bridge would not provide enough capacity to substitute for the 50-year old one-way trestle bridge. Further, the new bridge capacity would funnel more traffic through streets in a concentrated area that could not handle the vehicles. [Beveridge, George, "2-Bridge Plan Called Cheaper by NCPC Aides," *The Evening Star*, September 25, 1953]

Lee elaborated on the proposal in the *Star* a few days later. He cited the NPS' and Roosevelt association's objections to the E Street Bridge proposal based on how it would impact Theodore Roosevelt Island, but NCPC opposed the bridge for different reasons. "Indeed, if the island were suddenly to cast off its moorings and float down to the Chesapeake Bay, there is every reason to believe that the commission would not change its view." He cited the different road networks on either side of the Potomac River. Arlington Boulevard, he said, "looks like the New Jersey Turnpike compared to the District approaches" via D and E Streets and "poor old New Hampshire avenue." The city planned "to depress and grade-separate D and E streets as far east as Twentieth street":

The chaos will start wherever they come to the surface, whether it be Virginia avenue, Twentieth street, Seventeenth street, Fourteenth street or Pennsylvania avenue. The pressure of this new flow of east-west traffic on the very limited number of east-west passages between the White House and the Mall can't help causing trouble. The bridge will simply move the bottleneck several blocks east—into the heart of the city.

New Hampshire Avenue, in its lowest reaches, "is about as useless as an avenue can get." Traffic using the planned ramp to Virginia Avenue would face "a total impasse" at Rock Creek and Potomac Parkway. Assuming the traffic "survives that ordeal," it would reach Washington Circle. With priority already given to K Street and 23<sup>rd</sup> Street, a "three-level treatment" would be the only solution:

Finally, New Hampshire avenue gets to Dupont Circle, where the existing tunnel favors Connecticut avenue and the surface channelization favors Massachusetts avenue. Some expressway!

He disagreed with the District consultant's cost estimate because it did not cover all the street work that would be needed. "I do not see how the E street bridge and its approaches can fail to cost the District less than \$30 million."

The E Street Bridge also would "do considerable harm to two proposed real estate developments," namely Arlington Towers Apartments in Virginia and the Potomac Plaza project on land in Foggy Bottom that formerly housed the Gas Works of the Washington Gas Light Company (this is a reference to the future Watergate complex). The Arlington complex would be "caught in a pincers between the bridge's two main approaches—Arlington boulevard and Wilson boulevard." Similarly, the gas company's triangle "would be hemmed in by a solid wall of traffic on all three sides, and the handsome hotel proposed for the southern tip of the triangle."

Lee also stated that the "mood of Congress" was against the E Street Bridge, in part because of the impact on the island. In the Senate, the District committee blocked planning funds for the bridge from the 1954 District budget. Representative Joel T. Broyhill (R-Va.), who had joined the House in 1953 and would play key roles in transportation issues, "appears to have little enthusiasm for the E street proposal," while "one veteran committee aide on the House side predicted recently that there was no chance of congressional approval of the E street bridge over the Roosevelt Island."

As for alternatives, the Jones Point Bridge was much-needed, but was not a substitute for the central area bridge. In the "virtually unanimous view" of NCPC, the best alternatives were "a combination of a 6-lane bridge slightly downstream from the railroad bridge, followed a little later by a 4-lane bridge connecting Arizona avenue and Canal road with Lee highway via Spout Run parkway and also with George Washington parkway along the Virginia side of the river."

Lee added that the bridge downstream from the railroad bridge would blend with the District highway department's plans for the Southwest:

The highway department is about to launch the huge and highly commendable project of building a southwest freeway all the way across the southwest section on the line of F street, including a new bridge across the Washington Channel. The current idea is to tie the west end of this route into the Fourteenth street bridge approaches near the Jefferson Memorial.

Our proposal is to keep the southwest freeway clear of the present Fourteenth street bridges and instead to extend it across the river on a new bridge and tie into the Shirley highway, U.S. 1, Washington boulevard, and Mount Vernon highway between Roaches Run and the Pentagon.

By linking the southwest freeway to Shirley highway, the highway department can produce a continuous, east-flowing expressway extending from Woodbridge at the

Fairfax-Prince William County line [in Virginia] to South Capitol street [in the District] a few blocks from the Capitol Building . . . . The southwest-Shirley location would avail itself of a D.C. approach that is going to be built anyway rather than a lot of extensive construction necessitated entirely because of the bridge, as in the case of E street.

NCPC's proposal would affect neither Arlington Towers Apartments nor the Potomac Plaza project. Lee added that if the proposed bridge and the Arizona Avenue bridges could not be built for less than the E Street Bridge, "I will gladly eat the Modjeski and Masters' report page by page." [Lee III, Blair, "To the Editor of the Star," *The Evening Star*, October 1, 1953]

As a *Star* editorial about the Lee letter put it, "The Potomac River bridge problem is becoming more confusing with the passing of nearly every week." ["Another Bridge Plan," *The Evening Star*, October 1, 1953]

### **The Roaches Run Bridge**

The NCPC proposal for a bridge linked to the Southwest Freeway would often be referred to as the Roaches Run Bridge. In 1937, the American Guide Series volume on the District of Columbia described Roaches Run:

A flat-arched fieldstone underpass carries the [Mt. Vernon] Memorial Highway under the Railroad Bridge, on the south side of which is the lagoon-like Roaches Run Waterfowl Sanctuary. Hundreds of wild ducks use these waters as a feeding ground in winter, and during the summer months there are often flocks of snowy egrets wading near the borders of the sanctuary or roosting in near-by trees. A parking space and picnic area is provided about midway of the lagoon, which is most appealing at sunset, when pastel colors, deepened by their transmission through smoke from passing railroad trains, are reflected in the quiet waters. [*The WPA Guide to Washington: The Federal Writer's Project Guide to 1930s Washington*, Pantheon Books, 1983, pages 449-450]

Representative Broyhill tried to play a "peacemaker role" by appearing in a closed session of NCPC in support of the Jones Point Bridge and the E Street Bridge. He argued that the Jones Point Bridge and a central area bridge were needed and it was senseless to jeopardize them by "squabbling over specific locations." [Beveridge, George, "Broyhill Sees Planners, Asks Truce on Spans," *The Evening Star*, October 29, 1953]

The day after meeting with Representative Broyhill, NCPC asked the District commissioners to study the Roaches Run location. Members of NCPC wanted better cost estimates before endorsing either proposal. Engineer Commissioner Prentiss, a member of NCPC, opposed the request because he thought District highway officials, NCPC, and BPR should be able to agree on cost estimates without a formal study. "I don't see any sense in spending a lot of money, which is hard to get, to hire someone to make a cost estimate because we can't believe each other."

Bartholomew argued that the realistic cost estimates should include the cost of the highway and street improvements on both sides of the river that should, in fairness, be charged to either

project. Prentiss agreed that some of the street changes should be part of the cost estimate but explained that some of the changes would occur regardless of which bridge is built and the cost of such changes should not be added to the cost of the bridge. [Beveridge, George, "Planners Urge Study of Cost of Bridge Below 14<sup>th</sup> St. Span," *The Evening Star*, October 30, 1953]

NCPC's request prompted John R. Searles, director of the District's Redevelopment Land Agency (RLA), charged with rebuilding southwest Washington, to express concern that a Roaches Run Bridge would route too much traffic into the area. The Southwest Freeway was designed to carry all the through traffic currently using residential streets. "I'm no traffic expert, but I doubt if the freeway would be able to handle all the extra traffic that would result from a new Potomac River bridge." ["Roaches Run Bridge Hit in View of Traffic Entering Southwest," *The Evening Star*, November 3, 1953]

In response to NCPC's request, General Prentiss instructed city officials to extend "every means of co-operation to come up with the answers." In addition, a four-member committee was established to conduct the cost inquiry: John Nolen, Jr., Director of NCPC; J. N. Robertson, the District's highway director; Joseph Barnett, Chief of BPR's Urban Roads Branch; and Robert C. Horne, chief engineer of National Capital Parks. ["Experts Study Costs of Roaches Run and E Street Bridges," *The Evening Star*, November 5, 1953]

A month later, General Prentiss informed NCPC that the Roaches Run Bridge would cost between \$33.9 million and \$53.2 million, compared with \$30 million for the E Street Bridge. The *Star* pointed out that:

The wide variance in cost estimates for the Roaches Run bridge depends mostly on what approach road improvements are included as necessary to tie the bridge traffic in with existing highway networks in Virginia and the District . . . .

It is considered likely that the planning commission, at its meeting this week, will challenge the inclusion of Roaches Run improvements that would result in high cost figures. At the same time, it also may balk at the absence of some improvements in figuring the \$30 million E street bridge cost.

The four-member committee had "agreed on cost standards to be followed but did not agree on what approach projects to include." As a result, approach estimates included "improvements extending as far north as Constitution avenue and as far east as Seventeenth street for the Roaches Run Bridge and as far east as Seventeenth street for the E street project." [Beveridge, George, "Roaches Run Bridge Cost Put At \$33.9 to \$53.2 Millions," *The Evening Star*, December 8, 1953]

On December 10, 1953, Governor John S. Battle of Virginia released a report by the consultant firm of Wilbur Smith and Associates proposing a \$107 million highway program for the State's connections with the District. As reported in *The Evening Star*:

The report generally represents a new approach to area traffic problems. It plays havoc impartially with major proposals of the Washington Area Regional Highway Planning Committee, District officials and area planners.

The report addressed the dispute over the location of a central area bridge:

The consultants told a reporter they agree with highway officials that most peak-hour traffic is headed for downtown Washington, which an E street bridge would serve. But they rejected the E street project on grounds that approach roads in that area could not handle increased traffic that would be generated by another bridge there.

Consistent with NCPC's views, the consultant report recommended two bridge locations. One would be down river from the 14<sup>th</sup> Street railroad bridge to tie into the proposed Southwest Freeway in the District. The other would cross at Three Sisters Islands—named after three Native American sisters in alternative legends—upstream from Key Bridge:

On the District side, it would lead into MacArthur boulevard, Canal road, and the proposed Arizona parkway through Glover-Archbold Park. In Virginia, it would follow the George Washington Memorial parkway for half a mile to its junction with Lorcom lane.

As perhaps the report's major feature, the two new bridges would tie directly into two of the three proposed expressways. The downstream, or Hains Point, bridge [Roaches Run], would feed into a proposed Potomac River expressway. This expressway, leaving the bridge, would follow the line of the present Mount Vernon Memorial highway nearly to Alexandria's eastern edge to link with U.S. Route 1 near Gum Springs.

The Three Sisters Bridge would connect with an 8.8-mile-long Falls Church expressway. This road would parallel Lee highway (Route 29-211) as far as Washington boulevard, veer northward around Falls Church and then cut sharply southward to connect with Arlington boulevard (U.S. Route 50) near Gallows road.

The report rejected or downplayed other planned facilities:

Specifically, the report recommended against the Cabin John Bridge . . . . It said the Cabin John span would not attract more than 2,200 cars a day. It said approaches to the Jones Point Bridge "might warrant immediate construction," but did not otherwise endorse the Jones Point Bridge as a high-priority project. [Beveridge, George, "Virginia's New Road Program Clashes With D.C. on Bridges," *The Evening Star*, December 10, 1953]

(Cabin John is a community about 8 miles northwest of Georgetown and six miles southeast of Great Falls. Who "Cabin John" or "Captain John" was is shrouded in mystery. Because of its location near the Potomac River, Cabin John has a long history that includes the Chesapeake and Ohio Canal; its locks are the explanation for Seven Locks Road that runs through the area. When the U.S. Army Corps of Engineers completed the Washington Aqueduct system in 1863, designed by General Montgomery C. Meigs, to provide water from Great Falls to the District of

Columbia, they included a tunnel and Union Arch Bridge to carry the water; farmers used the smooth, flat surface as a road.

(In the 1870s, Congress appropriated funds for a macadam surface on what was called Conduit Road. The Corps wanted the road to transport equipment between Cabin John and Great Falls, but it served east-west farm traffic better than nearby River Road, which was wide enough only for one horse, with little room for opposing traffic. In 1942, Congress passed legislation changing “Conduit Lane” to MacArthur Boulevard, to honor General Douglas MacArthur for his actions in defense of the Philippines at the start of U.S. involvement in World War II. [Welles, Judith, *Cabin John: Legends and Life of an Uncommon Place*, Signature Book Printing, 2008, pages 16-17; Stewart, Alice Fales, *The Palisades of Washington, D.C.*, Images of America, Arcadia Publishing, 2005, page 36])

The following day, NCPC postponed its decision on the location of the central area bridge, citing the Wilbur Smith report as a main reason. Bartholomew told reporters he was prepared to vote, but realized others needed time to review the Virginia report. He urged the members to come to the meeting on January 6, 1954, prepared to vote without further delays. [Beveridge, George, “Planning Commission Delays Bridge Vote Until January 6,” *The Evening Star*, December 11, 1953]

### **Representative Broyhill Intervenes**

Representative Broyhill did not need more study time. In his view, the Wilbur Smith report was “all wet” on several points. It had not assigned a high priority to the Jones Point Bridge that he was trying to push through Congress, while criticizing the E Street Bridge across Roosevelt Island that he also favored. “I’m going to proceed and ask for hearings immediately after Congress convenes.”

He particularly disagreed with the report’s plan to link its proposed bridges to expensive new expressways. “With their plan, the bridge can’t be built without the costly expressway. With ours, existing approach roads are pretty well worked out to tie in with the Jones Point and E street bridges.”

While NCPC members liked the report’s rejection of the E Street Bridge, District and Maryland officials were displeased. General Prentiss, like Representative Broyhill, rejected the need for expensive freeway construction to go along with the District’s proposed E Street Bridge. Chairman Russell H. McCain of the Maryland State Roads Commission also was concerned that the report rejected the Cabin John Bridge because it would affect the location of the western leg of upgraded U.S. 240 (to be discussed later). “Maryland is going to have to study the report. After further study, we’ll have a comment.” [Beveridge, George, “Broyhill Attacks Virginia Plan Bridge Site,” *The Evening Star*, December 11, 1953]

One reason why NCPC delayed its vote until January 6 was that it wanted to know what the Regional Highway Planning Committee would do. Samuel R. Harrison, deputy director of the District Highway Department, headed the group, which included Maryland and Virginia officials as well as representatives of BPR, NCPC, Capital Transit Company, and the Military District of

Washington. The committee had been formed in July 1949 to analyze data, such as origin-and-destination records, collected in preparation for the 1950 Comprehensive Plan. On January 4, the committee voted 6-to-1 in favor of the E Street Bridge and rejected the Roaches Run Bridge. The NCPC representative was the only dissenting vote. (BPR's H. J. Spelman did not vote.) The committee also voted in favor of the Jones Point and Cabin John bridges, both rejected by the Wilbur Smith report. ["Regional Planners Favor E Street Bridge, Reject Roaches Run," *The Evening Star*, January 5, 1954]

Although NCPC members remained divided, the commission voted 6-to-4 on January 6 against the E Street Bridge and in favor of the Roaches Run Bridge:

Thus, the stage was set for another Capitol Hill feud, with the city's roadbuilders and planners attempting to sell Congress on conflicting bridge schemes. In similar battles in the past Congress has given the nod most often to District officials.

Today's vote climaxes nearly two years of bitter argument over the bridge issue.

As Congress convened, Representative Broyhill introduced a bill in support of the E Street Bridge. The bill named it the Theodore Roosevelt Memorial Bridge. He warned NCPC that its opposition could endanger the chances for congressional support of any central area bridge. "Governing bodies in Virginia all favor E street. The planning commission stands alone in my opinion." He added:

If the planning commission opposes E street, I don't think Congress ever will approve the Roaches Run bridge, because there is not enough support for it. The only thing the planning commission can do is to kill the chances for E street. [Beveridge, George, "Planners Reject E St. Span, Back Roaches Run," *The Evening Star*, January 6, 1954]

Representative Broyhill recognized concerns about the effect of the E Street Bridge on Roosevelt Island:

I sincerely regret that some well-intentioned citizens have objected to the E street bridge location because the proposed span would go over Theodore Roosevelt Island. Theodore Roosevelt Island will not be destroyed, nor will the bird sanctuary there be disturbed. I am sure that were the great 'Teddy' alive he would be the last to stand in the way of progress and the great needs of the citizens of our communities. [Beveridge, George, "Bridge Hearings Will Start Soon, Broyhill Says," *The Evening Star*, January 7, 1954]

An editorial in the *Star* criticized NCPC's support of the Roaches Run Bridge. The vote against the E Street Bridge was not surprising, although "those votes were influenced by considerations that have little to do with the facts of traffic needs." The vote in favor of the Roaches Run Bridge was harder to understand:

The Roaches Run site, it is believed, will eventually be discredited—for it has been pulled like a rabbit out of a hat. It has received no serious study from an engineering or traffic point of view. It raises more questions than it answers. While it protects the artificial wilderness of Roosevelt Island . . . it would play hob with East Potomac Park,

Washington Channel and the Mall. Engineering studies will doubtless bring many objections into focus—including cost to local and Virginia taxpayers—that have received little or no attention up to now, because they have not been seriously considered up to now.

If Congress gave Representative Broyhill's bill a fair hearing, the members would be able to "decide between fact and nonsense." If not, his constituents would be the "chief victims" but "it will not be long before the traffic jams at existing bridge crossings will become so intolerable that action will be forced." As for NCPC, the editorial said:

The National Capital Planning Commission—heavily weighted down by non-residents who have no fixed responsibility for meeting local needs—has been proved wrong before and will doubtless be proved wrong again. ["No Way to Bridge the Arguments," *The Evening Star*, January 7, 1954]

One NCPC member who voted in favor of the E Street Bridge explained his reasons in a speech to the Board of Trade's River and Harbor Committee. John A. Remon, a NCPC member and chairman of the Washington Regatta Association, said the Roaches Run Bridge would destroy much of the city's water recreational activities. "The E street bridge is the logical site. It will not interfere with the waterfront or with water recreation." ["Ruin of Boating Seen With Span At Roaches Run," *The Evening Star*, January 9, 1954]

Another factor against the Roaches Run Bridge was its impact on plans for redeveloping Southwest Washington. Remon also was chairman of RLA, which debated the bridge dispute in a closed-door board meeting on January 13, 1954:

Mr. Remon said the reason for getting into the bridge controversy was limited to a fear that a Roaches Run span would further endanger the development of Tenth street S.W. as a major traffic gateway to a rebuilt Southwest area.

Tenth Street was seen as an attractive approach road for the new southwest, but the District Highway Department had long planned a bridge over Washington Channel to connect the 14th Street bridges with the Southwest Freeway in the F Street corridor and 10<sup>th</sup> street. Highway officials rejected the idea that 10<sup>th</sup> Street could serve both purposes. NCPC had supported the plan for the 10<sup>th</sup> Street gateway, but the RLA feared that NCPC's support for the Roaches Run Bridge reflected a change of views on the gateway plans.

Director Searles of the land agency said, "Every developer, investor and planning consultant we've had agrees Tenth street is vital to serve the Southwest. Now it looks like the planning commission has given up on Tenth street." [Beveridge, George, "Redevelopers See Bridge as Threat to Plans," *The Evening Star*, January 14, 1954]

Moreover, the bridge dispute was affecting plans for the Southwest Freeway. General Prentiss said that detailed planning was delayed because the design depended on whether the freeway would tie into the existing 14<sup>th</sup> Street bridge, as District officials wanted, or the proposed Roaches Run Bridge. The decision would affect, among other features, whether the new freeway

would be six or eight lanes wide. The dispute was in addition to uncertainty about whether 10<sup>th</sup> Street would be a gateway to the southwest or serve Virginia traffic. An early end to the bridge dispute was crucial because the Southwest Freeway was the city's next major freeway project. Planning would take a year, with construction expected to last 2 years. [Beveridge, George, "Bridge Quarrel Delays Design For Freeway," *The Evening Star*, January 17, 1954]

On January 29, 1954, Bartholomew, the new NCPC chairman, addressed the Committee of 100 for the Federal City, an organization that had been formed in the 1920s, initially to support development of the city. According to a *Star* account, he "expressed amazement" at the lack of city support for the comprehensive development plan:

Mr. Bartholomew said the contrast between Washington and other cities around the Nation is sharp. He said that elsewhere, once the overall plan for development of a city is adopted, the various city departments follow it.

"If a department doesn't agree, it doesn't hire consultants, publish a separate report and go to the newspapers," he commented . . . .

He said the comprehensive plan for the development of Washington drawn by the planning commission, should be followed in general, if the city is to avoid serious mistakes. "The White House is in danger of becoming the center of the business district," he commented.

He said the downtown business district has a tendency to grow to the west. More should be done to strengthen the east end of the business section and stabilize what business is there, he added.

The Roaches Run Bridge would serve better than the E Street Bridge for two-thirds of government workers east of 16<sup>th</sup> Street and would avoid routing them past the White House. Good planning called for creating "circulation" around the central area instead of directing more traffic toward downtown:

Mr. Bartholomew also advocated a good mass transportation survey to help plan for the increasing problem of traffic. He suggested that expressways be designed now with room for a rapid transit system, saying that is the only way a city can acquire a system now. ["D.C. Adherence To Planning Decisions Urged," *The Evening Star*, January 30, 1954]

The Committee of 100, after a presentation by Nolen, backed the Roaches Run Bridge on February 19. ["Committee of 100 Hears Nolen, Backs Roaches Run Span," *The Evening Star*, February 20, 1954]

### **Congress Confronts The Issue**

At NCPC's request, Representative John P. Saylor (R-Pa.), whose years in the House reflected a strong environmental perspective, introduced a bill directing the District commissioners to build the Roaches Run Bridge. The Saylor bill provided for District and Virginia approaches as well as a central entrance to Washington National Airport, an overpass of the railroad, and an

interchange with U.S. 1. ["New Bill Proposes \$26 Million Bridge At Roaches Run," *The Evening Star*, February 26, 1954]

Representative Saylor explained that he introduced H.R. 8096 mainly "to provide an opportunity for Congress to consider the merits of the Planning Commission's proposal." He was concerned that otherwise, congressional consideration would go to the E Street Bridge, which was the District's preferred option even though it was opposed by NCPC, the Interior Department, and the Theodore Roosevelt Memorial Association:

I am informed that the E Street bridge location proposed by the District Commissioners does violence to all well accepted concepts for the protection and enhancement of the western terminus of our world-famed Mall. It would project a commercial type steel girder bridge across Roosevelt Island and in many other respects be out of harmony with the standards set for that area by the Lincoln Memorial, the Arlington Memorial Bridge, and the flanking parkways along the river.

The Roaches Run site, on the other hand, accords with well considered plans for the National Capital Planning Commission . . . . [NCPC] is composed of key public officials and eminent citizens qualified in city planning matters. Its present chairman, Harland Bartholomew, was appointed by President Eisenhower last August. He is one of the Nation's leading city planners and has been a consultant on the Washington plan for more than 25 years. I believe we should give the Commission's plan full consideration and weigh carefully the broad issues involved in the decision on a new bridge location. ["Roaches Run Bridge Bill, Extension of Remarks of Hon. John P. Saylor," *Congressional Record-House*, March 3, 1954, pages 2614-2615]

On March 1, the House District Committee began hearings on the Broyhill bills in support of the E Street Bridge and the Jones Point Bridge. The first day was devoted to the District's case for the E Street Bridge. General Prentiss explained that the E Street Bridge was the District's highest priority, followed by the bridges at Jones Point and Nebraska Avenue extended. The

E Street Bridge, he said, was designed to relieve morning and evening congestion snarls. He was satisfied that approaches could be designed in the District and Virginia to handle any new traffic the bridge would generate in the corridor. He said the District had considered the tunnel option but concluded it would be impractical because of cost and river front terrain.

General Prentiss emphasized that the District had considered other locations for the central area bridge, but E Street emerged as the "sound solution." Other options included Arizona Avenue,

K Street, H Street, Roaches Run, and extensions of Constitution and New Hampshire Avenues. "I have satisfied myself that none would serve the purpose so well as E street." It would serve commuters, but not without attracting high amounts of through traffic.

District Highway Director Robertson said the 19 lanes of existing Potomac River bridges carry 210,000 cars a day, compared with 190,000 vehicles crossing on the 19 lanes of Anacostia River bridges. Despite this disparity, the District was building a six-lane East Capitol Street bridge to

boost Anacostia River capacity. A new Potomac River bridge was needed. Already, the 14<sup>th</sup> Street bridges carried 105,000 cars daily, which he called the highest concentrated bridge total in the world.

Robertson estimated the cost of the E Street Bridge to be \$32 million and said it would be financed by Federal-aid and District revenue. He estimated Virginia's cost to be about \$2 million for connections. Representative Broyhill indicated he would amend his bill to reflect the higher cost.

Representative James C. Auchincloss (R-NJ) asked Robertson if the District had considered suspending the E Street Bridge over Roosevelt Island instead of building piers on it. Robertson replied that the District had considered but discarded that option because it would increase the cost to \$58 million. As planned, General Prentiss said, the bridge would include three piers resting on the island and would pass about 40 feet over it.

Frank M. Masters of Modjeski and Masters, was one of the other witnesses on the first day. His firm gave the E Street Bridge the top priority among the sites studied, with E Street the most logical site. "Within a couple of years' time, there are going to be long delays in getting across the Potomac River unless additional facilities are provided."

No opposition was expressed to the Jones Point bill, which called for the Federal Government to pay for the new bridge. [Beveridge, George, "E Street Bridge Urged by D.C. at House Hearing," *The Evening Star*, March 1, 1954]

Throughout the discussion of the location of a central area bridge, officials had debated the extent and cost of the approaches to the new bridge. On March 3, the issue erupted during the hearing on the Jones Point Bridge when Virginia Highway Commissioner James Anderson's blunt letters to subcommittee members stated that while Virginia favored the E Street and Jones Point Bridges, there was "no possibility" that the State could pay for the approaches to either structure. His letters, as the *Star* put it, raised the "subcommittee's ire." Several subcommittee members said they would not support either bridge without a Virginia funding commitment, while one "influential member" said he would insist on documentation of Virginia's financial situation before he would support the bridges.

For the E Street Bridge, the District planned to use District and Federal-aid funds to pay for approaches over federally owned park land in Virginia (\$2.8 million), but expected Virginia to pay \$2.2 million for land and approaches on State land.

W. Frank Smith, an urban engineer with the Virginia Highway Department, explained that Virginia spent about \$40 million a year (including about \$10 million a year in Federal-aid) on new highways, but could afford only about \$1 million a year for the area within a 15-mile radius of Washington. That area had about \$35 million in "immediate needs," none of which included the bridge approaches.

When Representative Broyhill pointed out that northern Virginia contributed a much higher percentage of revenue than it was receiving, Smith explained that the department allocated funds

based on a rigid formula of area, population, and mileage established by the State legislature. He would determine if any of the \$1 million could be diverted to approach work. "I wish I could tell you that we could do that, but the other needs in this area are so great I don't know." (The formula Smith mentioned was a longstanding point of frustration for northern Virginia; the State legislature, dominated by rural politicians, took revenue from the heavily populated northern Virginia for road projects in the State's rural counties.)

Representative Broyhill said, "While I'm proud to be a Virginian, I'm not proud of the position of the Virginia Department of Highways this morning." He arranged a meeting with Commissioner Anderson for the following day, a Saturday, in Richmond to try to convince the State to pay for the E Street Bridge approaches.

Witnesses supported the Jones Point Bridge. Chairman Carroll D Kearns (R-Pa.) asked General Prentiss how he could justify full Federal funding for the new structure. General Prentiss replied that the new bridge would be of some value to area residents, but its major benefit would be "to the general riding public" since it was intended to be an area bypass for motorists not bound for local jurisdictions. It would be a "vital link" in the area's planned circumferential for through traffic.

The Broyhill bill authorized \$20 million that would cover construction of a four-lane bridge, approaches through Alexandria to connect with the Shirley Highway in Virginia, and a short approach in Maryland to connect with Overlook Avenue at Chesapeake Street, SE., in the District. The Modjeski and Masters study estimated the Virginia approach would cost \$7 million while the approach in Maryland and the District would cost about \$2.1 million. General Prentiss recommended increasing the authorization by \$4.5 million to allow for a six-lane bridge.

George N. Lewis, Jr., traffic engineer with the Maryland State Roads Commission, explained that Baltimore was planning a harbor tunnel as a bypass for through traffic. "My feeling is that if the Jones Point bridge is not built, Washington will be one of the last cities, from New England on down the coast, not to have a bypass system." He added that if the Federal Government was willing to pay for the bridge, "Maryland will be glad to consider an agreement with Virginia and the District to take over its maintenance and operation." [Beveridge, George, "Broyhill to Attempt to Prod Virginia on Funds for Bridges," *The Evening Star*, March 4, 1954]

On March 6, Representative Broyhill had a 2-hour meeting with Commissioner Anderson and State Senator Fenwick to discuss funding issues. On Monday, March 8, Commissioner Anderson provided what the *Post* called a "guarded statement" to Representative Broyhill and Senator Fenwick on State funds for the two approaches. The commission was willing to develop general approaches to the E Street Bridge but was not willing to seek a special appropriation for the approach to the Jones Point Bridge.

The Virginia Department of Highways, Anderson said, was responsible for maintenance and improvement of the main road affected by the E Street Bridge, namely Arlington Boulevard (U.S. 50). Already, the department had committed millions of dollars for development of Arlington Ridge Road and two overpasses on Glebe Road. However, the Department would be "happy to work with the Arlington County Board in a restudy of priorities and will accord the

utmost consideration to any request by Arlington County and its representatives for a high priority to future work on Arlington Blvd.”

As for the Jones Point Bridge, the commission “did not have and would not have the means to provide reasonably adequate highways” in the Arlington-Fairfax area. The commission had spent twice as much in Fairfax County as in any county in the State, but Anderson quoted from the Wilbur Smith report saying “traffic problems of Northern Virginia are largely the problems created by Washington.”

Representative Broyhill said he was “very pleased” that Anderson agreed about the need for a contribution toward the E Street Bridge. This view, the Congressman said, was a reversal of Anderson’s claim that the commission would not put up a single cent for bridge approaches. “My impression is that the State Highway Department is willing to assume its obligation. Unless the State is willing to do this much, Congress will not be willing to approve either bridge and I would not expect it to.” [McDade, matt, “Va. Bridge Help Hinted by Highway Commission,” *The Washington Post*, March 9, 1954]

Commissioner Anderson, contacted by telephone in his Richmond office, told a reporter that the memorandum was neither a reversal nor a restatement of position, but a clarification. “We went into that hearing not knowing just what the situation was. We now find that most of the money we’ve been spending up there [in Arlington] for years may be considered as providing approaches to the bridge.” As for the Jones Point Bridge, he said the E Street Bridge would be built first. Virginia officials could decide about the approaches to the Jones Point Bridge later. [“Virginia Held Willing to Aid E Street Span,” *The Evening Star*, March 9, 1954]

On March 9, the subcommittee heard from opponents of the E Street Bridge. Joseph C. Grew, a former ambassador to Denmark, Switzerland, Turkey, and Japan, led the opposition as a trustee of the Theodore Roosevelt Memorial Association. He called the E Street Bridge a “direct violation” of the plans for the island and said the proposal was “an effort to persuade Congress to break its word.” The goal in deeding the island to the Federal Government was to provide a public park in a state of wilderness. As planned, a terrace and balustrade would be the only artificial constructions on the island. “It is essentially a place of solitude and repose.”

Representative Broyhill told Grew that the planned “Theodore Roosevelt Memorial Bridge would be a much greater memorial than the wild island that looks like the very devil right now.” During his drive to Richmond over the weekend, he had questioned 81 people, only one of whom had even heard of Roosevelt Island, while 66 had heard of the George Washington Bridge in New York City.

Grew replied that the Federal Government had failed to live up to its agreement in accepting the deed but that the Eisenhower Administration was prepared to provide the funds needed to prepare the island for its dedication on October 27, 1958, the centennial of Theodore Roosevelt’s birth. He argued that bridge standards appropriate in any other city were not appropriate in this case; the “aesthetic must be considered in Washington because it is so material in Washington.”

Secretary of the Interior Orme Lewis told the subcommittee that the bridge would detract from the entire monument area near the Lincoln Memorial. The massive high-level bridge would divert attention from the area’s carefully planned memorial and park features. At one point, he

had suggested construction of a tunnel but it was ruled out because of cost. “I don’t think Washington, D.C., is a place where money is so doggoned important.”

Bartholomew called the E Street Bridge a “grievous and costly mistake.” It was, he said, in “an illogical and fundamentally unsound location” that would create acute new traffic congestion and disrupt property values by shifting the retail business district. Part of the congestion problem was that Arlington National Cemetery forced traffic around it to points away from the area to be served by the E Street Bridge. The Key and 14<sup>th</sup> Street bridges were at their “logical locations.” The E Street Bridge would serve north Arlington, while growth was expected to occur near Alexandria and Fairfax County. In the District, much of the bridge traffic would be headed east of the White House, making it a “center of traffic congestion.” The high cost “cannot be justified.”

Since it was “never pleasant to appear against public improvement,” NCPC had offered the Roaches Run Bridge as an alternative. The funds for the E Street Bridge could better be spent for the Inner Loop road that also would tie into the Roaches Run Bridge.

Mrs. Alice Roosevelt Longworth, President Theodore Roosevelt’s daughter, sent a letter to the subcommittee rejecting any bridge over the island and naming the proposed bridge in her father’s memory. [Beveridge, George, “Opponents Call E Street Plan ‘Ruinous.’” *The Evening Star*, March 9, 1954; Beveridge, George, “Planners Push New Attack on E Street Bridge,” *The Evening Star*, March 10, 1954]

On March 10, Representative Howard W. Smith (D-Va.) testified before the subcommittee in opposition to the E Street Bridge. Representative Smith, a member of the District Committee but not the subcommittee, had represented Alexandria and Arlington and Fairfax Counties until redistricting in 1950; Representative Broyhill’s district included those areas now, while Representative Smith’s district covered 20 counties to the south. (Representative Smith would become chairman of the powerful Rules Committee in 1955 and serve in that capacity through 1989.)

He had long favored an Alexandria bridge, “which becomes more essential every day.” However, he had opposed the E Street Bridge “since its inception.” It would “channel more traffic into an already congested area” of Washington. Further, he considered the deed transfer a firm contract that nothing could be done on the island without the Theodore Roosevelt Memorial Association’s consent. “Unless you get the consent of the association, it is a complete waste of time and motion to submit such a proposition to Congress.” Proceeding without the association’s consent would be “an unmoral act which in my opinion Congress would not consider for three seconds.”

Representative Smith also addressed the issue of Virginia funding for approaches. The State always had done its share. “I can say confidently that when the chips are down Virginia is going to do its share, but they have to have something definite to work on.” [Beveridge, George, “E Street Bridge Called Waste of Time,” *The Evening Star*, March 10, 1954]

In view of the bitter opposition to the original proposal, General Prentiss surprised the subcommittee by sending a proposal on March 11 for a combination bridge-tunnel across the Potomac River at E Street. The *Star* described the plan:

The bridge would start from the District side of the Potomac like any other low-level bridge [about the height of the nearby Arlington Memorial Bridge]. As it approached the controversial Roosevelt Island, it would decline to land level and pass under the island surface through tubes. On the Virginia side of the island it would rise again and continue to the shore as a conventional bridge.

The tunnel would be built by “open-cut construction,” then covered over so that the island would appear unchanged. The District contended that the revised plan would cost about \$3 million more than the E Street Bridge.

General Prentiss explained, “We want to put everything possible before the subcommittee and that is why we sent this plan up today.” The original high-level bridge was less costly than a tunnel and “sounder from an engineering point of view,” but the bridge-tunnel idea “has certain advantages.” The obvious one was that it answered objections about the impact on Roosevelt Island, the Lincoln Memorial, and surrounding area.

Chairman Kearns said he was “definitely undecided” about the E Street and Jones Point Bridge proposals, but said, “I resent the idea we have been wasting our time in these hearings on the E street bridge,” as suggested by Representative Smith. The chairman announced he would postpone hearings until everyone had a chance to review the District’s bridge-tunnel proposal.

Representative Broyhill thought the new concept might “overcome some objections” to the original proposal. However, he preferred the original high-level bridge “from a standpoint of beauty and practicability.”

He also had made some progress in his weekend meeting with Commissioner Anderson, who was at least no longer totally opposed to participating in the cost of the approaches to the E Street Bridge. His original bill for the Jones Point Bridge had assigned the cost of the approaches to the Federal Government:

The Virginia legislator said today he has decided to amend the bill to cut about \$6 million from the cost and have the Virginia approach routes extend through Alexandria only as far as Route 1. He said this would open the way for a firm understanding that the connection from there to Shirley highway would be a clear-cut responsibility of the Virginia Highway Department.

The highway department, in a follow-up letter, has taken the position that the bridge approaches need go only as far as Route 1 immediately, and added: “As traffic develops over the years and as additional funds become available, the southern approach could be, and undoubtedly would be, extended from Route 1 to the Shirley highway.” [Beveridge, George, “Bridge-Tunnel Now Proposed At E Street Site,” *The Evening Star*, March 11, 1954]

At the time, about half the island was below the high-water flood mark, with about 17 percent under water at high tide. Further review of the tunnel concept revealed that it would require about 35 percent of the island to be raised by 35 feet. The added cost would mostly be for a draw-span in the low-level bridge. [Beveridge, George, "Bridge-Tunnel Would Require Raising of Island," *The Evening Star*, March 12, 1954]

The *Star's* Metropolitan Scene columnist, John W. Thompson, Jr., wrote, "It's a good bet that you saw the death of the E street bridge at the Capitol the other day." He attributed the death to Representative Smith. He was a powerful member of the District Committee and the influential Rules Committee, which determined which bills reached the House floor. Technical issues aside, his view that the Congress would not consider a bill that violates the agreement with the association "is very apt to be correct." His opposition to the E Street Bridge might also mean the demise of any central area bridge. "For it remains to be seen whether supporters of a crossing at Roaches Run . . . can muster the strength to get it through." If the District commissioners continue to oppose the Roaches Run Bridge, "it is hardly likely that Congress will approve it." [Thompson, Jr., John W., "The E Street Bridge Looks Dead," Metropolitan Scene, *The Evening Star*, March 14, 1954]

### **The Bridge Dispute Nosedives**

With a hearing on the Roaches Run Bridge scheduled for March 30, the Northern Virginia Regional Planning Commission voted to support the Roaches Run Bridge after a presentation by Executive Director C. C. Robinson:

He said the Roaches Run span, downstream from the present Highway (Fourteenth street) Bridge, could be tied in with Mount Vernon boulevard, U.S. 1, Glebe road and Shirley highway. By connecting with the proposed Four Mile Run parkway, the bridge route into Virginia would lead also to Columbia pike, Arlington boulevard and Lee highway.

The commission, in 1952, had voted to support the Jones Point and Nebraska Avenue bridges, but had refrained from endorsing the E Street Bridge.

Arlington, represented on the commission by county board member Alvin K. Kimel, preferred the E Street Bridge. However, as Kimel explained, the E Street Bridge was looking like a losing proposition. The Roaches Run Bridge was his second choice. ["Northern Virginia Planners Indorse Roaches Run Span," *The Evening Star*, March 25, 1954]

On March 30, the Kearns subcommittee heard from NCPC and other supporters of the Roaches Run Bridge. Bartholomew explained that the Roaches Run Bridge idea grew out of NCPC's desire to find an alternative to the E Street Bridge. In Virginia, the greatest growth was expected to be south of Arlington Boulevard, an area that would be better served by the Roaches Run Bridge:

On the District side, he argued that—unlike the E street bridge—it would funnel traffic east of the White House in areas with the highest land values, business properties that

need strengthening, most parking facilities and the highest volume of Federal employment in permanent buildings.

By tying into the limited access Southwest Freeway in the F Street corridor, he said, the bridge would allow traffic to use several north-south streets to enter the road system.

Bartholomew said the Southwest Freeway was part of an important inner belt that was essential immediately. The Roaches Run Bridge would feed directly into it, as well as into the Four-Mile Run belt.

Representative Broyhill questioned Bartholomew's statement that the E Street Bridge would provide fewer major benefits for people living south of Arlington Boulevard. Asked by Representative Broyhill to choose between the Roaches Run and Jones Point Bridges, Bartholomew said they served different purposes and that "if a person has a bad cold and an upset stomach he has to take two different types of medicine." NCPC had not made a choice, and he was reluctant to offer his own view, but said that "from an actual relief of congestion standpoint the Roaches Run bridge would probably do more than any other we could build at the present time." Congress would have to decide the priorities for these two bridges as well as others that NCPC supported (Jones Point and Cabin John spans for the outer beltway, Roaches Run and a bridge upriver from Key Bridge tying into the inner belt).

Nolen, NCPC's director, testified that the Roaches Run Bridge and its approaches would cost \$26.3 million or about \$6 million below the estimated cost of the E Street Bridge and approaches:

Mr. Nolen said this takes advantage of plans already in preparation for the Washington channel bridge, a Potomac Yards overpass and eventual construction of a Four-Mile Run expressway, which does not now exist.

Other witnesses who testified in favor of the Roaches Run Bridge included Robinson; General Grant, now president of the American Planning and Civic Association; and Edward J. Kelly, National Capital Parks superintendent, on behalf of the NPS. [Beveridge, George, "D.C. Planners Stress Savings in Roaches Run Bridge Site," *The Evening Star*, March 30, 1954]

The second day of hearings featured mainly critics of the Roaches Run Bridge. Engineer Commissioner Prentiss led the opposition, saying "it simply will not work." Critics argued that the bridge would bring more traffic just east of 14<sup>th</sup> Street than the north-south streets in the area could handle:

Contending that studies show 80 per cent of the cars crossing the river have destinations north of Constitution avenue, they argued there is no practical means of getting increased traffic beyond Constitution and Pennsylvania avenues.

In addition—sometimes in biting language—they criticized the planners' cost estimates as too low and attacked proposed Virginia approach routes as impractical.

General Prentiss recognized that Congress might not approve his preferred E Street Bridge. In that event, he said, he outlined a nine-point second-best option:

1. Immediate authorization of the Jones Point Bridge,
2. Increased authorization, from \$7 million to \$11 million, for early construction of a south-bound four-lane 14<sup>th</sup> Street bridge to replace the three-lane trestle structure,
3. Replace the streetcar tracks and sidewalks on Key Bridge with additional traffic lanes,
4. Construct an off-ramp from the Whitehurst Freeway to the Rock Creek and Potomac Parkway,
5. Construct an underpass at Washington Circle in the K Street line,
6. Improve roadways around the Lincoln Memorial for better connections with Arlington Memorial Bridge,
7. Extend 15<sup>th</sup> Street, NW., through the Washington Monument grounds to provide better service to the 14<sup>th</sup> Street bridges,
8. Determine how to improve the traffic bottleneck at Independence Avenue and 17<sup>th</sup> Street, NW., and
9. Swift construction of the Southwest Freeway simultaneously with the Washington Channel bridge connecting the freeway with the 14<sup>th</sup> Street bridges and Ohio Drive.

(Ohio Drive dates to the early 20<sup>th</sup> century. The Road Drivers and Riders' Association, formed by horse lovers in 1903, wanted a roadway "where drivers may speed their horses," as the *Star* explained. The association called it the Speedway, although it was sometimes called the Centennial Speedway. ["The Proposed Speedway," *The Evening Star*, October 5, 1903] The Speedway opened in West Potomac Park on May 11, 1904, with thousands of spectators observing the festivities. It extended from the Tidal Basin to 26<sup>th</sup> Street, SW. It would be reconstructed and extended through East Potomac Park as Riverside Drive. In 1949, as will be discussed, Ohio's congressional delegation succeeded in renaming the road Ohio Drive.)

All these projects were in the District's proposed 10-year public works plan, but should be bumped up in priority if Congress did not approve the E Street Bridge. Asked by Representative Auchincloss if all these projects would cost as much as \$100 million, General Prentiss replied, "No, sir, far less than that."

Representative Saylor, testifying on behalf of his Roaches Run Bridge bill, said the testimony reminded him of "a group of children who have presented their case to their parents and have had the parents, in their wisdom, turn them down." The parents, in this analogy, were the members of NCPC who had rejected all of the District's arguments. NCPC, he reminded the subcommittee, had been established to resolve such disputes.

John E. Harwood, representing the Virginia highway agency, read Commissioner Anderson's letter saying his department had agreed to cooperate within its means by building approaches for the E Street or Jones Point bridges:

Mr. Anderson's letter said a "very hurried study" by the planning commission indicated that the Roaches Run approach cost could be "many times the approaches needed for an E

street bridge.” Then Mr. Anderson said he doubted that Arlington officials would approve of spending State funds it gets for such a bridge.

The District’s engineering and planning chief, G. I. Sawyer, disputed NCPC’s cost estimate of \$26 million for the Roaches Run Bridge:

He said that it would cost \$33.2 million to do what the planners proposed, exclusive of land costs in Virginia. But he contended it would cost either \$46.6 million or \$50.6 million to carry out either of two plans needed to make the bridge “a partly workable highway facility.”

The Roaches Run Bridge, according to District Highway Director Robertson, could “never be made to function to its full capacity.” To get the increased traffic north of Constitution Avenue would require a tunnel from south of the avenue to north of G Street. The District hadn’t done a detailed estimate of what the tunnel would cost but “it would be plenty.”

Clifton G. Stonebruner, Arlington County’s highway engineer, opposed the Roaches Run Bridge. The county favored the E Street Bridge, but in view of concerns about its effect on Roosevelt Island, Stonebruner suggested shifted the bridge to pass over a small triangle of land downriver from it.

H. J. Spelman testified on behalf of BPR in opposition to the Roaches Run Bridge:

In a lengthy statement, he attacked the proposal on grounds that: The Virginia approaches were not capable of sufficient traffic capacity; District streets could not handle the new load; the bridge would “bring an obstruction” close to the main runway of Washington National Airport; it would be unwise “from a civilian defense standpoint” to add another bridge to the Fourteenth street concentration; the Potomac River approach road would conflict with Federal land use plans near the airport.

Mr. Spelman said nearly one bridge lane’s traffic capacity (between 800 and 1,000 cars per hour) can be added to the existing Washington-bound Fourteenth street bridge if the District carries out plans to connect the bridge to a Washington Channel span leading to the proposed Southwest freeway.

Another full lane’s capacity can be added when a new four-lane bridge is built to replace the trestle-topped, three-lane Virginia-bound Fourteenth street bridge, he declared.

In closing the 2-day hearing, Representative Kearns announced that he did not expect to call the District subcommittee into executive session to decide the central area bridge dispute until the end of April. [Beveridge, George, “Prentiss Offers Alternate Plan In Dispute Over Bridges,” *The Evening Star*, March 31, 1954; Beveridge, George, “House Unit Study of Bridges Not Expected Until Late April,” *The Evening Star*, April 1, 1954]

On April 3, NCPC chose second-best options if Congress decided against the Roaches Run Bridge. In that event, it favored immediate construction of the Jones Point Bridge, immediate

replacement of the trestle-topped 14<sup>th</sup> Street bridge, and the nine-point plan that General Prentiss had outlined.

During the meeting, Bartholomew and General Prentiss stressed that neither was conceding defeat or giving in to the other. Instead, they were simply acknowledging the possibility that Congress would not approve either central area bridge. NCPC added several conditions to the nine-point plan. It wanted the District to ensure that the bridge over the Washington Channel did not preclude construction of the Roaches Run Bridge and that the six-lane Southwest Freeway be designed to allow for expansion to eight lanes.

*Star* reporter George Beveridge explained that “the fact that the two groups are united on even a second-choice plan puts them closer together on a single bridge proposal than they have been for years.” [Beveridge, George, “Jones Pt. Span Agreed To as Second Choice,” *The Evening Star*, April 3, 1954]

On April 20, Bartholomew and General Prentiss met to discuss their different estimates of the cost of the Roaches Run Bridge. They did not intend to agree on the cost, but only to identify the reasons for the differences so they could let the subcommittee know what they were. In a joint cover letter to Chairman Kearns, they said the main reason for the difference was that NCPC compiled its estimate on a net basis while the District used gross cost figures:

On the one hand, the planning commission reasons that credit should be allowed for construction that would take place, regardless of the bridge and which had already been included in the District’s highway improvement program or contemplated as a Federal or Virginia project.

On the other hand, the District contends that the legislative authorization for the bridge should include the cost of all construction required to permit it to function, even though a large part of this construction may be needed whether or not the bridge is constructed.

General Prentiss told reporters that he and Bartholomew had not tried to reconcile their differences on which bridge would serve the area better. “We simply explained our differences on cost estimates and set them out on paper.” [“Officials Agree On Variance In Bridge Costs,” *The Evening Star*, April 21, 1954]

In late May, the District submitted its budget for FY 1955 to the House Appropriations Committee. The city requested \$2,794,000, to be matched equally by Federal-aid highway funds, to build the Southwest Freeway from South Capitol Street to 4<sup>th</sup> Street. According to J. N. Robertson, construction could begin about 8 months after the District begins detailed plans for the freeway. However, several factors were delaying the detailed plans, including whether Congress would approve the Roaches Run Bridge; if so, the freeway would include eight lanes instead of six.

The dispute on the role of 10<sup>th</sup> Street, SW., was another cause of delay. District highway officials wanted 10<sup>th</sup> Street to carry large volumes of north-south traffic, but developers planning the new southwest, represented by the New York consulting firm of Webb and Knapp, wanted

10<sup>th</sup> Street to be a mall-like entrance to the redeveloped southwest waterfront. [Beveridge, George, "Budget Asks \$2,794,000 Freeway Fund," *The Evening Star*, May 23, 1954]

Chairman Kearns, who had postponed a decision on the central area bridge dispute, decided on May 26 to poll subcommittee members on the issue by mail when a quorum did not appear for a meeting. As Beveridge put it, chances for the E Street Bridge and the Roaches Run Bridge "nosedived when the two proposals became bitterly deadlocked" between NCPC and District officials.

The subcommittee's focus was clearly on the Jones Point Bridge. Representative Broyhill had prepared his amendment authorizing Federal construction of the bridge on condition that Maryland, Virginia, and the District pay for the approach roads. He told reporters the total cost of the project was \$24.3 million, divided among the Federal Government (\$14.8 million), Virginia (\$7.3 million), Maryland (\$885,000), and the District (\$1.2 million).

Representative Broyhill was optimistic about the Jones Point Bridge, but he and Representative Kearns agreed that the timing for a central area bridge was uncertain. Representative Kearns said, "In the future, I think the city might go to a tunnel beneath the river. If the cost of that is prohibitive we will probably have to resort to a toll system because another central area bridge is needed." [Beveridge, George, "Kearns to Poll House Unit on Bridge Needs," *The Evening Star*, May 26, 1954]

The subcommittee members informed Representative Kearns of their views on the central area bridge in time for a June 3 meeting. The members agreed on Representative Broyhill's revised Jones Point Bridge bill. Under the Broyhill bill, the District would build the bridge after receiving commitments from Maryland and Virginia regarding the approach roads. The four committee members present for the meeting supported to bill, while Representative Kearns had proxy letters from the other members favoring it. He hoped the District Committee would complete the bill in time for consideration on the House floor in June.

The results of Representative Kearns's poll of members on the central area bridge were not reported, but must have been inconclusive, unlike the poll on the Jones Point Bridge. He decided to leave the issue open until the next session of Congress. Referring to the agencies disputing the location of the central area bridge, he said, "One thing this has proved to me is that these people are going to have to get together before they bring their proposal up here for us to consider." [Beveridge, George, "House Unit Approves Bridge Across Potomac at Jones Point," *The Evening Star*, June 3, 1954]

On June 11, the House Committee on the District of Columbia unanimously approved the Jones Point Bridge bill. The full House approved the bill on June 14, sending it to the Senate. It passed without debate on a voice vote, one of 13 District bills the House approved in a 14-minute period. [Proposed Potomac River Bridge at Jones Point, VA., *Congressional Record-House*, June 14, 1954, pages 8176-8178; Warren, Don S., "House Adopts Bill for Bridge At Jones Point," *The Evening Star*, June 14, 1954]

## Southwest on The Drawing Board

In some ways, the southwest redevelopment plan was a model of the urban theories described in *Toll Roads and Free Roads* and *Interregional Highways*. In this case, as Gutheim and Lee described, the District of Columbia Redevelopment Act of 1945 set the stage:

The National Capital Park and Planning Commission was authorized to designate redevelopment areas and boundaries and to prepare and adopt plans in accordance with the existing comprehensive plan . . . . The five-member Redevelopment Land Agency was created and empowered with the unique public authority to acquire property designated for redevelopment. The land would then be prepared for transfer to public and private developers. To attract private developers, on whose participation the program depended, the cost of the land could be reduced by as much as two-thirds of the original price. [Gutheim and Lee, page 262]

The commission selected the southwest, the smallest of the District's quadrants, to be the first area redeveloped:

According to the 1950 Comprehensive Plan, much of the small southwest quadrant and large areas in the northwest and southeast quadrants possessed high concentrations of "obsolete dwellings," overcrowding, and other potential threats to public health. When these separate conditions were overlapped, however, the Southwest emerged as the principal first target for renewal. [Gutheim and Lee, page 267]

Contemporary accounts of the process invariably described the existing southwest as filled with "slums," but the area provided neighborhoods for thousands of low-income residents, including many African-Americans:

Of all the post-World War II redevelopment projects in Washington, the southwest quadrant was the most dramatic. It involved the clearing of four hundred acres and the forced removal of 23,500 people, of whom 76 percent was black residents. The redevelopment process exacted a huge human toll, mainly on the large number of people displaced because no replacement housing was provided. Many blocks of potentially historic buildings were leveled. The effects of the southwest redevelopment reverberated for years afterward in citizens' attitudes toward planning, local governance, and neighborhood conservation. [Gutheim and Lee, page 259]

The RLA asked Washington architect Louis Justement and architect-planner Chloethiel Woodard Smith to prepare a radical redevelopment plan for the area:

Reminiscent of Daniel Burnham's legendary advice to "make no little plans," the Justement-Smith plan aimed at a "whole process of rebuilding the city in a purposeful and accelerated fashion" . . . .

The new residential areas planned in the redeveloped section of Washington were to be attractive enough to bring back the suburbanites who had fled the city. As the planners pointed out, the process of dispersal coupled with the inability of the historic ten-mile

square District to annex suburban territory (and thus maintain a large affluent tax base) made the specter of the bankrupt city very real.

The broad and original concepts outlined by the Justement-Smith plan included a new entrance or “front door” esplanade to the Southwest, along 10<sup>th</sup> Street, passing over the railroad tracks and the planned expressway. The entrance was planned to link the formerly isolated quadrant with the cultural facilities along the Mall, most notably the original Smithsonian Building. “The view down Tenth Street to the channel, uninterrupted by buildings, over-passing the highway, bordered by parks on the east and a wide planted park set back along the west, would provide an inviting entrance leading to main east-west access avenues to residential areas and to the attractive drive leading to Fort McNair.” The functional success of this new artery depended on its connection with Maine Avenue, which paralleled the Washington Channel. [Gutheim and Lee, page 268]

The residential area was to include “groups of buildings, high-rise apartments and town houses like those in Georgetown, with front and back yards” as well as neighborhood stores and public buildings to create a “richly varied and human urban area.” The report also considered the impact of the freeway:

Intended to cut across this newly molded quadrant was an expressway designed to connect the 14<sup>th</sup> Street Bridge with South Capitol Street. In relation to the proposed 1950 Comprehensive Plan’s Inner Loop, the freeway would serve as the first stage of this central thoroughfare. The freeway would not only carry through traffic above the “central congested part of the city,” but it would also give residents in the Southwest access to the rest of the city. Rather than cutting through the quadrant as tentatively outlined in the 1950 Comprehensive Plan, the freeway suggested by the Justement-Smith plan should bound and define the residential area to be developed. When the artery was later built, it became that boundary (and barrier) and separated the new federal buildings complex south of Independence Avenue from the residential area. [Gutheim and Lee, pages 268-269]

The Justement-Smith vision was filtered through other ideas and geographic realities, resulting in compromise:

The 1952 compromise report approved large areas for clearance but recommended replacement by low-rise buildings that would follow in form and location the old row-house configurations. This compromise report by design avoided the “extremes of idealism—such as the complete wiping out of this area and of its replacement by a forest of multi-story apartments, and, on the other hand . . . the extreme of expediency, such as replacement or face-lifting of the existing development” . . . . The compromise report agreed to the desirability of the 10<sup>th</sup> Street Mall or esplanade but expressed reservations about the interchange between the terminus of the new mall and Maine Avenue. Based on this report, a final redevelopment plan was proposed. [Gutheim and Lee, pages 270-271]

Having agreed on general concepts, the RLA selected a firm to carry out the plan:

The flamboyant New York City real estate developer William Zeckendorf, representing the firm of Webb and Knapp and recruiting the design and technical guidance of architects I. M. Pei and Harry Weese, took charge of the vast project. The detailed plan was developed between 1954 and 1959 and was based on the general plan approved in 1952. The detailed plan was largely a response to the spirit of the Justement-Smith plan. Zeckendorf envisaged the new Southwest as a showcase of unusual architectural beauty.

The detailed plan included 10<sup>th</sup> Street as a gateway:

Zeckendorf's Southwest was to be entered via a 10<sup>th</sup> Street Mall and was to be inhabited by four thousand families of varying incomes. There was to be a modern town center, as well as enlarged waterfront restaurants, marine activities, and a cultural complex.

Zeckendorf's 10<sup>th</sup> Street Mall took inspiration from the vision of the Justement-Smith plan. The mall or esplanade in the Zeckendorf plan was described as a "wide and impressive span, flanked by stately government buildings." Contrary to its earlier proposed function as an entrance linked directly with the waterfront along Maine Avenue, this mall would end "in a circular overlook providing motorists or pedestrians a grand view of the waterfront and residential Southwest Washington." [Gutheim and Lee, pages 271-272]

Zeckendorf met with President Eisenhower on July 8, 1954, to discuss issues associated with redevelopment of southwest Washington. The meeting lasted 40 minutes. The developer told reporters he briefed the President on the proposal and its potential, leaving behind a schematic drawing of the plan. He would not discuss details of the discussion but did say the President's reaction "was far from unfavorable."

He apparently also talked with President Eisenhower about the Auchincloss bill, introduced in the Committee on Public Works, that would allow for construction of Federal office buildings in the redeveloped area to replace temporary buildings built during World War II on the Mall. The *Star* drew this conclusion because Zeckendorf "held a copy of it in his hand as he left the White House."

In addition, according to Webb and Knapp counsel Harold Riegelman, Zeckendorf talked with President Eisenhower about the "effects of various bridge proposals" on the plans. Riegelman did not elaborate, but the *Star* speculated that this was a reference to the Roaches Run Bridge that "would pour an inordinate amount of traffic into the Southwest area." Zeckendorf's firm also was concerned about plans to use 10<sup>th</sup> Street, SW., as a major traffic artery connecting with the 14<sup>th</sup> Street bridges. "The New Yorkers want to use Tenth street as a tree-lined mall to serve as a grand entrance to the rebuilt waterfront area." The *Star* pointed out that a traffic consultant hired by the New York firm was planning to meet with Highway Director Robertson to try to resolve the issue. ["President Sees Zeckendorf on Slum Project," *The Evening Star*, July 8, 1954]

## Constitution Avenue Bridge

Senator Francis H. Case (R-SD) decided to try to resolve the dispute among the agencies on the central area bridge. He had been a newspaper editor before his election to the House of Representatives in 1936. He had won election to the Senate in 1950. At the time of the central area bridge dispute, he was chairman of the Senate District Committee. In Washington, Senator and Mrs. Case lived in the Brandywine Apartments, built in 1953-1954, on Connecticut Avenue between Albemarle and Brandywine Streets, NW., in the Forest Hills neighborhood.

On June 16, 1954, he proposed a compromise to end the bitter dispute. Meeting with Bartholomew and General Prentiss, he suggested construction of a bridge in a direct line from extended New Hampshire Avenue, NW., that would miss Theodore Roosevelt Island while serving the same traffic. It would pass downriver from the island, crossing a small, partially submerged island known as South Island and tie in with Arlington Boulevard and Jefferson Davis Highway in Virginia.

His idea, similar to one proposed by Stonebrunner during the House hearings, would address concerns about the effect on Roosevelt Island while a parking area and footbridges included in the plan would make the island more accessible. The low-level bridge (15 feet above South Island) also would answer complaints that the high-level E Street Bridge would affect views of Roosevelt Island and the Lincoln Memorial. Senator Case also thought it would be less costly than the E Street Bridge while using New Hampshire and other north-south streets to better advantage.

General Prentiss and Bartholomew agreed to study the proposal. [Beveridge, George, "Case Proposes A Compromise Site for Bridge," *The Evening Star*, June 16, 1954]

Senator Case's efforts to resolve the central area bridge dispute achieved success on July 28, 1954, during a breakfast meeting at the Cosmos Club. General Prentiss, Bartholomew, and NPS's Wirth agreed to a low-level bridge downriver from Roosevelt Island tying into 24<sup>th</sup> Street, NW. The original Case plan to cross South Island proved doubtful when the Theodore Roosevelt Memorial Association opposed it because the little slip of land was subject to the terms of acquisition of the larger island. The *Star* explained:

The new Twenty-fourth street bridge agreed upon today would miss South Island completely, presumably taking it outside any jurisdiction controlled by the island association.

As the *Star* added, the Cosmos Club meeting resulted in agreement on other issues:

1. Construction of a second bridge from Roaches Run, Va., to tie into Twelfth street N.W., in lieu of District plans to rebuild the old trestle-topped Fourteenth street bridge at its present location. Presumably—as part of the Fourteenth street bridge complex—the new Roaches Run bridge would carry Virginia-bound Potomac traffic and the existing new Fourteenth street bridge would continue to handle city-bound traffic.

2. Reconstruction of Twenty-fourth street N.W. as a “full expressway” from the new downtown bridge connection as far north as R street N.W. The plan, Senator Case indicated, is to have the rebuilt street serve as the western leg of the city’s proposed “inner belt road system.” The location previously has been in conflict.
3. Construction of a tunnel beneath the Mall west of Lincoln Memorial through which Twenty-fourth street would connect with the new downtown bridge. This would obviate a maze of above-ground construction on the Mall—highly objectionable to park officials.

Senator Case planned to amend his Jones Point Bridge bill, which included his New Hampshire Avenue bridge plan, to reflect instead the 24<sup>th</sup> Street plan:

Senator Case said he hoped the agreement reached today would mark the start of a settlement of major problems which have held up area development. [“Case Reports Agreement on 24<sup>th</sup> St. Span,” *The Evening Star*, July 28, 1954]

On July 28, NCPC formally endorsed the compromise plan, noting that the long dispute about the central area bridge stemmed from NCPC’s conviction that new Potomac River bridges should tie into the Inner Loop. NCPC referred to “substantial agreement” on the immediate need for the Jones Point Bridge, a new Highway Bridge from Roaches Run to 12<sup>th</sup> Street, SW., the upriver bridge linked to 24<sup>th</sup> Street, and early construction of the 24<sup>th</sup> Street and Ohio Drive freeways to serve as legs of the Inner Loop. NCPC also referred to a “future needs” program that included another bridge between Key and Chain Bridges and a third bridge near 14<sup>th</sup> Street “when additional traffic volume warrants it.”

The Roaches Run Bridge, the *Star* explained, “would serve as a replacement for the 50-year-old trestle-topped Fourteenth street bridge, which is to be demolished.” The article continued:

Highway officials had planned earlier to rebuild the old bridge in its present location. District officials plan to use the new Highway Bridge for one-way Washington-bound traffic, and reverse the one-way traffic flow on the Fourteenth street bridge built in 1950. The latter bridge now handles Washington-bound cars.

General Prentiss told NCPC that the District did not have a timetable for the projects. “What we have here is a plan. The next step is to set up a work program within the Highway Department—a definite schedule of projects within the ability of the District of Columbia to pay for them.” The 24<sup>th</sup> Street bridge project was the first priority, assuming Congress approved it. The District would use \$400,000 in the current budget to begin work on the bridge. [“Bridge Accord Paves Way for Other Major Highway Projects,” *The Evening Star*, July 29, 1954]

On July 29, Senator Case’s District Committee approved a bill authorizing the compromise central area bridge and the Jones Point Bridge. The bill referred to the 24<sup>th</sup> Street bridge as being in the vicinity of Constitution Avenue; it would subsequently be referred to as the Constitution Avenue Bridge. The bridge was to connect with 24<sup>th</sup> Street, the reconstructed north-south expressway, and Constitution Avenue. The bill authorized \$24.5 million for the project.

It was to be located “north of the Memorial Bridge and south of the southern portion of Theodore Roosevelt Island sometimes referred to as ‘Small Island’ . . . .” As part of the project, officials were to build and maintain pedestrian access to Small Island.

The key was that the Theodore Roosevelt Memorial Association approved the plan. Hermann Hagedorn, the association’s secretary, described it as “an excellent plan . . . a masterly compromise”:

Mr. Hagedorn, who had come to Washington from New York yesterday to fight an earlier bridge plan, stayed on as a guest at today’s luncheon-business session of the committee. One subcommittee aide quipped: “He came down to give us the dickens and stayed for lunch.”

After Senator Case reported agency agreement, the committee completed work on the bill in about 5 minutes.

The hope was that following Senate approval, the House would substitute the Senate’s two-bridge bill for Representative Broyhill’s Jones Point Bridge bill, a move that would avoid a conference committee. [Beveridge, George, “D.C. Bridge Bill Wins Approval Of Committee,” *The Evening Star*, July 29, 1954]

*Star* columnist John Thompson discussed how the compromise came about. Each party in the dispute, he explained, was strong enough to kill the plans of the other parties. It would take high-level compromise to reach agreement. “That’s just what has happened.”

Earlier, as reflected in the hearings, each party fought for its solution. The Roosevelt association “dealt some of the most damaging blows to the E street proposal.” Senator Case had met with association leaders in New York City to try to win their support for his original New Hampshire Avenue plan:

He failed at the time but succeeded even better than perhaps he himself knew. He had impressed the warring camps with his determination to get a downtown bridge of some sort now—not tomorrow but today.

At a subsequent NCPC meeting, General Prentiss suggested that he and Bartholomew try to work things out:

What probably cracked the impasse between the two groups was reaching accord on a proposed inner belt by which through traffic would be able to bypass or move around the central downtown area. Almost the core of the planners’ objection to an E street span had been that it would cut across their suggested inner belt instead of feeding into it. The Federal Park Service also was opposed to the District plan that the west leg of the inner belt should go through Rock Creek Park. After conferences with his staff Gen. Prentiss was able to suggest a freeway up Twenty-fourth street N.W., instead of through the park and this was close to the Twenty-third street leg the planners had been thinking about.

After working out the details, Bartholomew withdrew his objections to the low-level bridge that would miss Roosevelt Island and tie into 24<sup>th</sup> Street.

As for the District's motivation to compromise, General Prentiss felt that the highway bridge to replace the inbound trestle-topped bridge was too far upstream:

Instead of replacing the present Highway span, why not build it downstream about at Roaches Run and tie into the Southwest freeway? This sounded good to the planners.

The resulting compromise announced by Senator Case “was a major development . . . the first in many years between the traditionally warring District Building and the Planning Commission.” Thompson attributed it to “the persistence of Senator Case, the initiative of Gen. Prentiss and the willingness of Mr. Bartholomew to get together before all was lost.” [Thompson, Jr., John W., “How Did Bridge Compromise Happen?” *Metropolitan Scene, The Evening Star*, August 1, 1954]

*Star* editors rejoiced at the end of the “battle of the bridges.” News of the agreement was “as welcome in this area as a drought-relieving shower.” An editorial hoped that Senator Case's plan to include the compromise central area bridge in his Jones Point Bridge bill “will be successful, so that planning for the new span can be started at once.”

The agreement on the Roaches Run Bridge was more problematic:

This phase of the “peace pact” between the District and the NCPC calls for more careful study than obviously has been given to it so far. Congress some years ago vetoed the idea of a single bridge at Fourteenth street in favor of twin bridges, one of them to replace the present Highway bridge. The Roaches Run proposal would run counter to congressional intent.

Nevertheless, Senator Case “deserves praise for his mediation service,” while the other parties “have shown good sense in sitting down together and working out a solution to one of Washington's more pressing traffic-bottleneck problems.” [“End of the Central Bridge Battle,” *The Evening Star*, July 29, 1954]

The Senate approved the two-bridge bill on August 12, 1954, without discussion, and the House followed suit on August 17, again without debate. [Construction of Bridge Over Potomac River, *Congressional Record-Senate*, August 12, 1954, pages 14255-14257; Construction of Bridges Over Potomac River, *Congressional Record-House*, August 17, 1954, pages 14878-14878]

On August 30, 1954, President Eisenhower signed Public Law 83-704 on construction of bridges over the Potomac River. Title I authorized the District to construct, maintain, and operate a low-level bridge over the Potomac River “from the vicinity of Constitution Avenue in the District of Columbia to the Virginia side of the Potomac River, such bridge to be constructed north of the Memorial Bridge and south of the southern portion of Theodore Roosevelt Island sometimes referred to as ‘Small Island’,” along with approaches. The District also was to build a structure for pedestrian access from the new bridge to the “Small Island,” subject to approval by the

Theodore Roosevelt Memorial Association. The NPS would build a pedestrian bridge linked to Roosevelt Island.

The law authorized \$24.5 million from the District's highway fund for the bridge and other structures. The funds also were to cover "construction, reconstruction, and repair of all roads which are changed or made necessary" by the bridge project.

In addition, the law directed Federal Agencies controlling needed land to transfer it to the District upon the request of its commissioners for the bridge and its approach and connecting roads as shown on plans to be prepared and approved by the District commissioners and BPR.

Title II authorized \$14,925,000 from the general Treasury for the Secretary of the Interior to construct a six-lane bridge over the Potomac River in the vicinity of Jones Point:

The bridge shall be of deck girder structure with a swing span having a one-hundred-and-fifty-foot horizontal clearance above mean low water . . . .

Construction was not to begin until Maryland and Virginia had given assurances that they would construct and maintain "approaches to such bridge as will be reasonably adequate to make possible the full and efficient utilization of such bridge."

In a signing statement, President Eisenhower called title 1 "a compromise solution for the long-standing controversy as to the location of a central area bridge across the Potomac." He had signed the bill even though it "contains serious defects which should be corrected as soon as possible." Some of the defects could be corrected by Executive action, but others would require legislative action:

Title 1 of the enrolled bill, in providing for the construction of the central area bridge by the Commission of the District of Columbia, fails to provide statutory recognition and adjustment of the relationship of the bridge, together with its approaches and connecting roads, to existing and potential improvements on park lands. The bridge, with its high traffic volume, will have a serious impact on some of the most important of the National Memorials. It can affect importantly the effectiveness of the memorial concept of the Arlington Memorial Bridge, which symbolizes the reunion of the North and South and provides a monumental approach to Arlington National Cemetery. It can infringe upon the Water Gate design as a monumental entrance to the Mall from the Potomac River. Most serious of all could be the effect of the bridge on the beautiful setting of the Lincoln Memorial.

In order to minimize the possible impairment of the monumental design and artistic setting of the Lincoln Memorial and other monumental structures in that area, the Secretary of the Interior should continue to keep control and jurisdiction over all park lands in the vicinity of the bridge except the actual bridge structure and the road and street surface between curbs necessary for maintenance by the District of Columbia. The Secretary of the Interior also should be authorized to approve all plans for the bridge and the approach roads and interchanges at both ends of the bridge since park structures and

land are involved. Trucks should be prohibited on the bridge and its approaches, and all passenger-carrying buses now utilizing the Arlington Memorial Bridge should be required to use the new bridge upon its completion.

As for title II, he saw “no logical basis” for giving the Secretary of the Interior the responsibility for building the Jones Point Bridge. He recommended that Congress pass legislation to shift responsibility “for the construction, maintenance, and operation” of the bridge to the Commerce Department for construction by the Bureau of Public Roads or to the U.S. Army Corps of Engineers.

(Public Law 84-534, which President Eisenhower signed on May 22, 1956, transferred responsibility for the project to the Secretary of Commerce. The President signed Public Law 84-535 the same day renaming the "Jones Point Bridge" the "Woodrow Wilson Memorial Bridge," reflecting the centennial of President Wilson's birth on December 28, 1856. BPR began construction in 1958.

(The existing authorizing statutes had not addressed operation and maintenance of the bridge. Public Law 87-358, approved by President John F. Kennedy on October 4, 1961, provided that Maryland, Virginia, and the District were to maintain and operate the new bridge, with the District’s portion of the cost not to exceed one-third of the total annual cost.

(The three jurisdictions entered into a maintenance agreement on December 18, 1961. With that issue concluded, officials dedicated the bridge on December 28, 1961, and opened it for traffic. Because the Federal laws authorizing the bridge project had not addressed ownership, BPR owned the bridge.

(For more information on this bridge, see “Why Is The Woodrow Wilson Bridge Named After Woodrow Wilson?” on this Web site at <http://www.fhwa.dot.gov/infrastructure/wrambler.cfm>)

### **Reopening the Central Area Bridge Debate**

With the Case compromise in place, NCPC, the District Highway Department, and National Capital Parks established a three-man committee to work on details of the project:

- Douglas Brinkley – District Highway Department
- Ellis Price – NCPC
- Merel Sager – National Capital Parks

Even before President Eisenhower approved the two-bridges law, the *Star* reported on several lingering controversies about the central area bridge. One dispute was where the bridge would touch down in the District. The *Star* reported that, “Washington’s proposed ‘Twenty-fourth street bridge’ over the Potomac River . . . may turn out to be a ‘Twenty-fifth street bridge.’” Both streets were in the vicinity of Constitution Avenue, and a link to Constitution Avenue was possible as well. NCPC favored Constitution Avenue, but District highway officials were afraid “that this simply would pour more traffic into the same bottlenecks without developing entirely new approach roads.” Under the compromise worked out with Senator Case, “whichever street

is selected would then become the west leg of the proposed 'inner loop' highway around the District's downtown area." ["Central Bridge May Tie Into 25<sup>th</sup> Street," *The Evening Star*, August 18, 1954]

General Prentiss addressed the District connection on an appearance on WWDC's "Report to the People" program. He said the District might drop its opposition to a connection with Constitution Avenue if it could be closed during peak periods, with traffic forced to use 24<sup>th</sup> or 25<sup>th</sup> Street, NW. He understood the desire of planners in the Interior Department to keep traffic away from the Lincoln Memorial by moving most traffic from the Arlington Memorial Bridge onto to the new structure, leaving Arlington National Cemetery, the Lincoln Memorial, and the bridge connecting them for sightseers. However, he said, "we have got to insure the maximum use of our bridges." The District was resisting their idea of linking the new bridge to Constitution Avenue as a way of diverting it from the park area. He pointed out that the "capacity of Constitution avenue to absorb traffic" must be considered.

He acknowledged President Eisenhower's statement about prohibiting trucks on the new bridge and shifting buses from Arlington Memorial Bridge to the new structure. General Prentiss was concerned that under this "substitution" concept, still more bridges would be needed. ["Compromise May Link Bridge With Constitution Avenue," *The Sunday Star*, September 5, 1954]

One option was to widen Constitution Avenue west of 12<sup>th</sup> Street, NW. A mall-like center strip would be added on the south side of the present 80-foot wide avenue and another 80-foot roadway would be added south of the center mall. One advantage of the plan was that it would require demolition of several war-time temporary office buildings that officials had wanted to remove for many years. The temporary buildings were on the Washington Monument grounds and along both sides of the Reflecting Pool east of the Lincoln Monument. A connection between the new bridge and Constitution Avenue would be attractive to motorists currently using Arlington Memorial Bridge because it would eliminate the "headache of winding around the perpetually-clogged Lincoln Memorial circle." [Beveridge, George, "D.C. Studying Plan to Double Width of Constitution Avenue," *The Sunday Star*, September 12, 1954]

On September 17, NCPC unveiled tentative plans developed by a three-man committee consisting of Conrad Wirth, BPR's Spelman, and Leon Zach representing the Army's chief of engineers. They had developed the plan with the Brinkley-Price-Sager technicians committee established in August. Both groups acknowledged that the remaining issue of the District connection was the subject of ongoing traffic studies to determine the feasibility of widening Constitution Avenue. "My feeling," the District's Robertson said, "is that we are in general agreement on this as a tentative plan, but subject to later revision when the traffic studies are all in."

The technicians' report indicated that Arlington Memorial Bridge would continue carrying its "just traffic load" during peak periods, but the approaches to the two bridges were designed so that traffic could be "shifted from one to the other in only a few minutes." The plan included a barricade that could be imposed if traffic overloaded Constitution Avenue.

Aside from Constitution Avenue, the technicians included only one District link. The new bridge would connect to a north-south expressway just west of 25<sup>th</sup> Street, NW., that would be the western leg of the Inner Belt. The expressway would be carried over Virginia Avenue and under K Street just west of Washington Circle. The *Star* summarized other details:

Southward, the new expressway would follow the present road beside the Lincoln Memorial's Watergate steps to tie into Independence Avenue and Ohio Drive. The technicians said this would require widening the Watergate road and the arches of the Memorial bridge. But they favored it over other proposals, just as costly, to tunnel under the steps or build a new roadway over the river edge.

Virginia-bound traffic on Twenty-third Street N.W. and the Rock Creek and Potomac Parkway would have access only to the Memorial Bridge. Westbound Constitution Avenue traffic could use either bridge—getting to Memorial via a new wide-arc ramp connecting with Twenty-third Street.

On the Virginia side of the river, Washington-bound motorists would have less choice about the bridge they would use. The new bridge, for example, would take motorists only from Arlington Boulevard, southbound lanes of the George Washington Memorial Parkway and from Jeff Davis Highway. Motorists from the south—using Mount Vernon Memorial Highway, Shirley Highway via Washington Boulevard or the Pentagon roads—would be able to connect only to Memorial Bridge.

(The Watergate was a performance area during warmer months when a barge would hold performers before as many as 12,000 people who sat on the steps and surrounding areas. The concerts ended in the mid-1960s because they were disrupted by noise from frequent jets using Washington National Airport. However, the name survived in the Watergate complex of buildings.)

NCPC approved the Wirth-Spelman-Zach plan, subject to resolution of the Constitution Avenue issue. Bartholomew complimented District and Federal officials who had so quickly reached agreement on the main bridge feature. [Beveridge, George, "Detailed Plans For Downtown Bridge Unveiled," *The Evening Star*, September 17, 1954]

On October 19, the three-man technicians committee presented their plan to the Wirth-Spelman-Zach committee, which secured NCPC approval on November 6 for the plan for handling traffic leaving the bridge in the District. Beveridge, in the *Star*, summarized the three main features of the plan:

1. New three-lane roads would be built paralleling the Lincoln Memorial Reflecting Pool to carry traffic to and from the Lincoln Memorial Circle and around the Washington Monument to connect with existing Mall roads east of Fifteenth Street N.W.
2. These new roads would serve only the Arlington Memorial Bridge, but would be capable of handling all the rush hour traffic using the bridge. They would require demolition of the Navy and Munitions Buildings on Constitution Avenue and other tempos [sic] on the Monument Grounds and south of the Memorial Reflecting Pool.

3. The new Constitution avenue bridge, located about 1,200 feet upriver from Memorial Bridge, would connect directly with Constitution avenue. It also would route traffic southward to Independence avenue and northward on a proposed “Twenty-fifth street expressway” to feed such east-west streets as E, H, and I.

By giving each bridge its own traffic escape valves, the problem was solved to every one’s satisfaction.

The roadways paralleling the Reflecting Pool would be 38 feet wide, with 14<sup>th</sup> and 12<sup>th</sup> Street, NW., underpassing the roadways while 15<sup>th</sup> Street would be realigned.

The plan satisfied park officials, Beveridge explained, “because it develops the Mall roads to their original purpose of carrying motorists in a ‘park-like’ setting from the Capitol all the way to the Lincoln Memorial Bridge. [sic]” The report before NCPC stated:

The removal of the temporary office buildings built on the Washington Monument grounds and on both sides of the reflecting pool will make it possible to complete this part of the central motif of the Nation’s Capital.

The new bridge opposite Constitution avenue would take much of the traffic now being handled by the Arlington Memorial Bridge and that bridge could then be returned to its originally planned use and could still take a good share of the morning and evening rush-hour traffic involving downtown east of Fourteenth street.

With NCPC’s agreement, the District planned to begin design work on the new Constitution Avenue Bridge. [Beveridge, George, “Bridge Accord Clears Way to Draw Up Plans,” *The Evening Star*, November 6, 1954]

Although the key actors in the long running dispute over a central area bridge had reached agreement, other parties with a say in the matter had not been involved in the meeting with Senator Case at the Cosmos Club.

In October, the Commission of Fine Arts reversed course. It had helped kill the 24<sup>th</sup> Street Bridge because it would cross Roosevelt Island. Now, the commission members concluded that a crossing of the island was preferable to the impact of the congressionally authorized bridge on the Lincoln Memorial grounds, the National Mall, Arlington Memorial Bridge, and Arlington National Cemetery. As Beveridge put it, members considered the area “one of the most carefully-planned beauty areas of the world.” The commission members “feel the new bridge, which has no esthetic part in the scene, would dominate it and detract from the view from any vantage point.”

A member of the commission, Joseph Hudnut of Dover, Massachusetts, a former Harvard University Professor of Architecture, put the commission’s view in a letter to the *Star*. If additional lanes were needed, he argued, they should be carried across the river in a tunnel financed by the Federal Government. Asked by Beveridge if any other option were acceptable, Professor Hudnut said the commission had discussed the “two-span bridge across the upper part of Roosevelt Island.” He quickly added that the only “real answer” was a tunnel:

But Dr. Hudnut said such an island crossing as be described “would not do nearly the damage” that the approved bridge would to esthetic values of the Lincoln Memorial and the monumental parks and structures that surround it.

As Beveridge pointed out, the Fine Arts Commission’s opposition to the bridge was not a surprise since it had testified before Congress on the subject. What was a surprise was that it now preferred a crossing of Roosevelt Island if a tunnel could not be substituted for the bridge. [Hudnut, Joseph, “Bridge Question Revived,” Letters to the Star, *The Sunday Star*, October 3, 1954; Beveridge, George, “Fine Arts Unit May Ask Island Site for Bridge,” *The Sunday Star*, October 3, 1954]

The Committee of 100 for the Federal City also had not been present at the Cosmos Club meeting. On November 2, the committee adopted a resolution calling on NCPC for a careful, detailed study to pick a new site for the 24<sup>th</sup> Street bridge upriver from Arlington Memorial Bridge. Members were concerned that the bridge, which would be visible from the Lincoln Memorial grounds, would, as one member put it, mar the “full emotional significance” of the memorial.

Elbert Peets, landscape architect of the Fine Arts Commission, argued that a crossing over the north end of Roosevelt Island would be a better choice, although a tunnel would be preferable. As planned, the 24<sup>th</sup> Street bridge would mar the view of visitors to the island. He called it a “tragic situation.”

General Grant, who also had helped block the E Street Bridge, argued that Roosevelt Island was the “wrong place” for the structure. He favored NCPC’s plan for the Roaches Run Bridge and thought it should have priority. “If it turns out that there is need for another bridge farther upriver, let the next generation take care of it.” The committee considered endorsing the Roaches Run Bridge, but was discouraged from doing so by AAA’s Washington I. Cleveland. He told the committee, “There isn’t a ghost of a chance for that location at this time.” [“New Study Is Urged to Change Site for Central Area Bridge,” *The Evening Star*, November 3, 1954]

Although bridge opponents suggested a tunnel would address their aesthetic issues, the cost of a tunnel remained a concern. Representative Broyhill asked Ralph Smillie, a consultant engineer involved in tunnel projects in New York City, for a cost estimate. Smillie concluded that a tunnel would cost approximately \$73 million. He added that he would not support a tunnel because merging traffic lanes in a tunnel would invite disasters, fires, and explosions. The high cost, traffic considerations, and the length of time needed to build a tunnel argued against the idea. [“Fine Arts Unit To Weight River Crossing Site,” *The Evening Star*, November 10, 1954]

In July, just before agreement had been reached on the Potomac River bridges, NCPC hired Wilbur Smith and Associates to study future Potomac River bridges in the Washington area. The study was to indicate general locations and traffic volumes expected in 10-15 years. It would also consider population growth, employment trends, and residential development. [“Planners Hire Firm to Study Need of Potomac Bridges,” *The Evening Star*, July 28, 1954]

The firm released its report in December. The report recommended immediate construction of several facilities, including the Inner Loop expressway around the center of town, with priority for the Southwest Freeway segment. District highway officials were working on the loop, including traffic studies, location of grade separations, and cost estimates. According to Highway Director Robertson, previous estimates indicated the entire loop would cost \$130 million. Under present funding levels, construction would take 10-12 years, but the city wanted to begin construction on a bridge first.

As a second priority, the Wilbur Smith report identified a central area bridge as needed, but in what the *Star* called “the report’s biggest surprise,” questioned whether projected traffic would best be served by building the bridge at Constitution Avenue as authorized by the law, or over the Three Sisters Islands upriver from Key Bridge. The District was preparing a contract for preliminary engineering of the authorized bridge.

The consultants did not choose among the two proposed bridges, saying the Constitution Avenue Bridge would be “better adapted” to trips downtown while the Three Sisters location “appears to have better long-range planning possibilities,” particularly in view of projects included in Virginia’s as-yet-unfunded plans. The *Star* summarized the report’s comparison:

Three Sisters is the only proposed bridge that would give good connections between Virginia and outer Northeast Washington. But to make adequate connections to the inner-loop it would require very expensive connections.

Constitution avenue would give direct access to the central area. But it would create problems on Washington streets, generate restrictive traffic volumes on already crowded Arlington boulevard and involve esthetic values in the Lincoln Memorial area.

Noting that the Commission of Fine Arts preferred a tunnel to a bridge for aesthetic reasons, the report said of the tunnel option:

This type of facility would be very costly and would, because of grade, preclude contact with the inner loop. All traffic would tend to be unduly concentrated on Constitution avenue. Extensive approach roadways would be required.

Further, among immediate needs, the report gave priority to improving District streets before building the central area bridge:

Coincident with the improvement of existing bridges, and their approaches, and taking precedence over the construction of new crossings, it is essential that additional street capacity be provided on the Washington side of the river.

Roadways are currently taxed during peak hours and cannot accommodate the additional loadings which would result from increased bridge capacity.

The concern was that the bridge would open before the Inner Loop Freeway, thus compounding congestion on the local streets that would have to carry the traffic.

On the issue of timing, General Prentiss told reporters the plan was to open the Inner Loop before the bridge, but not necessarily to full freeway standards:

We plan to have the loop ultimately built to limited-access characteristics and consultants are studying it. I've asked them to plan the ultimate development and also to give us an interim plan. For some parts of the loop, for example, we've been talking in terms of using existing streets with parking banned temporarily.

We can't just sit back until we build the belt to its ultimate. I want to see the money spent as judiciously as possible to develop the most critical parts of the loop and the most critical intersections, and to use existing pairs of streets until we have money to go further.

Third, the report recommended replacing the trestle-topped bridge and widening the approach roads to the 14<sup>th</sup> Street Bridge completed in 1950. The report did not specify where the trestle replacement would be, but under the District-NCPC agreement, it would be built downriver from the existing 14<sup>th</sup> Street Bridge near Roaches Run. It would carry one-way northbound traffic while the existing bridge would carry southbound traffic.

The fourth immediate need was to increase the capacity of Key Bridge up to 15 percent by removing streetcar tracks and moving the sidewalk off the bridge proper. These changes would allow the District to add two traffic lanes. The report also recommended improving the District approaches by, for example, building a grade separation structure at M Street. Robertson indicated the city was preparing to make these changes.

Finally, the report recommended immediate improvements to the approaches on both sides of Arlington Memorial Bridge to increase automobile capacity by 10 percent. The NPS, which was responsible for the Virginia approaches, had not planned any changes. In the District, highway officials and NCPC had agreed on a plan for improving traffic flow in the vicinity of the Lincoln Memorial.

The report also recommended bridge projects that should be under construction by 1960:

- A six-lane Roaches Run Bridge downriver from the 14<sup>th</sup> Street railroad span;
- Improved approaches to Chain Bridge by improving Canal Road;
- Construct a four-lane bridge at Jones Point.

By 1965, a replacement bridge would be needed at Cabin John, Maryland, as part of the outer loop beltway. Maryland and Virginia had conducted traffic studies for the bridge, but did not have funds for construction. ["Planners Consider Consolidated Area Development Data," *The Evening Star*, December 4, 1954; Beveridge, George, "Bridge Report Proposals Win D.C. Approval," *The Evening Star*, December 5, 1954]

As 1954 neared an end, Webb and Knapp reopened discussions with NCPC about reconstructing 10<sup>th</sup> Street as a wide, mall-like "grand entrance" to the District's redeveloped southwest quadrant, free of heavy through traffic. Under the developer's plan, 10<sup>th</sup> Street would be a divided street

from Maine Avenue along the Washington Channel to Independence Avenue south of the National Mall. The plan included a roadway east under Independence Avenue to 9<sup>th</sup> Street. Fourteenth Street would be a one-way expressway from Maine Avenue to Constitution Avenue, carried under the National Mall in a tunnel. To avoid heavy through traffic, 10<sup>th</sup> Street would not be connected by interchange with the planned Southwest Freeway.

In a letter to NCPC's Bartholomew, Zeckendorf suggested ways of handling traffic without including 10<sup>th</sup> Street as a major artery and requested formal approval of principles for other elements of the redevelopment plan that NCPC had indicated it supported. Bartholomew reconstituted the Wirth, Spelman, and Zack committee to consider the proposals. [Beveridge, George, "Webb & Knapp Offers 3 plans For Southwest," *The Evening Star*, December 21, 1954; "Webb & Knapp Calls For Mall Policy Decision," *The Evening Star*, December 22, 1954]

### **Ole Singstad's Views**

On January 8, 1955, Representative Broyhill revealed that the NPS had asked Ole Singstad, a well-known bridge and tunnel expert based in New York City, to consider whether a tunnel would be a feasible alternative to a bridge in the vicinity of the Lincoln Memorial. In New York City, he had designed the ventilation system for the Holland Tunnel and completed the tunnel project after the death of chief engineer Clifford M. Holland. He designed the Lincoln, Brooklyn-Battery, and the Queen-Midtown Tunnels. His firm had designed the Big Walker Mountain Tunnel in Virginia and the Baltimore Harbor Tunnel as well as tunnels in other countries.

Wirth had agreed to the compromises negotiated by Senator Case the previous July. However, he agreed with the Fine Arts Commission's doubts about the aesthetic impact of the Constitution Avenue Bridge that Congress had authorized.

The District had rejected the tunnel idea several times, in part because of cost and because of the difficulty of connecting the tunnel with its approaches. Now, highway officials expected to approve a contract soon to prepare detailed plans for the bridge. Representative Broyhill understood the District's thinking on the matter but said:

I'm in entire accord with this further exploration of the tunnel idea. But I'm not optimistic about the possibility because of the problems involved. At the same time, this will not delay plans already under way for the bridge. [Beveridge, George, "Expert Asked for Views on Potomac Tunnel," *The Evening Star*, January 9, 1955]

In a telephone interview with George Beveridge, Singstad revealed that he had been studying the matter for several weeks at the request of the District Chapter of the National Society of Professional Engineers, which had adopted a position in support of a tunnel on November 16, 1954. "Don't expect a complete and final report. But I'm not discouraged about the prospects of a tunnel, and I'll be in Washington to exchange views." Although a tunnel would present "complex problems, especially on the Virginia side of the river, I don't see anything insuperable about it as far as I've gone." [Beveridge, George, "Expert to Back Practicality of Tunnel Here," *The Evening Star*, January 11, 1955]

Singstad was in Washington on January 15 for a meeting at the Interior Department with representatives of about 30 Federal and District agencies and private organizations. He rejected the District's estimate that a tunnel would cost \$80-90 million as "absolutely fantastic—just baloney." He expected a much lower cost, but could not provide a specific figure until he had studied the conditions of rock and mud that the tunnel would fit into. Those conditions would determine the feasibility of a tunnel as well as what it would cost, which also would be affected by whether the tunnel carried four or six lanes of traffic.

He had developed a plan to address the District's concern about the difficulty of connecting a tunnel with roads on either side of the tunnel. In his rough scheme, the tunnel would be built under the river bottom only for the length of the navigation channel. It would then begin a 5-percent grade rise to emerge on Columbia Island, just off the Virginia shore, to begin above-ground connections with Arlington Boulevard, Jefferson Davis Highway, and the George Washington Memorial Parkway. The District links, which he had not developed, would be less difficult.

Singstad said that the District's borings for the bridge would provide some of the information he needed about underwater conditions, but he would need a "super-sonic sounding device" to complete cost estimates. The NPS was looking for the device. Wirth said, "I'm very pleased and encouraged by all this. I just hope everyone will be reasonable enough to wait until all the facts are in."

Chairman David E. Finley of the Fine Arts Commission said that Singstad's preliminary report was "very reassuring" based on the group's concerns about the bridge option. At the same time, however, he was concerned that the tunnel's tall ventilating towers would have a negative aesthetic impact.

During this period, the District had a new engineer commissioner, Colonel Thomas A. Lane. He had taken office on December 10, 1954, replacing General Prentiss who assumed command of the Engineer Center at Fort Belvoir, Virginia. Colonel Lane had been commissioned in the U.S. Army Corps of Engineers in 1928, serving during World War II and had entered Japan in 1945 with the occupying forces. In 1950, he became District Engineer of the Okinawa District, a post he held for 2 years. He said his work on Okinawa most closely paralleled what he expected to do in the District. On Okinawa, "we built a complete community from scratch for more than \$200 million, including highways, harbor improvements, power plants and housing." His position before becoming engineer commissioner was engineer of the Army Field Forces at Fort Monroe, Virginia. Colonel Lane's address was 3915 Livingston Street, NW., in the District's Chevy Chase neighborhood near the Maryland State line. [Giles, John A., "Gen. Prentiss Named to Head Engineer Center," *The Evening Star*, November 24, 1954]

Colonel Lane did not attend the Interior Department meeting but based on an earlier briefing, said that the data presented thus far "wasn't sufficient, certainly, for us to start thinking seriously about a tunnel instead of a bridge." [Beveridge, George, "Expert Assails \$80-90 Million Tunnel Figure," *The Evening Star*, January 16, 1955]

On January 19, 1955, National Capital Parks officials conducted the sonar tests Singstad had requested. In "Operation Sonar," they mounted the device on a World War II-era amphibious DUKW (usually referred to as Duck) borrowed from the Beach Erosion Board and passed over the Potomac River several times upriver from the Arlington Memorial Bridge. On the Virginia side, the route ended near the north end of Columbia Island where the tunnel would link with Arlington Boulevard. The route swerved on the District side to line up with Constitution Avenue. [Beveridge, George, "River Bottom Tested by Sonar To Learn Feasibility of Tunnel," *The Evening Star*, January 19, 1955]

Singstad presented his report to NCPC on February 4. A four-lane tunnel at Constitution Avenue could be built for \$25 million; a six-lane tunnel, for \$35.8 million. These costs covered only the tunnel, not approach changes. The Operation Sonar data gave him "far more information than is usual when an engineer is called upon to make a preliminary estimate." He favored the four-lane tunnel option, but provided the six-lane estimate because the proposed tunnel was intended to replace a six-lane bridge.

District highway officials quickly discounted Singstad's figures. They said the cost of approach structures would be \$17 million. Since a six-lane tunnel would be needed, the total cost would be over \$52 million. Congress, they said, would have to be induced to authorize funds to make up the difference in the cost of the bridge and tunnel. ["Singstad Estimates 4-Lane Tunnel Cost as \$25 Million," *The Evening Star*, February 4, 1955]

In an editorial, the *Star* predicted that Congress would be interested in Singstad's estimates, but asked:

Who is going to pay the extra cost of a tunnel, the main purpose of which is said by the Fine Arts Commission to be avoidance of "conflict" with the Lincoln Memorial and the Memorial Bridge? Obviously, the District should not be asked to pay the bill for this esthetic enterprise. Which prompts another question: Just what is esthetically wrong with the idea of building another attractively designed bridge over the Potomac in the central area? A properly designed bridge can be a monumental asset to any city, as well as a utilitarian structure. ["Tunnel Versus Bridge," *The Evening Star*, February 5, 1955]

### **The 10<sup>th</sup> Street Mall**

NCPC's three-man committee reported on February 4 that it rejected the 10<sup>th</sup> Street Mall that Webb and Knapp favored for its southwest redevelopment plan. The committee would recommend shifting the 300-foot wide mall to 9<sup>th</sup> Street. Tenth Street was needed for heavy traffic going through southwest from the Potomac River bridges and the new freeway in the F Street corridor.

Zeckendorf's firm had chosen 10<sup>th</sup> Street for its grand entrance partly because it could easily pass over the existing Pennsylvania Railroad tracks that rose sharply to the east. The three-man committee answered this concern by proposing to move the tracks underground near D Street between 4<sup>th</sup> and 12<sup>th</sup> Streets or simply build the 9<sup>th</sup> Street mall over the existing tracks.

The committee's report indicated that its plan could "readily adapt itself [to] any proposal for redevelopment of the Southwest area," adding:

It was also evident from these studies that the successful redevelopment . . . did not depend upon a mall specifically located at Tenth street: however, it does depend upon proper handling of the abnormal traffic that must traverse this area.

The report assumed construction of the Roaches Run Bridge across the Potomac River and Washington Channel to touch down in line with 10<sup>th</sup> Street. The *Star's* Beveridge described the committee's plan:

Their plan showed Tenth street as the major Southwest street for through north-south traffic, with a big traffic interchange at Tenth and the F street freeway. Tenth would be a single street as far north as D street. Then it would separate widely to Independence avenue, with north bound lanes connecting to Ninth street and southbound lanes connecting from Twelfth.

Both Ninth and Twelfth would underpass roads on the city's main east-west mall, providing non-stop expressways all the way to Constitution avenue.

The committee's report stated that a grand entrance at 9<sup>th</sup> Street would have a "much longer, gradual approach to the waterfront" and would permit adequate service for through traffic on other existing streets. It would leave the produce market in place and accommodate the Smithsonian Institution, which was planning a National Air Museum at 10<sup>th</sup> and Independence. The Smithsonian plan was in direct conflict with the Zeckendorf redevelopment plan. [Beveridge, George, "Tentative Approval Given by Planners to S.W. Mall Revision," *The Evening Star*, February 4, 1955]

The *WPA Guide* described the produce market:

Washington's water front, along Maine Avenue east of 14<sup>th</sup> Street, SW., on the north bank of the Washington Channel, is, after the ponderous monumentality of the Mall and the impounded elegance of posted parks, a realm of welcome small things and the reassuring clutter generated by humans going about their essential business. The buildings are modest, inclined to dinginess, and take character from the kind of merchandise that is handled in them . . . . There are excellent sea-food restaurants, wholesale and retail markets for fish, poultry, vegetables, and groceries, yacht clubs, yacht brokers, boat chandlers—in short, the water front, apart from the potentially lethal truck traffic, is probably just about as Pierre L'Enfant visualized it.

Immediately east of 14<sup>th</sup> Street, Maine Avenue dips under southbound railroad tracks separating Washington Channel from the Tidal Basin. In this blind end of the Channel are Government-built slips, complete with fresh-water and electrical outlets, which can be rented by owners of self-propelled craft. Across Maine Avenue from the public wharves are a series of busy wholesale markets where barrels, sacks, baskets, and boxes are perpetually shifted by stevedores from trucks into high piles, into warehouses and out

again. Immediately east of the public wharves are fish markets, where the customer may name it and get it fresh. Or he may go out on the whitewashed wharf and bargain first hand for "SALTY WATER OYSTERS AND CLAMS" with fishermen who hawk from the decks of their boats, and who offer samples of raw oysters shucked on the spot. [*WPA Guide*, page 324]

Zeckendorf agreed to study the committee's proposal, but added in a statement that if the plan could not be reconciled with the principles behind the Webb and Knapp plan, "We shall regretfully be forced to withdraw" from the southwest redevelopment. Except for "paramount reasons," if the principles could not be carried out, the development plan would become "purely academic." ["Planner Agreed To Study New Mall Proposal," *The Evening Star*, February 5, 1955]

In March, the consulting firm of DeLeuw, Cather completed a southwest traffic study for the District. Based on traffic projections for 1980, the firm recommended that the main north-south routes for heavy traffic through the southwest should be 9<sup>th</sup> Street for southbound traffic and 12<sup>th</sup> Street for northbound traffic. Tenth Street would be reserved for Zeckendorf's 10<sup>th</sup> Street Mall. The consultants recommended replacing the trestle-topped bridge with a structure slightly upriver from its present location.

Based on traffic projections for 1980, DeLeuw, Cather dismissed NCPC's favored Roaches Run Bridge. The consultants did not rule out the bridge; they said "no plan should be so inflexible that it cannot be modified to accommodate unforeseen developments." However "if and when" the bridge were built, it should not connect with the Inner Loop, but lead directly into redeveloped southwest.

The Southwest Freeway would continue over the Washington Channel from 12<sup>th</sup> Street, cross diagonally over West Potomac Park, and connect with two one-way Potomac River bridges near 14<sup>th</sup> Street. The freeway would contain eight lanes, not the planned six lanes. Within the District, the freeway would continue along Ohio Drive (instead of Independence Avenue as NCPC preferred) toward the Lincoln Memorial to complete the south leg of the Inner Loop. Using Independence Avenue for the freeway extension, although favored by NCPC, was impractical in the view of Deleuw, Cather. It would "require that substantial areas be taken from the Washington Monument grounds, the lawn bordering the Reflecting Pool and from the Tidal Basin."

To resolve the dispute on the grand entrance to the new southwest, President Eisenhower had asked George A. Garrett, president of the Federal City Council, to meet with the parties. (In 1954, 50 business and civic leaders formed the Federal City Council to provide citizen leadership whenever needed to promote civil development projects and attack problems threatening the economy and development of the Nation's capital. They selected Garrett, an investment banker and former ambassador to Ireland, to be the council's first president. ["Federal City Council Registers Charter, Prepares to Aid D.C.," *The Evening Star*, September 13, 1954; "Garrett, Investment Banker, Heads Federal City Council," *The Evening Star*, November 16, 1954]

Garrett had met with Zeckendorf on March 23. Zeckendorf, Garrett reported, was working on plans to resolve the controversy in time for NCPC's April 7 meeting. [Beveridge, George, "New Highway Plan For Southwest Gets Federal Study Today," *The Evening Star*, March 24, 1955; "Report Denies Roaches Run Span Needed," *The Evening Star*, April 7, 1955]

Somewhat surprisingly, NCPC voted "tentative approval" of Zeckendorf's 10<sup>th</sup> Street Mall in April, reversing NCPC's tentative approval in February of a plan that retained 10<sup>th</sup> Street as a major traffic route. The vote, with four members absent, including Bartholomew, came after a report by BPR's Spelman on behalf of the Wirth committee on the issue:

Key points in the planners' approval were that the new plan does far less damage than earlier proposals to the wholesale produce market center on the waterfront and does not preclude eventual construction of a Roaches Run bridge—a pet planning commission project.

The plan calls for the Tenth street mall to be angled slightly eastward from Tenth as it approaches the waterfront, ending in a wide circular "overlook" atop Maine avenue and the Washington Channel.

Several problems remained. One was that the plan would divide the area where the Smithsonian Institution planned to build its National Air Museum south of Independence Avenue near 10<sup>th</sup> Street. Others included Zeckendorf's plan to add 6,000 to 7,000 more Federal workers to the area than NCPC had proposed in its comprehensive plan. Spelman said the committee had not considered the possibility that the Central Intelligence Agency (CIA) also was considering a southwest location that would add as many as 10,000 more workers.

Garrett said that NCPC's action was "a great encouragement to me and to the Federal City Council." Zeckendorf also appreciated the tentative approval. He said his firm looked forward "to continued reconciliation of any divergent details which may remain to be worked out toward realization of a definite comprehensive plan." [Beveridge, George, "Key Proposal Of Zeckendorf Is Accepted," *The Evening Star*, April 9, 1955]

Wilbur Smith and Associates, NCPC's consultants, reported on May 5 that the Roaches Run Bridge was needed, although not necessarily right away. The 14<sup>th</sup> Street bridge provided convenient access to the downtown area, but handled only 38 percent of total peak hour traffic. "The limitations of available bridge capacity are clear." With volumes expected to reach over 390,000 trips a day, the Roaches Run Bridge would serve as a "Southwest portal" and, combined with the 14<sup>th</sup> Street bridge, accommodate 37 percent of that traffic.

Like the DeLeuw Cather study, the new Smith study saw the Roaches Run Bridge as a future need, not a current one. District officials agreed. Director Robertson said he would not object to the bridge "if it becomes necessary in the future."

That same day, NCPC approved the District's plan to proceed to detailed design of the eight-lane Southwest Freeway between South Capitol Street and 9<sup>th</sup> Street, SW. Several critical issues, including the dispute between Zeckendorf and the Smithsonian Institution over the 10<sup>th</sup> Street

mall, remained to be decided at NCPC's June meeting. However, the Roaches Run Bridge continued to be a sticking point as the District presented its plan for the Inner Loop Expressway as proposed by DeLeuw Cather and Company. Beveridge summarized:

Charles DeLeuw, explaining his plan, said the loop expressway was drawn to meet 1980 traffic estimates and contemplates a new Potomac River bridge at Constitution avenue. He said he wouldn't argue that a Roaches Run bridge might never be needed. But he contended the loop expressway, big as it is, "could not handle traffic from any other bridge in any location" in 1980.

Mr. DeLeuw proposed that the loop system be six lanes wide except for four lanes along Ohio Drive from Fourteenth street to Lincoln Memorial; eight lanes between South Capitol and Fourteenth street S.W., and eight lanes on the north leg east of New York avenue.

The firm's report estimated that the Ohio Drive expressway leg of the Inner Loop would cost \$13 million, compared with \$17.2 million for NCPC's proposed substitute of an Independence Avenue leg. [Beveridge, George, "Planners Add Up Facts To Speed S.W. Project," *The Evening Star*, May 6, 1955]

### **Bridge Versus Tunnel**

By March, top Eisenhower Administration officials were studying the bridge-versus-tunnel issue for the Constitution Avenue Bridge in the vicinity of the Lincoln Memorial. A White House spokesman said the tunnel was under study, but the issue had not yet been presented to President Eisenhower. Engineer Commissioner Lane said that if the President approved the tunnel, the District would not object on one condition: that the Federal Government pick up the difference in cost:

I don't believe the Board of Commissioners has ever taken a position on the question. But as one member, I'd say that as long as the facility were [sic] equally useful for traffic and meant no additional cost to the District, I'd certainly have no objection to it.

Representative Broyhill agreed that "the extra cost should not be charged to the District." He added, "I don't believe the House District Committee would stand for higher costs being levied against the city." ["Tunnel Acceptance By D.C. Indicated If U.S. Pays Extra Cost," *The Evening Star*, March 18, 1955]

In early March, the *Star* revealed that Maryland, Virginia, the District, and BPR had hired Wilbur Smith and Associates to study the feasibility of charging tolls on Potomac River bridges. The \$15,000 study was to consider existing bridges and those bridges the consultant thought were "likely to be required" based on

- Projected 1970 traffic volumes;
- Traffic volumes and toll revenue;

- Traffic and toll estimates and “the rate of retirement of such costs through the collection of tolls”;
- The use of special license plates to give “special rate privileges to commuters; and
- Whether individual planned bridges could be financed through toll collection.

The three jurisdictions and BPR decided on the study after conferences to discuss financial responsibility for the cost of several planned bridges.

The *Star* pointed out that Wilbur Smith and Associates had studied tolls for Virginia in 1953, taking “an extremely dim view of toll prospects here”:

Citing “administrative and political obstacles,” the 1953 report said there appeared to be “little hope unless a plan can be devised whereby tolls could be imposed on all of the river-crossings.” It also said the inter-jurisdictional problems would be so complex they “would likely be unworkable.”

. . . Some toll proposals affecting major bridges here, it is felt, would be certain to raise a storm of controversy. One argument is whether tourists should have to pay to get access to the Nation’s Capital. Any suggestion of tolls affecting Arlington Memorial Bridge also would be a red-hot issue.

Although Congress has never taken a position on tolling the bridges, officials “felt the possibilities should at least be explored”:

Aside from policy, some officials are worried about space considerations. They question whether existing spans, particularly, would have sufficient space for installation of toll gates. Two or three lanes of gate space are needed for each lane of bridge space, these officials said. [Beveridge, George, “Survey Made on Feasibility of Tolls for Potomac Bridges,” *The Evening Star*, March 6, 1955]

Representative Broyhill, learning of the study, told reporters the study was a “ridiculous . . . waste of the taxpayers’ money.” The idea of imposing tolls on citizens to visit the Nation’s capital was “an affront to every one of them.” He would vigorously oppose the idea. [Beveridge, George, “Broyhill Calls Study of Tolls on Bridges ‘Ridiculous Waste,’” *The Evening Star*, March 20, 1955]

In May, the *Star* summarized the consultant’s conclusion: “Prospects of tolls on Potomac River bridges, never exactly bright, appeared even dimmer today, after a preliminary discussion of the financial feasibility.” As a practical matter, tolls were not feasible if they were charged on some, but not all the bridges. Even the outer bridges (Jones Point and Cabin John) would not carry enough traffic to pay for themselves through tolls. They were, however, the only ones the consultant seriously considered. However, for tolls to be feasible, all the bridges would have to charge tolls. Even Arlington Memorial Bridge, despite the lack of space for toll plazas at the Lincoln Memorial or Arlington National Cemetery that would “not appear intrusive,” would have to be a toll bridge or motorists would use it to avoid tolls on the other crossings. [Beveridge, George, “Consultant Doubtful Over Prospects of Potomac Bridge Tolls,” *The Evening Star*,

March 15, 1955; Beveridge, George, "Tolls on Bypass Bridges Seem Doomed by Survey," *The Evening Star*, May 1, 1955]

As NCPC prepared to meet on April 7 to decide on the tunnel option, the Bureau of the Budget was pressing for a decision. Under the compromise worked out by Senator Case, NCPC was on record supporting the Constitution Avenue Bridge authorized by law. However, the Interior Department was working on legislation to amend the law to substitute the tunnel and authorize \$28 million in Federal funds to pay the additional cost to the District. The Budget Bureau wanted a decision by April 15 from the District commissioners, NCPC, and the Commission of Fine Arts.

At its closed-door April 7 meeting, NCPC received the special committee report on the issue. The report stated:

The objections which have been urged to the bridge are based upon esthetic grounds. Your committee believes that from a general planning and service standpoint, either the bridge or the tunnel will be suitable.

The committee has not attempted to pass upon the question as to whether the esthetic advantages of a tunnel . . . are worth the large increase in cost involved.

The committee believed the approach roads for the six-lane tunnel option would operate suitably, although the tunnel would have only 90 percent of the traffic capacity of the bridge.

During the meeting, Colonel Lane reportedly attempted to force NCPC to decide between the bridge and tunnel options. That did not happen, as the *Star* explained:

The farthest the Federal planners would go . . . was to "accept" a committee report saying that, from "a general planning and service standpoint, either the bridge or the tunnel will be suitable" . . . Mr. Bartholomew made it plain to reporters, meanwhile, that the planners believe a new bridge at Roaches Run – downriver from existing Fourteenth street spans – would be better than either a bridge or tunnel in the Lincoln Memorial area.

Asked if there was concern that a tunnel would provide only 90 per cent of the Constitution avenue's bridge capacity, he said he feels too much traffic is being brought into that area anyway. "We believe a Roaches Run and Fourteenth street bridges would handle enough traffic that it is not necessary to worry about squeezing every bit of capacity in that (Lincoln Memorial) area," he said.

NCPC planned to send a letter to the Budget Bureau, but would not release its contents to reporters following the meeting. However, the *Star* reported that the reply would point out that:

- The commission already has approved a traffic plan for the bridge.
- The commission will be glad to consider a specific tunnel plan if one is submitted.
- The question of whether the Federal Government should pay as much as \$28 million because of esthetic considerations involved is basically one for the Federal Fine Arts Commission and Congress to decide. [Beveridge, George, "Quick Answer By Planners

on Tunnel Asked,” *The Evening Star*, April 7, 1955; “Planning Group Avoids Firm Stand on Tunnel,” *The Evening Star*, April 8, 1955]

On May 6, the White House held a conference to discuss the bridge-versus-tunnel question for the Constitution Avenue crossing of the Potomac River. Participants included Bartholomew, Robertson, Wirth, District Commissioner Samuel Spencer, Finley of the Fine Arts Commission, Ambassador Grew of the Roosevelt association, and Rowland Hughes, director of the Budget Bureau. Officials conferred for 40 minutes with former Governor Sherman Adams, the presidential assistant who served informally as President Eisenhower’s chief of staff.

After the conference, the White House’s assistant press secretary, Murray Snyder, issued a statement:

There was no decision reached but a committee consisting of Commissioner Spencer as chairman, and Mr. Wirth and Mr. Bartholomew was set up to work with the Bureau of the Budget in developing the Government’s position on whether this should be a bridge or a tunnel. In other words, to iron out whatever differences there are and reach a conclusion. [“Three Named to Settle Bridge-or-Tunnel Issue,” *The Evening Star*, May 6, 1955]

The District asked the U.S. Army Corps of Engineers for a permit to build the low-level Constitution Avenue Bridge with an immovable span. Colonel Ray Adams of the Corps’ Washington District, took testimony in early May not only on the Constitution Avenue Bridge but on whether opening of the existing Potomac River moveable bridges should be stopped. He estimated that review of the testimony would take several months.

The District Highway Department favored permanent closure of the bridges, in part to save money on operations. The District also calculated that if the new bridge were built with a draw span, the change would add \$1.9 million to the construction cost and cost about \$109,000 a year for operation. BPR and AAA testified in support.

Several businesses testified against permanent closure. A representative of Spentonbush Fuel Transportation Services, Inc., said that his company made 132 trips between Norfolk and Rosslyn, Virginia, to provide oil to American Oil Company (best known for its Amoco service stations). The shipments could not be made by barge; fixed spans “definitely would mean our tank operation would cease.” American Oil estimated that shipping the oil entirely by truck would increase costs by about 18 cents a barrel.

The District Fire Department also opposed permanent closure of movable spans. Deputy Chief Fred Litteral said it was “very essential” that fireboats be able to pass the bridges to reach Georgetown industries along the waterfront. [“Closing Drawspans of All Potomac Bridges Studied,” *The Evening Star*, May 11, 1955]

The White House-appointed committee, which was expected to complete its report in early June, was unable to reach a decision. On June 2, Commissioner Spencer, the chairman, said he had told Governor Adams that the committee could not agree and would not submit a report on the subject. Despite the committee’s failure, Spencer was hoping for an early decision by the Budget

Bureau. ["No Agreement Reached Yet on Bridge or Tunnel," *The Evening Star*, June 3, 1955; "D.C. Seeks 'Yes' or 'No' On Bridge vs. Tunnel," *The Evening Star*, June 5, 1955]

After the committee failed, Representative Broyhill wrote to President Eisenhower urging him to decide the issue in favor of immediate construction of the bridge. He did not "concur in the fear . . . that a bridge would mar the beauty of the Nation's capital." He added that the possibility that Congress would approve a tunnel that would far exceed the cost of a bridge was "highly improbable." Congress was "friendly to the bridge idea," he said:

The mood of economy is merely a reflection of your own policies to cut Government spending to achieve a balanced budget and a reduction in the heavy tax load.

With the Senate about to begin hearings on the District's budget, now was "an excellent opportunity to obtain money for the project." Therefore, he wrote:

I request that you give immediate attention to this problem and that you direct the Bureau of the Budget to submit to Congress as soon as possible an estimate of the amount necessary to begin the erection of another bridge . . . in the area previously designated by Congress. [Beveridge, George, "Broyhill Urges Eisenhower to Decide for Span," *The Evening Star*, June 7, 1955]

Commissioner Spencer revealed on June 13 that the Budget Bureau had ruled out a tunnel:

It appears in the light of all the circumstances that a bridge will best meet the needs, and studies are now being made to determine whether some change in the site of the proposed bridge may be possible which will be satisfactory to the Fine Arts Commission and others concerned and at the same time will meet traffic needs and cost limitations.

This involves making certain engineering studies which it is hoped may be completed within about 10 days.

The Fine Arts Commission has never advocated a tunnel, except as an alternative to a bridge in the Lincoln Memorial area and would be in favor of a bridge at some other location.

The alternative location would cross the upriver part of Roosevelt Island. ["Bridge Proposal Gets Backing Over Tunnel," *The Evening Star*, June 13, 1955]

At NCPC's June meeting, the planning commissioners considered an objection submitted in a jointly signed letter from all but one member of the Ohio congressional delegation. Having worked hard to get a main city street named after their State, they objected to conversion of Ohio Drive to an expressway. "This is very disconcerting," they wrote. "This is the most important section of Ohio drive. We are strenuously opposed and urge that it be retained as a park drive." Aware of the delegation's concern, NCPC had formed a subcommittee to study the issue but it had not reached a conclusion. DeLeuw, Cather submitted an alternative during the meeting. The *Star* described it:

This would be a cutoff just south of Lincoln Memorial and use . . . Independence avenue paralleling the Mall and crossing the north end of the Tidal Basin before swinging into Southwest Washington.

Mr. DeLeuw said, however, he prefers Ohio drive for the freeway, although he realizes this involves one of Washington's nicer park areas. The point is, he said, that the Independence avenue route would cost about \$4 million more than the \$12 million estimate on the Ohio drive route.

On another familiar issue, District highway officials reported to NCPC that the Roaches Run Bridge would cost about \$5.5 million more than the estimated \$19-million cost of the bridge replacing the 14<sup>th</sup> Street trestle-topped bridge. ["State Delegation Protests Ohio Drive as Freeway," *The Evening Star*, June 17, 1955]

### **The Roosevelt Association's New Position**

On June 16, 1955, the Theodore Roosevelt Memorial Association conditionally approved construction of a bridge across the northern tip of Roosevelt Island as a substitute for the congressionally approved Constitution Avenue Bridge. The association listed three conditions as summarized by the *Star*:

- Both the National Park Service, the National Capital Planning Commission and the Federal Fine Arts Commission [sic] also have the right to approve the final "character and design" of the bridge and its location.
- The bridge be named "The Theodore Roosevelt Bridge."
- The bridge be a low-level one preferably of masonry construction similar to the Arlington Memorial bridge.

A low-level bridge might address the esthetic issues in the vicinity of the Lincoln Memorial, but a "fairly high span probably would be needed near the Virginia shore in order to rise from the river to connect with Arlington boulevard north of the new Arlington Towers Apartments."

The association, in a letter to Chairman Finley of the Fine Arts Commission, made clear that it would not support a bridge such as the E Street Bridge that would cross the middle of the island.

Reaction to the association's new stand was mixed. NCPC vice chairman Remon said, "We've studied this thing uphill and downhill. I don't want it to drift any longer." Donald E. Gingery, a Rockville-area developer who had served on the Maryland-National Capital Park and Planning Commission since his appointment in 1949, expressed irritation. "It is beyond my comprehension how a private organization, like the Roosevelt association, can sit and dictate how and where a bridge can be built with taxpayers' money."

District sources told Beveridge that city officials were perplexed about why Congress did not simply authorize funds for the Constitution Avenue Bridge approved by Congress and President Eisenhower under the Case compromise instead of waiting for, as Beveridge summarized, "this agency and that for new decisions." Nevertheless, Commissioner Spencer called the move "the

biggest step forward that's happened," adding that a bridge over the north end of the island was "a very good solution of the whole thing." General Lane said, "The decision clears the way for a possible alternate solution."

One interested observer was Senator John C. Stennis (D-Ms.), a former Circuit Court judge who had been in the Senate since winning a special election in 1947; he lived in the city's Wakefield neighborhood at 3609 Cumberland Street near Connecticut Avenue, NW. As chairman of the Appropriations Committee subcommittee handling the District's budget, he was about to chair a hearing on the budget on June 17 where the bridge issue was expected to be discussed. Reporters had the impression that his patience was growing thin:

"I don't want to appear to be threatening anyone," he said last night. "But here we are in a situation where a law authorizing a bridge at a certain place (Constitution avenue) is on the books, the money (\$1.5 million for 1956) is available and the need for a bridge becomes more urgent every day.

"Time is short. This matter should not be put off any longer."

Commission Chairman Harland A. Bartholomew had announced that the planning body was prepared to hold a special meeting if "prompt action" is requested before Congress adjourns.

Senator Stennis said his subcommittee wants a decision within a few days. "We are not thinking in terms of getting something before Congress adjourns," he said. "I am not interested in where the bridge is placed—there's a law on the books stating where—but I just don't like to see this matter suspended any further," the Mississippian said.

After the Friday hearings, Senator Stennis said he wanted a decision by Monday, June 20, when the subcommittee was scheduled to complete markup of the District appropriations bill. [Beveridge, George, "Budget Problem Arises In Dispute on Bridge" and "Stennis Presses District For Decision on Bridge," both *The Evening Star*, June 17, 1955]

As District officials worked over the weekend to study the feasibility of the plan adopted by the Roosevelt association, Senator Stennis postponed markup to June 22 at the request of the District commissioners and Budget Bureau director Hughes. Senator Stennis said he wanted "an all-around agreement" by all agencies involved and a detailed report on the "feasibility of the new location from the standpoint of engineering and of service to the public, as well as the cost thereof." [Beveridge, George, "D.C. Engineers Rush Plans for Island Bridge," *The Evening Star*, June 18, 1955]

On June 22, District officials met with Senator Stennis to discuss the city's findings. The bridge across the northern tip of Roosevelt Island would cost \$43.2 million. Although the city had studied the proposal, city highway officials emphasized that they did not support it. Highway planner Brinkley said, "We don't believe there is any good substitution for the Constitution avenue bridge." District officials explained that they were willing to consider other ideas, but

were not going to support a plan that would cost so much more than the Constitution Avenue span.

In response, NCPC rejected the District-drawn plan for the Roosevelt Island bridge as well as a proposal by Wirth to support concurrent construction of a Constitution Avenue tunnel and the Roaches Run Bridge. Instead, NCPC reaffirmed its support for the Constitution Avenue Bridge. Bartholomew concurred despite his doubts that it was wise to “keep concentrating traffic in the Lincoln Memorial area.” He was concerned that if the bridge were built, people would view it as the solution to the Potomac River crossing problem. He urged, again, early construction of the Roaches Run Bridge.

Remon addressed the point before the vote:

I feel that approval now of the Constitution avenue bridge is the current solution to this whole problem. What comes after is another matter.

Based on these actions, Senator Stennis’s subcommittee included \$1.5 million in construction money for the project. He said he wanted a bridge built, but during the meeting, no viable alternative had been presented. [Beveridge, George, “Constitution Ave. Bridge Is Backed by Planners,” *The Evening Star*, June 22, 1955]

The full Senate, with the support of the White House, approved the District appropriations act for FY 1956 on June 23, including the \$1.5 million for the Constitution Avenue Bridge. The vote was unanimous. The only change since Senator Stennis’s subcommittee added the provision came when the Senate adopted Senator Case’s amendment allowing, within a strict timetable, a possible shift of the bridge somewhat upstream. The amendment permitted the bridge to be built over South Island if the Theodore Roosevelt Memorial Association gave its consent by August 1, 1955. Senator Stennis accepted the amendment because it would not cause a delay in construction of the bridge. He added, “This bridge must be built to take care of mounting traffic demands.”

The Senate’s action, as the *Star* put it, “pointed today toward early construction of the \$24.5 million Constitution avenue span Congress already has authorized.” [Beveridge, George, “Senate Passes Bridge Funds,” *The Evening Star*, June 23, 1955]

The bill now went to a conference committee with members of the House, which had passed its version of the bill a month earlier without a provision on the bridge. The conference committee had to reconcile many issues, not just bridge funding.

### **Grudging Support For The Bridge**

While the conference was underway, bridge proponents and opponents continued to work toward their goals. Harry T. Thompson, associate superintendent of National Capital Parks, objected to plans for the Constitution Avenue Bridge between South Island and Arlington Memorial Bridge because he wanted Roosevelt Island to be the sort of place Theodore Roosevelt would have loved:

We have acquired a house with a view, and someone has come along and painted over the windows. It seems a great tragedy that the wealthiest nation in the world would suffer an irreparable damage to the greatest assembly of memorials in the world for the sake of a few dollars. We as a nation are not that poverty-ridden that we can afford to mar and almost commit a public act of vandalism against the men whom we have enshrined in our memorials.

If that is the will of Congress, “we will just have to live with the situation.” He promised that Interior Department officials were “not going to be bad losers. But we’re sorry about it.”

Thompson indicated that the NPS, NCPC, and the Theodore Roosevelt Memorial Association would take a second look at their plans for the island. The Interior Department had \$135,300 for a proposed new ferry landing. Other projects included a terraced memorial observation overlook, foot bridges, and a second comfort station. With the bridge project, however, the restudy may find that the present program would be a “waste of money.” [“Revision Seen In Plans for Island Retreat,” *The Evening Star*, June 24, 1955]

Officials put pressure on the association to allow the bridge to cross the upriver end of South Island. Commissioner Spencer said he would approach the association in support of the shift, which he thought was “feasible” for traffic needs and to answer aesthetic objections. Peets of the Fine Arts Commission sent the association a sketch of the proposal, including his idea that South Island could be built up with fill soil to screen part of the bridge from Roosevelt Island. His plan, which would leave the Lincoln Memorial area free of visual intrusions, would “infinitely decrease” the damage the original plan would do to the area.

One drawback to the shift was that the District had not worked out plans for a span across South Island. Peets thought it would hit Constitution Avenue. Senator Case, who had written to the association to request its support for the shift, thought the new bridge would tie into E Street. He said he had proposed the South Island crossing to the association a year earlier and was turned down:

The situation now, however, is different. Then, no bridge had been approved. Now, if nothing is done, the bridge will be built as a straight extension of Constitution avenue over the river. [Beveridge, George, “New Proposal Made to Solve Bridge Impasse,” *The Evening Star*, June 26, 1955]

Representative Saylor had not given up on the possibility of a tunnel to handle cross-river traffic in the vicinity of the Lincoln Memorial. He had asked Wirth why he did not support NCPC’s endorsement of the Constitution Avenue bridge. In a letter dated June 27, Wirth said it was “evident that more than one river crossing is needed.” Traffic relief in the vicinity of the Lincoln Memorial was needed, but the Constitution Avenue Bridge, “no matter how well designed or how much traffic relief it might give . . . would be greatly destructive of more important national values.”

Wirth recommended, first, shifting the \$24.5 million that Congress had authorized for the Constitution Avenue span to a six-lane bridge at Roaches Run. Second, he believed the Interior

Department should build a four-lane tunnel at Federal expense to carry traffic across the river in the vicinity of the Lincoln Memorial. In favor of his proposal was that while the tunnel had been rejected previously because of cost, the proposed tunnel had never been tied to concurrent construction of the Roaches Run Bridge. As for the difference in cost between a bridge and tunnel, he argued that the disparity was mainly for related road improvements that he did not think should be charged to the tunnel. ["Saylor Plans Another Pleas For Tunnel," *The Evening Star*, June 27, 1955]

House-Senate conferees on the District of Columbia appropriations act, 1956, resolved the longstanding controversy over the Potomac River crossing in favor of building the Constitution Avenue Bridge between south of South Island and Arlington Memorial Bridge. They included \$1.5 million in the bill for the bridge at this location, dropping Senator Case's amendment allowing a shift to South Island if the Theodore Roosevelt Memorial Association agreed to it. The House conferees had insisted on dropping the Case amendment because they believed that District officials did not strongly favor it.

On June 30, the House and Senate approved the conference report on the appropriations act and sent the bill to the White House for the President's signature. During floor consideration, no one in the House or Senate objected to the bridge provision included in the conference report.

Senator Case still thought his idea was worth pursuing. He was "not weeping" about the Constitution Avenue Bridge location, which he noted was the result of a compromise he had helped to forge. He also did not want to delay construction of the bridge, wherever it might be located. If the Roosevelt association changed its position, he would introduce a "quickie bill which I think probably could get through before Congress adjourns" permitting the shift to South Island. He cautioned, however, "I'm certainly not going to make another move myself unless something is done by them." [Beveridge, George, "Congress Oks Bridge Funds, Ending Wrangle," *The Evening Star*, June 30, 1955]

President Eisenhower signed the FY 1956 appropriations act on July 5, 1955 (P.L. 84-131).

### **The Endless Debate**

On July 8, 1955, the Theodore Roosevelt Memorial Association reversed its position and approved a crossing of the memorial island, most likely in a straight line from Constitution Avenue to South Island's southern tip. The concept was described as two short bridges, linked at South Island, which would screen the bridge from the Lincoln Memorial area. Director Hermann Hagerdorn included the decision in a July 8 letter to Secretary of the Interior Douglas McKay. Members, the letter said, had undertaken considerable soul-searching:

On the one hand they have the obligation, bequeathed to them by their predecessors, to defend the integrity and sanctity of the island as an area of wild solitude in the very heart of the Nation.

On the other, the trustees recall the part that Mr. Roosevelt as President played in conserving and developing the grand plan of the National Capital. They remember that

he encouraged, supported and defended the McMillan Commission in its (1901) efforts to salvage and revitalize the L'Enfant plan, and that he established the National Commission of Fine Arts to watch over the plan's development in the future.

In reconciling their loyalties to President Roosevelt, the Nation, and the memorial island, they realized that "their paramount obligation is to the National Capital":

They have, therefore, agreed to approve, in principle, the construction of a low-level bridge across South Island, provided that the proposed bridge shall be named the Theodore Roosevelt Bridge, that it provide access to the main island, and that its design be approved by the National Commission of Fine Arts.

During a morning meeting, Hagerdorn, the Interior Department, and the Fine Arts Commission agreed to meet with District officials to discuss the new route. They also would meet with congressional leaders to seek a legislative fix. [Beveridge, George, "Trustees Okay Bridge Over Roosevelt Island; Association Paves Way For Project," *The Evening Star*, July 8, 1955]

District and Federal officials quickly agreed to seek an amendment allowing the shift. The Fine Arts Commission, NPS, and District commissioners agreed that NPS would submit legislation permitting the location change. Meanwhile, their technicians would work on a practical location and design for the bridge.

Aside from numerous technical details, officials also had to reconcile broader concerns. Wirth insisted that the legislation give Interior Secretary McKay powers to approve all features of the bridge and its approaches, citing President Eisenhower's statement on the subject when he signed the Constitution Avenue Bridge legislation:

The Secretary of the Interior also should be authorized to approve all plans for the bridge and the approach roads and interchanges at both ends of the bridge since park structure and land are involved.

The current law left "no check whatsoever" on District officials. Wirth said that such an arrangement had "never been done in the history of the development of the city of Washington."

Commissioner Spencer asked Wirth to submit a bill for District review and, if he did, promised quick reaction.

Although Wirth and Hagerdorn endorsed the "two bridge" idea on a straight line from Constitution Avenue, District officials called the idea unworkable. The concept would not allow sufficient navigation clearance. Further, moving the bridge as far upriver as Wirth and Hagerdorn suggested would cause problems for the Virginia connections. With Congress due to adjourn soon, all parties hoped to resolve these differences promptly. [Beveridge, George, "Quick Plea to Congress On Island Span Planned," *The Evening Star*, July 9, 1955]

The District commissioners quickly agreed to yield their authority over the bridge. With the endorsement of the Budget Bureau and NPS, the commissioners agreed to an amendment that would permit construction of the bridge over the south end of Roosevelt Island and give the Fine

Arts Commission and Interior Department approval authority over the design and connecting roads. The amendment also would allow the District to revert to the location between Roosevelt Island and Arlington Memorial Bridge if technical details for the shift could not be worked out. In that case, the Fine Arts Commission and Interior Department would retain approval powers.

Despite the Federal-District battles over the past 3 years regarding the central area bridge, General Lane said he expected that with all parties in support, the amendment “will not delay this bridge in any way.” [Beveridge, George, “District Yields Strong Voice to U.S. on Span,” *The Evening Star*, July 16, 1955]

As Congress moved toward the August 2 adjournment of the first session of the 84<sup>th</sup> Congress, the amendment passed in the Senate, but not the House.

Failure of the amendment left the location of the bridge in doubt. Despite the lack of congressional action, all parties favored the new location. On August 4, 1955, NCPC voted unanimous approval of the bridge over the south end of Roosevelt Island. With this action, District officials could begin immediate plans for the bridge. However, congressional action on the amendment permitting construction in the new location would still be needed.

Despite agreement on the bridge location, NCPC and others were concerned about the connections in the District and Virginia as displayed on a diagram that District Highway Director Robertson submitted. The *Star* described the approach roadways in the District as resembling “the layout of the Union Station railroad yards.” It included “no less than 25 traffic lanes running more or less parallel and about half as many separate roadways between E street and Constitution avenue to provide access to or by-pass of the bridge.” The sketch drew “tart criticism.”

Robertson responded that the use of so many roadways resulted from the limited space for the approaches. Engineer Brinkley added that the sketch outlined adequate connections for the bridge in Virginia with Arlington’s Jefferson Davis Highway as well as direct connections with Constitution Avenue and the west leg of the Inner Loop. The *Star*’s summary of the meeting added:

The plan, Mr. Brinkley said, also offers the novel feature of tunneling the inner belt under the west grounds of Lincoln Memorial, preserving the vista there.

These explanations did not satisfy Douglas Orr of the Fine Arts Commission. To avoid marring the National Mall, he favored a District connection north of Constitution Avenue and completely off the Mall.

Although the District was prepared to begin design, Robertson said he would not begin until he received approval in writing from the Fine Arts Commission and the Roosevelt association. “Not that we don’t trust these gentlemen,” he told NCPC with a laugh. “We just want it in writing so that when we go back for the necessary legislation next session there won’t be any more changes.”

NCPC also approved construction of a four-lane bridge to replace the trestle-topped three-lane bridge at 14<sup>th</sup> Street in the approximate location of the existing structure. The District had

completed plans for the bridge and, with NCPC approval, could include \$9 million in the budget request for FY 1957 construction. NCPC approved this project with the understanding that it would not jeopardize the NCPC-supported Roaches Run Bridge or allow District officials to seek approval for new highways that NCPC opposed. [Beveridge, George, “Planners Back Bridge Location” and “Bridge Location Remains Hazy For Planners,” *The Evening Star*, August 4, 1955]

As will be discussed later, BPR released sketch maps in September showing the tentative outline of Interstate highways in urban areas. The maps showed black lines representing unnumbered Interstate highways on an outline of the metropolitan areas with limited details of jurisdictions and no depiction of other roads and streets. The map of the Washington area showed four Interstate crossings of the Potomac River:

- (1) the Jones Point Bridge as part of a circumferential,
- (2) the Chain Bridge crossing, also part of the circumferential,
- (3) the extension of Shirley Highway across the Potomac River and Washington Channel carrying traffic to the Southwest Freeway, and
- (4) a U.S.-50 bridge crossing south of Roosevelt Island and cutting across the northern tip of Columbia Island.

The map did not show the Roaches Run Bridge favored by NCPC.

By early September, District officials were hoping the Commission of Fine Arts would approve relocation of the Constitution Avenue Bridge to cross the lower tip of Roosevelt Island in the compromise worked out by District highway officials, NCPC, and National Capital Parks. On September 16, the commission replied that the revised location was “acceptable in general,” but could not “give approval in detail.”

The commission wanted the bridge to be as low as possible to reduce visibility from the Lincoln Memorial grounds. However, the main concern involved the approach connections on the District side of the river where it would connect with Connecticut Avenue and the Inner Loop. The commission wanted to move the complex interchange as far north of Constitution Avenue as possible to get it away from the Lincoln Memorial. The limitation was that as part of the Interstate System, the bridge and connections would have to meet Interstate standards. [“Bridge Details Stir Objections from Fine Arts,” *The Evening Star*, September 16, 1955]

By November 1955, all agencies involved had worked out their differences on the Constitution Avenue Bridge. The agreement shifted the crossing away from the Lincoln Memorial and the Arlington Memorial Bridge to cross the southern end of Roosevelt Island. Although referred to as the Constitution Avenue Bridge, the bridge would enter the District midway between Constitution Avenue and E Street, NW. The approach road network in the District was still complicated (one planner referred to it as looking like a “bowl of spaghetti”) but was a compromise that all parties accepted. In Virginia, the bridge would connect with George Washington Memorial Parkway, Arlington Boulevard, Wilson Boulevard, and Jefferson Davis Highway.

The District highway department had \$3 million to complete the bridge plans and start construction. An additional \$20 million would be needed to finish the project. Securing this additional funding might be easier because BPR had included the crossing in the Interstate System. Congress had failed to agree in 1955 on how to pay for construction of what was still officially called the “National System of Interstate Highways” but would return in January 1956 to try again.

The *Star*, in an editorial on November 3, 1955, commented that, “It is gratifying that an agreement apparently has been reached among all agencies on the location and approaches for the new central-area Potomac River bridge.” After summarizing the agreement, the editorial pointed out that another 3 years would be needed before traffic could start using the new bridge. “So the importance of getting an early start on the long-delayed undertaking is obvious.” The editorial was titled “Agreement at Last.”

In early 1956, Oscar S. Straus II, president of the Theodore Roosevelt Memorial Association, wrote to Engineer Commissioner Lane. Straus observed that the Commission of Fine Arts had suggested a change “in order to keep the necessary network of approach roads, on the District side, away from the Lincoln Memorial.” He added, “We in the association would not quarrel with that decision.” The association had only one condition, namely that the bridge “provide access to the island not only for pedestrians but also for motor cars” that would need parking spaces. He added:

We recognize the problems of parking involved, but believe that these can be worked out to the satisfaction of all the Government agencies concerned as well as of the association and the visiting public.

The city was awaiting formal letters of support from the Interior Department and the Fine Arts Commission, but Commissioner Lane said he would begin pressing immediately for House action on the needed legislative amendment. [Beveridge, George, “Island Trustees Back Span Plan,” *The Evening Star*, January 5, 1956]

### **Other Developments**

Several other developments were moving in a positive direction for bridge projects in the southwest redevelopment area. The Smithsonian Institution had identified an alternative site for the National Air Museum that would remove the conflict with Zeckendorf’s planned 10<sup>th</sup> Street Mall. The new site was between Independence Avenue and C, 4<sup>th</sup> and 7<sup>th</sup> Streets, SW. [“Alternate Site Is Studied for Air Museum,” *The Evening Star*, November 5, 1955]

(The National Air and Space Museum opened in 1976 on the opposite side of Independence Avenue between 4<sup>th</sup> and 7<sup>th</sup> Streets.)

Meanwhile, CIA Director Allen W. Dulles had decided to locate the agency’s headquarters at Langley, Virginia, on a 749-acre Federal tract partly occupied by BPR’s research facility. A consultant, Gilmore D. Clarke of the New York firm of Clarke and Rapuano, had studied the Langley site and one other candidate for CIA headquarters on the 100-acre Winkler tract at

Shirley Highway and Seminary Road in Alexandria. As the *Star* explained, planned transportation improvements made the Langley site superior in Clarke's view:

He noted that the George Washington Memorial parkway would be extended from its present terminus near Key Bridge all the way to the Langley site, a new Constitution avenue bridge is slated near the Lincoln Memorial and Key Bridge is to be widened.

These improvements alone, he declared, "would make the Langley tract more serviceable to CIA employes [sic] than the Winkler tract, even if Shirley highway is ever widened to six lanes . . . ."

The consultant conceded that drastic improvements to Chain Bridge, Canal Road and Virginia highways should be made. But his view was that they would be made in time, and that, meanwhile, the new parkway and its connections would take "more than 70 per cent of CIA commuters." [Beveridge, George, "Planners Start Study Of Langley as CIA Site," *The Evening Star*, November 5, 1955]

On November 3, 1959, President Eisenhower attended the ceremony laying the cornerstone for the CIA building at Langley. "Upon the quality of your work," he told the 2,000 spectators, "depends in large measure the success of our effort to further the Nation's position in the international scene."

On the way to the ceremony, he stopped at Spout Run to cut a ribbon opening a 5-mile section of the George Washington Memorial Parkway from Lorcom Lane to State Route 123:

Although the extension goes all the way to the CIA site, traffic will be shunted off at the cloverleaf intersection with Virginia Route 123. Contracts have already been let to carry the parkway beyond CIA to connect with the projected Washington circumferential highway at Cabin John.

The presidential ceremony took no more than 2 minutes. Mr. Eisenhower, wearing a gray felt hat and gray tweed overcoat, was handed two pairs of gold-plated scissors bearing the National Park Service seal by Roger Ernst, Assistant Secretary of Interior for Parks.

After clipping the red, white and blue ribbon in two places, Mr. Eisenhower was presented with one of the shears as a memento of the occasion. The President also kept a bit of the ribbon as a trophy.

Representative Broyhill, NPS Director Wirth, Superintendent Harry T. Thompson of National Capital Parks, and about 100 others attended the brief ceremony. ["President Lays Stone, Says CIA Helps Peace," *The Evening Star*, November 3, 1959]

### **The Tunnel Option – Again**

With the agreement on the new location of the Constitution Avenue Bridge, the next step was action by the House, where the bill amending the 1954 law was bottled up in the District subcommittee headed by Representative James C. Davis (D-Ga.). The problem was that

Virginia's Representative Smith, chairman of the House Rules Committee, opposed the bridge. He acknowledged as much to a reporter, adding that he would "not oppose" a tunnel across the Potomac River. Without Chairman Smith's approval, the bill could not reach the House floor for a vote. If the amendment did not pass, the city's only option was to complete work to build the bridge on the previously approved location.

The Interior Department was still promoting the idea of a tunnel instead of the bridge, whatever the location. In late March 1956, the department was preparing a bill for Representative Broyhill authorizing full Federal funding for a four-lane tunnel under the river near the Lincoln Memorial. The department had not secured White House approval for the bill; the Budget Bureau had objected to a 1955 version of the bill that called on the Federal Government to pay the difference in cost between a bridge and tunnel.

Now, Interior officials planned to argue that the Federal Government should pay 100 percent of the cost in view of vital importance of the Lincoln Memorial area. They added that if pending legislation to authorize the Interstate System became law, BPR would pay 90 percent of the cost of the bridge; additional Federal funds would have to cover only 10 percent of the cost.

District officials continued to favor the bridge across the south end of Roosevelt Island. They disputed the Interior Department's plan for a four-lane tunnel, arguing that a six-lane bridge or a six-lane tunnel was needed to accommodate traffic volumes. [Beveridge, George, "Bill to Propose U.S.-Financed Potomac Tunnel," *The Evening Star*, March 25, 1956]

Chairman Davis planned for his District subcommittee to hold hearings on the crossing, but as the day neared, the subcommittee gave conflicting information on what would be considered. In what Beveridge called "an on-again-off-again comedy of errors," the subcommittee said it would consider only the bridge amendment during the hearing. It planned to hold a separate hearing on the tunnel bill, but then decided to combine the bills in one hearing. Then it went back and forth, limiting the hearing to the bridge amendment, then switching back to both.

Beveridge, after talking with committee sources, suggested two possible reasons for the flip-flops on hearing plans:

One was that Mr. Broyhill, author of the tunnel bill, hasn't always had the vigorous support of other District Committee members for some of his proposals, so there was no great enthusiasm about considering his bill.

The other was that Representative Smith, Democrat of Virginia, and one of the District Committee's most influential members, is dead-set against the bridge, so his feeling probably helped rule out a hearing on the bridge alone.

Representative Broyhill, Beveridge explained, still supported the bridge, but had submitted the Interior Department's tunnel bill "only because the bridge matter appeared to be stymied."

Beveridge characterized the "confused Potomac River bridge-tunnel mess" as "more muddled than ever." [Beveridge, George, "Davis Sets Tuesday For Bridge-Tunnel Airing," *The Evening Star*, April 29, 1956]

The hearing took place on May 1. As in the past, Engineer Commissioner Lane favored the amendment and rejected the tunnel option. He explained that the proposed four-lane tunnel would be unable to handle the projected traffic, adding that because of grades on both sides of the Potomac River, even a six-lane tunnel would not be adequate. He estimated that a six-lane tunnel would cost three times the proposed bridge and require 30 times the annual maintenance cost. He added, in a new argument, that because the tunnel opening would be below water level on the District side, the project would have to include “a tremendous unsightly levee” northward from the Lincoln Memorial to prevent flooding of the tunnel.

Representative Smith, a member of the District committee but not the subcommittee, participated in the hearing as a courtesy. Beveridge summarized the exchange between the Congressman and the commissioner:

Mr. Smith questioned Gen. Lane sharply on several points. He said he thought the District’s decision to build a 27-foot high bridge with no drawspan threatened future development of the Georgetown Harbor and pointedly suggested that the District reconsider this.

Mr. Smith also drew from Gen. Lane a concession that the Interior Department must oppose the bridge since it has failed to respond to requests for approval Gen. Lane has been seeking since December.

Director Robertson pointed out the widespread agency support for the amendment. He was, he said, “highly disturbed” that Representative Broyhill had introduced the tunnel bill “at this late hour.”

Ole Singstad, after the hearing, told reporters that talk of a high levee was ridiculous. The grade of the District shore could be raised gradually to keep the tunnel out of danger. [Beveridge, George, “D.C. Fights Tunnel At Lincoln Memorial,” *The Evening Star*, May 1, 1956]

The subcommittee expected to hold an additional hearing to give the Interior Department and other tunnel advocates an opportunity to testify. However, by June, the subcommittee had not scheduled the hearing.

Appearing on the WWDC radio program “Report to the People,” General Lane said that if the House did not act, the District would move forward with construction of the Constitution Avenue Bridge as described in the current law. Construction, he said, could begin in about a year. [“House Nudged On Bridge Plan,” *The Evening Star*, June 3, 1956]

Chairman Davis scheduled a second day of hearings for June 13 to give tunnel advocates an opportunity to present their case. Ahead of the hearing, Chairman Davis predicted early action. He told reporters he was impressed by the case District officials made for the amendment to allow construction across Roosevelt Island, but reserved judgment on the bridge-versus-tunnel debate.

The issue of navigation clearance, raised by Representative Smith, would also be considered. He made clear his concern that the planned low clearance would harm Georgetown business

interests, such as Smoot Sand & Gravel Company, which had a harbor plant near 30<sup>th</sup> and K Street, NW., and American Oil Company, which had a terminal in Rosslyn, Virginia. (Much of Smoot's success resulted from its rights to the gravel at Gravelly Point, useful for construction throughout the area. [Kelly, John, "Gravelly Point Park's moniker is one that should just be shoveled aside," *The Washington Post*, February 6, 2018]

The U.S. Army Corps of Engineers had held a hearing on these concerns in 1955, but granted the District's request for a bridge 26½ feet above mean low water without a draw span. It concluded that Smoot operated with tugs and barges that would be able to pass under the bridge. It could substitute land-based transportation for the occasional shipment requiring a higher clearance. The oil company would incur additional costs because it would have to use barges instead of tankers, as well as "supplemental trucking" in bad weather. These additional costs, the Corps concluded, were "not considered unreasonable in the light of the public interests involved." [Beveridge, George, "Davis Predicts Action on Span," *The Evening Star*, June 10, 1956]

During the hearing, Chairman Davis heard from tunnel supporters. He did not get to hear from bridge supporters but indicated that if the subcommittee did not hold another hearing, they could submit their views in writing for consideration.

Harland Bartholomew appeared before the subcommittee as a member of NCPC, not as chairman speaking for it. Between a bridge and tunnel, he favored a four-lane crossing. As he had often said, he was concerned that any crossing at this location would strain the capacity of city routes unless the city also adopted the plan NCPC had approved – a widened Constitution Avenue, new roads on either side of the Reflecting Pool, and reconstruction of E Street as a major thoroughfare.

The Fine Arts Commission's Finley opposed any crossing at Constitution Avenue because of the damage it would do to the landscape in the memorial area. He favored a tunnel, but if a bridge must be built, he preferred that it cross Theodore Roosevelt Island instead of the route specified in the law.

Ole Singstad appeared to debunk criticisms of the tunnel option. A four-lane tunnel and its approaches, he assured the subcommittee, would cost \$25.5 million.

Other groups sending representatives in support of the tunnel were the Society of Professional Engineers, the Freedom Foundation, and the Marine Corps Memorial Fund. Time ran out before Conrad Wirth of the NPS or C. Melvin Sharpe of the Theodore Roosevelt Memorial Association had testified in favor of the tunnel.

District officials attended the hearing but were not called as witnesses before time ran out. They indicated they would submit a statement in favor of the bridge:

J. N. Robertson, District director of highways, said he would explain to the subcommittee that the city heads still favor a bridge and hope to build one. He made public estimates of cost ready for the subcommittee showing that a six-lane crossing [was] now estimated to be \$47,842,000 for the tunnel, \$18,699,000 for a steel bridge and \$15,550,000 for a pre-

stressed bridge. [Rogers, Harold B, "River Tunnel Urged At Construction Site," *The Evening Star*, June 13, 1956]

### **Moving a Bill**

Chairman Davis did not hold another hearing. However, the subcommittee amended the Senate-approved bill. With the House amendments, S. 2568 would:

- Name the structure the "Theodore Roosevelt Bridge."
- Allow the bridge to cross either of the two islands constituting Roosevelt Island as agreed upon by the Theodore Roosevelt Memorial Association and the District commissioners.
- Subject the general plan for the bridge to approval of the Commission of Fine Arts.
- Give the Secretary of the Interior approval of the general location of the bridge and its approaches, interchanges, and connecting roads, as President Eisenhower had suggested in his signing statement for the original Potomac River bridges bill in August 1954.
- Maintain the monumental character of the area as far as possible.
- The Secretary of the Interior would retain control and jurisdiction of all park lands in the vicinity of the bridge upon completion of the bridge except those needed for the bridge structure and the approach roads and streets, which would become the responsibility of the District of Columbia, also as suggested by the President.
- Call for construction of a "six-lane bascule span bridge" in response to concerns about the low-level fixed structure required by the original law and the Senate amendment.

The House considered the bill on July 9, 1956. Chairman Davis told his colleagues that the bill was a result of agreement by the Roosevelt association to allow the bridge to cross South Island. All parties, he said, agreed this new location was preferable to the location in the 1954 law; even the Interior Department agreed. He referred to the hearings on the bridge-vs.-tunnel issue, but said the consensus of the District Committee was that "this bill, as now amended, provides the best disposition of the problem which is presented by the need for another bridge in the area at or near Constitution Avenue.

After brief discussion of the cost of the bridge and approaches, the House approved the bill without a recorded vote. [Construction of Bridges Across Potomac River, *Congressional Record-House*, July 9, 1956, pages 12192-12194]

Because the House bill differed from the Senate bill approved in 1955, a conference committee would be needed to reconcile variances to create a bill both Houses could approve.

For conferees, the critical issue was the change from a low-level fixed span to a bascule bridge. However, conferees agreed on July 23 to retain the bascule bridge approved by the House.

On July 25, the House approved the conference report without debate. [Bridges Across the Potomac, *Congressional Record-House*, July 25, 1956, page 14448]

The Senate planned to take up the bill on July 27, the final day of the 84<sup>th</sup> Congress. However, Senator Albert Gore, Sr. (D-Tn.), chairman of the Subcommittee on Roads, Committee on Public

Works, presented a major obstacle. Senator Gore explained why he objected to the construction of a bascule bridge:

He told *The Star* last night he would fight any move for provision for the draw span in the new bridge, declaring that if it meant a six-month delay for a congressional decision he thought that would be worthwhile.

“With prospects of enormous growth of Arlington, Fairfax and the Alexandria area, several more bridges across the Potomac will be needed in the foreseeable future,” He said. “It would be far more economical, if necessary, to compensate the two concerns involved in the Georgetown harbor for their losses in connection with the occasional passage of vessels that will not clear the 27 feet allowed in plans for the new Constitution avenue bridge.

“I am perfectly willing to be reasonable with these two concerns but I am unwilling to let two concerns impose unreasonable requirements on the thousands of people who will use the bridge and on the taxpayers of the country and the District.

As one who lived in Arlington, I can testify to the inconvenience occasioned by the use of the draw span on a Potomac River bridge. I speak of the Arlington Memorial Bridge and the Fourteenth street bridge. By reason of the draw spans there I have missed roll calls, I have missed appointments. I have missed planes.”

(In 1938, Gore won election to the House of Representatives. He lived in Arlington, with his address shown in the *Congressional Directory* as 203 Arlington Village, then simply Arlington Village, and finally 1303 South Barton Street in Arlington. By the time he won election to the Senate in 1952, the Gore family, including future Senator and Vice President Al Gore, Jr., had moved to Suite 809 on the top floor of the Fairfax Hotel at Embassy Row, 2100 Massachusetts Avenue, N.W., near Dupont Circle. They spent the rest of the year in Carthage, Tennessee. [Maraniss, David, and Nakashima, Ellen, “Al Gore, Growing Up in Two Worlds,” *The Washington Post*, October 10, 1999]

Senator Gore had helped write the Federal-Aid Highway Act of 1956 that called for completion of the Interstate System in 13 years. Senator Gore’s willingness to delay the bridge bill raised questions about whether the District would be able to complete the bridge within the timeframe of the new Interstate program. It had only \$6.3 million in Interstate construction funds at present; District officials were concerned that eventually, some of the projects might not be completed in time and would cost the District more than the 10 percent local share authorized by the legislation. [Warren, Don S. “Senate Fight Expected On Draw for New Bridge,” *The Evening Star*, July 27, 1956]

On the final day of the 84<sup>th</sup> Congress, the Senate acted on many bills but did not consider the Potomac River bridge legislation. Senator J. Glenn Beall (R-Md.) took to the Senate floor to ask the Senate Majority Leader, Senator Lyndon B. Johnson (D-Tx.), why the bill was not called for a vote. Senator Johnson replied that as he had told Senator Beall privately, the problem was that

Senator Gore said he would not let the Senate approve the conference report if he could prevent it:

If the conference report in question had been called up tonight, I was fearful that we might be here all night. I did not think Senators would want to spend all night debating the proposed bridge.

Senator Beall accepted Senator Johnson's explanation, but added:

At this time, when we are thinking about the necessity of building a bridge over the Potomac River, whatever the merits of it may be, and we do not consider the conference report, and we adjourn without agreeing to the conference report, we have something to explain to the people of the District of Columbia and Virginia . . . . This is something all of us should think about. [Proposed Potomac River Bridge, *Congressional Record-Senate*, July 27, 1956, page 15146]

With that, the bill died.

Senator Gore had killed the bill by simply sitting in his seat on the Senate floor. With him present and ready to object, Senator Johnson would not call the bill for a vote that probably would have taken only a few moments. [Warren, Don, "White House May Decide Fate of Roosevelt Bridge," *The Evening Star*, July 28, 1956]

The *Star*, in an editorial, said the best that could be said about "the latest Constitution Avenue Bridge fiasco" was that the project "has had tougher controversies to work its way out of before." The editorial explained that powerful Representative Smith had insisted on a movable span bridge that House and Senate conferees agreed to include in the bill. However, "Senators, contesting the need and added cost, wouldn't hear of it." As a result, the "carefully worked out House and Senate agreement on a new and superior route for the bridge, across Roosevelt Memorial island, went by the boards."

The editorial stated that the House position was "indefensible." The U.S. Army Corps of Engineers, the real experts on the matter, had approved the navigation clearance of a fixed span.

The District could wait for January and hope the new Congress would approve the improved location, with or without a movable span. City officials could approach the White House for guidance on the best path forward. Or they could proceed with the bridge as approved by Congress and President Eisenhower in 1954. The latter would, however, "be a grievous mistake":

There is general agreement on the upstream location of a bridge passing over the island and that location should be retained, although the delay in starting construction will add to the inconvenience of Representative Smith's constituents who work in Washington.

The editorial agreed with General Lane's decision not to make a snap judgment. He wanted to talk with the White House and see if any other possibilities would allow the District to proceed. "He should do so without delay."

The editorial was titled “Bridge Fiasco.”

### **Unraveling a Fiasco**

On July 30, 1956, General Lane discussed the Constitution Avenue Bridge in a meeting with representatives of the Fine Arts Commission, National Capital Parks, and NCPC. They agreed to delay action in hope that the new Congress would approve the amendment shifting the bridge to cross the southern tip of Roosevelt Island. If Congress did not do so, the District would have no choice but to proceed to build the bridge at the 1954 location. However, Finley and others from the Fine Arts Commission made clear they would oppose proceeding on the line called for in the 1954 legislation.

After the meeting, General Lane told reporters that everyone agreed “very strongly” that they should do everything they could to secure congressional approval for the shift in location. However, no one had a “very explicit” idea how to secure the needed approval in view of the disagreement on the draw span. As a result, he said there was “very little likelihood” construction could begin before January. [“Officials Agree To Push Newer Bridge Sites,” *The Evening Star*, July 31, 1956]

Clinging to a slim hope, the District asked the General Accounting Office (GAO) for a ruling on whether, in view of congressional support for the new location, the District could use the available \$8.2 million to begin work on the crossing of Roosevelt Island. GAO ruled that the city could not legally spend the funds on the preferred route. The funds must be spent on the basis of the legislation approved in 1954, for a bridge between Arlington Memorial Bridge and a location that did not cross Roosevelt Island, unless Congress amended that law. Further, the U.S. Army Corps of Engineers added that it would not issue a permit for the bridge to cross Roosevelt Island unless Congress passed legislation changing the location. [Beveridge, George, “Ruling by GAO Forbids Funds For New Span,” *The Evening Star*, September 16, 1956]

With the fixed-bridge remaining the key obstacle to congressional action, General Lane wrote to Colonel George B. Sumner, the District Engineer for the Corps, to say the District would not object if he reopened the issue of a draw span. General Lane said he understood “new evidence” had been presented on the issue and, although he was concerned about the added cost of a draw span, he thought navigational needs should be the deciding factor:

If your conversations with interested parties indicate that there is substantial evidence available which would have affected the . . . Army’s decision on this approval, and which was not presented at the original public hearing, the Board of Commissioners would make no objection to your reconsideration of this approval in the light of the additional evidence.

He asked Colonel Sumner for “prompt action” to review the new evidence so all information on the subject could be presented to the 85<sup>th</sup> Congress when it convened in January 1957.

Colonel Sumner confirmed to reporters that American Oil Company had presented additional information. He added, “We have not yet determined, however, whether the new evidence is

sufficient to justify another hearing.” He added that any change would apply equally to which ever location was eventually selected. [Beveridge, George, “D.C. Agrees to Review Of Draw Span Dispute,” *The Evening Star*, September 25, 1956]

In the final days of the 1956 election, Representative Broyhill’s opponent cited the central area bridge situation as one reason voters should vote against the incumbent. On October 10, Democrat Warren D. Quenstedt, appearing on WMAL television, recalled that Representative Broyhill had promised “more Potomac River Bridges” in his campaign 4 years earlier. “Well, what do we have? We have the same number of bridges as we had in 1952, but we have more people using them . . . . How long does it take to plan a bridge? How long does it take to build one?” He singled out Representative Broyhill’s role in the central area bridge:

Here Joe Broyhill’s record is one of inconsistency and confusion. Repeated attempts to get action here have failed mainly because Joe Broyhill first opposed a tunnel in favor of a bridge and after it looked like this would become a reality, he suddenly threw the whole matter into a turmoil by advocating construction of a tunnel.

How long must people of the 10<sup>th</sup> district put up with this failure to produce? We have no new bridges and we have no tunnels despite Joe Broyhill’s four long years in Congress. [“Broyhill Cites Democrats to Defend Record,” *The Evening Star*, October 13, 1956]

Despite such criticisms, Representative Broyhill would win reelection.

When the 85<sup>th</sup> Congress convened, Senator Gore quickly made clear during an early hearing on the big new Interstate program that he still opposed more draw spans on Potomac River crossings. When Robertson, the District’s highway director, appeared before the subcommittee, Senator Gore raised the Potomac River issue. Robertson said the city would soon send the same amendment to Congress as in 1956.

Senator Gore explained that he did not want to be unfair to water traffic, but with motor vehicle traffic increasing, the opening of draw spans would cause additional delays. He planned to introduce a resolution calling for the District commissioners to survey ways to prevent draw spans, including the possibility of limiting water traffic to heights that would not require movable spans. He also thought that one solution might be acquiring the property along the waterfront to force businesses that needed draw spans to relocate. [“Gore Pushing for Bans On Potomac Draw Spans,” *The Evening Star*, January 10, 1957]

Senator Dennis Chavez (D-NM), chairman of the Committee on Public Works, had attended the subcommittee hearing. Instead of waiting for Senator Gore’s resolution, Senator Chavez wrote to the District commissioners to ask them to cooperate with BPR to investigate the wisdom of eliminating draw or lift spans on Potomac River bridges. The committee, he said, desired “that a study be made of the economics of providing draw or lift span bridges across the Potomac River as contrasted with the construction of fixed span bridges.”

He added that “it would be helpful to the committee if detailed information were available relative to the value of navigational facilities to those persons or firms now exercising them, and

the damage which would accrue from the termination of such facilities, and the cost to such persons or firms of modifying navigational equipment so as to eliminate the necessity of draw spans.” He requested a report by February 15. [Rogers, Harold B., “Chavez Seeks D.C. Probe of Potomac Drawspans,” *The Evening Star*, January 20, 1957]

In case anyone doubted Representative Smith’s views on the issue in the new Congress, he predicted that much additional study would be needed before a decision could be reached on the Constitution Avenue Bridge. He remained a “tunnel man,” he said, adding that he thought a better idea was to avoid any additional crossings of Potomac River in the central area. [“Smith Balks at Changes In Jones Point Bridge,” *The Evening Star*, February 7, 1957]

On February 15, the District commissioners submitted a response to Senator Chavez, arguing that Congress should not require draw spans on any future Potomac River bridges above Hains Point. The report, prepared by the District Highway Department and BPR, made the case for a fixed span for the Constitution Avenue Bridge. It also rejected the need for a draw span on the new Virginia-bound 14<sup>th</sup> Street bridge and the planned Roaches Run Bridge.

The report acknowledged that the fixed-span Constitution Avenue Bridge would affect American Oil and Smoot Sand and Gravel, but predicted they could make satisfactory adjustments. For example, American Oil could build two 10-inch pipelines from Four Mile Run, near National Airport, to Rosslyn. Smoot could use barges and towboats low enough to pass under the new bridge. Moreover, using taxpayer dollars to favor American Oil against its competitors would not be in the public interest “under circumstances which would not benefit the general public through a reduction in commodity prices.”

Pressure to substitute a tunnel for the Constitution Avenue Bridge continued. The same day that the District and BPR again rejected the option, Leon Chatelain, Jr., president of the American Institute of Architects, urged a tunnel across the Potomac River. A bridge would, he said, “irreparably damage the character and beauty” of the city. [“Commissioners Ask Future Ban On Draw Spans,” *The Evening Star*, February 16, 1957]

Chairman Davis convened a hearing of the District subcommittee to consider the location of the Constitution Avenue Bridge and Representative Broyhill’s re-introduced tunnel bill. The parties remained firm in their longstanding positions. Wirth of the NPS was one of many witnesses advocating a tunnel instead of a bridge on the first day of the hearing. He contended that a four-lane tunnel with approach roads could be built for \$25.5 million. He wanted to dispel any public misunderstandings regarding cost. The estimate was “a firm one we are prepared to defend.” He cited studies that he said demonstrated that tunnels were “at least equivalent to the efficiency of bridges in their capacity to handle traffic—lane for lane.”

The Fine Arts Commission’s Finley stressed that the tunnel was the only option that would not “sacrifice the beauty” of the area. Bridges at many other locations along the Potomac River would be satisfactory. “But that is not true of the area surrounding the bridge and Theodore Roosevelt Island.”

Bartholomew told the subcommittee that NCPC had approved either a bridge or tunnel, but he reiterated his concern about forcing six lanes of traffic into the Lincoln Memorial area. He estimated that the central area needed 14 new lanes to handle projected traffic, but they could be dispersed above Key Bridge and below the 14<sup>th</sup> Street bridge, where the Roaches Run Bridge would be located, as well as in the Constitution Avenue location.

In addition to testimony, the subcommittee accepted for the record a letter from Roger W. Jones, assistant legislative director of the Bureau of the Budget, to District Commissioner Robert E. McLaughlin, indicating the bureau was “inclined” to favor a six-lane bridge, but with a significant change from past views:

The Budget Bureau wishes to point out that while it inclines to agree with the District Commissioners in advocating a bridge . . . we recognize that the Congress may wish to take into account esthetic values and other considerations in advocacy of a tunnel.

A tunnel would cost more than a bridge, Jones wrote, and that was important with the Federal Government and the District trying to hold down expenditures:

However, except on cost grounds we express no opinion as to the tunnel. If the Congress should find considerations other than cost sufficiently overriding to enact legislation authorizing a tunnel . . . the bureau would be prepared to accept this decision.

[Beveridge, George, “Budget Bureau Gives Nod to 6-Lane Potomac Span,” *The Evening Star*, February 19, 1957]

### **To Break the Impasse**

On March 1, Senator Case introduced S. 1445, a bill to authorize construction of highway bridges across the Potomac River under the Federal-Aid Highway Act of 1956. The bill specified bridges at two locations long favored by NCPC, namely the Roaches Run Bridge and one crossing the Three Sisters Islands between Key and Chain bridges. He emphasized that his bill was not a substitute for the Constitution Avenue Bridge, which he had helped secure approval for in 1954. “My new bill has no effect on that. If the other controversy unravels itself, well and good.”

In a letter to Representatives Smith and Broyhill, he recommended the District should abandon its plan to rebuild the 14<sup>th</sup> Street trestle-topped bridge as part of the Interstate System:

It seems poor use of interstate funds to take out of use and build a replacement bridge when (1) the Fourteenth street bridge functions so well and (2) the great need is for additional bridges.

As long as we tolerate some of the temporary buildings that we do, certainly new money can better be spent in adding bridges than in destroying and replacing one as useful as the Fourteenth street bridge.

He favored the Three Sisters location for a bridge as a result of Maryland’s plans for U.S. 240. As will be discussed later, Maryland planned to route traffic on rebuilt U.S. 240 to a link with the

Potomac River Freeway as the entrance to Washington. Senator Case thought an upstream location at Three Sisters would keep Virginia traffic out of the heavily congested central area of the District.

In response to reporter inquiries, General Lane explained that the Roaches Run Bridge and the Three Sisters Bridge are in the District's long-range plans approved by the city and NCPC. The "most immediate and urgent need" was the Constitution Avenue Bridge, but the 14<sup>th</sup> Street trestle-topped bridge had "outlived its usefulness." The District had been planning the replacement project for 10 years, he said. Senator Case's bill "raises a lot of complex issues," General Lane said, adding, "I don't want to criticize Congress, but it is desirable for sponsors of a new plan to take it before the Planning Commission, where problems can be discussed, before reaching the legislative stage." [Bills and Joint Resolutions Introduced, *Congressional Record-Senate*, March 1, 1957, page 2852; Beveridge, George, "Case Bill Asks 2 More Bridges," *The Evening Star*, March 3, 1957]

The city was working to increase the lanes available for traffic moving between the District and Virginia. Aside from the plan to replace the trestle-topped bridge, the city was widening Key Bridge and removing streetcar tracks to add two lanes for motor vehicles. The city also planned to paint another lane on Chain Bridge to increase its capacity. [Beveridge, George, "A Primer on That Aging 'Bridge Problem,'" *The Evening Star*, February 24, 1957]

On March 20, District officials testified before Chairman Davis's subcommittee in support of the Constitution Avenue Bridge to be built across the southern tip of Roosevelt Island. They disputed many of the assertions of tunnel advocates. The District, they said, could build the six-lane bridge for \$15 million as a fixed span or \$18.6 million with a draw span, noting that whichever design was used, BPR would pay 90 percent of the cost as part of the new Interstate program. If Congress did not act, the District would build the bridge Congress had approved in 1954, regardless of the views of any other group.

Representatives of Smoot Sand and Gravel and American Oil testified in support of a draw span or, failing that, a tunnel.

The subcommittee also considered the project to replace the trestle-topped 14<sup>th</sup> Street bridge. The District's Robertson testified that adding a draw span would increase the cost by \$1.5 million, which the subcommittee, having previously approved \$9 million for the project, would have to authorize. Chairman Smith told Robertson that he'd better "get that draw span straightened out right fast. If you propose to cut off [navigation] traffic on the Potomac River, you're going to have trouble."

In executive session, the subcommittee approved that the new bridge contain a draw span. The new bill also increased the amount of funds authorized in the 1946 Act to \$17.5 million for two new 14<sup>th</sup> Street bridges. The subcommittee added a draw span to the project despite the possibility that passage of the bill in the Senate would have to overcome Senator Gore's objections. [Beveridge, George, "House Group Approves Bill For Draw Span," *The Evening Star*, March 21, 1957]

Earlier in the month, the Senate District subcommittee approved funds for replacing the trestle-topped bridge, but did not require a draw span. When the House District Committee approved the subcommittee's bill and sent it to the House floor, the committee was setting up a confrontation between the powerful Chairman Smith, who was unalterably opposed to a fixed span, and Senator Gore, who was unalterably opposed to a draw span. ["New 14<sup>th</sup> Street Bridge Clears Bar, Faces Another," *The Evening Star*, March 26, 1957]

On April 8, 1957, the House approved the bill amending the 1946 legislation authorizing funds for two four-lane bridges to replace the existing 14<sup>th</sup> Street bridge. The primary opposition came from Representative H. R. Gross (R-Ia.), a journalist who had won election to the House in 1949 and was known as a penny-pinching fiscal conservative who used every parliamentary device to slow down bills authorizing expenditures. His primary concern in this case was not the draw span, but why Federal taxpayers should pay for a bridge that would primarily benefit residents of Maryland, Virginia, and the District of Columbia.

Supporters replied that Virginia and the District were paying for changes in the approach roads and that the new bridge would serve Federal facilities such as the Pentagon and the Navy Department Building. Chairman Smith said:

There are large Federal Government installations situated on the other side of the river. Virginia did not tell them to put them over there. They just put them over there for the convenience of the Government. Those people have got to move back and forth across the river.

Chairman Davis added, "The reason for that [Federal expenditure] is, as the gentleman knows, that this bridge is on the main United States Route No. 1." ["House Passes Bill for Second Bridge at 14<sup>th</sup>," *The Evening Star*, April 8, 1957; Authorizing Commissioners to Construct Bridges, *Congressional Record-House*, April 8, 1957, pages 5270-5278]

The next day, April 9, the House District subcommittee approved a bill authorizing \$25.5 million to pay 100 percent of the cost for the Secretary of the Interior to build a tunnel instead of the Constitution Avenue Bridge. Representative Kearns cast the only vote against the measure after the subcommittee rejected his amendment calling for financing the tunnel with tolls. He later told reporters that with a 25-cent round-trip commuter toll, the tunnel could be paid for in 13 years. He thought the 14<sup>th</sup> Street bridge bill that the House had approved the day before should be "the last free bridge or tunnel over the Potomac the House will vote."

In the face of this defeat in the subcommittee, District officials hoped for a better result in the Senate. As the Senate District subcommittee prepared for hearings on the issue, Engineer Commissioner Lane said he and other officials would "continue to oppose a four-lane tunnel, as we have in the past." [Beveridge, George, "D.C. Officials Turn to Senate In Bridge Fight," *The Evening Star*, April 10, 1957]

On April 11, the Senate District subcommittee began hearings on the issue. During the first day, George Beveridge wrote, advocates of a bridge and tunnel "began to retrace the tortuous arguments over whether a six-lane bridge or a four-lane tunnel should be built over or under the

river at Constitution avenue.” Amid these familiar arguments, he reported that the “most lively testimony, however, was an exchange between Senator Gore and Mr. Smith over the draw span,” with Senator Alan H. Bible (D-Nv.) trying to intervene. Chairman Smith appeared before the panel as a witness:

Senator Gore, chairman of the Senate Highway Subcommittee, said he opposed draw spans on Potomac bridges “now and forever hereafter,” because the “safe and efficient movement of traffic” must have priority on the huge new Federal system of interstate highways.

Mr. Smith argued for a tunnel at Constitution avenue which would eliminate the draw span issue.

He also noted that the House this week passed a bill authorizing the old Fourteenth Street replacement with a draw span, however. Since the existing Fourteenth Street Bridge has a draw span, Mr. Smith said, he hoped Senator Gore would not oppose that.

“No, I’m also for closing those bridges that do open now,” Senator Gore said.

Mr. Smith said he hoped Senator Gore was “not as adamant on this as you sound.”

“He was pretty adamant about the Constitution avenue bridge last year,” put in Senator Bible.

“Yes,” observed Mr. Smith. “And we haven’t got any bridge, either.”

Beyond the drawspan issue, Senator Gore said he had no position on the bridge-versus-tunnel fight.

When it came to draw spans, neither Senator Gore nor Chairman Smith “intends to yield in the deadlock over whether the bridge should contain a draw span.” [Beveridge, George, “Gore and Smith Feud Again Over Draw Span,” *The Evening Star*, April 12, 1957]

On April 20, the *Star* urged the Senators to, as the title of its editorial put it, “End This Farce.” Congressional testimony over 5 years “proved conclusively that a six-lane river crossing is essential” and that a four-lane tunnel would be a bottleneck “connecting systems of six and eight lane expressways.” While Chairman Smith and Senator Gore “wield strong influence in the House and Senate, some resolution of the impasse must be found.”

Testimony on April 25 demonstrated the wide differences on the bridge-tunnel debate. Lloyd Rivard, a District traffic engineer, testified that park and planning officials were distorting the fight with “vague generalizations.” He particularly attacked their argument that a four-lane tunnel would carry adequate traffic while a six-lane bridge would generate too much traffic for local streets. Tunnel advocates, he said, cited “meaningless estimates” of traffic over a 24-hour period to show that a four-lane tunnel would be satisfactory. The real test was whether four lanes could handle traffic during the morning and afternoon peak periods. Rivard stated that a six-lane bridge would carry twice as much traffic as a four-lane tunnel during these periods on weekdays.

He added that the traffic capacity of the bridge should be understood in the context of planned expressways that park officials preferred to ignore in arguing for a tunnel.

By contrast, National Capital Park's Thompson questioned whether all the capacity of a six-lane bridge was really needed for full use only a few hours 5 days a week:

He took the position that a tunnel would handle all the traffic that should go into the Lincoln Memorial area and that new bridges elsewhere could provide for other needs.

Mr. Thompson showed the Senators a model of precisely how approach roads to a tunnel and the tunnel itself could function. He said the total cost would be \$25.4 million.

When Senator Beall suggested that the tunnel option might be the only way to overcome the draw span stalemate between House and Senate, Senator Bible pointed out that the same issue would affect the 14<sup>th</sup> Street bridge project. It would have to be resolved. He planned to order a committee study of the issue to resolve conflicts. He hoped to decide between a tunnel or bridge in about 2 weeks.

Smoot and American Oil Company officials also testified. Smoot vice president A. M. Parker said that his firm required openings only about 10 to 12 times year. Under present rules, the openings occurred outside peak periods and did not interfere significantly with traffic. American Oil's G. H. Montgomery contended that without access to the Potomac River, the company would have to shut down its storage plant at Rosslyn, shift operations to Baltimore, and truck oil into the Washington area. The result would be the loss of \$675,000 in payroll as well as substantial local taxes.

Walter Kurlo, a BPR attorney, testified in support of the six-lane Constitution Avenue Bridge. The bridge, which would be part of the Interstate System, would be adequate for traffic while the tunnel would not. He also referred to studies by the U.S. Army Corps of Engineers that ruled out the need for a draw span, prompting approval of a permit. He did not believe the Corps would have issued the permit if the fixed-span posed a real threat. As for American Oil, he suggested that the company could deliver oil downriver from existing bridges, then transport it by a pipeline that would cost about \$1.5 million.

AAA officials testified that a possible compromise would be to include the draw span but prohibit openings between 6 a.m. and 8 p.m. However, he and Arlington County Engineer Clifton G. Stoneburner supported the six-lane bridge. General Grant, on behalf of the Committee of 100 on the Federal City testified in support of the tunnel on aesthetic grounds. [Beveridge, George, "Rivard Assails Tunnel Backers," *The Evening Star*, April 25, 1957; Beveridge, George, "Bible Seeks Bridge Decision in 2 Weeks," *The Evening Star*, April 26, 1957]

In early June, the Senate District Committee's Subcommittee on Fiscal Affairs voted 2 to 1 for a bill, S. 1707, calling for a six-lane fixed span for the Constitution Avenue Bridge. Senator Bible discounted the testimony of witnesses who were concerned about impacts on the two businesses that needed a draw span. A fixed span would cause them some difficulties, but he was convinced they could overcome them. Senator Beall, the dissenter, indicated he would take his arguments

to the full committee but if he lost that vote, would not attempt to block the bridge. [Warren, Don S., "Potomac Bridge Issue To Be Debated Thursday," *The Evening Star*, June 5, 1957]

Senator Bible, as chairman of the subcommittee, may have expected to prevail when the full committee took up the bill. If so, he was surprised the following day when the full committee voted, 5 to 3, to support S. 944, which would amend the August 1954 legislation to authorize a tunnel connection between the District and Virginia. Senator Beall, noting that he was not opposed to a bridge, summarized the deciding factor:

We all voted for a fixed span bridge at the last session, and sent it over to the House only to have it die. [Carper, Elsie, "Senate Unit Kills Bridge, Favors a Tunnel," *The Washington Post and Times Herald*, June 14, 1957]

Senator Bible, in the odd position of writing a majority report when he was in the minority, explained:

This tunnel would be constructed north of the Arlington Memorial Bridge and south of, or under, Theodore Roosevelt Memorial Island, together with approaches and roads connecting the tunnel and approach ramps with streets and park roads in the District of Columbia, with streets and park roads on the Virginia side of the Potomac River . . . .

Proponents of this measure felt that the construction of a tunnel would provide a suitable traffic facility, and would result in a minimum of damage to the memorial character of the area, as well as the park lands on the Virginia side of the river which would be affected by such a crossing.

While writing the majority report, he endorsed the minority views included in the committee's report. Based on the hearings held April 11, 17, and 23, 1957, the dissenters were convinced that a four-lane facility, whether bridge or tunnel, "would not accommodate traffic demands." BPR, they pointed out, shared this view and had approved the bridge, but would not approve a four-lane facility for funding under the Interstate program. That was because the 1956 Act required that designs "shall be adequate to accommodate the types and volumes of traffic forecast for the year 1975."

The capacity of a six-lane fixed span was 4,500 vehicles per hour in one direction, but only 2,200 vehicles going in one direction through a four-lane tunnel.

The minority view also covered the aesthetic issue:

One of the very purposes of S. 1707 is to change the location of the bridge . . . and move it to an upstream location . . . so as to minimize its impact on the memorial area, the proposed location being controlled at both ends by physical considerations. For example, on the Virginia side, Arlington Towers and the Marine Corps War Memorial fixed the alinement of the bridge. On the District side, the connections to Constitution Avenue and the inner loop fixed that end of the bridge. We are convinced that bridge structures can be architecturally beautiful to the enhancement of the area, and would have the advantage

of not plunging those who use the crossing into a tunnel as they approach the monumental area and bring them to the surface after they have passed it.

The minority report commented on the navigation clearance:

The Secretary of the Army has concluded that the cost to the public involved in providing a movable span in the Constitution Avenue bridge alone could not be justified on the basis of any benefits accruing to the two companies which now require the spans to be opened, and all other benefits to other navigation interests. [*Amending the Act of August 30, 1954 . . .*, Report Together With Minority Views (To Accompany S. 944), Committee on the District of Columbia, United States Senate, 85<sup>th</sup> Congress, 1<sup>st</sup> Session, Report No. 477, June 20, 1957]

On July 3, the Senate considered two bills amending the August 1954 legislation authorizing the fixed-span Constitution Avenue Bridge. S. 944 authorized the Secretary of the Interior to construct, operate, and maintain a four-lane tunnel from the vicinity of Constitution Avenue in the District to Virginia, to be built north of the Arlington Memorial Bridge and south of, or under, Theodore Roosevelt Memorial Island, as well as approaches. In planning the approach ramps and connecting roads in the District, the Secretary was to consult with NCPC, the Commission of Fine Arts, the District commissioners, and BPR. For the Virginia approaches and connecting roads, the Secretary was to enter into agreements with Arlington County and the State Highway Commission. The amendment authorized \$25.5 million to cover all costs, including the cost of approaches and connecting roads.

An alternative bill, S. 1707, was identical to the bill the Senate approved in 1956. It authorized a six-lane fixed span bridge crossing the southern tip of Roosevelt Island.

Senator Bible informed his colleagues about the long history behind these bills, saying that S. 944 brings into focus the key question about the Constitution Avenue crossing, namely “whether that crossing is to be a 6-lane bridge crossing or a 4-lane tunnel crossing.” He summarized the history of his committee’s review as well as the testimony pro and con.

Senator Beall summarized the arguments for S. 944, adding, “I think, if we wish to have a crossing of the river, the main thing we must work out is a bill which will be approved by both bodies of Congress.”

Senator Joseph C. O’Mahoney (D-Wy.) was the chief sponsor of S. 944 and floor manager for it during the debate. Senator O’Mahoney, an attorney, had won election to the Senate in the Democratic landslide of 1932 and had strongly backed President Roosevelt’s New Deal legislation. He became chairman of the Committee on Interior and Insular Affairs in 1949, and served in that capacity until he was defeated for reelection in 1952. He was elected again in 1954 and returned to the Committee on Interior and Insular Affairs, although not as chairman. While in Washington, he lived in the Sheraton-Park Hotel, a largely residential hotel at Connecticut Avenue and Woodley Road, NW., just west of the National Zoological Park. (The hotel is now known as the Marriott Wardman Park Hotel.)

Senator O'Mahoney said that he had introduced S. 944 as vice chairman of the Theodore Roosevelt Memorial Association. The proposed bridge, he said, "would mar the scenic beauty of this area." The Federal Government "has been endeavoring to make this region of the Potomac River . . . a scenic center for the people of the United States." For the record, he entered a letter dated March 27, 1957, from Secretary of the Interior Frederick A. Seaton, a former Nebraska Senator who had taken office as Secretary on June 8, 1956:

I am, of course, vitally interested in this problem and am anxious that it be resolved in the total public interest.

As custodian of our national shrines, monuments, and memorials, which would be affected by either a tunnel or a bridge in the location now being considered, I wish you to know that you have the full support of the Department in pursuing the objectives of constructing a tunnel in the general vicinity of Constitution Avenue extended . . . . [The] Department of the Interior is opposed to a bridge trafficway in this vicinity . . . .

He also referred to the statement President Eisenhower issued upon signing the Potomac River bridges bill on August 30, 1954. President Eisenhower said he wanted trucks to be prohibited on the Constitution Avenue Bridge and that all passenger-carrying buses that were using the Arlington Memorial Bridge should use the new crossing. The Secretary continued:

This is an indication, it seems to me, that the President of the United States would not prefer the bridge to a tunnel which would carry the traffic.

Senator J. Allen Frear, Jr. (D-De.), a bridge supporter from the District Committee, asked if NCPC, the Commission of Fine Arts, and other organizations favoring a tunnel were willing to pay for the difference in cost between the tunnel and a bridge. Senator O'Mahoney claimed to believe that the cost of a six-lane bridge would be "much greater" than the cost of a four-lane tunnel and that, in any event, a four-lane tunnel "would carry much more traffic per square foot than any bridge which was ever built." Supporters of the two options disagreed on the cost, but Senator O'Mahoney added:

It is much more desirable to construct even a more expensive tunnel than to destroy the beauty of the memorial center of Washington.

With the vote nearing, Senator Bible urged his colleagues "to bear in mind that if a four-lane tunnel is built at the proposed Constitution Avenue crossing, the expert testimony is to the effect that from the day the tunnel is constructed it will be packed to capacity."

He then asked his colleagues to approve amending S. 944 by striking out the bill after the enacting clause and substituting S. 1707. Before the vote, Senator O'Mahoney said:

The result of the adoption of the amendment offered by the Senator from Nevada would be to reverse the action of the Committee on the District of Columbia, to repudiate the recommendation of the Department of the Interior, to violate the recommendation of the Fine Arts Commission, and other bodies, and to kill the tunnel.

Senator Bible responded that adopting the amendment would sustain the views of the District commissioners, BPR, and AAA.

Without a recorded vote, the Senate rejected Senator Bible's amendment. It then promptly voted in favor of S. 944 and the tunnel option. [Construction of Bridges Over the Potomac River, *Congressional Record-Senate*, July 3, 1957, pages 10881, 10883-10889]

### **The House Tries Again**

The Senate action encouraged Chairman Davis, who told a *Star* reporter, "Now that the Senate has passed the four-lane tunnel plan, I think we will get some action and move along." Recalling the debate over whether a four-lane tunnel would be adequate, the reporter asked if Representative Davis agreed. "Well, I think so." ["Sponsors Seek Action Soon on River Tunnel," *The Evening Star*, July 7, 1957]

On August 1, the House took up H.R. 6763, a bill to amend the Potomac River bridges act approved on August 30, 1954. The bill replaced Title I of the law with a 10-section substitute headed "Tunnel in Vicinity of Constitution Avenue." Six of the sections reflected the Senate-approved S. 944, including authorization of \$25.5 million to carry out the provisions of the act. In addition, H.R. 6763 provided:

There is hereby authorized to be expended from the appropriations available to the National Park Service the sum of \$1 million for the preparation of plans, designs, and construction purposes.

The bill authorized the Interior Secretary, at his discretion, to employ professional engineers, landscape architects, or other consultants as needed. He was "granted authority to incur obligations and enter into contracts [that] shall be deemed a contractual obligation of the Federal Government for the payment of the cost thereof . . . ." Finally, H.R. 6763 provided:

There shall be transferred to the Department of the Interior so much of the records, property, and funds of the District of Columbia as may be appropriate by reason of the enactment of the foregoing provisions of this act. Such measures and dispositions as the Director of the Bureau of the Budget shall deem to be necessary to effectuate the said transfer shall be carried out in such manner as he shall direct.

That this aspect of the bill would be contentious became clear when Chairman Smith of the Rules Committee introduced House Resolution 375 establishing the terms of debate. Almost immediately, debate began on the merits of a tunnel rather than the resolution. When Chairman Smith completed his initial comments on the resolution, Representative Arthur L. Miller (R-Ne.), a member of the District Committee, pointed out that the resolution referred to construction of bridges but the underlying bill was for construction of a tunnel. "I think the gentleman must admit that there is quite a vast difference in an efficient overhead bridge and a tunnel."

After Representative Broyhill briefly explained the background, Representative Miller requested evidence as to the efficiency of the tunnel for meeting the traffic demands. Chairman Smith

explained that the evidence would be presented when the bill, not the resolution, was up for consideration.

After a brief exchange with Representative James G. Fulton (R-Pa.) about the difference in cost, Representative Gross, the penny pinching obstructionist from Iowa, said he opposed the resolution because it waived points of order, one of his primary methods of delay since they allowed him to question whether a measure was in accordance with House rules. In the case of H.R. 6763, he said he realized “there are very good reasons why points of order are waived on this bill,” citing the \$1 million taken from the NPS appropriation and the transfer of records, property, and funds from the District to the Interior Department. The NPS and District funds, he said, were appropriated for one purpose and designating them now for a different purpose without action by the Committee on Appropriations was improper:

I submit that these are two reasons why this bill is brought here under a rule waiving points of order. The rule ought not be adopted, and we can dispose of the bill quickly by defeating the rule.

As far as Representative Gross was concerned, “the taxpayers of this country should not be saddled with the cost of building a tunnel under the Potomac River for the benefit, in part at least, of the State of Virginia.”

With the resolution still under review, other congressmen began debating whether a four-lane tunnel could handle traffic as well as a six-lane bridge. Representative Miller, for example, pointed out that “a four-lane tunnel under the river would be obsolete and not adequate to handle the traffic as soon as it is finished.” He favored a six-lane bridge, but if the House wanted a tunnel, he hoped it would have at least six lanes.

Finally, the House agreed to the resolution, allowing debate on H.R. 6763 to get underway. Debate would last an hour, with Chairman Davis given 30 minutes in support of the bill and Representative Sidney E. Simpson (R-II.) given 30 minutes in opposition.

Chairman Davis discussed the history of the debate in recent years and past congressional action, as well as the hearings held and Ole Singstad’s testimony, that allowed the subcommittee to draft the bill. He said:

The engineers and the traffic experts state that by 1970 we will need 17 additional traffic lanes from the Virginia side over to the District of Columbia. Very careful plans have been made to provide these 17 traffic lanes. Two of them have already been provided by the widening of the Key Bridge and the adding of two lanes to the Key Bridge [sic, probably Chain Bridge]. One of them will be provided by the construction of the new outgoing 14<sup>th</sup> Street bridge, which now has three lanes and the new bridge will have four lanes. A bridge is planned at Roaches Run which will provide six lanes. This tunnel will provide four lanes. Another bridge at Three Sisters will provide four lanes also.

With all these added lanes, the four-lane tunnel “will be able to take care of all the traffic that ought to be funneled into Constitution Avenue from Virginia.”

Further, the experts said “it would be a mistake to funnel more vehicles into the Constitution Avenue [sic] than could be carried through this tunnel.” He pointed out that NPS Director Wirth stated that “a four-lane tunnel would provide crossing [sic] for the maximum number of vehicles which Constitution Avenue and the streets in that area should be called upon to handle.”

Several congressmen expressed the view that, as Representative Louis C. Rabaut (D-Mi.) put it, “It certainly is apparent to anyone that on 6 lanes you are going to move more traffic than you are on 4.” Here and throughout the debate, Chairman Davis tried to convey they idea that six lanes were not needed at this location because with a total of 17 added lanes, Virginia traffic would be dispersed over several crossings:

It must be dispersed. It must be brought in so that it will not congest the approaches to these various crossings. So that when [traffic] is delivered over into Washington it will not all be funneled into one point.

When Representative Alfred J. Westland (R-Wa.) expressed support for the bill and commended Representative Broyhill for his presentation of the case, Representative Gross said he also wanted “to commend the gentleman from Virginia when it comes to tapping the Federal Treasury for the benefit of his people. He is always on the job.”

Another frequently raised issue was why the Federal Government should pay 100 percent of the cost of the bridge. Representative Broyhill had said that since the tunnel would tie into land owned by the Federal Government, “it is not different than the various national parks throughout this great country.” Of course, the people of Maryland, Virginia, and the District would be the primary users of the tunnel, “but since this is the Nation’s Capital, it will be used by all the people of the country.” He added that since the route was on the Interstate System, the Federal Government was going to pay 90 percent of the cost of whatever was built in the corridor, “so the only thing we can argue about is 10 percent of the cost of construction.”

Representative John M. Robsion, Jr. (R-Ky.) was one of several congressmen who took exception to the comparison with National Parks. “It would seem to me that 90 percent of the traffic over this bridge would consist of people who live in Virginia and work in the District of Columbia. I do not know on what theory the State of Virginia should be relieved of any responsibility for this expense, when they are getting taxes from the homes that are being built over there and from the people, yet they shift the entire responsibility to the Federal Government.”

Representative Broyhill replied that it was “the extension of the Federal Government through its nontaxpaying Federal installations that has caused the necessity for construction of this facility here in the District.”

He also pointed out that building a bridge across Roosevelt Island would affect planned memorials, including one to President Theodore Roosevelt on the island named after him and the Freedom Foundation Memorial to the Bill of Rights planned for construction near the Iwo Jima Memorial (Marine Corps War Memorial) in Virginia. (Sarcastically, Representative Gross said “that would be in the national park known as northern Virginia.”)

During the 2 days of debate, the House considered why Virginia and the District did not pay for the tunnel, possibly by making it a toll facility. Representative Kearns introduced an amendment calling for a 25-cent toll round trip. “Then nobody can go home and be accused of favoritism or that they voted for a tunnel to take care of Virginia.” As a member of the District Committee, he acknowledged that Virginia’s agreement to pay for the approaches would be a sufficient contribution to the project.

Some congressmen wondered where the District funds were coming from. Representative John Taber (R-NY) asked, “Would part of it come out of the school lunch program or the school education program?” This question and several others, including confusion about the cost of a tunnel versus a bridge plus the approaches, prompted him to add, “this is all mixed up . . . . You cannot tell a single thing about what the bill does or what it means. It is just a mess.”

The \$1 million taken from NPS was another sticking point. Several members called Director Wirth to ask his views on the transfer. One of those was Representative Michael J. Kirwan (D-Oh.). He recognized the need for the tunnel, but not at the expense of National Parks. He asked Wirth if he had a hand in shifting this \$1 million from park needs:

I just called the Director of the Parks, and he said no, that he made no such request for a million dollars . . . . I served notice on him then that “if we overgave you a million dollars this year for the Park Service, I will guarantee you will not get it again.”

As Representatives objected to the bill and the debate process, an impatient Chairman Smith took the floor to say:

I think more misinformation has been spread around this thing in an effort to defeat a good bill than anything I have seen around here lately. The most absurd questions have been raised about this. Gentlemen get up and talk about using the money for school lunches, and they will have some people think that is true. It has nothing in the world to do with this bill. This is a bill to build a tunnel across the Potomac River.

The issue had been debated for 3 years and he did not want to spend a day or two “on a filibuster about this bill.” He said, “If you want to strike out the enacting clause, go ahead and do it, and we will swim across the river if we have to.”

He was particularly upset by the debate over who should pay for the tunnel:

Now, if you want to throw this thing out of the window without any consideration, all right, but when you realize the Navy Department and your Pentagon Building employ thousands and thousands of people who use these bridges every day, that it is not for Virginia, it is not for Maryland, it is not for the District of Columbia, but it is for the United States of America . . . . Your Federal employees have to come across that river every morning and every night, coming and going to work, and that condition is getting bad.

As for the number of lanes, he pointed out that between the four-lane tunnel and six-lane Arlington Memorial Bridge, “you have got together there in one area 10 lanes of traffic that are

going to be turned in daily to the downtown area of Washington where the traffic is congested.” He asked:

Now, do you think you ought to make it any worse than we have to make it under this bill? If you put 12 lanes around the White House and the Jefferson Memorial into the business part of Washington, you just will not be able to handle it.

As a member of the District Committee, he could say that these factors and the expert testimony had been behind the committee’s creation of the bill:

If our thoughts on it, if our work on it, if the time we have spent on it, if the work of the various and sundry engineers and other experts we brought here are worth anything, then let us go ahead and pass this bill. If you do not want to pass any bill, if you want to go home and say, “Yes, we would not let them build a bridge across the Potomac for the people of Virginia and Maryland and the District,” if you want to demagog [sic] about this thing, then let us get through with it.

Representative Clare E. Hoffman (R-Mi.) immediately raised a point of order regarding the use of the “demagog business.” Chairman Smith replied, “If anybody is out of order on any occasion, on any bill, talking about demagoguery in this Chamber, I do not know him.” During the remaining debate, the phrase would be referenced repeatedly.

Representative Hoffman, who often used a humorous tone in the debate, discussed how the bridge approved in 1954 had turned into a tunnel. He said “the evidence is, and it is not disputed, that the engineers came up, as I got it anyway, with a six-lane bridge and that will cost less than a four-lane tunnel.” They also agreed a bridge would carry more traffic than a tunnel:

Then why do we not have a bridge recommended? . . . . Is it because two private enterprises, an oil company and a gravel and sand company, for their own profit want a draw in any bridges that may be built? Is that it? Or is it because over in the other body they insisted that if they built a bridge, they have a draw on it and they could not get a bill [with] a draw in the Senate because of the opposition of a gentleman from Tennessee?

. . . . So not being able to get a six-lane bridge with a draw, it is now a four-lane tunnel to accommodate those two companies and we soak the taxpayers. I cannot accept it.

Representative Gross said, “So they just sent this bill in to try it on for size and see how it will fit, and maybe next year we will have another one.”

Representative Hoffman continued, “I cannot soak the taxpayers for a tunnel when a bridge will better serve the people at a far less cost.”

Representative Saylor introduced an amendment to drop the \$1 million transfer from the NPS. Representative Walter H. Judd (R-Mn.) thanked him for the amendment, saying “This is the worst thing in the bill, from the standpoint of a great many of us.” He was for the tunnel, but not “this business of reaching over into somebody else’s pocket and taking money that was appropriated or planned for other purposes that are also equally worthy.”

When several representatives asked whose idea the \$1 million transfer was, Representative Broyhill said that the Interior Department's representatives had suggested it "to proceed with the drawing of the plans and construction of this facility because of the emergency. They stated that they had funds they could transfer over for temporary use until funds were appropriated for the specific purpose later on." However, in view of the controversy the provision had provoked, he planned to support the Saylor amendment. Chairman Davis agreed that he would not object if his colleagues dropped the provision.

Representative Gross offered his own amendment that authorized the District of Columbia and Virginia to build the tunnel. He explained:

Mr. Chairman [of the Committee of the Whole House], a little while ago those of us who were opposed to this bill were accused of being demagogues. I do not know anything that smacks more of demagoguery than to try to shift the building of all the bridges from Maryland and Virginia into the District of Columbia onto the taxpayers, all the taxpayers of this country, including those in Iowa.

Like many of his colleagues, he thought the District and Virginia could finance the tunnel as a toll facility, just as his own State had done to pay for replacement of a Mississippi River bridge that had collapsed in Representative Schwengel's district "only a year or so ago." Instead of coming to Congress asking for funds to replace the bridge, Representative Schwengel "asked for an authorization so that a new bridge might be built with private funds across the Mississippi River, a toll bridge . . .")

As for the \$1 million transfer from the NPS, he said he was "suspicious of committee members yielding so quickly when somebody offers an amendment as in the case of the gentleman from Pennsylvania . . ." Representative Hoffman suggested that "they be commended for acknowledging it was wrong and they took it out." To that, Representative Gross replied, "I wish they would acknowledge that the rest of the bill is wrong."

The House rejected the Gross amendment. [Authorizing Construction of Bridges Over the Potomac River, *Congressional Record-House*, August 1, 1957, pages 13365-13387]

On August 2, the House resumed debate on H.R. 6763. Chairman Davis, after stressing several points in response to the issues raised the day before, pointed out that since the Senate had already approved a bill authorizing a four-lane tunnel, "if we pass a four-lane tunnel bill we can coordinate the two bills, go ahead and move, and solve the traffic problem."

Representative Hoffman again wondered why a bridge bill had become a tunnel bill. The night before, he said, he had asked several Senators why they had passed a tunnel bill and the "answer from everywhere was that they understood that the House would not build a bridge but had to have a tunnel." He favored an amendment that would leave the 1954 law as the solution to the traffic problem. "If you gentlemen want a way of getting across the river, this amendment which will be proposed will give it to you and give it to you now."

In addition, he referred to Chairman Smith's comment about demagogues. "Well, now, my feelings are not very easily hurt, and I am not sure they were hurt at that time, but they should have been." Chairman Smith was hurling that charge "at everyone who opposed the position the gentleman takes on his bill."

Representative Broyhill observed that many of his conservative colleagues were trying to kill the bill under the impression that doing so would save taxpayer money. That was not the case, he said, because if the bill died, the District could proceed with the bridge project authorized in the 1954 legislation, with Federal-aid funds:

We are only here trying to work out a compromise so that these people whom we have charged with the responsibility of preserving these beautiful areas around our Nation's Capital can work out this problem. So far as paying the cost of construction is concerned, you have already answered that question before in the approval of Public Law 704.

Representative Hoffman introduced his amendment that would change four-lane tunnel to a "6-lane bridge." When Representative Broyhill pointed out that that the 1954 law already called for a six-lane bridge, Representative Hoffman replied:

Then why not see that it is built. Call for the ousting of the bureaucrats who defy the Congress. Cut off their compensation. Refuse to give them funds to operate. Who are they? Where do they get their power?

Chairman Smith said that the Hoffman amendment "raises a very fundamental question," namely whether a bridge or tunnel should be built:

Underlying the question of the bridge is the question of the use of the Potomac River by transportation. At Georgetown there is one of the oldest ports in the United States. There is important business there now. There is a movement on now to improve the ports of Alexandria and Washington for international shipping. If the amendment passes in its present state, there is no provision for a bascule span to permit traffic to go up and down the river . . . . Every bridge there now has a bascule span and if you put one in without such a span, you close up the oldest port in America.

He suggested amending the Hoffman amendment by adding "with a bascule span" to the wording. Representative Hoffman agreed, but said:

The cat is out of the bag now exposed by what the gentleman from Virginia said. And it is a sorry looking alley cat. Navigation. Navigation. Sometime in the future we are to have a seaport up the river in Georgetown.

In short, he said, the beneficiaries were "a couple of boatowners [sic] and oil company and a sand and gravel company":

The sand and gravel company and the oil company, their officers, their stockholders, their employees stand to profit—not the folks who want to cross the river . . . . We are to build this tunnel to pay a less cost for these two companies, private industries to operate . . . .

Do we need an investigation to learn why officials refuse to build a needed bridge and what kind of, and who is doing the lobbying for a tunnel instead of a bridge.

The House agreed to Chairman Smith's amendment of the Hoffman amendment.

As debate continued, Representative Gross offered another amendment, this one providing that for the purpose of building the tunnel, "the Secretary of the Interior shall offer for sale to the State of Virginia, at a fair appraised value, such lands and other property held by the Federal Government as may be necessary for construction of the said tunnel and approach ramps."

Chairman Smith pointed out that as a result of the approved Hoffman amendment, "this is no longer a tunnel bill." The House rejected the latest Gross amendment.

Undaunted, Representative Gross offered another amendment, this one authorizing \$25.5 million, one half to be contributed by the District of Columbia, the other half by Virginia. Without debate, the House quickly rejected the amendment.

Representative Kearns recognized that the amended bill now referred to a bridge, but he offered an amendment drafted earlier to require a toll of 25 cents, round trip, through the tunnel referenced in the original bill. By explanation, he cited the Holland Tunnel in New York City, which was paid for "in 7 years at a cost of 50 cents per car." Based on projected travel on the crossing of the Potomac River, "we could amortize this tunnel in 10 years, and I think we could keep the toll on for another 10 or 11 years, we would have sufficient money for maintenance for 25 years." He acknowledged the long-running dispute over a bridge versus tunnel. "It has rightly been said that we have enough bridges over the river; in my opinion, we must go to tunnels eventually. They are more consistent."

Representative Broyhill opposed the amendment. It was, he said, "rather superfluous" since the bill now called for a bridge, not a tunnel. As for the toll idea, he said that with the Arlington Memorial Bridge 1,000 feet away and Key Bridge about 2,000 feet away, Virginia motorists would have three choices, one of which involved paying a toll:

I believe if such a crossing were built it would not be used up to 10 percent of its capacity. It would certainly be a foolish thing for the Federal Government to do to the entrance to our Nation's Capital.

When Representative Kearns asked about the possibility of reducing the toll, Representative Broyhill replied:

As the bill is presently written—and I do not know anyone who knows how it is written with all these amendments in it—it is a superfluous bill. We have a law on the statute books now with certain funds appropriated for a six-lane bridge. The way this bill is now written we might just as well vote the whole thing down, because we already have a law to permit the building of a bridge.

Several congressmen tried to determine what would happen if the bill were returned to committee, leaving unchanged the bill approved on August 30, 1954. As for whether the District

of Columbia could use the available funds now, Representative Taber replied, “They would not have to wait 10 minutes.” Perhaps confused or in despair, Representative Broyhill pointed out that the language transferring the funds to the Department of the Interior had been stricken from the bill on the floor. Representative Taber replied that nothing had been stricken out of the 1954 law:

Representative Broyhill. As the bill stands today practically everything has been stricken out.

Mr. Taber. The money is there and they would be ready to go.

As the debate came to an end, the House took a roll call vote on the Hoffman amendment, as amended to include “bridge with bascule span.” The House voted for the amendment, 226 to 109.

Representative Miller offered an amendment to recommit the bill to the District Committee, which the House quickly approved. [Authorizing Construction of Bridges Over the Potomac River, *Congressional Record-House*, August 2, 1957, pages 13489-13503]

Recommitting the bill essentially killed it but gave the committee members a chance to redraft it if they wished.

On August 6, the House was debating a supplemental appropriations act that included funds for a new airport to serve the Washington-Baltimore area, with expansion of existing Friendship International Airport in Maryland or a new airport in what is now called now Burke Lake Park, Virginia, as options. Representative Hoffman observed that:

The local Congressmen cannot agree where they want it—Burke or Friendship. Many of us do not care where it is constructed just so one is built.

The situation is like this bridge-tunnel controversy; we would have had a bridge the other day if the bill had not been recommitted. If the gentlemen from Virginia want their people to have service, why do they block it? Already there is legislation on the books saying that there shall be a bridge, but someone does not want it where that bill authorizes its construction, so we do not have a bridge anywhere.

What is the situation? Our good friend from Virginia [Mr. Broyhill], our delightful friend from Virginia [Mr. Smith], they are keeping people waiting . . . Why? Because they cannot make up their minds. Yes, of course they have; oh, yes; they want a tunnel or they want a bridge, with a draw in it, so those two companies up the river can make larger profits.

Chairman Smith’s comment about the port of Georgetown was still on Representative Hoffman’s mind:

Well, now, the aristocratic population that lives up there in Georgetown may not welcome a lot of dockworkers under their noses, however fine the workers may be. They would not mix any more than oil and water.

And when is Georgetown going to be a seaport? Are we to dredge the channel of the river from Georgetown way down to the bay entrance? They are talking now about the channel not being deep enough to take boats up to Baltimore. What do the gentlemen want to do? Make a seaway to Georgetown? And after you get the seaway what are you to use it for? What do the gentlemen propose to ship up to Georgetown. The talk of Georgetown as a seaport, seems to be nonsense.

There is something about that bill or, rather, about the refusal to build that bridge, that was authorized a long time ago, that just smells to high heaven, and it would not be too bad a thing if the Congress, with the investigating committees it has, would just appoint another to find out what is loose somewhere around. It is all right to represent your constituents, but, after all, other people have some interest in what we do.

I asked the gentleman from Virginia [Mr. Broyhill]: “What makes you think you will get a tunnel any quicker than you would a bridge? He replied: “There have been a lot of folks who have wanted a bridge over there for a number of years, but they will not build it.” I asked him who would not build it, and he said the Department of the Interior.

Well, let us get after them. Who are they? It may be all right for the Supreme Court to defy the Congress and tell us we do not know what we are legislating about and that we do not mean what we say, but are we to let the Department of Interior come along and usurp the function of criticism which the Supreme Court has assumed? It is about time we sat down on the Department of the Interior, and if they will not do what we tell them to do, cut off their appropriations; they come to time [sic]. [Supplemental Appropriations for 1958, *Congressional Record-House*, August 6, 1957, pages 13778-13779]

On August 7, he introduced a bill to amend the 1954 Potomac River bridge act to shift the bridge to Roosevelt Island. With Congress due to recess on August 30, any consideration of the bill or of the issue would have to wait for the second session of the 85<sup>th</sup> Congress beginning on January 7, 1958.

(As Representative Hoffman suspected, a Georgetown seaport, if ever under consideration, never became a reality.)

### **Trying to Get Construction Underway**

At the end of July, Engineer Commissioner Lane left office. Speaking of his two and a half years as Engineer Commissioner, General Lane said he favored home rule to replace the current government by presidentially appointed commissioners. “This gives our friendly rivals in the suburbs more control over the spending of our tax dollars than we have ourselves.” His next assignment was Commanding Officer, Fort Leonard Wood in Missouri.

At a farewell party for him on July 25, the *Star's* principal political cartoonist, Jim Berryman, gave the departing commissioner a recent editorial cartoon about the battle over the Constitution Avenue Bridge. It depicted General Lane at his desk, happily waving his "Transfer Order to Command of Fort Leonard Wood." Behind him was a filing cabinet labeled "Potomac Crossing," with bulging drawers for "Bridge vs Tunnel." The caption read, "Hooray . . . Back to the Old PONTOON BRIDGES!" [Bassett, Grace, "Cool Controversy Marks Lane's Rule in District," *The Evening Star*, July 7, 1957; "Officials Laud Lane, Hail Welling at Party," *The Evening Star*, July 26, 1957; Berryman cartoon, *The Evening Star*, July 22, 1957, page 8]

General Lane's successor was Colonel Alvin C. Welling, a 46-year old civil engineer who had joined the U.S. Army Corps of Engineers in 1938 after graduating from the Massachusetts Institute of Technology. During World War II, he was stationed until 1943 in Alaska where he was involved in construction of the Corps' Southern Sector portion of the pioneer Alaska Highway in 1942. In 1943, he was reassigned to New Delhi, India, as executive officer to the Chief of Engineers, Service in Supply, in the China-Burma-Indian theater where he had been a staff officer on construction of the Assam-Burma Road. He had served several times in the Washington area: at Fort Belvoir, Virginia (1939), Office of Chief Engineer at Gravelly Point (in 1943, for 6 months, and again in 1951), and Fort McNair War College (1955-1956).

When President Eisenhower named him to the post of Engineer Commissioner, Colonel Welling was stationed in Heidelberg, Germany, as deputy engineer of the U.S. Army in Europe. He, his wife, and two school-age children moved into a home at 4629 Rockwood Parkway, NW., in the Spring Valley neighborhood of the District south of American University, just north of the Palisades, and not far from Glover-Archbold Park. The family included a beagle, named Gerald Kanine Beagle, that the Wellings had acquired in Arlington a few years earlier when he was a pup, (Having been shipped by mistake to Albuquerque, New Mexico, during the transfer, "Jerry" arrived belatedly in Washington.) ["Officials Laud Lane, Hail Welling at Party," *The Evening Star*, July 26, 1957; "Welling to Succeed Lane As D.C. Commissioner," *The Evening Star*, July 3, 1957]

After arriving in Washington, the family stayed at the Berkshire, a deluxe rental apartment building at 4201 Massachusetts Avenue, NW., where he talked to reporters in the lobby. None of his assignments had been "tame." As the *Star* put it:

Whether the task involved the 500-inch rainfalls of Assam, the 79-below zero cold of Alaska or running a teeming metropolis like the Nation's Capital, Col. Alvin C. Welling says he regards every last one as a challenge and source of enjoyment.

He told reporters, "Please. I don't want to talk about the Southwest Freeway, home rule, the Constitution Avenue Bridge or River Beno Dam. Right now, I'd rather talk about finding a house." He wanted to meet with his friend, General Lane, for updates on all the issues facing the new engineer commissioner, some of which Colonel Welling was familiar with from earlier postings to the area. He was looking forward with "keen anticipation" to his new assignment.

On July 29, General Lane and Colonel Welling paid a courtesy call on President Eisenhower at the White House. They declined to tell reporters what they discussed with the President, but

General Lane did say that he had not brought up any particular problems. They had discussed, he said, the position of engineer commissioner. [Stepp, John W., "Col. Welling to 'Enjoy' Challenge of D.C. Post," *The Evening Star*, July 19, 1957; "New Commissioner and Gen. Lane Call on President," *The Evening Star*, July 29, 1957]

By the time Colonel Welling took his oath of office on August 1, District officials had had enough. They were ready to move on the Constitution Avenue Bridge at its original location between Roosevelt Island and Arlington Memorial Bridge as approved in 1954. The District Highway Department asked the commissioners to authorize the project. Colonel Welling was believed to support the proposal, but Commissioner McLaughlin wanted time to examine cost estimates.

(Further, the Corps' permit for the fixed span was to expire on August 23. Robertson had requested an extension. The Corps extended the permit for 2 years to start construction and 4 years to complete the bridge.)

Two Senators stated they agreed with the District Highway Department. Senator Bible said the record was "abundantly clear" that the bridge was not only needed but congressionally authorized. "I urge that the bridge be built without further delay." Senator Gordon L. Allott (R-Co.) also recommended that the city "should start to build and build quickly." He acknowledged that he was "torn between loyalties" as a member of the National Monuments Commission. His preference was to keep the west shore of the Potomac clear for a monument to the Five Freedoms, but he felt that traffic needs overrode his preference. ["Officials Ask Go-Ahead On Constitution Bridge," *The Evening Star*, August 6, 1957]

On August 16, District officials announced they would go ahead. Colonel Welling predicted that construction would begin by the middle of 1958:

Commissioner Robert E. McLaughlin, who announced the decision jointly with Col. Welling, said the White House has offered no objection to proceeding with the bridge authorized in 1954. He said the city had agreed, however, to follow certain suggestions made by President Eisenhower at the time the 1954 legislation was signed. Included, he said, is a provision that trucks be banned from the bridge.

The District authorized Modjeski and Masters to begin designing the planned steel bridge while selecting a Chicago firm, Freyssinet-Preload Corporation, to design a bridge of prestressed concrete. The more cost-effective alternative would be chosen.

Design work on the bridge had begun after approval of the 1954 bridge, but approaches had been redrawn based on consultation with other organizations. The 1954 Act required consultation with NCPC and the Fine Arts Commission, but did not give them approval over the plans. As Beveridge pointed out:

This fact, nevertheless, is not likely to rule out heavy controversy during the next year among city highway officials and the planners, Fine Arts Commission and National Park Service.

Representative Broyhill, after the bruising battle over his tunnel bill, issued a statement:

I am of course gratified that we have no further obstacles to encounter and that the Commissioners intend to go ahead with construction. While there were a lot of annoying and disagreeable procedures we had to go through in Congress recently, we had to debate the issue to let the people know that Congress does not desire to amend the bridge authorization law which I sponsored in 1954. [Beveridge, George, "Work Expected to Start On Bridge by Mid-1958," *The Evening Star*, August 17, 1957]

Representative Broyhill later said he had conferred with White House officials since failure of his tunnel bill and had urged them to support the 1954 bridge location. They were, he said, primarily concerned about the traffic impact on the Lincoln Memorial area and the possibility of trucks on the roads in the memorial's vicinity.

Colonel Welling said the city had "a firm understanding" with BPR that the bridge would qualify for Interstate funds at a Federal share of 90 percent despite the truck ban. He also was reaching out to NCPC and the Fine Arts Commission to gain their support. Neither had, as yet, commented, but in a broadcast on WWDC's "Report to the People," Commissioner McLaughlin was asked if he thought the bridge would finally be built. "I certainly do. It is the full intention of the Commissioners and the Highway Department to go ahead with construction as fast as possible." [Beveridge, George, "Inter-Agency Accord Sought On River Span," *The Evening Star*, August 18, 1957]

Chairman Smith accepted the District's decision, saying he had exhausted his legislative efforts to secure a draw span. "There's nothing I can do," he said. "Congress passed the law." As for the businesses calling for a draw span, he said that if "the engineers who have the power to block the river want to do that, that's up to them." Still, he said, "I just don't like abandoning the age-old theory that rivers are highways" that should not be closed. ["Smith Stops Efforts to Get Draw Span," *The Evening Star*, August 19, 1957]

Before commenting formally, the Commission of Fine Arts asked for a model of the bridge and its approaches. Colonel Welling refused, saying the preparation of such a model would be a needless delay. On November 21, he gave the commission the plans for a multiple-arch span, faced with masonry, patterned after the Arlington Memorial Bridge. The *Star* praised the design, saying it was "far from the 'ugly scar' foreseen by one prominent opponent." It was "in short, a handsome design." The editorial pointed out that the 1954 law required consultation with the Fine Arts Commission, not its concurrence. "We hope, however, that the commission and the highway engineers will come to an early agreement on the design, so that actual construction of the long-awaited bridge can be started in the near future." ["Hardly an 'Ugly Scar,'" *The Evening Star*, November 25, 1957]

The commission did not agree. On December 19, David Finley replied in what Beveridge called "a bitter denunciation" of the city's plan to move forward with the bridge project. Finley said the commission strongly opposed the location of the bridge and hoped Congress would pass a law in 1958 shifting the bridge to a location across Roosevelt Island. However, if the city insisted on proceeding, the commission favored a masonry-type bridge. Finley also said the city should seek

the commission's advice on the architectural features of the connecting roadway structures in the District and Virginia:

In any event, the Commission of Fine Arts does not concur in or take any responsibility for the grave decision arrived at by the District Commissioners to proceed with the bridge in the short time intervening before the re-assembling of Congress.

You are at liberty, of course, under the law, to disregard such advice. We are not at liberty, however, to give you anything less than our considered, disinterested opinion as to what is best for the City of Washington.

He explained that the bridge was only a part of the project, which included roadways, overpasses and other structures. "These structures are hardly less important than the bridge itself, in the effect they will have on the appearance of the city." The commission was especially concerned about a planned 23<sup>rd</sup> Street overpass of Constitution Avenue which it said would "deposit a stream of traffic practically at the base of the Lincoln Memorial." In addition, the commission was concerned about how the approaches would affect Roosevelt Island, Arlington Memorial Bridge, and the Iwo Jima Marine Memorial:

Since you have refused to furnish the information requested, the commission is not in a position to advise as regards the proposed structures, except in the case of the bridge over the Potomac River at Constitution avenue.

In that regard, the commission would approve a masonry-type bridge "at some other location." To avoid any doubt, Finley added:

In considering the merits of the design, however, it must be understood that the commission does not, either directly or by implication, approve the erection of a bridge and its network . . . so near the Memorial bridge and the Lincoln Memorial. [Beveridge, George, "Fine Arts' Protest On Bridge Studied," *The Evening Star*, December 20, 1957]

The *Star* referred to the letter as "merely one opinion . . . expressed by an agency specifically created to give it." The editorial said that "after more than five years of interminable wrangling," the District commissioners had no choice but to proceed in view of the actions of other agencies and the Congress. "There has never been a more dismal demonstration of their utter incapability of working together in the common interest."

The point was not that the location was ideal. It was a compromise, worked out with Senator Case, that "Congress approved in its own confused exasperation over the hopeless conflict between the various executive agencies involved." The commissioners "seem powerless" to do anything but proceed. "Only the President of the United States can straighten out the inexcusable mess created by the inability of his executive agencies to reach agreement." There was still time for President Eisenhower to send "a forthright request" to Congress to approve legislation shifting the bridge to the tip of Roosevelt Island, and for the House and Senate to act. "If it is not done, and quickly, we shall have our own Bridge of Sighs near the Lincoln Memorial." ["Monument to Confusion," *The Evening Star*, December 22, 1957]

The day after the editorial, Colonel Welling replied to Finley's letter, saying the District was "pleased to have that architectural advice in writing" and adding that, "If it represents the commission's final advice on the bridge, then the commission and the engineers of the District could perhaps go on to further consultations."

He ruled out further discussions of the approaches and affected roadways. He planned to confine future consultations with the commission to design of pedestrian access between Small Island and Roosevelt Island:

The District has written the Theodore Roosevelt Association in search of the association's wishes concerning the pedestrian access from the bridge to Small Island. The item has since been discussed telephonically with a representative of the association.

The District would seek the Fine Arts Commission's advice after the Roosevelt Association offered its views on the pedestrian access.

As for the approaches, the District had consulted with the commission in 1955-1956. "The commission's views are well known, and every reasonable effort is being made to accommodate them." Colonel Welling added, "Any adequate bridge or adequate tunnel in that general vicinity will lead to the same general approach road system." ["Fine Arts Angered, Bridge Plans Pushed," *The Evening Star*, December 24, 1957]

In early 1958, Secretary Seaton informed reporters that he had written to the District Commissioners and spoken with Commissioners McLaughlin and Colonel Welling to request all plans for the Constitution Avenue Bridge. His request, he explained, was in accordance with President Eisenhower's August 1954 signing statement that the Secretary "should be authorized to approve all plans for the bridge and for approach roads and interchanges" to protect Federal interests. Secretary Seaton hoped to meet with Colonel Welling soon to discuss procedures for moving forward.

Asked if the NPS would continue to work on Capitol Hill against the bridge, Secretary Seaton said, "I have not any such intention." As for whether he thought he would approve the city's plans, he replied:

I certainly would hope so. I am entirely convinced that we need more ways and means of getting across that river. No one needs to convince me of that. But whether I can approve the plans, I can't say until I see what they are. I have never seen them at all.

He added that the President, in 1954, had given him "a heavy responsibility—I have to certify that whatever is done there will not be inimical to the interests of the Lincoln Memorial."

The NPS's Wirth indicated he had not initiated further discussions with Congress on the tunnel option.

Asked if he would meet with Secretary Seaton, Colonel Welling replied that he was "interested in working with anyone who has a legitimate interest in the various phases of the project—

provided the conversations are in the direction of progress rather than in the directions of impediments and delays.” He added:

I am not interested in a tunnel or in a four-lane bridge. From a considerable position of strength, I am opposed to efforts to amend the existing legislation, either in favor of a tunnel or to choose a new location for the bridge.

He said the District Highway Department had been working with National Capital Parks to ensure its concerns were addressed. [Beveridge, George, “Seaton Stresses Right to Okay Bridge Plans,” *The Evening Star*, January 12, 1958]

At the invitation of the District commissioners, they escorted Secretary Seaton and Under Secretary O. Hatfield Chilson on an inspection tour of the bridge site on January 27. Secretary Seaton also asked to see the site that would have taken the bridge over the tip of Roosevelt Island. The *Star* described the tour:

The inspection party first visited the District side of the river. The officials walked over ground which already has been staked out with the five roadways which would interlace park land near the Lincoln Memorial and link the projected bridge with Rock Creek and Potomac parkway, the Memorial roadways and the city street system.

The bridge would touch the shore slightly south of Constitution avenue near the ornamental Watergate, which flanks Memorial Bridge.

Mr. Seaton questioned particularly the elevation of the bridge approaches. Highway officials said the bridge at the shoreline would be 18 feet above the ground. The roadway would slope downward and reach ground level about 300 feet west of Twenty-third street  
.....

Later, the party crossed Memorial Bridge to the Columbia Island end of the proposed new bridge. Mr. Seaton there checked the vista which include [sic] the Lincoln Memorial, Washington Monument and Capitol dome.

Motorists, District officials told the Secretary, would have an unparalleled view of these sites. However, Associate Director Harry T. Thompson of National Capital Parks, “told a reporter . . . that in his opinion construction of a bridge at the proposed site would ruin this vista, which he called the finest in the area.”

The excursion did not resolve all concerns. Secretary Seaton was concerned about whether people in the vicinity of the bridge would be able to see the Lincoln Memorial. Although he had wanted to see the Roosevelt Island site that had been subject of recent legislative wrangling, he said of the 1954 location, “I’d rather work this plan out if I can.” [Deane, James G., “Seaton Hopes For Accord on Bridge Soon,” *The Evening Star*, January 27, 1958]

During a joint meeting of the Senate and House District Committees on February 4, Representative Broyhill asked the District commissioners when they would begin work on the Constitution Avenue Bridge. Commissioner McLaughlin replied that the city was waiting to see

how Congress would act on pending matters, including the bill authorizing a tunnel instead of a bridge. "I'd like to have that indication today," he said. That would not be possible, Senator Bible explained, until the Senate committee held hearings on a resolution that Senator O'Mahoney was about to introduce on the subject. Although Senator Bible favored the bridge, he did not want to deny tunnel supporters prompt opportunity for their views to be heard.

Colonel Welling, who was sitting in the crowd, tried to get Representative Broyhill's attention, stage whispering "Joel . . . Joel." When recognized, he told the joint committees that the District had submitted plans for approach roads on both sides of the river to Secretary Seaton 3 weeks earlier. "This is a procedure we always follow when roads cross park land." As soon as he received approval from Secretary Seaton, he said, he would start construction.

Despite Commissioner McLaughlin's hesitation, Colonel Welling and Commissioner David B. Karrick told reporters they were satisfied that the District had congressional authorization to build the bridge approved in August 1954. Karrick said, "I think we have all the congressional authority we need to build the bridge." ["Commissioners Differ On Bridge Go-Ahead," *The Evening Star*, February 4, 1958]

### **Another Look at a Tunnel**

On February 4, Senator O'Mahoney introduced a "sense of Congress" resolution calling on the District to halt preliminary work on the Constitution Avenue Bridge until Congress had "an opportunity" to consider the O'Mahoney tunnel bill. Representative Saylor introduced an identical resolution on February 5. (A "sense of Congress" resolution, if approved, does not require presidential approval or have the force of law. It is simply advice from Congress that Federal agencies may take – or not.)

The resolution angered Representative Broyhill, who said, "It doesn't have a chance." It also was, he said, ridiculous to say the House had not considered the tunnel alternative. "The House did, in effect, act on that proposition when it had my bill up late in the session and refused to pass it." [Preston, Alex R., "House Move Made to Block Bridge Project," *The Evening Star*, February 5, 1958]

Senator Bible was named head of the Senate District Committee on February 6, taking the place of Senator Matthew M. Neely (D-WV), who had died on January 18, 1958. The *Star* told its readers:

Senator Bible, a traditional friend of the District, has championed home rule, immediate construction of a Constitution avenue bridge and a study of Washington Metropolitan Area problems.

He parted with the District Commissioners and the Eisenhower administration on local suffrage by favoring an elected mayor, city council and school board in the past. The administration wants instead a territorial form of government for Washington. ["Senator Bible Named D.C. Committee Head," *The Evening Star*, February 6, 1958]

On February 6, Representative Broyhill introduced a resolution to the House that he said would “shore up, if necessary, the Commissioners so they won’t think there’s too much sentiment up here to halt the job.” Referring to action on his 1957 tunnel bill, he said, “After the battle we had, I don’t see how anyone can contend that that issue has not been settled in the House.” As for advocates of a tunnel in the House and Senate, he would ask Chairman McMillan to call up the O’Mahoney-Saylor bill at the committee’s next meeting:

If it’s action they want, by golly they’ll get it. I am confident they’ll back me up . . . .  
Their whole proposal is ridiculous.

He would not seek House action on his resolution at this time, but if the commissioners hesitated, he said:

I shall press for action up here. My resolution is here to back them up in case they are getting any kind of pressure to hold off . . . . I can understand why they wouldn’t act last year while Congress was thrashing out the question of a tunnel or a bridge and its location. It was only after Congress acted and settled the matter—I thought once and for all—and they got the nod from the White House that they went into action. [Preston, Alex R., “Broyhill Moves To Block Delays On New Bridge,” *The Evening Star*, February 6, 1958]

Senator O’Mahoney issued a new attack on the bridge on February 13. He was particularly concerned about the cost of the project, which had been estimated to be \$24.5 million in 1954. Given inflation in construction costs since then, he said, “it is not too much to say the proposed bridge . . . eventually would cost as much as \$40 million.”

The District’s highway chief, Robertson, denied the Senator’s claim. Land and construction costs had jumped since 1954, but the bridge still could be built for \$24.5 million. In part, that was because some of the approach road projects previously assigned to the bridge were now part of other projects, including the Inner Loop.

Senator O’Maloney also wanted to delay the project because he understood the State Department was concerned that the approaches might affect the new State Department building at 23<sup>rd</sup> and C Streets, NW. The department had asked Secretary Seaton for a report on the issue, but, according to the Senator, “the District Commissioners refuse to give the information.” Robertson told reporters that conferences with the State Department were planned to clarify that the bridge approaches “would not disturb the State Department layout in any respect.” [“O’Mahoney Hits Bridge As Costing \$40 Million,” *The Evening Star*, February 13, 1958]

Senator Bible’s announcement that hearings would be held on the O’Mahoney/Saylor resolution prompted Senator John M. Butler (R-Md.), who lived in Baltimore, had not taken a firm view on the Constitution Avenue crossing, to announce his support for the six-lane bridge on February 25. He urged the District to begin construction of the bridge immediately. Hundreds of his Maryland constituents were delayed in daily bottlenecks trying to cross the Potomac River. Congress, he said, “already has spoken” in support of the bridge. He particularly denounced lobbying by Federal agencies against the bridge project:

This opposition obviously is spear-headed by the National Park Service. Personally, I resent the lobbying of Federal agencies for their pet projects in Congress, and I respectfully urge the President to call a halt to Federal agency lobbying against the already-approved bridge legislation.

It is high time that the District Commissioners brush the minority opposition aside. They should proceed without further delay to build the Constitution avenue bridge.

The same day, District officials met with Department of State officials regarding the approach road near their new building under construction to serve 9,000 employees. Robertson said after the meeting that he thought State Department officials felt the approach road plan would help traffic flow around the building, not hinder it. Colonel Welling agreed, saying “the result of the conferences which I have attended is that the conferees end up agreeing that the Highway Department proposals are the most efficient and, all things considered, the most acceptable.” [“Butler Blasts ‘Lobbying’ By Agencies on Bridge,” *The Evening Star*, February 25, 1958]

Reacting to Commissioner McLaughlin’s desire for an “indication” of congressional intent, the House District Committee on March 3 rejected the “sense of Congress” resolution by Senator O’Mahoney and Representative Saylor calling on the District to delay construction of the bridge until the House had acted on Senator O’Mahoney’s Senate-approved tunnel bill. In an executive meeting, the committee adopted a resolution stating:

It is the sense of the committee that the Commissioners proceed forthwith with the construction [of] the Constitution avenue bridge project. The committee further requests the President of the United States to facilitate immediately through the Federal Government any clearances bearing upon the initiation of the bridge project construction.

With no delaying action likely in the House of Representatives, the last obstacle was approval by Secretary Seaton. Publicly, he indicated he was trying to work with District officials to resolve concerns about the impact of the approaches on the Lincoln Memorial. He was, he said, “very hopeful of having the whole thing ironed out next week,” adding that “nobody wants more time to go by” without another crossing of the Potomac River. [Beveridge, George, “Seaton Seeking Bridge Accord By Next Week,” *The Evening Star*, March 6, 1958]

On March 25, the District commissioners met with Secretary Seaton to present revised proposals for the approach roads. The new plans included “significant reductions,” according to Colonel Welling, in the elevations of roadways and overpasses in the vicinity of the Lincoln Memorial. In addition, the city planned to slope the embankments along the roads to create the appearance of gently rolling terrain. In addition, the commissioners presented photographs of current views from the planned location of approach roads. The roads, in the District’s view, would be only slightly visible from the memorial. The photographs also showed that the new approach roads would be concealed by existing vegetation.

Secretary Seaton conceded that the changes moved “toward” his objectives, but he declined to offer any judgment until his staff had reviewed the plans in detail. “This has given some

renewed hope that we can work this thing out,” he said. His goal was to allow the much-needed new river crossing without doing “violence” to the memorial area. [“Interior Officials Study New Bridge Road Plans,” *The Evening Star*, March 26, 1958; “Approaches Set Lower at Bridge,” *The Evening Star*, March 30, 1958]

Secretary Seaton submitted his report to President Eisenhower in April. He conceded the “urgent need for an additional bridge across the Potomac between Memorial Bridge and Key Bridge,” but in view of the limits imposed on location by the 1954 legislation, he “recognized the vital necessity—in the public interest—of minimizing the possible impairment of the monumental design and artistic setting of the Lincoln Memorial and other memorial structures in the area.” It was “regrettable” that the legislation was so specific as to location and type of bridge, thereby limiting the ability of “responsible executive agencies to carry out their obligation to preserve and protect to the maximum possible extent the distinctive aesthetic values associated with what has been universally acclaimed as one of the world’s outstanding national shrines.”

The focal point of the Interior Department’s concerns was the “location of approach roads and interchanges . . . lying directly northwest of the Lincoln Memorial bounded on the north by Constitution avenue, on the east by Twenty-third street and on the south and west by the Rock Creek-Potomac parkway.” Although the District had modified these facilities to address the department’s concerns, the result was that “within this relatively compact area and on immediately abutting lands, it will be necessary to place a maze of structures running as high as 22 feet above present grade, and involving a number of overhead grade separations.” Nearly 400 trees would have to be removed along with most of an evergreen grove at Ohio Drive and other plantings.

To avoid “such an encroachment on the dignity, beauty, serenity and magnificent setting of the Lincoln Memorial,” he asked the President to support “one last effort to secure from the Congress the slight modification of the controlling legislation” to shift the bridge to cross Small Island on Roosevelt Island:

Given full support of the executive branch, I firmly believe that communication of the facts as we now know them to the Congress might well result in a favorable response.

If Congress acted promptly, the shift in location “need not cause an appreciable delay in initiation of construction.”

He added:

Failing favorable action by the Congress during this session, and in light of the history of the entire matter and the present traffic situation, we would have no choice but to proceed—however regretfully—as expeditiously as possible to carry out the directive of the Congress [in the 1954 Act] within the strict limitations laid down by it.

On April 19, the White House announced that President Eisenhower endorsed Secretary Seaton’s recommendation. The President opposed immediate construction at the planned location to

allow for “one last effort” in Congress to shift the bridge so that the District end would be between Constitution Avenue and E Street, NW.

District officials were concerned about the delay, but considered the President’s decision to be final. Colonel Welling said:

It has been obvious for months that this bridge proposition would have to go to the White House for a decision. Now we have it, and that’s that.

Representative Broyhill, too, was disappointed about the delay, but was encouraged by Secretary Seaton’s assurance that if Congress did not act in the current session, the District would be authorized to proceed with the existing plans.

Members of the House and Senate District Committees promised quick action. [Beveridge, George, “New Site for Bridge Asked by President,” *The Evening Star*, April 20, 1958; Secretary Seaton’s letter is reprinted in the same issue]

Colonel Welling agreed with the President that shifting the bridge was preferable for aesthetic reasons, although the \$250,000 expended on the proposed bridge at its present location would be lost. He also noted that a “hard core of tunnel advocates” were not ready to give up on eliminating the bridge altogether. Further, he said, the draw span issue would remain to be resolved wherever the bridge was built.

The *Star* editors considered the President’s desire to shift the bridge “the only really satisfactory solution to an almost hopelessly complicated dilemma.” Three years earlier, “all Federal and District agencies” agreed on the shift, but “it was sabotaged on Capitol Hill by Federal park and planning officials who wanted no bridge at all.” The editors thought that with the President’s support “such a spectacle is not likely to be repeated.” [“Welling Cites Tunnel Bill,” *The Evening Star*, April 21, 1958; “Most Satisfactory Solution,” *The Evening Star*, April 21, 1958]

General Grant urged the Committee of 100 on the Federal City to remain firm in support of the tunnel, especially since the Senate had approved the tunnel bill. The committee continued to support the tunnel option, but conditionally approved President Eisenhower’s recommended shift of location, if a tunnel were not possible, as preferable to the one approved in 1954. [“Ike’s Choice Of Span Site Is Supported,” *The Washington Post and Times Herald*, April 29, 1958]

### **Back to the Hill**

Secretary Seaton submitted a bill on May 1 to authorize the location shift. In a letter to congressional leaders, he called the shift “a desirable and harmonious solution” to the long fight over the bridge. He also disclosed that the Theodore Roosevelt Memorial Association had submitted written approval of the plan to cross the tip of Roosevelt Island. To avoid any concern that the NPS would continue to fight the project, Secretary Seaton said, “agencies of this department are prepared to co-operate fully with the Board of Commissioners of the District in carrying out this project expeditiously.” [Beveridge, George, “Fast Action Urged On Shifting Bridge,” *The Evening Star*, May 2, 1958]

The bill amended Title I of the 1954 law to read:

That (a) the Commissioners of the District of Columbia are authorized and directed to construct, maintain, and operate a low-level bridge, to be known as the Theodore Roosevelt Bridge, over the Potomac River, from a point north of and in the vicinity of Constitution Avenue in the District of Columbia to the Virginia side of the Potomac River, such bridge to cross such portion or portions of the two islands comprising Theodore Roosevelt Island at the location approved in writing on April 30, 1958, by the Theodore Roosevelt Association,

The bill also amended subsection (b) of Title I to authorize the commissioners “to construct and maintain structures providing pedestrian access or vehicle access, or both,” to Roosevelt Island if requested by the Interior Department.

The House District Committee approved the bill on May 12, 1958, although six members voted “present” or “no” to protest the long delay in the bridge project. The committee’s report stated:

The committee voted reluctantly to report this legislation favorably to the floor. However, it is the feeling of the committee that there has been entirely too much procrastination and delay in the construction of a bridge in this area, particularly in view of the fact that the original location approved by Congress in 1954 was the result of a compromise by various groups . . . .

The Commissioners’ efforts in the construction of the project should no longer be subjected to delaying tactics on the part of the Commission of Fine Arts, Park Service, National Capital Planning Commission, and the Theodore Roosevelt Association. In fact it is only with the understanding that the President will keep the above-listed organizations in support of the bridge project that the committee has expressed a willingness to go along with the proposal to change the location of the structure.

Nevertheless, in view of “the great importance of maintaining the navigability of the Nation’s waterways,” the committee recommended that the U.S. Army Corps of Engineers, “in acting on any application for a navigation permit for the upstream bridge location, give serious weight to the requirements for vertical clearance by existing navigation.” [Amending the Act to Authorize and Direct the Construction of Bridges Over the Potomac River, Committee on the District of Columbia, House of Representatives, 85<sup>th</sup> Congress, 2d Session, Report No. 1721, May 14, 1958, page 3]

This reference to the permit, which the Corps issued for the low-level bridge in 1954, was seen as being included in deference to Chairman Smith, despite his promise not to try to block the bill. Asked about this committee statement, Robertson said that increasing clearance from the planned 27.5 feet would not delay construction. [“Robertson Discounts Delay for Higher Span,” *The Evening Star*, May 13, 1958; and “House to Act Monday On New Site for Bridge,” *The Evening Star*, May 15, 1958]

Chairman John L. McMillan (D-SC) predicted prompt House action.

When reporters asked Chairman Smith if he would oppose the bill, he replied:

I don't agree with a fixed span, but we need the bridge so badly I'm going to stop fighting it. They can build anything they want with no fuss from me. [Preston, Alex, "House Group Reports Relocated Bridge Bill," *The Evening Star*, May 12, 1958]

Senator O'Mahoney and Representative Saylor also conceded the measure. The Senator said, "If the administration takes such a conclusive position, I am willing to accept the bridge. And if the [Roosevelt] association accedes to Secretary Seaton's recommendation, then I accede."

Representative Saylor agreed. "If the administration feels that way about it and if the Theodore Roosevelt Association feels that way about it, I am willing to go along." ["Early Vote Due on Span As Tunnel Fight Fades," *The Evening Star*, May 14, 1958]

Chairman McMillan introduced the bill on the House floor on May 19, explained the measure, and secured House approval without debate in 30 seconds. [Amending the Act to Authorize and Direct the Construction of Bridges Over the Potomac River, *Congressional Record-House*, May 19, 1958, page 9005]

The Senate Committee on the District of Columbia approved the bill on May 20. Its report contained a sentiment similar to the view expressed in the House committee report, referring to "too much procrastination and delay":

The Commissioners' efforts in the construction of the project should no longer be subjected to delaying tactics on the part of the Commission of Fine Arts, the National Park Service, the National Capital Planning Commission, the Theodore Roosevelt Association or any other body. [Amending the Act to Authorize and Direct the Construction of Bridges Over the Potomac River, Committee on the District of Columbia, United States Senate, 85<sup>th</sup> Congress, 2d Session, Report No. 1622, May 21, 1958, page 3]

On May 26, the Senate approved the bill, with minimal discussion limited mainly to praise of committee members for moving the bill and expressions of support for the relocated bridge. [Construction of Bridges Over the Potomac River, *Congressional Record-Senate*, May 26, 1958, pages 9448-9449]

The congressional action earned praise in a *Star* editorial titled "New Era of Progress" on May 27. "It is a rare occasion when District legislation . . . swishes through Congress with such unanimity and speed . . ." The editors singled out Secretary Seaton, calling him "an earnest and effective mediator" who resolved "the heated controversy between his own park conservationists and the District Highway Department." The editorial ended:

So there now dawns for Washington a bright new era of building for a greater and more beautiful city. The whole community is grateful to all concerned in paving the way for this epochal progress.

Without fanfare or a statement, President Eisenhower approved the bill on June 4, creating Public Law 85-446.

## The Last Gasp(s)

The Commission of Fine Arts was still not convinced. On June 26, it approved preliminary design for a twin to the 11<sup>th</sup> Street Bridge over the Anacostia River. To be built in 1962, the bridge, located about 300 feet upstream from the existing bridge, would carry westbound traffic, with eastbound traffic crossing on the existing span. The commission acted on a number of other matters, but wanted further conferences with the District Highway Department on design details of the Theodore Roosevelt Bridge. [“Fine Arts Group Oks 11<sup>th</sup> Street Bridge Plan,” *The Evening Star*, June 27, 1958]

On September 11, the commission gave “general approval” to the design for the new 14<sup>th</sup> Street bridge to replace the trestle-topped bridge. With the new bridge scheduled to open in 1962, District officials indicated they would make some improvements to the trestle-topped bridge to keep it open until then. The commission requested some changes in the ramps for the Washington Channel bridge connecting to the Southwest Freeway, but they were not considered to be serious problems.

However, the commission was still not satisfied with “all the details” of the Theodore Roosevelt Bridge. A commission official said the problems resulted “from the basic difficulty of getting a satisfactory bridge in that area.” The commission held a closed-door meeting with District highway officials, during which, according to reports, a District official told participants that the two agencies “have never been closer in their aims than they are now.” [“Fine Arts Unit Oks 14<sup>th</sup> St. Bridge Plans,” *The Evening Star*, September 12, 1958]

By October, the final hurdle was Secretary Seaton’s approval of the bridge and the approach road network in the vicinity of the Lincoln Memorial. On October 30, Secretary Seaton informed the commissioners by letter that he was in “complete agreement” on the basic approach design, but wanted further discussion of three details based on traffic and engineering data. The three areas were road layouts south and east of the Lincoln Memorial; whether a bridge will carry 23<sup>rd</sup> Street over Constitution Avenue or an intersection with a traffic light would suffice; and, in Beveridge’s words:

The precise location of the opening of a tunnel which will carry the District’s “inner loop” freeway beneath the Lincoln Memorial grounds to the west of the memorial. Interior wants this tunnel portal moved as far as possible north of the memorial. The District says it must be near it, in order to permit “inner loop” traffic to get to the Arlington Memorial Bridge and to the Rock Creek and Potomac parkway.

Although these issues remained to be resolved, General Welling ordered highway officials to begin immediately to work on detailed plans and construction drawings for the bridge. (Engineer Commissioner Welling had been promoted to Brigadier General on August 9.) The first step would be approval of a contract with Modjeski and Masters for this work. The Interior Department’s issues about approach road details would not affect the bridge itself.

Further, Interior officials said the Secretary was not unalterably opposed to the existing approach details, but just wanted “a final look” at the most recent data on the three topics. General

Welling held a press conference, during which he said he was “confident” the data would convince Interior officials to approve the planned approach network. He said he also had instructed Highway Director Robertson to develop a contract for design of the Potomac River Freeway east from Key Bridge. According to Beveridge:

Gen. Welling also disclosed details of design for the new Constitution avenue bridge, which he said have agreement of the Federal Fine Arts Commission. These include decisions to build only six bridge piers, equally spaced, across the river with 222-foot spaces between them, and to build the “end piers” on each side of the river of stone masonry. [Beveridge, George, “Work Ordered On Potomac Bridge Design,” *The Evening Star*, October 31, 1958]

The remaining issues proved more stubborn than General Welling expected. As late as November, he responded to a question about the project on WWDC’s “Report to the People” by saying that if the District and Interior could not resolve remaining issues, “someone else” would have to reach a decision. Asked if “someone else” meant President Eisenhower, General Welling would not clarify his meaning. He did not expect the reviews to lead to an “impasse” and remained confident that traffic would be crossing the Theodore Roosevelt Bridge in 1962. [“White House Seen Getting Bridge Row,” *The Evening Star*, November 2, 1958]

One issue was resolved in January 1959 when BPR approved the plan to have sidewalks on both sides of the bridge. For safety reasons, BPR preferred to eliminate pedestrians from Interstate highways. In this case, however, BPR agreed to the plan approved by the Commission of Fine Arts that included a sidewalk on both sides, with steps to the island. [“Crossing the Bridge,” *The Evening Star*, January 27, 1959]

Mid-afternoon on April 19, 1960, the District held a ceremony near the intersection of Constitution Avenue and the Rock Creek and Potomac Parkway to mark the start of construction of the Theodore Roosevelt Bridge. With several hundred spectators on hand, General Welling presided over the event. He said the bridge had been a “prime project of mine” that had come “out of debate . . . into action.” He observed that approval of the bridge had broken the logjam of area projects, leading to construction of a Cabin John Bridge as part of the outer beltway, an underpass at Washington Circle, the Culture Center (today’s Kennedy Center), and an “interceptor” for removing raw sewage from the Potomac River.

Commissioner McLaughlin, calling the project “a tribute to the reasonableness” of the agencies involved, said the subtitle of the bridge should be “Potomac Compromise.” Reflecting the long debate, Commissioner Karrick said he “never expected to live to see the start of its construction.”

Representative McMillan described the legislative battles behind the bridge and said he hoped “to walk across this bridge some day.” Senator Frear of the District committee observed that it was “always a pleasure to see progress.”

As part of the ceremony, General Welling asked three officials to press three buttons. The first button prompted the District’s fireboat to shoot jets of water into the air. The second button would signal the start of the piledriver. The third button would begin three blasts from a 75-

millimeter cannon to signal that construction was underway. The fireboat shot the jets of water and the piledriver began, but the cannon failed due to a broken firing pin. Nevertheless, construction had begun. [McKelway, John, "Mighty Cannon Is Mute Witness At Roosevelt Bridge Ceremony," *The Evening Star*, April 20, 1960]

The Cabin John Bridge opened on December 31, 1962. In a ceremony on May 30, 1969, the bridge was renamed the American Legion Memorial Bridge.

Although NCPC's Roaches Run Bridge was not built, the \$7 million Washington Channel Bridge that was part of the compromise worked out by Senator Case was opened in a ceremony on July 31, 1962. During the ceremony, NPS's Wirth told the crowd that the District had "one of the best highway departments in the Nation." District Engineer Commissioner Frederick J. Clarke said the bridge was "the symbol of what can be accomplished by co-operation between city planners, the Park Service, the Redevelopment Land Agency and highway builders." ["Channel Bridge Passes Test," *The Evening Star*, August 1, 1962]

Senator Case, who would have been an honored guest during the ceremony, died a few weeks earlier on June 21 after a heart attack in his Senate office. Efforts to name the bridge in his honor began almost immediately. On September 25, 1965, Congress approved a Joint Resolution that the bridge be named the "Francis Case Memorial Bridge" and urging the District commissioners to place a plaque with the name in a visible location. The name, and the sign containing the name, remain in place.

(He was preparing for a reelection battle against his Democrat opponent, former Representative George McGovern, who most recently had been administrator of the Kennedy Administration's Food for Peace Program. McGovern would win the election against Senator Case's appointed replacement.)

(Although the Southwest Redevelopment Plan would continue, Zeckendorf would not be part of it. With Webb and Knapp in financial distress, the company signed a contract on November 2, 1964, transferring its commercial land holdings in the area to a consortium that included David Rockefeller of Chase Manhattan Bank (and brother of New York Governor Nelson A. Rockefeller). The company had lost its residential property interests in August to a group headed by local developer Charles S. Bresler. Webb and Knapp declared bankruptcy in 1965. [Ottenberg, Miriam, "Syndicate Buys SW Holdings Of Zeckendorf," *The Evening Star*, November 2, 1964; Gutheim and Lee, page 273]

(By the 1970s, the Tenth Street Mall had been completed. It formed an arrow-straight street that is now called L'Enfant Plaza. The mall was surrounded by tall office buildings, a hotel, and a plaza in the center of which was an impressive fountain. The grand mall consisted of sidewalks and a wide median walkway between traffic lanes. The development included a hidden shopping mall called The Promenade that officially opened on November 16, 1968, with over 30 stores, service establishments, and eating places, as well as a movie theater. The Promenade opened amidst great optimism, but over time, depended almost entirely on lunchtime business from nearby office workers.

(The boulevard-like mall Zeckendorf had envisioned stretched only from Independence Avenue to an overlook high above the restaurants and the Maine Avenue fish market along the Washington Channel, with a steep pedestrian path and traffic lanes connected to Maine Avenue. Beyond weekday work hours, the Tenth Street Mall sees infrequent foot traffic, with little to attract the public except parking spaces for visitors to the National Mall across Independence Avenue. As for the link between the Tenth Street Mall and the Maine Avenue waterfront, a 2017 book about southwest Washington explained:

An outgrowth of the Zeckendorf-Pei plan for Southwest, the Tenth Street promenade that was envisioned was unfortunately terminated with a fountain in 1968 at the Banneker overlook due to the exit ramp for I-395, and it remains an anomaly of urban vision from the 1960s . . . . Southwest residents and tourists headed to the Metro station from the waterfront continued to scale a non-landscaped hill on a dirt path from the popular Maine Avenue waterfront almost 50 years later. [Williams, Paul K., and Alexander, Gregory J., with the Southwest Neighborhood Assembly, *Southwest DC*, Arcadia Publishing, 2017, page 17]

(A paved path is also available.

(The James V. Forrestal Building straddles the entrance to the mall, stretching along Independence Avenue from 9<sup>th</sup> Street to nearly 12<sup>th</sup> Street; it was built in the late 1960s only after much conflict with the Smithsonian Institution, NCPC, Zeckendorf, the General Services Administration (GSA), and others. It initially housed the Department of the Navy and now is home to the Department of Energy. To the east of L'Enfant Plaza, the Department of Housing and Urban Development was on the west side of 7<sup>th</sup> Street, SW. Across 7<sup>th</sup> Street, the Nassif Building housed the Department of Transportation until 2007, when the department moved to two buildings on M Street, SE. (The Nassif Building, now known as Constitution Center, houses several Federal agencies).

(Richard F. Ward's 1978 history of the District's southwest described the Tenth Street Mall at the time:

Originally envisioned as the grand entrance to the Southwest, the Tenth Street Mall/Overlook has lost its purpose. There are several reasons for this. First, Tenth Street is not one of the streets which continues from the Northwest across the Mall and into the Southwest. It is a truncated street, always has been and always will be as long as there is a Smithsonian Castle on the Mall. Secondly, the original plan to build a parking garage under the Overlook fell through. People were to have been attracted to the Overlook not only for the fine view but also because of a national aquarium across the channel in East Potomac Park. A Ponte Vecchio on the channel (a touch of Italian in the area would be welcome) would span the Washington Channel so people could walk to the park. The idea is fine but has to wait for times when such things are given higher priority. And, finally, the true center of the Southwest is probably Fourth Street. The Tenth Street entrance is more of a side entrance. [Ward, Richard F., *South and West of the Capitol Dome*, Vantage Press, 1978, pages 83-84]

The waterfront restaurants, including Hogate's and Phillips Flagship, have disappeared, replaced by The Wharf, a multi-billion dollar mixed-use development. The first two buildings of The Wharf opened in October 2017.

## Getting U.S. 270 into the District of Columbia

### The Old Road

The road from Frederick, Maryland, to Washington, D.C, can be traced to pre-colonial times. A history of Rockville, Maryland, described the Indian trail that initially followed the route:

Indians defined the original path ten thousand years ago. Groups of Piscataways, Senecas, and Susquehannocks followed game, set up seasonal camps, and marked an inland north-south route along this piedmont ridge. By the 1690s, European settlers had displaced the Indians and appropriated the old road known as the Sinequa Trail.

[McGuckian, Eileen S., *Rockville: Portrait of a City*, Hillsboro Press, 2001, page 3]

A historian of Germantown, Maryland, stated:

The native Americans in this part of the country also used mainly waterways to travel from one place to another and the Indian paths usually connected one waterway with another. The Indians had a path along part of the eventual route of the Frederick Road, for they also had to have some way to get around the falls of the Potomac River; but their path veered off to the west above Germantown to proceed to the mouth of the Monocacy River. [Soderberg, Susan, *A History of Germantown, Maryland*, published by the author, 1988, pages 24]

During colonial times, the road was gradually improved as settlers formed towns in the corridor and farmers needed a path to market:

Travelers and planters in the area of present-day Rockville relied on the colonial route. They appreciated the Maryland Assembly's attempt to keep the roadway cleared of obstructions, notched for directions, and free of standing water. As early as the 1740s, local planters shipped hogsheads of cured tobacco down the *rolling road* to the port of George Town. Pioneers heading to western Maryland, the Ohio territory, and beyond traveled the Great Road. [McGuckian, page 3, italics in original]

In 1755, the road was part of one of the more disastrous moments in the French and Indian War. British General Edward Braddock took a force north to a French post at Fort Duquesne (site of Pittsburgh) in an attempt to force the French out of British colonial territory. From Williamsburg, Virginia, he led his army to Georgetown, then north, stopping initially at Owen's Ordinary (or inn) near the present site of Rockville. The British army continued north to Dowden's Ordinary (Clarksburg) and Frederick before turning west to Cumberland. From there, army engineers had to carve a wider road out of an old Indian trail to get the force to Fort Duquesne:

West of Fort Cumberland the road dwindled to a narrow path, and Braddock's army yielded to colonial engineers who cut a new twelve-foot right-of-way for the advancing army. On July 9, having marched two hundred miles to within sight of Fort Duquesne, they were surprised by French regulars, French Canadian militia, and Indian warriors. Braddock's troops were handily defeated, and Braddock was fatally wounded.  
[McGuckian, pages 1-2]

Braddock made many mistakes on this expedition, including not listening to his aide-de-camp, a young Virginian named George Washington, and others who explained that a British-style assault would not work in the wilderness:

Benjamin Franklin, who was called in to help procure supplies for the army, reports that it was Braddock's ignorance of wilderness fighting that was the cause of the failure.  
[Soderberg, page 25]

Following independence and creation of the United States of America, the road between Georgetown and Frederick remained important. "It is shown on the 1790 census map of Maryland as one of only seven major roads in the state at that time." [Soderberg, page 24]

Its importance increased when the general government built the National Road from Cumberland, Maryland, to Wheeling (then in Virginia) as a portage between the Potomac and Ohio Rivers. Construction took place from 1811 to 1818; soon, the general government began extending the road west. Maryland had chartered the Frederick Turnpike in 1805 and extended it to Boonsborough. With revenue from bank charters, Maryland financed the "Bank Road" to complete the road from Baltimore to Cumberland, reaching it in 1820, with only a few gaps.

In 1805, Maryland embarked on a network of turnpikes, many centered in Baltimore but in other parts of the State as well:

In 1805, the Maryland Assembly chartered the Washington Turnpike Company, the first in Montgomery County. Originally, the plan was to improve the existing roadway from the District of Columbia line, through Rockville and Clarksburg, to the main square in Frederick. This would be financed by shares of capital stock for twenty dollars each, with George Town, Washington City, Frederick, Elizabethtown (Hagerstown), and Rockville each responsible for raising subscriptions.

The twenty foot wide roadway . . . was completed by the mid-1820s. The company erected guideposts and milestones to inform travelers of distances from the District to toll gates, other turnpikes, and destination towns . . . . The turnpike company depended upon user revenue to keep the road in repair. Travelers paid tolls at gates in Tenallytown, Bethesda, and the Wilson farm (now Georgetown Prep). The Maryland legislature set the rates.

Tolls varied for herds of sheep, hogs, or cattle (measured in scores of 20); every horse and his rider or led horse; a chariot, coach, or stage with two horses and four wheels; and a carriage with four horses [McGuckian, pages 29-30]

The Great Road, as it was also called, was heavily traveled:

George Washington traveled the road many times and often stayed at Peter's Tavern (later Tabler's) that stood on the south bank of Bennett's Creek on Frederick Road. Other famous visitors to Tabler's were Lafayette and President Andrew Jackson. In the 1840s James K. Polk stayed at the Hyatt House, an inn in Hyattstown, on the way to his inauguration.

There was a considerable controversy from 1829 to 1831, when there was a push to replace [the Great Road] with a road from Washington to the National Road which would run further east, through Brookeville and New Market. The proposition was defeated, however, and the road remained as it was.

During the Civil War the Frederick Road was used by both the Union and Confederate armies . . . . [Soderberg, page 25]

Conditions gradually improved:

The turnpike company constantly attempted to improve service. Horse and foot travelers between George Town and Frederick in the 1820s shared the road twice weekly with a two-horse stage, which cost three dollars. By 1828, a passenger stage went daily; for four dollars, a passenger could ride from George Town or Wheeling. By then, the loops between Bethesda and Montrose, present-day Old Georgetown Road, had been bypassed with a straighter route . . . .

The Washington Turnpike Company remained solvent through most of the nineteenth century . . . . It fought constant wash-outs and could not raise funds to install planks in the deep wheel ruts in 1852. Public financing of the canal and the railroad westward from Baltimore provided an edge that road-connected towns did not match until the mid-twentieth century. [McGuckian, page 30]

New technology had been the turnpike's downfall. Transportation by "foot, horseback, carriage, and stage" had dominated for many years:

In the late nineteenth and early twentieth century, the alternatives greatly expanded. The steam railroad came into Montgomery County in 1873, connecting remote areas to markets in Washington and triggering a real estate boom that dramatically changed the size, appearance, and character of Rockville. Two decades later, the electric trolley opened another connection to the nation's capital . . . .

By the last decade of the nineteenth century, the Washington Turnpike Company had lost all incentive to maintain the Rockville Pike. The road was rutted and muddy, particularly during winter. Users paid insufficient tolls to warrant keeping the tollbooths open. The turnpike declared bankruptcy and deeded the roadway to the Montgomery County commissioners. [McGuckian, page 71]

In 1898, a report by the Maryland Geological Survey said of the road in Montgomery County:

The most extensive piece of road-construction undertaken in this state for a number of years is the rebuilding of the old turnpike between Rockville and Georgetown. No road in the county was more in need of improvement both on account of its condition and of its importance as the direct route from Rockville to Washington. It has long been known as one of the worst pieces of main highway in the state. The old foundation stones, many two or three feet in size, formed the surface of the roadway proper which was but little used. At the sides a rough single-track dirt road had been worn sometimes five to ten feet below the level of the old road-bed . . . . As a result where there should have been a well-traveled road and much improved suburban property there was but little travel and land values below those of other neighborhoods no farther removed from Washington.

As provided by State law, Montgomery County issued road bonds to raise \$25,000 to improve the road from Rockville to the District, a distance of 7.5 miles. To prepare the road for a macadam surface, the contractor removed the foundation stones of the old turnpike “which are taken out and thrown to one side and afterwards crushed to form the material for the new road.” Considerable grading was necessary “on account of the depth to which the sides have been worn and also to reduce the grades to 6 per cent, as required by the law authorizing the improvement.” Despite this recycling of material, “much additional stone” was needed. The result:

The road as constructed has 16 feet of macadam flanked on either side by a 12-foot dirt road. Broken stone is put on to a depth of 12 inches for a short distance from Rockville but elsewhere it is 9 inches . . . . At the present writing, October, 1899, about 3 miles have been completed.

The report listed three turnpikes in the county, including the Georgetown and Rockville Turnpike. At the time, tolls were not collected. [*Report on the Highways of Maryland*, Maryland Geological Survey, The Johns Hopkins Press, 1899, pages 242-243]

For Frederick County, the survey indicated that tolls were collected on 129 miles of stone road:

It is a noticeable feature that nearly all of the main thoroughfares in the county are turnpikes. This is especially true about Frederick from which radiate nine turnpikes that are very well traveled within three to five miles of the city.

A list of the county’s turnpikes included “Frederick and Washington (or Georgetown)” along the path of future U.S. 240 (now State Route 355). The listing indicated the road was “Piked” from Frederick to Araby (near the Monocacy River). The report did not comment on the condition of the road. [*Report on the Highways of Maryland*, pages 231-232]

### **The Road in the 20<sup>th</sup> Century**

The automobile revived interest in road travel. During the early 20<sup>th</sup> century, the Washington-to-Frederick road was included in the National Old Trails Road, a transcontinental route from Baltimore to Los Angeles, mostly over historic roads such as the National Road. In 1916, good roads writer Robert Bruce included a description of this segment in his book about the National Road. Beyond Dupont Circle, he wrote, motorists could leave Washington on Connecticut

Avenue or Wisconsin Avenue (reached via Massachusetts Avenue), with both connecting in Rockville. Either route took the motorist to the “suburban village of Bethesda.” Bruce described the route just beyond the District line:

Thence it passes over the railroad to the fork beyond; here leave the trolley by keeping practically straight ahead on the Rockville Pike. That part of this highway from the District line to Rockville, which had already been graded and macadamized by Montgomery County was taken over about three years ago by the Highway Department of the U.S. Government, and is now maintained by it for the purpose of experimenting with the different kinds of road surfacing. Signs giving the number and character of the “experiment” will be noted along the way.

A motorist would cross the trolley line alongside the road into Rockville. Riding through Gaithersburg, Bruce found:

At the west end of Gaithersburg begins a stretch of concrete road, part of which is a relocation taking the place of the former highway over Middlebrooke Hill. The points where the old route enters and leaves the present concrete road are easily identified.

After leaving this good road, the motorist reached Henderson’s Corner, near Brink:

From here on there is a choice of two routes, the one straitaway to the left being the continuation of the road followed by Braddock’s expedition of 1755, over which we have been traveling; this is about eight miles shorter than the other and a typical old-style pike, rough in spots and next to impassable in wet weather.

The alternate route “should always be taken after any considerable rain.” (Henderson’s Corner survives today as a sign at the intersection of Ridge and Frederick (MD 355) Roads.)

Crossing into Frederick County, the motorist would “pass through the first one of the three toll gates (8 cents toll), which are among the last in Maryland.” It was called the Monocacy and Urbana Turnpike. Beyond Urbana, the road passed through the field where the Battle of Monocacy took place on June 9, 1864, when Confederate General Jubal Early pushed back Union General Lew Wallace as the southern forces headed for Washington. Just before crossing the Monocacy River, the motorist reached the second toll gate:

Then we pay 10 cents at the second toll gate, and cross an iron bridge over the Monocacy River; almost immediately beyond is a bridge over the B & O R.R. tracks (“Monocacy Junction”), and to the left of it the monument to the New Jersey volunteers.

Also on the left our route passes a very large boulder overlooking the Monocacy battlefield and erected to the memory of the Confederates who fell in that struggle. The road here is level and fine, fully equal to the approach into Frederick by the direct road from Baltimore. Next is the third and last toll gate (8 cents), beyond which we enter South Market Street in Frederick. [Bruce, Robert, *The National Road*, Published in Cooperation with the National Highways Association, 1916, pages 89-93, maps on pages 86-87]

In September 1916, the Maryland State Roads Commission agreed to take over the three privately owned turnpikes along the road in Frederick County: the Washington Turnpike, the Buckeystown Turnpike, and the Monocracy and Urbana Turnpike, with a combined mileage of about 17 miles. Including toll-free county road mileage, the State acquired 25 miles for \$25,000. [“More Tollgates To Go,” *The Baltimore Sun*, September 30, 1916]

Maryland gradually improved the road to meet the needs of the automobile. On September 24, 1925, the State held a ceremony in Hyattstown to celebrate completion of the last mile of improved road, just south of that community. Prominent citizens participated in a parade over the last link of the new 42-mile highway and were entertained at supper. Ceremonies included a concert by the Browningsville Band, fireworks, and a dance, as well as addresses by officials such as John N. Mackall, chairman of the Maryland State Roads Commission, Maryland Secretary of State E. Brooke Lee, and U.S. Representative Frederick N. Zihlman (R). According to the *Star*:

The new road is shorter by 10 miles than either of the other two routes, through this county between Washington and Frederick, and is expected to promptly become popular with autoists generally. The other roads—by way of Rockville, Gaithersburg and Dickerson, and by way of Rockville, Gaithersburg and Ridgeville—are about the same distance—52 miles. [“New Highway Link Opened With Parade,” *The Evening Star*, September 24, 1925]

The improved road was one of the original U.S. numbered highways approved in 1926. Its number, U.S. 240, indicated it was the second branch off U.S. 40, then a transcontinental route from Atlantic City, New Jersey, to Oakland, California, “across the bay from San Francisco,” as the initial log put it. That same log, which the American Association of State Highway Officials (AASHO) published in 1927, described U.S. 240:

### **United States Highway No. 240.**

#### **Total Mileage, 39**

**Maryland** Beginning at Frederick to the Maryland-District of Columbia line at Washington. [*United States Numbered Highways*, American Association of State Highway Officials, 1927, pages 18-19, 43]

The second log, published in 1929, listed U.S. 240 as continuing into Washington, adding 4 miles to the route (43 miles). The logs did not identify control points within cities, which were responsible for deciding on the routing. The District gave U.S. 240 several routings over the years, but by the 1950s, it reached the District line at Chevy Chase, followed Wisconsin Avenue to K Street, NW., continued on 23<sup>rd</sup> Street, NW., to the Lincoln Memorial Circle, and ended at a connection with U.S. 50 before U.S. 50 crossed Arlington Memorial Bridge into Virginia. (Today, the former U.S. 240 roadway is designated Maryland Route 355.)

## A Modern Upgrade

In 1947, Maryland Governor William Preston Lane asked the State legislature to approve a \$200-million, 5-year plan to create “a system of highways second to none in the nation.” With legislative approval, Governor Lane’s 4 years in office (January 3, 1947 – January 10, 1951) included construction or reconstruction of 757 miles of roads at a cost of \$106 million, planning and the start of construction of Maryland’s expressway system, and early work on his pet project, the Chesapeake Bay Bridge.

A 1958 history by the State Roads Commission of Maryland discussed Governor Lane’s plan:

To finance it he asked for a 100-million-dollar bond issue, an increase in the gasoline tax from four to five cents, an increase in motor vehicle license fees with emphasis on the heavy trucks, allocation of the titling tax fees to the Roads Commission instead of to the general funds of the State, support of the State Police out of general revenues instead of motor vehicle receipts and a re-distribution of such funds on a 50-30-20 basis to the Roads Commission, Baltimore City and the counties which thereafter were to finance their own road construction and maintenance.

(The city of Baltimore is not part of Baltimore County or any other county; therefore, it received a share of the fund along with the counties.)

The General Assembly approved most of Governor Lane’s request in time for his administration to begin the 5-year program during the construction season of 1948:

One of the great contributions of the Lane administration to the highway system was the planning and partial construction of some expressways designed on the controlled-access principle.

The Baltimore-Washington Expressway, the Baltimore-Harrisburg Expressway, and the Washington National Pike south from Frederick were planned with full control of access except at traffic interchanges . . . .

Controlled access was slow to catch on in Maryland, as in the other states. From time immemorial people had gained access to their roads wherever they wanted; they did not take kindly to long detours to get on roads in front of their properties . . . .

The Lane administration made the courageous move to begin whole new highways on this principle—a worthy inheritance to future motorists of Maryland and to the next administration. This step was formalized by the Expressway Act of 1947. [*A History of Road Building in Maryland*, State Roads Commission of Maryland, 1958, pages 157, 161]

From Frederick south, the new expressway would be built on a new alignment, a proposition that caused concerns in Montgomery County, particularly in the heavily populated area near the District line. *The Evening Star* explained the route of the Northwest Freeway in May 1947:

The freeway is a proposed high-speed, limited access, divided highway that would be an alternate of Route 240 and would run from a point near Gaithersburg, west of Rockville and Bethesda, to take traffic off Wisconsin Avenue leading into Washington . . . .

When the freeway route first was announced a year ago, strong protest was made by owners of highly developed properties centering in the Bradley boulevard area.

As Maryland began planning an expressway in the U.S. 240 corridor, one issue that would have to be resolved was the connection with the District of Columbia. Officials were considering construction of two entrances. One route would enter the District in the vicinity of the current alignment along Wisconsin Avenue. The second route bypassed the Wisconsin Avenue corridor and the western side of the city. At Cabin John, the new expressway would connect with a road into the District parallel to the Potomac River.

The Maryland-Capital Park and Planning Commission would play a key role in the routing. The commission grew out of the need for planning in the two Maryland counties (Montgomery and Prince George's) surrounding the District of Columbia following establishment of the National Capital Park and Planning Commission in 1926. The national commission, whose authority did not extend beyond the District's border, was directed to cooperate with local planning organizations, none of which existed. Gutheim and Lee explained:

The Maryland legislature passed legislation in 1927 providing for a district containing the two counties contiguous to the District of Columbia. The Maryland-National Capital Park and Planning Commission was provided authority to plan, acquire land in the public interest, levy taxes to pay for park acquisitions, and draw up zoning ordinances . . . .

The relationship between the National Capital Park and Planning Commission and the Maryland-National Capital Park and Planning Commission was one that saw suburban planners identifying with the aspirations set forth by the federal commission. This relationship between the suburbs and the city was characterized by the similarity in the name selected by the Maryland commission. [Gutheim and Lee, pages 215-217]

The commission attempted to shift the western alignment to less developed land:

The second route would extend north from MacArthur boulevard near Cabin John, through Cabin John Run valley and Thomas Valley to Tuckerman lane and then to an intersection with 240 near Gaithersburg.

The commission was trying to keep the two alignments clear of new obstacles by withholding approvals for proposed subdivisions, but was running out of patience with the failure of the Maryland State Roads Commission and the PRA to agree on a route. On May 17, 1947, the commission released the text of a resolution, adopted unanimously, threatening to abandon protective measures for the Northwest Freeway "should current agreement, at least as to plan, now prove impossible between these agencies . . . ." ["Threat to Drop Freeway Made By Planners," *The Evening Star*, May 18, 1947]

By December 1949, Maryland roads officials were still undecided, but had a new proposal under review:

Maryland planning officials today were studying a Federal recommendation to change the route of the proposed new dual Northwest freeway from Rockville south so that it would bypass Washington, instead of entering the District via MacArthur boulevard.

Divulged for the first time yesterday by the commission, the suggested rerouting would require another Potomac River bridge near Glen Echo, it was said. The plan was to be taken up later today with Virginia officials and also will be incorporated into the comprehensive highway plans now being prepared for the metropolitan area.

Federal officials said the rerouting, which would bring through trucks and passenger cars down the east side of the Cabin John Valley, would cost less than the previous plan. It would also have the additional advantage of permitting traffic to flow uninterruptedly north and south across the Potomac.

Traffic crossing the Potomac River near Glen Echo would enter the George Washington Memorial Parkway. The parkway provided access along the Potomac River to Alexandria, U.S. 1, and Shirley Highway:

Southbound trucks from Rockville destined for points in Washington, it was explained, would continue to use Wisconsin avenue. [Shepard, Nelson M., "Planners Delay Action on Bridge Over Anacostia," *The Evening Star*, December 8, 1949]

While the routing in the vicinity of the District remained uncertain, Maryland began construction of the Washington National Pike near Frederick. On December 29, 1949, the Maryland State Roads Commission awarded \$13.4 million in contracts, bringing the year's total to \$56,123,549, a record to that date, fueled by Governor Lane's roads program. Among the new contracts was a 4.6-mile section of the Washington National Pike in the Frederick area. [Associated Press, "Maryland Lets \$13,447,900 in Road Contracts," *The Evening Star*, December 29, 1949]

The routing close to the District remained uncertain for several years, but in January 1951, the Maryland-National Capital Park and Planning Commission recommended expressway construction through the Maryland portion of Rock Creek Park. The expressway would connect with the existing Rock Creek and Potomac Parkway. The commission's vice chairman, Blair Lee III, said the expressway was the keystone of a plan that would be similar to the network of roads in the suburbs of New York City:

Under the plan, the expressway would continue north from its junction with a Rock Creek Park parkway to a point southeast of Kensington where it would fork. One prong would run northwest to join the new Northwest freeway (relocation of Route 240) and the other would go northeast to hook up with the new Columbia pike to Baltimore (relocation of Route 29).

In addition, an express highway would leave the George Washington Memorial Parkway along the Potomac and extend up Cabin John Branch to join the relocation Route 240.

Mr. Lee pointed out, however, the plan is opposed by the National Capital Park and Planning Commission and the Regional Highway Planning Committee. The latter, he said, favors bringing Route 240 into Washington through the Landon School, Wood Acres, and Sumner developments.

The planning committee's idea, he contended, would "mutilate" existing neighborhoods and seriously affect several school and playground sites, if carried through.

But the Maryland commission's proposal, he insisted, "would follow natural barriers and split no neighborhoods. The increased construction cost would be somewhat compensated by the fact that the right-of-way is either already in public ownership or is undeveloped." ["New Expressway In Rock Creek Park Proposed," *The Evening Star*, January 7, 1951]

In October, engineers of the Maryland State Roads Commission decided on a route through Montgomery County, subject to commission action. The new plan included the western alignment southwest of Rockville, down Thomas Branch and Cabin John Creek Valleys to MacArthur Boulevard parallel to the Potomac River. With completion of the George Washington Memorial Parkway in Montgomery County, passenger vehicles to and from the District would shift to the parkway. A new bridge across the Potomac River at Cabin John, if built, would provide for traffic bound to or from Virginia.

In addition:

Construction of a truck cut-off from the vicinity of Tuckerman and Lux lanes to Wisconsin avenue—or Route 240—just north to Grosvenor lane. An eventual parkway through Rock Creek Park extended would connect with Silver Spring and upper Sixteenth street.

A third element of the plan was to rebuild River Road from the new highway west of Burning Tree Country Club to the District.

The National Capital Park and Planning Commission had long advocated the route along the two stream valleys. ["National Pike Approach to D.C. Selected by Maryland Experts," *The Evening Star*, October 4, 1951; Roberts, Chalmers, "Route of District-Frederick Superhighway Settled at Last," *The Washington Post*, October 4, 1951]

The roads commission approved a plan on October 18, 1951, that included two entrances to the District. South of Rockville, the expressway would split, with one leg continuing south to MacArthur Boulevard and the other reaching East-West Highway between Silver Spring and Bethesda where traffic could use Wisconsin and Connecticut Avenues for District access. Basically, the roads commission had adopted the National Capital Park and Planning Commission's plan. A commission announcement explained:

The plan will carry traffic southeastward from the Brink area and will distribute it by means of new connecting roads, over the fan-shaped network of traffic arteries already

serving the suburban area northwest of Washington, from MacArthur boulevard to the East-West highway.

The plan involved construction of about 25 miles of new highways and extensive upgrading of about 10 miles of existing roads. [“Maryland Plans Roads Leading To New Pike,” *The Evening Star*, October 19, 1951; “Progress on an Important Highway,” *The Evening Star*, October 29, 1951]

A former Republican mayor of Baltimore (1943-1947), Theodore R. McKeldin, defeated Democratic Governor Lane’s reelection bid in 1950, part of a Republican wave against Democratic incumbents, and became Governor on January 10, 1951. As discussed by Anne E. Bruder in *Tomorrow’s Roads Today*, the new Governor’s experience in Baltimore gave him a good understanding of the need for better highways:

As [M]ayor he had received a 1944 proposal from New York City Planning Director and consultant Robert Moses to demolish blighted areas near the Central Business District (CBD) in order to construct a new expressway through the City. The area that Moses proposed for the new expressway was on the north side of the CBD in Baltimore City near the Mount Vernon District. The proposal would displace a number of residents, including business elites. The Mount Vernon residents opposed the plan, and it was dropped from consideration.

As Mayor, McKeldin also made the final decision on the location for the Baltimore-Washington Parkway entrance to the City. The City Public Works Department extended Russell street south to meet the Baltimore-Washington Parkway at the City-Baltimore County boundary. As with other portions of the highway, at-grade intersections were made into interchanges while other portions were made into bridges to avoid railroads. [Bruder, Anne E., “*Tomorrow’s Roads Today*”: *Expressway Construction in Maryland, 1948-1965*, Maryland State Highway Administration, September 2011, page 28]

While these efforts were underway to improve access to Friendship International Airport, Mayor McKeldin ran for Governor. He campaigned, in part, on taking a fresh look at Governor Lane’s highway building and financing policies.

With the Lane program providing funds for another year or two, Governor McKeldin did not announce his road plan until 1953, known as the Twelve-Year Program, to rebuild Maryland’s highway system by 1965.

Governor McKeldin appointed Russell H. McCain of Frederick to be chairman of the Maryland State Roads Commission. McCain had been on the commission since 1945, serving as a minority member during the two previous Democratic administrations. [*A History of Road Building*, page 165]

With construction well underway on the new expressway from Frederick to the Montgomery County line, a *Star* reporter talked with McCain about the progress:

The State Roads Commission, he said, decided to start the new highway near Frederick when the Maryland-National Capital Park and Planning Commission and other agencies could not agree on an approach to Washington.

Difficulties in planning a “northwest freeway” from Washington began after the war. A direct route would have gone through the Landon school property and many estates in which much money had been invested.

Route 240, at the time, was carrying 40,000 cars a day across the District line, making it one of the busiest roads in the State:

The difficulties of getting into Washington have not all been solved, but it has been decided to swing the highway well west of the direct route, down a valley called Thomas Branch to Cabin John Creek.

Entry to Washington from this road would be by River road and a new connecting link to Massachusetts avenue and then to Wisconsin avenue; or straight down the river along MacArthur boulevard. Sometime in the distant future, entry also will be possible along the Maryland section of the George Washington boulevard, to be built from Great Falls to the Key Bridge in the river valley.

Because the George Washington Memorial Parkway would ban trucks, the State would use River Road or Massachusetts Avenue for the connection. [Kennedy, George, “Frederick Superhighway Goes Nowhere and Most Motorists Don’t Know It Exists,” *The Evening Star*, November 14, 1951]

On November 20, 1951, the commission awarded a contract for the first construction of the Washington National Pike in Montgomery County. It was a 3.8-mile grading and surfacing project straddling the Frederick-Montgomery County line. [Associated Press, “Low Bid Announced On Pike Surfacing,” *The Evening Star*, November 21, 1951]

## **Second Thoughts**

Even as officials planned construction of the Washington National Pike in Montgomery County, the Maryland State Roads Commission began encountering opposition to the southwestern leg linking the road with Massachusetts Avenue, River Road, and MacArthur Boulevard. Meeting at Bethesda County Club on November 30, 1951, about 400 property owners from the area bounded by Bradley Boulevard, the District Line, Massachusetts Avenue, and Seven Locks Road urged the State to abandon the plan until Maryland and Virginia determined the location of the Cabin John Bridge across the Potomac River. The *Star* listed the owners’ concerns:

There is no present need in the area for such a route. Moderate expansion of existing highway facilities should meet the needs of the foreseeable future.

The proposed route would sharply increase traffic congestion along Wisconsin avenue, River road and Massachusetts avenue and would open the door to commercialism.

The commission's plan for a cutoff in the vicinity of Tuckerman lane to lead to East-West highway near Silver Spring would handle all through traffic originating outside the Massachusetts avenue-River road area. ["National Pike Link Proposal Opposed By Property Owners," *The Evening Star*, December 1, 1951]

In April, the commission hired consultants Wilson Ballard and Joseph Knoerle of Baltimore to prepare a report on how to address traffic problems in Montgomery County. They were already working on the final routing of the Washington National Pike near the District but now would expand their work to include the inter-county freeway plan that was part of the outer circumferential for the area. During a meeting in Baltimore, McCain emphasized to other commissioners that the two projects were closely related, in part because they were affected by the location of the Potomac River crossings. According to the *Star*:

Ballard said the National pike must serve to drain local traffic in the lower Montgomery County area. He pointed to the difficulty of obtaining rights-of-way for new construction in the highly developed sections, owing to high prices. The highway will cost around \$20 million, he explained.

He said the Cabin John and River road locations are among those being studied to bring the National pike into Washington.

The commissioners also heard from the county manager, Irving G. McNayr, who complained about delays in fixing the location of the road. The county, he said, was delaying construction of schools until the plans were known. [Millen, William A., "State to Assist Montgomery on Road Problems," *The Evening Star*, April 10, 1952]

State Senator DeWitt S. Hyde, a Republican running for election to the U.S. House of Representatives, addressed the subject during a Cosmos Club luncheon at the Carlton Hotel. "I think it is certain that the road will come down Thomas Branch [near Burning Tree Golf Club] as that is the only place that's feasible." With work stalled at Brink, he recognized that the location of the Cabin John bridge was a factor in developing the western leg:

The new National Pike would connect with that bridge, under a long-range program, he said.

"If we had effective regional planning that covered Maryland, Virginia and the District and the various jurisdictions would agree, we would save time, money and avoid many mistakes," Senator Hyde told his audience.

Senator Hyde pointed out that under legislation recently enacted by Congress, a regional council would be set up. But he explained this is only advisory and "the final say is in the hands of the local authority."

"Regional planning is urgently needed to take care of the Washington metropolitan area," he declared. ["National Pike Likely To Enter Capital Via Thomas Branch," *The Evening Star*, July 18, 1952]

(Hyde won the election and took office on January 3, 1953. His predecessor, Representative J. Glenn Beall, was elected to the United States Senate.)

The Maryland-National Capital Park and Planning Commission was working on a long-range master highway plan. By early October 1952, the commission had distributed copies of a proposed plan to the Maryland State Roads Commission, BPR, NCPC, and county officials. The commissioners identified a system of high-speed highways as the backbone of their comprehensive plan.

The plan assumed construction of the hub-and-spoke layout that was common in expressway proposals for the Nation's big metropolitan areas. In the Washington area, the inner hub would surround the downtown business district, while the Inter-County Belt Freeway would serve as the rim. The commission's plan for the Maryland suburbs called for five spokes or radials:

1. Washington National Pike from the District to Frederick,
2. Northern Parkway (Silver Spring to Gettysburg, Pennsylvania),
3. Relocated U.S. 29 (between Silver Spring and Burtonsville, Maryland),
4. The Baltimore-Washington Parkway, and
5. The Annapolis Freeway.

The *Star* described the general location of the Inter-County Belt Freeway in Maryland:

The freeway would extend from a proposed new bridge across the Potomac at Cabin John, Md., completely around the Nation's capital to another proposed bridge in the vicinity of Alexandria, Va. It would cross the Annapolis Freeway at a point near Ardmore, Md.

The Inter-County Belt Freeway would connect the arterial routes leading out of the capital at distances varying from two to five miles from the District line.

The circumferential would bypass the District, providing a bypass for traffic not bound for the city. ["Highway Plan For Maryland Nears Windup," *The Evening Star*, October 5, 1952]

By the end of the month, the park commission had to assure area residents that criticism of the plan was "premature" because it was not final and was not even due for publication until the middle of November. The criticism centered on relocation of U.S. 240 in Montgomery and the location of the Inter-County Belt Freeway. Residents, the park commission indicated, would have an opportunity for comment and their recommendations would be considered. ["Park Planners Assail Highway Plan Critics," *The Evening Star*, October 31, 1952]

On November 15, about "300 irate Berwyn" residents attended a protest meeting of the Berwyn Citizens Association to object to the way the route of the Inter-County Belt Freeway "dips in" toward the University of Maryland and Berwyn instead of continuing a logical path farther north. On the park commission's map, the freeway would cross Baltimore Boulevard (U.S. 1) at Berwyn a mile north of the university. State Delegate J. Frank Lillard, Jr., told the residents, "I intend to investigate whether there has been any pressure from the 'kingmaker on the hill' to

bring the freeway closer to the university. And you can draw your own conclusions as to who I mean.” He was referring to university president Dr. H. C. Byrd.

The park commission contended that the routing was affected by the large tract of Federal lands north of Berwyn (Beltsville Agriculture Research Center) and the heavy development to the south. The commission was exploring options for shifting the beltway routing through the area. [“Freeway Route Fight Flares at Berwyn Session,” *The Evening Star*, November 15, 1952; “New Route Suggested North of Berwyn for Proposed Freeway,” *The Evening Star*, November 17, 1952]

On October 26, the Maryland State Roads Commission completed work on *Proposed 12-Year Program for Road Construction and Reconstruction, 1954-1965*. With former Governor Lane’s 5-year plan ending in 1953, the plan called for \$568 million beginning in 1954. The commission asked for authority to impose tolls on roads already under construction or planned; a 1-cent increase in the gas tax; increased motor vehicle registration fees; and authorization for additional State highway construction bonds totaling \$330 million.

For the Washington area, the report identified priority for the inter-county circumferential route, completion of the Washington National Pike, and the Washington-Annapolis expressway (U.S. 50). Among the suggested toll possibilities that might raise a total of \$50 million for construction were the Washington National Pike, Annapolis expressway, and an Eastern Shore Expressway from Queenstown to Warwick. (The report did not cover the Baltimore-Washington Parkway or its Baltimore extension because they would be completed before the 12-year plan began.)

When the commission released the report on November 12, the *Star* included a map of planned new roads. The map showed the Washington National Pike ending on the west side of Washington at an indefinite point. “The new U.S. 240 from Frederick will be continued into Washington over a route not yet determined,” the caption read. The map also showed the Maryland portion of the inter-county circumferential, touching the Potomac River at Cabin John and Alexandria. The only town identified on the map of the circumferential was Berwyn Heights, which also the northern terminus of a plan to reconstruct Edmonston Road from Defense Highway. The plan, however, did not include either bridge. [“Maryland Maps Huge Road Plan,” *The Evening Star*, November 12, 1952; Bruder, page 28]

Governor McKeldin endorsed the program, including the call for additional revenue:

Despite the large sums of money involved, the program is based on economy and careful spending because it would be far more costly in the long run to permit our present inadequate roads to deteriorate than it will be to have a progressive program of modernization. [“McKeldin Voices Support Of State Roads Program,” *The Evening Star*, November 13, 1952]

According to the State roads history:

The Legislature of 1953 passed the entire Twelve-Year Program substantially as proposed except the increase in the registration fees was postponed to April 1, 1955, instead of 1954 as requested.

Subsequently, the Legislature postponed it again and finally repealed the increase altogether, thus eliminating one of the important arches of the 3-arch financial structure. The raids on construction funds for maintenance continued . . . .

The man tapped to carry on the new program was Norman M. Pritchett. He is a career man, having started with the Commission in 1928 as rodman on a survey party. As a result of his highway location work he is completely familiar with the road system in all its ramifications. [*A History of Road Building*, pages 168-170]

Governor McKeldin approved the initial legislation, covering the first 4 years, on April 27, 1953.

The park commission held a public hearing at the Glenbrook Club in Bethesda to present its plan to about 300 people on December 16. The *Star* summarized the public comments:

Each speaker urged that the big thoroughfares go through some other neighborhood than his own. Warm applause greeted a suggestion that major highways for through traffic be constructed to carry cars and trucks across the Potomac River to Virginia at a point well west of Bethesda . . . .

Most of the opposition fire was directed at plans for completion of the National Pike, a new route 240, through Bradley Hills Grove . . . . Residents of [the] Thomas Branch Valley route, west of the Bradley Hills Grove location, said they believe they have a commitment from the State commission not to build the pike through their area.

A resident of that area, Attorney David Fegan, warned of “guile and deceit among officials of the State Roads Commission.” Mr. Fegan charged that the State commission already has received a report on a study of the new route 240 made by the Ballard engineering firm of Baltimore, and he said the report recommends against the Thomas Branch route. But State commission officials still hope to use this approach, he asserted.

Mr. Fegan said he had been told by a State official that when the State commission gave the Ballard firm the contract, “it expected and understood that Ballard would recommend the Thomas Branch-River road route.”

He planned to ask the General Assembly to investigate the contract and, if necessary, “I shall name names and dates and be more specific in a situation that appears to be a waste of the public’s money and a fraud upon many of us property owners.” He said that Ballard and Knoerle had done “a thorough job,” adding, “It appears that the State Roads Commission is casting reflections on Ballard’s ability so that the commission can be whitewashed in the situation.” [“Wary Reception Given Highway Master Plan,” *The Evening Star*, December 17, 1952]

In a report to the General Assembly on the 12-year program, the Maryland State Roads Commission indicated that it planned to construct the Washington National Pike from Clarksburg to the Brink interchange in the first 4 years, along with extending the pike to Seven Locks Road, a distance of around 14 miles. At Seven Locks Road, the pike would split. For the southeast leg:

A Rock Creek parkway connection would run from the end of the pike to Wisconsin avenue at Grosvenor lane . . . . Another connection . . . would extend the route beyond Wisconsin avenue to East-West highway at or near Beach drive . . . . Also planned for the first four years would be acquisition of rights-of-way for the last .9 mile to bring the link all the way to the District line.

The southwest leg, from Seven Locks Road to River road, a distance of 4.5 miles, was scheduled for the second 4-year period. “The final 1.8 mile stretch from River road to the George Washington Memorial parkway on the Potomac River would be delayed until the last four-year period.” The current plan was to run this final segment down Thomas Branch, but the location remained to be determined. [“National Pike Slated to Reach D.C. Area Within 4 Years,” *The Evening Star*, January 21, 1953]

On January 24, 1953, the State opened the 4-mile section of the Washington National Pike from Frederick to U.S. 15 south of Urbana. Amid intermittent rain, Governor McKeldin failed to appear as planned to snip the ribbon, leaving McCain to open the road. The *Star* noted that, “The Governor, who seldom misses an opportunity to snip a ribbon and pass out some of his autographed photos, decided the weather this morning was fit only for dedicating duck ponds.” Following the ceremony, participants drove to Frederick.

The State was already constructing the extension to Hyattstown, about 5 miles south, to be opened during the summer, and the segment to Clarksburg, scheduled for completion by the end of 1953. [“National Pike Section Dedicated at Urbana; McKeldin Rained Out,” *The Evening Star*, January 25, 1953]

### **The Chevy Chase Revolt**

At the same time, the Maryland State Roads Commission had to deal with growing protests from the Chevy Chase area to the eastern leg of the link to the District of Columbia. Chevy Chase was one of the country’s earliest 19<sup>th</sup> century streetcar suburbs. Two entrepreneurs developed the area:

- William Morris Stewart, whose fortune stemmed from mining gold in California and silver from the Comstock Lode in what was then Utah Territory, and
- Francis G. Newlands, an attorney and friend of Stewart who had married the daughter of a financier who had also benefited from Comstock Lode silver mining.

Stewart and Newlands secretly bought about 1,700 acres of farmland between Calvert Street in the District and Jones Bridge Road in Maryland (just south of today’s Capital Beltway). They incorporated the Chevy Chase Land Company in June 1890.

To connect this farmland with the District, they extended Connecticut Avenue and an electric railway to the end of their property at a cost of \$1.5 million. They formed the Chevy Chase Club to attract wealthy buyers, dammed a small stream at Coquelin Run near Jones Bridge Road to create Chevy Chase Lake, and built an amusement complex to provide fare-paying streetcar riders. A history of Chevy Chase explained the attractions that would appeal to District residents with streetcar fare:

An amusement complex there drew people to the area on weekends; the complex eventually included boats for hire, refreshment kiosks, a merry-go-round, a bandstand where the Marine Band often played, and a dance pavilion where Irene and Vernon Castle introduced the Castle Walk in the ragtime era.

Growth was slow, in part because of the devastating Panic of 1893 and the slow recovery over about 4 years. As late as 1922, the Chevy Chase Land Company had not paid a dividend to investors. Activity picked up in the building boom that followed World War I.

Today, the lake is gone as is the streetcar line, but the company survived, as the 1990 history reported:

Today the company is going strong, with far-flung interests. In our area, it owns the Chevy Chase Shopping Center and the Metro building which it built in Friendship Heights on the northeast corner of Wisconsin and Western Avenues. It also owns land on Connecticut Avenue just south of the bus terminal in Chevy Chase, D.C.

In the area where Chevy Chase Lake once stood, the company owns the office and retail complex—land and buildings—on both sides of Connecticut Avenue between Manor Road and the railroad tracks, as well as the townhouses and garden apartments on Manor Road. [Town History Committee, *The Town of Chevy Chase: Past and Present*, Town of Chevy Chase, 1990, pages 11-14]

Citizens from 12 area organizations in the Chevy Chase area formed the Citizens' Action Committee for Fair Highway Planning headed by former Senator Gerald P. Nye (R-ND). A former journalist, he had joined the Senate on November 14, 1925, filling the seat of his recently deceased predecessor, and served until January 3, 1945, following defeat of his reelection bid. By then, he had purchased 3 acres of pasture land in Chevy Chase on a hill above Rock Creek Park; he lived at 6 Farmington Drive.

Attacking the roads commission for "secrecy" in preparing the plans, the new committee claimed that the State's goal was to open Rock Creek Park in Maryland and the District for commercial traffic on a six-lane superhighway:

The group specifically is objecting to what they call "Alternate B" plan [sic] for construction of the southeast leg of Route 240 from the vicinity of Grosvenor lane and Wisconsin avenue to a terminal point on East-West highway in the vicinity of Beach drive. The road planned, they say, calls for the route to follow the east boundary of the Bethesda Naval Hospital, cross Jones Bridge road via an overpass and head southeasterly

across Connecticut avenue by way of an overpass. The latter overpass would be 100 yards south of Jones Bridge road and would call for an elaborate cloverleaf interchange there.

The route then would cross the Baltimore & Ohio Railroad by overpass and, elevated to about rooftop level, would proceed along Cocquelin run over Jones Mill road coming into East-West highway, the group asserts.

The original plan made public recently in the State Highway Commission's 12-year program called for the southeast leg of Route 240 to run considerably north of Jones Bridge road and then along Rock Creek park to East-West highway.

The committee urged the State to abandon Alternate B, preserve Rock Creek Park from commercial traffic, and rely on existing regional planning agencies. Alternate B, they contended, would pass through more heavily populated areas than the original plan, thus reducing property values.

J. B. Hartranft, Jr., the committee's vice chairman, said "it was only by coincidence that the skullduggery was discovered in Baltimore." Alternate B had been "conceived under a veil of unprecedented mystery demanding public investigation." ["Super-Highway Plan Blasted at Chevy Chase," *The Evening Star*, February 9, 1953]

During a meeting with legislators and the citizens committees in Annapolis, Norman Pritchard admitted the commission had approved the shift because the new route would be six-tenths of a mile shorter. However, the approval came on November 7, too late to be included in the printed plan.

This explanation did not satisfy Senator Nye. He charged that the shift had occurred because the original plan would have required the taking of the home of an official of the Maryland-National Capital Park and Planning Commission. Pritchard denied this allegation.

Senator Nye claimed that the new plan included overpasses at Jones Bridge Road, Connecticut Avenue, the Baltimore and Ohio Railroad tracks, and Jones Mill Road. This amounted to construction of an elevated highway "alongside of and above the roof level of scores of new homes in the communities known as Rock Creek Knolls, Coquelin Terrace, North Chevy Chase and others." He pointed out that Senators Hubert H. Humphrey (D-Mn.) and Russell B. Long

(D-La.) lived in the affected area, as did several members of the U.S. House of Representatives. The expressway would affect 50 or more homes built in recent years at a cost of about \$40,000 each. Land in the area was worth \$30,000 to \$40,000 an acre. [Goodwin, Gene, "Restudy Sought On Chevy Chase Elevated Road," *The Evening Star*, February 13, 1953]

Donald E. Gingery was the accused member of the Maryland-National Capital Park and Planning Commission. Gingery, who lived at 9504 Jones Mills Road, denied any involvement in the road commission's shift to Alternate B, claiming that his home would not have been affected by the original plan. He stated, however, that Alternate B "in my opinion is the more logical and cheaper route":

Mr. Gingery urged a greater understanding by residents of the need for limited access, modern highways in the heavily populated suburban area.

He said the only open land left for a north-south route through the District was Rock Creek Park. But, he added, he opposed any such super highway being made accessible to truck traffic. ["Highway Foes Step Up Fight In Chevy Chase," *The Evening Star*, February 15, 1953]

Representative Hyde, who also opposed Alternate B, joined other critics in a conference with Governor McKeldin in Annapolis. Participants raised their concerns about the plot to open Rock Creek Park to a superhighway for trucks.

The roads commission defended Alternate B, pointing out that the plan did not call for overpasses at Jones Bridge Road and Connecticut Avenue. Rather, it called for underpasses. Moreover, Alternate B would cost nearly \$1.9 million less than the original plan and only one house was in the path of the right-of-way.

Ballard and Knoerle, the consultants who conceived Alternate B, also defended the plan, which would cost about \$2.6 million to build:

Mr. Knoerle said the route was nearly .6 mile shorter than the northern alternate, a plan that would have followed Rock Creek. He added the gasoline saving to motorists would justify spending \$2 million more for purchase of the right of way.

"The fact is however," he said, "we can purchase the alternate B right of way for about \$15,000 less than the northern right of way."

. . . The two consultants freely admitted that a major road eventually will go down the west side of Rock Creek Park. They denied, however, the Roads Commission was attempting to force such construction.

After listening to the concerns, Governor McKeldin promised to give the plan "thorough consideration."

Meanwhile, the Parkwood Civic Association of Bethesda and Kensington charged that

Alternate B favored trucking interests over residents. The association had launched a campaign to bombard Governor McKeldin with telegrams and night letters charging that the route would be "a permanent and continuing nuisance." ["McKeldin Talks To Chevy Chase Road Critics," *The Evening Star*, February 20, 1953]

Senator Nye and his committee continued their bitter attacks on the roads commission for conspiring with the District Highway Department to dump traffic on Beach Drive to open Rock Creek Park to truckers. The route would undermine the value of choice residential property in both jurisdictions.

At a protest meeting on February 27, Senator Nye accused the roads commission spokesman of switching his story about the number of overpasses, underpasses, and cloverleafs needed in less than 1 mile of the highway:

The freeway, he said, either would have to be “a replica of Glen Echo amusement park,” climbing and dipping at intersecting roads or an elevated highway above the rooftops and gardens of the residential communities.

The group and its allies promised to do everything they could to protect Rock Creek Park. [“Chevy Chase Area Picks Group to Fight Superhighway Plans,” *The Evening Star*, February 28, 1953]

By contrast, a Silver Spring Board of Trade resolution stated that an eastern entrance for relocated U.S. 240 to Washington in the vicinity of Rock Creek Park “is of vital necessity to the development of all sections of Maryland bordering on the District of Columbia.” The board was “not opposed to any relocation of leg B (the connecting link) of Route 240 either along the B & O Railroad or any other reasonably direct route that will reach the now planned Washington entrance.” [“Silver Spring Board Backs Commission On D.C. Road Plan,” *The Evening Star*, February 5, 1953]

On March 7, NCPC opposed Alternate B, as did the Committee of 100 on the Federal City. NCPC favored widening the existing road in Rock Creek Park to Colorado Avenue, then channeling traffic onto 16<sup>th</sup> Street and Tilden Street. John Nolen, Jr., NCPC’s director, said, “There is no need for an expressway into the northern regions” of the park. He favored an entrance for relocated U.S. 240 with the proposed George Washington Memorial Parkway in the vicinity of MacArthur Boulevard. Moreover, funneling traffic into the center of the city would merely increase congestion in the area. [“Two District Officials Oppose Chevy Chase Highway Plan,” *The Sunday Star*, March 8, 1953]

Additional groups announced opposition to Alternate B, including the Montgomery County Council, the Woman’s Club of Chevy Chase, and the Junior Woman’s Club of Chevy Chase.

The Silver Spring Board of Trade published a text advertisement in the *Star* on April 7 headlined, “Citizens of Montgomery County . . . We Believe You Should Know All The Facts!” Citizens opposing Alternate B “do not realize the large and continuing disservice to their own motoring safety and convenience their opposition may bring about.” If the eastern leg plan were not built “there will be no other route to the West remaining on the Bethesda, Chevy Chase, or Silver Spring side of Seven Locks Road, Burning Tree Golf Club, Bethesda Country Club, or Rockville, depending on where you will have to drive to reach the relocated and modern

Route 240.” The western leg of U.S. 240, bypassing the District, would be 5 miles from Georgetown and was designed to take truck traffic around the city, not serve residents in the Chevy Chase-Bethesda-Silver Spring area in their daily access to the District:

We Believe . . . that the west side of Rock Creek Park within the District of Columbia is the only location in which a modern, dual, limited-access highway can be built to move

motor vehicles quickly and safely from the central and northwestern Maryland suburbs of Washington to Massachusetts Avenue or to K Street, or down the Mall into Constitution Avenue.

*So, when Route 240 reaches the East-West Highway at Rock Creek Park, it is inevitable that this fine, dual, limited-access, modern highway will be continued to the Potomac River along the general alignment of the west side of Rock Creek Park.*

Construction of this highway was the “only salvation for the continued” mobility of the area. The advertisement concluded:

We Believe . . . that, if you as a citizen, who is constantly required to motor into Washington, allow the avenue of modern motor transportation to be closed to you at this time, you will regret its loss and suffer from its unavailability for all the years to come.

*You should support this far-sighted plan of the Maryland State Roads Commission, before this opportunity to use a fast, safe route into Washington and return, or to conveniently reach the same route for western traffic is lost. [Italics in original]*

### **Curbing Capper-Cramton**

On April 7, 1953, the *Star* reported on its front page that the Budget Bureau was “spearheading an economy move to scrap or modify” the Capper-Cramton Act, which President Herbert Hoover had approved on May 29, 1930. The authors of the legislation – Senator Arthur Capper (R-Ks.), chairman of the Senate District Committee, and Representative Louis C. Cramton (R-Mi.), chairman of the House District Committee – secured approval of \$16 million to acquire parkland. Gutheim and Lee described the legislation:

The Capper-Cramton Act provided land acquisition funds for the regional George Washington Memorial Parkway along both sides of the Potomac, on the Virginia side from Mount Vernon north to Great Falls and then south again on the Maryland side to Fort Washington. For the land in Virginia and Maryland needed for the parkway, both states were required to commit one-half the cost, either directly or through eight-year no-interest federal loans . . . .

The primary legacy of Capper-Cramton legislative efforts on the city of Washington’s behalf was the creation of the George Washington Memorial Parkway. The Capper-Cramton Act also provided \$1.5 million in funds for an extension of Rock Creek Park into Maryland and extension of the Anacostia Park system farther up the valley of the Anacostia River. In this act, Washington finally possessed the makings of a truly regional park system and at the same time had an important opportunity for demonstrating cooperation among the National Capital Park and Planning Commission and the Virginia and Maryland planning agencies. [Gutheim and Lee, pages 214-215]

Now, the *Star* reported, the Eisenhower Administration would reverse the Truman Administration’s final budget proposal, which called for \$1.25 million in funds for land purchases. (With the Korean War underway, Congress had not appropriated park acquisition

funds for 2 years.) At present, NCPC had no funds for land purchases. The Budget Bureau move would have many repercussions, including putting NCPC's master plan on the shelf, leaving park projects uncompleted. It also would abandon large tracts of land in Maryland that were being held in reserve from developers until funds became available for purchase of parkland. According to the *Star*, some Budget Bureau officials "want the act repealed outright," while others advocated killing only certain sections. [Hendley, Coit, Jr., "Budget Bureau Seeks to Scrap D.C. Parks Law," *The Evening Star*, April 7, 1953]

As Members of Congress and local organizations reacted to this news, a few days passed before the relocation of U.S. 240 was raised. The Maryland-National Capital Park and Planning Commission issued a statement on April 9:

Either outright repeal of the act or establishment by Congress of a definite policy of failure to make appropriations thereunder would be fatal to the metropolitan park system for the Nation's Capital.

The United States has a tremendous stake in these parks which would be sacrificed either through outright repeal or indirect repudiation of its commitments.

Congressional action also could affect the Federal Government's voice in acquiring Maryland park lands, as well as whether arterial highways should be routed through Capper-Cramton Act parks. The commission cited the Maryland State Roads Commission's proposal to extend one leg of relocated U.S. 240 through Rock Creek Valley:

It would be most unfortunate if the Congress should decide to abandon these controls and forfeit all interest in and control over the park system in Maryland thus far acquired.

The changes would repudiate agreements that President Hoover had reached with Maryland Governor Albert C. Ritchie under the Capper-Cramton Act. Paragraph 5 of the basic agreement that President Hoover, Governor Ritchie, Colonel Grant for the National Capital Park and Planning Commission, and Irvin Owings for the Maryland-National Capital Park and Planning Commission approved on November 19, 1931, for extension of Rock Creek Park into Maryland, stated:

It is further understood and agreed, in accordance with the Capper-Cramton Act and said Chapter 370, that the title to all lands acquired under the provisions of this Basic Agreement or any Supplementary Agreement shall vest in the State of Maryland, and that no part of any land purchased for park or recreational purposes with the funds provided by the National Commission, in whole or in part, shall at any time be conveyed, sold, leased, exchanged, or in any manner used or developed for other than park purposes by the Maryland Commission, and the development and administration of said lands shall be under the Maryland Commission but the development thereof shall be in accordance with plans approved by the National Commission, or the necessary approval of the Congress of the United States.

Such repudiation “would necessarily require Maryland to re-examine the park plan from the standpoint of Maryland alone.” Reconsideration might result in disposal of parkland to raise funds for future purchases. [“Planners See Repeal as Fatal To Park System,” *The Evening Star*, April 10, 1953]

Even as the House Appropriations Committee voted on April 17 to deny funding for the third year in a row to expand the area’s park system and slashed NCPC’s operating budget, the Committee of 100 on the Federal City opposed such changes. NCPC’s executive officer, Blair Lee III, told the Committee of 100 that the Budget Bureau had not yet attempted to repeal the Capper-Cramton Act, but “would be receptive to ideas from the outside.”

In addition, the Committee of 100 opposed construction of Maryland freeways in any part of the Rock Creek Park valley. General Grant, president of the American Planning and Civic Association, raised the issue before the committee:

The Maryland Freeway dispute arose when Gen. Grant protested plans for a road he said would extend from Maryland’s Route 240 through Rock Creek Park to the District line. He said such action would force the District to build a freeway through the city section of the park, and proposed a resolution opposing construction of a freeway in any part of the Maryland park.

Lee said the resolution also would apply to the Inter-County Belt Freeway that would enter the park on an east-west path for about a mile between Kensington and Wisconsin Avenue. District and Maryland planners had approved the route, in part because an alternative routing would require acquisition of valuable residential property:

“By prohibiting that East-West section of the park to the inter-county belt route, it will be killed because there just isn’t any place else it can go,” he declared. [“44 Pct. Cut Recommended In Planners’ Operating Budget,” *The Evening Star*; Beveridge, George, “Parks Growth Support by 100 Committee,” *The Evening Star*, both April 17, 1953]

On May 7, the Maryland-National Capital Park and Planning Commission released its 25-year master highway plan. The plan omitted the southeast leg of U.S. 240 that the Maryland State Roads Commission proposed to build across Chevy Chase to East-West Highway at Beach Drive. The planners decided to stay out of planning for the route because of the effect that action in Maryland would have on District decisionmaking. A spokesman said, “We are not in favor of dumping a lot of traffic on the East-West highway before the Rock Creek expressway is built.”

However, the commission did call for a change in the southwest leg of relocated U.S. 240. Under the commission’s plan, the Washington National Pike would be located about 1.5 miles to the west of Burdette Road; traffic would move along Thomas Branch to MacArthur Boulevard as the entrance to the District. [“Maryland Planners Omit Chevy Chase High-Speed Route,” *The Evening Star*, May 8, 1953]

*Star* editors understood the commission’s “wait-and-see attitude” regarding the southeastern leg of the Washington National Pike. In view of the plan to route the expressway through Rock

Creek Park, the “dispute over the expressway is the traditional one between park conservationists and highway engineers.” The editors, acknowledging the concerns of Chevy Chase residents and others, agreed that any further “invasion of Rock Creek Park by traffic would be unfortunate”:

But if, as the District highway planners assert, the highway is essential to the solution of Washington traffic problems, and if, as they also assert, it can be built along the western valley of the park in a way that will not seriously interfere with recreational use of the park or with its natural beauty, some concessions eventually may have to be made in the interest of the general public. [“Washington Must Decide,” *The Evening Star*, May 9, 1953]

On May 12, 1953, the Senate Appropriations Committee approved a bill that kept the Capper-Cramton Act program alive. It included more funds for NCPC than the House bill as well as funds for land purchases, including funds for park purchases in Maryland and to extend George Washington Memorial Parkway to Old Georgetown-Leesburg Pike. [“Senate Group Backs Capper-Cramton Act For Park Site Funds,” *The Evening Star*, May 12, 1953]

The Senate approved the committee’s proposal on May 20. Differences between the Senate and House appropriations bills would have to be resolved by a conference committee.

On May 26, Governor McKeldin met in Baltimore with opponents of the southeastern leg of the Washington National Pike. Republican political leaders told him that he could lose 4,000 to 5,000 votes in Montgomery County if the southeastern leg were built as planned. Senator Nye explained that he opposed the plan because it would open up Rock Creek Park for an expressway into the District. Norman Pritchard conceded the point:

That’s the way we had it planned. District highway authorities seemed very enthusiastic about using Rock Creek Park for that purpose.

Doing so would be logical, economical, and necessary in view of the heavy traffic between that part of the county and the District.

Senator Nye contended that the southeastern leg was unnecessary. The Inter-County Belt Freeway would provide needed access via existing roads into the District. That would not, responded State road officials, solve the area’s traffic problem:

“If the road is extended to the District through Rock Creek Park,” said Wilson T. Ballard, engineering consultant to the commission, “it would be along the west edge. It won’t destroy the park; it won’t do it any great damage.”

Senator Nye said NCPC had not consented to use of the park for an arterial highway. He also read a letter from the NPS indicating that the agency was “alert to the threat posed by the southeast leg” and would “vigorously oppose use of the Rock Creek Valley for any arterial highway.”

Regarding the politics of the dispute, Senate Nye told the Governor that Chevy Chase had “been a healthy community from a Republican standpoint. We’d like you to get credit for stopping this

thing.” [Goodwin, Gene, “McKeldin Asked To Block Work On Pike Route,” *The Evening Star*, May 26, 1953]

District Commissioner Renah F. Camalier, a local attorney and Masonic leader who had taken office in June 1952, announced on May 25 that he agreed with Engineer Commissioner Prentiss that relocated U.S. 240 should follow Rock Creek through the park into the District. The commissioners had previously endorsed the concept of a parkway only in principle. Now, Camalier told the Chillum Heights Citizens’ Association, that without the parkway, Washington businesses would “dry up.” [“Camalier Indorses Plan for Parkway Link to Route 240,” *The Evening Star*, May 26, 1953]

On June 12, the Maryland State Roads Commission met with the Maryland-National Capital Park and Planning Commission to request approval to use the Maryland section of Rock Creek Park for the southeastern leg. This permission would be needed because the planning commission owned title to the land. The commission deferred action until it could consult with opponents. However, the roads commission pointed out that while the planning commission held title to the lands, that meant the title actually was held by the State. If the planning commission denied use of the parklands for the expressway, a legal wrangle would result.

At the same time, the roads commission filed condemnation proceedings in Montgomery Circuit Court to block a 1,400-unit apartment development at Grosvenor Lane and U.S. 240. The development was on land needed for an interchange linking Wisconsin Avenue with the southeastern leg of Washington National Pike. [“Roads Group Acts to Block New Apartments,” *The Evening Star*, June 12, 1953]

Senator Nye appeared before the Maryland planning commission in a 90-minute plea to block the State’s plan to route the southeastern leg of U.S. 240 through the Rock Creek Valley. He disclosed a letter from Secretary of the Interior McKay calling Rock Creek Park one of the capital’s greatest assets. “Any adverse use of the park property which would be destructive of its natural beauty would be nothing less than tragic.” Senator Nye interpreted Secretary McKay’s letter to mean the Eisenhower Administration opposed use of the park for the expressway.

He also said conferees on the Capper-Cramton Act bills were holding off on reporting a conference report until they see what the planning commissions do on the issue. He did not suggest that he or his group had pressured conferees. He said, however, “I should go out of my way to see that no other funds are appropriated” under the Capper-Cramton Act if the expressway is allowed to go through the park.

As Senator Nye put it, “The roads commission is forcing you to be a leverage in the District to further destroy Rock Creek Park.” In dealing with the roads commission, he had never seen an agency “caught in so many falsehoods.” An attorney for the Chevy Chase Land Company agreed that the roads commission was an “arrogant, irresponsible group that concedes to no one.”

Senator Nye told the planners that his group favored construction of the outer circumferential and the widening and extension of Georgia Avenue, 16<sup>th</sup> Street, Connecticut Avenue, Massachusetts Avenue, and River Road. These arterials would provide needed access without the loss of

parkland. ["Parkland Funds Held Up by Road Plan, Nye Says," *The Evening Star*, June 19, 1953]

On June 25, State roads officials appeared before NCPC in closed session to argue in favor of Alternate B. NCPC argued that under the Capper-Cramton Act, NCPC and the Maryland-National Capital Park and Planning Commission must approve any plan for a road in Rock Creek Park. The legislation stated:

The title to the lands acquired hereunder shall vest in the State of Maryland. The development and administration thereof shall be under the Maryland National Capital Park and Planning Commission and in accordance with plans approved by the National Capital Park and Planning Commission.

The planners contended that roadways were covered by the term "development."

### **Hardening Positions**

The following day, Chairman McCain issued what the *Star* referred to as a "fighting-word statement." The roads commission would proceed whether NCPC or the Maryland planning commission approved the proposal. The statement said the commission had concluded "after an exhaustive study extending through the past several years that for a number of reasons only one logical and available route remains for the location of the main Western highway Route 240 into the District of Columbia."

He stated that "few unsolved traffic problems" existed in the State such as this one. With resources in hand and agreement from Federal and other highway authorities, "The Maryland State Roads Commission cannot fail in its duty to acquire the right of way and build Route 240 into Northwest Washington as a modern dual limited-access route."

The expressway would serve traffic that was presently using radials "planned for the horse-and-wagon traffic" of years past. The time needed for rush-hour traffic between Maryland and central Washington had doubled in recent years "due largely to the increased number of motor vehicles and the increased number of traffic lights." Allowing this situation to continue would render Maryland communities on either side of the park as "secondary areas because the people with means will save their time and energy and reduce their costs by taking advantage of the bridge and highway systems which reach into Virginia and for which great improvements will shortly be built without the opposition of any one on the Virginia side of the Potomac River."

For Maryland commuters from Wisconsin Avenue to Georgia Avenue, the Rock Creek Valley was "the only remaining central location in which a modern high-speed arterial highway can be located." Not building the expressway would "doom to ever-increasing traffic strangulation a present population of 100,000 people." As that population increased, ignoring "this vital need" would be impossible.

Further, McCain challenged the authority of either planning commission to block Alternate B:

The State Roads Commission is further of the opinion that the State of Maryland has never granted highway jurisdiction to either the Maryland-National Capital Park and Planning Commission or to any other national agency, superseding the State's paramount right to build arterial highways to transport its citizens from one portion of the State to another.

Under the Capper-Crampton Act, planning commissions had only "a joint advisory jurisdiction for park development and recreation planning." They were "in no wise to infringe on or eliminate the rights and obligations of the State of Maryland to provide arterial communication services for its citizens and the citizens of other States." [Beveridge, George, "Officials See Planners Today On Park Route," *The Evening Star*, June 25, 1953; Beveridge, George, "Roads Chief Denies Planners Can Block Rock Creek Project," *The Evening Star*, June 26, 1953]

In response to McCain's request that NCPC and the Maryland-National Capital Park and Planning Commission approve routing the southeastern leg of the Washington National Pike through the park to the District line, NCPC had intended to study it for several weeks. However, immediately after receiving McCain's letter challenging NCPC's legal authority, NCPC voted to oppose Alternate B.

NCPC denied McCain's legal analysis. In a statement, NCPC explained that the Capper-Crampton Act of 1930 gave both planning bodies control over the Maryland park areas and that it would exercise that power "until a contrary opinion shall be rendered by a court of law." The statement contrasted NCPC's approval of the Inter-County Belt Highway's use of an east-west section of Rock Creek Park near Wisconsin Avenue and Grosvenor Lane with the proposed use of a 1,200-foot section of the park at East-West Highway and Beach Drive for the north-south southeastern leg of U.S. 240 to near the District line and its continuation by District highway officials. NCPC recommended prompt construction of the beltline to Georgia Avenue "as soon as possible to provide a new facility between Route 240 and the Silver Spring area, relieving the East-West highway."

The statement also made clear NCPC's continued opposition to:

. . . the construction of a road of the expressway type in Rock Creek Park south of the inter-county belt route both in the District of Columbia and in Maryland. In lieu of the expressway, the commission favors further development and extension of a park road such as an extension of Beach drive, which might be planned to connect with the inter-county belt route within the confines of the park.

Although NCPC had not previously voted against the proposed southeast leg's use of Rock Creek Park, a spokesman explained the reference to "continued opposition" by pointing out that NCPC had not included the concept in its comprehensive highway plan adopted in 1950.

Prior to NCPC's vote, the commission heard from Senator Nye, who urged the commission to turn the proposal down. He acknowledged that his property would be affected, but that his opposition was based on destruction to the park. [Beveridge, George, "NCPC Vetoes Maryland Leg Of Rt. 240 Plan," *The Evening Star*, June 27, 1953]

McCain told reporters that the “time has come right now” to decide the legal issue. The State was holding up the apartment development near Wisconsin Avenue and Grosvenor Lane pending a decision on Alternate B; the State would acquire the property immediately if the plan were approved. Asked if courts would have to make the determination, he replied. “I don’t know. But the time has come right now to determine if we have the right to build needed roads in parklands. If we don’t we’ll have to readjust our thinking.” He still believed the State’s view was legally correct. “Now, we have to find out for sure just where we stand.” [Beveridge, George, “Maryland Aide Asks Decision On Park Roads,” *The Evening Star*, June 28, 1953]

Unlike NCPC, the Maryland-National Capital Park and Planning Commission was divided on Alternate B. As Gingery explained, the problem was the “lack of any land but park land available to accomplish the purpose” of the highway relocation. “We have to come to grips with problems,” he said. “If we’re wrong on a proposal, we stop planning it. If we’re right, we take the hell that goes with the planning.”

Blair Lee argued that the impact on Rock Creek Park was only one factor for the Maryland planners to consider. He considered it logical for the District to build the expressway toward Maryland instead of Maryland building it to a dead end at the District line. “That’s like building a house by putting the roof on first.” On July 1, the Maryland planners voted 4 to 2 to support use of Rock Creek Park for Alternate B. Support was conditioned on being able to approve detailed plans when they were available and that trucks would be banned, conditions that the Maryland State Roads Commission had already accepted. The Maryland planners also asked NCPC to reconsider its opposition to Alternate B.

Robert M. Watkins of Prince George’s County, the commission chairman, voted for Alternate B, but was concerned it would dump traffic on East-West Highway, long before the District built the extension into the city. He urged the Maryland State Roads Commission to work with the District Highway Department to get the extension built as fast as possible.

Senator Case of the Senate District Committee revealed that he opposed construction through the park. He wanted to know if NCPC would consider approving Alternate B “in order that the Senate committee might conduct a hearing in the matter.” [Beveridge, George, “Road Planners Seek Decision on Route 240,” *The Evening Star*, June 30, 1953; and “Roads Agency Studies Next Rt. 240 Move,” July 1, 1953, both *The Evening Star*]

Secretary of the Interior McKay wrote to Governor McKeldin on July 8 regarding Alternate B:

I shall oppose any such construction in Rock Creek Park in Washington.

I have spent a great deal of time in the park since I have been here in the department, and I am thoroughly convinced that the people in the District, yes, and the people of Maryland and the residential districts would be making a sad mistake in allowing a big, four-lane highway to come down through the park and destroy one of the loveliest parks in all of Washington.

I sincerely hope that you will be able to convince your Maryland State Roads Commission that it should not desecrate Rock Creek Park with construction of

U.S. Highway 240. [“McKay Attacks Plan To Extend Route 240 Through Park Here,” *The Evening Star*, July 8, 1953]

In response to McCain’s request that NCPC reconsider its opposition, Acting Chairman John A. Remon replied that another meeting to vote on Alternate B again would “serve no useful purpose.” NCPC members remained opposed. Instead, Remon suggested that NCPC and roads commission staff get together to exchange information. “A full exchange of information and ideas might induce either of our agencies to review its view of this matter.”

Remon particularly wanted information on reports that the Inter-County Belt Route and

Alternate B would run a short distance as parallel, separate roadways. NCPC previously had thought the two roads would merge through the narrow strip of the park. NCPC was concerned that parallel roadways would take even more parkland than expected and would move closer to residential developments on either side of the park. “The prospect for achieving an early settlement of the entire matter would best be promoted . . . by one or more conferences between our respective staffs.” [Beveridge, George, “Planners Reject Plea To Reconsider Stand on Route 240 Now,” *The Evening Star*, July 9, 1953]

A *Star* editorial acknowledged the merit on both sides of the controversy, but added:

It is not a controversy that is going to be settled in the public interest, however, if the merits continue to be obscured by name-calling, attribution of ulterior motives and the sort of emotionalism that has become so conspicuous a part of this fight.

The parties, namely NCPC and the roads commission, should “sit down together and reach an agreement in the public interest that is based on hard fact.” After all, the Maryland State Roads Commission and its supporters were not “ruthless vandals” determined to destroy Rock Creek Park. NCPC, the Interior Department, and others were not “dreamy visionaries” who preferred to preserve the park because they were “blinded” to rush hour realities. And the property owners that Alternate B would affect were no more “selfish than any other group of property owners would be in the same circumstances.

The *Star* did not believe that Alternate B would destroy the District’s Rock Creek Park. “Such a roadway, properly landscaped, might even improve the park by restoring qualities that are being lost now because of heavy traffic over winding park roads that were never designed for such purpose.” The problem was that “this highway through the District park is not going to be built in the near future.” That raised questions about Maryland’s wisdom in “terminating Route 240 at the Maryland gateway to the District’s Rock Creek Park.”

The editorial pointed out that Maryland and Federal planners had agreed to use the Maryland park for the Inter-County Belt Freeway. Like NCPC, the editors were surprised to learn that instead of running the two freeways on the same right-of-way, Maryland was planning two east-

west parallel freeways through the park. That plan could “not be easily defended” because it “would, indeed, ‘destroy’ that section” of the park.

The editorial summed up the situation by saying that neither the southwest leg of the Washington National Pike nor the Inter-County Belt Freeway were controversial, but they were not going to be built for several years. Alternate B was planned for immediate construction. Juggling the schedule to put the uncontroversial segments first did not seem impossible. But it provided a basis for discussion among the planners and road builders:

Certainly the National Planning Commission and the roads commission should arrange such conferences now and keep at it until they are in substantial agreement. They will reach agreement by such discussion much more quickly than by letters and press statements directed to and at each other.

[“The Wrangle Over Route 240,” *The Evening Star*, July 9, 1953; the same issue contained George Beveridge’s full-page summary of the controversy: “Route 240 – The Problem, Plan, Controversy and Outlook.”]

### **Looking For Accord**

The planners focused on the lack of “complete detailed” information on the State’s plans for the roadway in the park, particularly the structures, fills, and interchanges. Chairman Watkins of the Maryland planning commission directed his engineers to get the information from the roads commission immediately. “We are entitled to know and want to know everything planned in detail,” he said. Commissioner Sidney M. Oliver added, “And if you don’t get it, this commission will descend on the roads men in a body to demand it.”

NCPC’s Remon had written to the Maryland planners suggesting that since they had endorsed Alternate B, they “may now be in strong position to mediate the current issue, if it should develop that any basis exists for a mutually acceptable solution.” However, he doubted a solution was possible “in the present atmosphere of power politics.”

If the State proceeded with Alternate B, NCPC was prepared to go to court, but only reluctantly:

I believe that such litigation, regardless of its outcome, would have a damaging effect on the future relations between the various parties and especially on our requests for future appropriations under the Capper-Cramton Act. [“Area Planners Call for All Rt. 240 Details,” *The Evening Star*, July 10, 1953]

On July 18, House-Senate conferees agreed on the parks portion of the appropriations act. Conferees refused funding for land acquisition for parks in Montgomery and Prince George’s Counties. They agreed on \$100,000 for land acquisition in Virginia to continue construction of the George Washington Memorial Parkway in Fairfax County, as well as a compromise amount, \$126,457 for NCPC operations.

By refusing funds for land acquisition for parks in Maryland for the third straight year, the conferees put the Maryland-National Capital Park and Planning Commission in an awkward

position. The commission paid two-thirds of the cost of land acquisition, but if the Federal Government refused to pay its one-third share, the Maryland planners would have to rethink their master plan. Commissioner Watkins said, "We feel we have a very sacred contract with the Federal Government. Maryland has kept faith but Congress has not." ["Funds Refused for D.C. Area Park Projects," *The Evening Star*, July 19, 1953; "Commission to Study Ways to Save Area's Park Development," *The Evening Star*, July 21, 1953]

At the request of Governor McKeldin, McCain replied to Secretary McKay's letter. Given "the terrific development in and around the Metropolitan area of Washington," McCain wrote, all data and engineering expertise indicated "that the only possible way in which this situation can be solved is to utilize the small section of the border of Rock Creek Park." He pointed out that NCPC had approved "construction of a similar parkway in another section of Rock Creek Park." In view of the need and the limited options in highly developed Maryland communities adjacent to the District, "it appears that to provide a satisfactory facility, certain short sections of park land must be utilized."

McCain, in meeting his agency's commitment to address road needs, planned the southeast leg as "a highway of the parkway type." Moreover, the roads commission had agreed to permit the title to the roadbed "to be vested in" the Maryland-National Park and Planning Commission. That commission would determine the types of vehicles that would use the parkway. Since the roads commission did not have statutory authority to prohibit trucks from using the facilities it built, this shift in ownership would allow the planning commission to restrict commercial usage.

Acknowledging that NCPC and the roads commission had different obligations, McCain said the roads commission was "very willing at any time to sit down with the Capital Planning Commission to see if some mutually satisfactory arrangement can be derived that will solve this problem." ["Maryland to Bar Trucks From Park Route 240," *The Evening Star*, July 19, 1953]

At the end of July, planners and road builders made an unpublicized trip to New York to see how that State, famous for its parkways, built roads through parks. Participants in the 2-day trip included Norman Pritchett of the Maryland State Roads Commission; NCPC's Blair Lee III; planning engineers William C. Burrage and Warren Jiauque from the Maryland-National Capital Park and Planning Commission; William F. Boardman of the District Highway Department; BPR's Joseph Barnett; and the *Star*'s George Beveridge.

According to the *Star*, they learned that New York strongly resisted construction "of big traffic arterials through parks" if any alternative existed. However, parks occasionally gave way to "necessary new highways." When that happened, "meticulous care is taken to minimize the park damage." New York had miles of "shoestring parks" where no park had existed, consisting of modern, limited-access, six-lane parkways. Such parkways enhanced property values, according to New York officials. One of the important lessons was:

That New York, in contrast to Washington, has learned to resolve differences involving parklands on the merits of each project. In some cases, parks have been held inviolate against highway pressures. In others, highways have been found too important to be stopped.

Storms of protest erupted when highways threatened parks in New York and the Washington area, but conditions in the two areas were different. New York officials gave much of the credit to Robert Moses for resolving these problems:

As city construction co-ordinator, he has a mighty voice in building roads where they are needed. Sometimes they are needed through parks. As the city park commissioner, he has a major say in whether the parks can be used.

At the time, Moses was an admired figure around the country not only for his extensive road and park projects in the New York City area but as a consultant on thoroughfare planning in other cities. He was at the peak of power at this time, able to overcome or ignore critics of his plans.

The Washington area had no equivalent figure:

City planning and park officials said Mr. Moses' stature as a protector of parks has helped hold down the opposition. There is general assurance, they said, that affected park facilities will be rebuilt and additional improvements made.

"Any road that goes through a park is going to do some harm," one park official said. "But the people here have learned that the last man in the world who will do any undue harm to parks is Robert Moses."

(The image of Robert Moses today is very different than it was at the time, in part because of Robert A. Caro's critical biography, *The Power Broker: Robert Moses and the Fall of New York*, Knopf, 1974.)

New York officials would not comment for the record on the Washington controversy, but privately thought an expert could be brought in, not beholden to any group, to clarify the issues by determining whether the park absolutely had to be used and what damage the roadway would do. [Beveridge, George, "Planners Study N.Y. Parkways For Rt. 240 Key," *The Evening Star*, August 2, 1953]

Drawing on the lessons learned in New York, NCPC and the Maryland planning commission recommended staff meetings with the Maryland State Roads Commission, District Highway Department, and BPR for a joint attack on divisive issues. Remon explained:

I don't like this idea of every one going off in his own direction. It's time to get something done and kill off some of the conversation.

Watkins thought the joint approach might help apply the New York principles to the U.S. 240 question. He also thought an outside expert might be brought in, one "whose objectivity could not be questioned," someone of the stature of Robert Moses. He admitted that expecting everyone to agree to such a review might be "a Utopian idea," but he wanted to at least pursue it.

In view of agreement on the joint approach, Nolen held off on his intention to present a solution to the Alternate B controversy. His idea was that Maryland should end the southeast leg of the Washington National Pike at its interchange with the Inter-County Belt Freeway, rather than

continuing it through Maryland's Rock Creek Park to dead end at East-West Highway in the expectation that it would continue at some unknown time into the District. At Watkins' suggestion, Nolen agreed to let staff officials review the plan instead of presenting it to either commission at this time. [Beveridge, George, "Study by Staffs Urged to Solve Rt. 240 Dispute," *The Evening Star*, August 4, 1953]

On August 3, 1953, Senator Nye's group, the Citizens Action Committee for Fair Road Planning, published a full-page advertisement in *The Evening Star* highlighting the agreement between President Hoover and Governor Ritchie regarding ownership and use of Rock Creek Park in Maryland. With an arrow pointing at a box containing the paragraph on the signature page of the agreement, the advertisement's headline was: "President Hoover and Governor Ritchie didn't cross fingers when they signed this!" In view of the intentions of the Maryland State Roads Commission and the District Highway Department, the "challenge to the future of Rock Creek Park is very real and immediate."

As for whether building U.S. 240 through the Maryland portion of the park would be legal, the answer was "an emphatic 'No'" because of the 1931 agreement. Recent actions by the Maryland-National Capital Park and Planning Commission are "without the slightest weight."

Nye's committee offered a five-step plan for addressing traffic needs based on plans already under consideration. Build an outer belt for bypass traffic from Cabin John on the Potomac to Fox Ferry Point (across from Alexandria) at the southernmost point of the District. Provide better bus and other mass transportation service into the city from suburban terminals to reduce automobile traffic. Put bus bays on Sixteenth Street, Massachusetts Avenue, and Connecticut Avenue, so buses no longer block traffic while loading and unloading passengers. Broaden and improve existing arterial roads in Maryland. Continue to maintain existing roads in Rock Creek Park as parkways, "not four and six-lane expressways and speedways that will ruin the park forevermore."

The group called for a "concentrated effort" to preserve the park:

Between now and August 6<sup>th</sup>, and at that time, it is to be expected that individual members of the twelve-man National Capital Planning Commission will be under terrific pressure to change their minds, and approve the Rock Creek Park highway program. Possibly, three or four members of the Commission favor approving the use of the park for Highway 240. There is not now the slightest reason to believe that this minority could become a majority, but we can be sure there will be every effort made to cause a majority to favor the park road. **Let us not be caught asleep.**

We hope that community associations and individuals will find a way to let the National Capital Planning Commission know that their position against the expressway idea is in keeping with the best interest of Metropolitan Washington and that we want no such scars in Rock Creek Park as the road engineers would build at a cost of millions to the taxpayers.

A box at the bottom of the advertisement labeled “The Vicious Circle,” quoted F. Biggers: “We spend more and more millions of dollars to build more and more radical super-highways so that more and more thousands of people may drive more and more rapidly to the place where they must wait longer and longer to get into the District where it is harder and harder to move around at all.” [“Citizen Action Committee for Fair Road Planning,” *The Evening Star*, August 3, 1953, page A-15, bold in original. The advertisement did not identify “F. Biggers.”]

Planning for the Inter-County Belt Freeway had been relatively controversy-free except for the concerns about its location in relation to Berwyn and the University of Maryland. The Maryland and Federal planning commissions had endorsed construction of the belt freeway through Rock Creek Park between Wisconsin Avenue and Forest Glen. On August 7, however, NCPC received requests from two citizens groups to withdraw its approval from the belt freeway and continue to oppose use of the park for Alternate B. The two groups, the Rock Creek Hills and Parkwood Citizens’ Association, represented citizens living in the area north of Rock Creek Park between Wisconsin Avenue and Forest Glen. They argued that NCPC, which supported one use of the park and opposed the other, “should be made to conform” its inconsistent positions.

The Parkwood association also raised legal questions, pointing out that the developer of Parkwood sold land to the Maryland-National Capital Park and Planning Commission in 1938 with the understanding that the land would be developed “as a parkway to be used and maintained as part of the Rock Creek Park system . . . .” The association did not believe NCPC would have approved use of the park for the belt freeway if it had known about the contractual restriction on the Parkwood sale. Residents who bought their homes near the park had relied on that restriction.

Blair Lee’s initial reaction was to tell the groups that “the only possible alternative to the present belt route would be something outside the park which would go smack through both their subdivisions.” Instead, NCPC agreed to a staff review of the request from the two associations. [“Planners Asked To Revise Stand On Belt Route,” *The Evening Star*, August 7, 1953]

### **Working For Compromise**

Following meetings with the Maryland planners, McCain wrote to NCPC on September 16, about a change in plans. The Maryland State Roads Commission was willing to build the Inter-County Belt Freeway between Wisconsin and Georgia Avenues within the coming 4 years. Within that same time, however, the roads commission planned to complete the southeast leg of the Washington National Pike to East-West Highway. By advancing the schedule for the belt freeway for simultaneous completion with the southeastern leg, McCain addressed NCPC’s concern that Alternate B would dump traffic on East-West Highway. Traffic not bound for

East-West Highway area would now be able to use the belt freeway to connect with other arterial roads, thus reducing the number of vehicles reaching East-West Highway. [Beveridge, George, “Roads Agency Offers Rt. 240 Compromise,” *The Evening Star*, September 16, 1953]

Harland Bartholomew, who only recently had become NCPC’s chairman, indicated he was not familiar enough with the dispute to offer immediate comment. NCPC replied to McCain on

September 18 that advancing construction of the belt freeway was “an excellent decision on your part.” However, NCPC asked McCain to give “most consideration” to stopping the southeast leg of the Washington National Pike at the beltline instead of East-West Highway.

NCPC also suggested a joint meeting between the two groups to discuss options, as well as legal issues “which have been raised and which may even have a bearing on the action we have already taken.” This was a reference to the two citizens’ associations, whose attorneys had attended a meeting along with Senator Nye to detail the legal challenge to building the belt freeway through the park. The Inter-County Belt Freeway, they contended, could not be considered a “parkway.” [Beveridge, George, “Planners Ask Joint Parley on Route 240,” *The Evening Star*, September 19, 1953]

With the threat of lawsuits that could delay or block the belt freeway, Watkins of the Maryland planning commission suggested building both freeways as parkways like the George Washington Memorial Parkway or the Rock Creek and Potomac Parkway. A commission statement said that parkways would be “well within the spirit and letter of the Capper-Cramton Act.” As another example, the planners cited Fort Drive, the District loop that was planned for land acquired under the legislation. Of course, parkway construction also would address the legal issues raised by the attorneys representing Parkwood. [“Planners Seek To Lift Lawsuit Threat to Roads,” *The Evening Star*, October 2, 1953]

Gingery suggested that all parties make an informal tour of the land where Route 240’s southeast leg was to be built. The tour, which took place on October 11, included Bartholomew, Undersecretary of the Interior Ralph Tudor, Roads Commissioner McCain, District Engineer Commissioner Prentiss, A. B. McKee of the Maryland planning commission, and *Star* editor B. M. McKelway:

The tour started with a look at District streets slated for improvement to handle the increased traffic volume which would pour out of the park if the roadway were built. It followed the proposed route along the eastern edge of the park as far north as Colorado avenue, then along the park’s western edge to the District line and north to Wisconsin avenue.

The officials also examined Maryland park areas affected by the proposed intercounty belt highway across Montgomery and Prince Georges Counties. Mr. Gingery stressed that park areas must be used for the roadways and said delays in construction will only increase the costs.

The *Star* speculated that with Bartholomew, Undersecretary Tudor, and Roads Commissioner McCain “sitting together in an automobile examining a map spread across their knees, while traveling along the proposed Route 240, it was probable that more mutual understanding of the problem was gained than in months of letter writing and statement issuing.” [“Top Aides Take First-Hand Look At Route 240,” *The Evening Star*, October 11, 1953]

By October 30, NCPC and roads commission staff had worked out a plan for the Inter-County Belt Freeway that appeared acceptable to all parties as NCPC prepared to meet on this issue.

McCain outlined the proposal in a letter to NCPC on October 28. The agreement related to the belt freeway, but McCain hoped the agreement would lead to resolution of the U.S. 240 controversy. As the *Star* explained, “The roads commission wants to have the 240 leg drop out of the park a short distance east of Wisconsin avenue, and drop southward across North Chevy Chase to the East-West highway.”

The *Star* summarized the belt freeway proposal:

It would hug the extreme south edge of the park between Wisconsin avenue and Forest Glen, except for a 3,400-foot stretch outside the park and on privately owned property. A 198-foot right-of-way would be acquired.

Mr. McCain said staff members are agreed that for the time being, two 24-foot lanes could serve the dual purpose of carrying both belt freeway and Route 240 traffic over the park portion where the two roads would converge. Later, when the belt route is finished and the 240 leg extended through District portions of Rock Creek Park to downtown Washington, the area could be developed for two dual highways, he said.

The letter indicated Mr. McCain is willing to make two important concessions to the planners. One involves the limitation of a 198-foot right-of-way. The other is routing the belt road outside the park and over private property.

As traffic increased, the width of right-of-way would allow the roadway to carry six lanes.

The use of private property would increase the cost of the belt freeway but he explained:

If we can reach accord on all of our problems in the development of these highways in the park area, it is felt this additional expenditure may be justified.

Regarding the cross-section, McCain wrote:

This section provides for much narrower dividing strips than we normally use in our design and certainly much more restricted than is desirable for safety and comfort. However, any additional width of medium strips would entail a commensurate widening of the over-all section.

He added:

As mentioned above, staff members of each commission have worked out a plan whereby it is deemed that all of the objectives of the several commissions can be attained, with the possible exception of use of parklands for a 1,200-foot connection of the southeast leg of Washington National Pike (Route 240) from Beach drive to the East-West highway. [“Accord Likely On Maryland’s Belt Freeway,” *The Evening Star*, October 30, 1953]

Unfortunately, as George Beveridge wrote in the *Star* on October 31, “The bitter dispute between Capital planners and Maryland roadbuilders over the southeast leg of U.S. Route 240 dragged on today after a conference between the two raised several points of confusion.”

NCPC supported the revised plan for the Inter-County Belt Freeway, built to parkway standards, across Maryland's portion of Rock Creek Park. The planners not did agree on joint use of the roadway for the southeast leg of U.S. 240. They also did not agree that the southeast leg should cross North Chevy Chase and re-enter the park at East-West Highway near the District line. In a letter to McCain, Bartholomew wrote:

In order to prevent any misunderstanding as to this commission's previous action concerning Rock Creek Unit No. 3 for the south leg of U.S. 240, I take this opportunity to restate that this commission approved connecting the proposed southeast leg of U.S. 240 to the belt route in the vicinity of Wisconsin avenue or at some point further to the west.

During the 2-hour meeting, roads commission officials and Maryland planners urged fast action on the southeast leg and belt freeway. Norman Pritchett pointed out that homes under construction in the proposed right-of-way might add \$200,000 to land acquisition costs in the next 30 days. Gingery said that in view of the private development, "We're not calling 'wolf.' The wolf is here now." If the U.S. 240 project were held up, he added, it probably would "have to go not through a measly 5,000 feet of park but through all of the park from Wisconsin avenue to the East-West highway."

Consultant Wilson Ballard told NCPC that when his firm conducted its study, about 76,000 cars crossed the District line between Silver Spring and the Potomac River to the west each day. The volume had increased to 100,000 and would exceed 210,000 in 12 to 15 years. His partner, Joseph Knoerle, predicted that by 1980, 400,000 cars would cross the District line daily and that additional expressways to downtown Washington would be needed.

In that case, Bartholomew suggested that the road commission and planners study "the whole problem" of traffic crossings, not just piecemeal parts of it. McCain replied that he was willing to cooperate in such a study, but did not want the study to "be put in the position of [causing] unnecessary delay" on the Inter-County Belt Freeway or the southeast leg of U.S. 240. [Beveridge, George, "Planners Fail To Indorse Leg For Route 240," *The Evening Star*, October 31, 1953]

In response to an inquiry from Beveridge, Bartholomew, back home in St. Louis, agreed that several points in his letter to McCain were hazy. Bartholomew confirmed that NCPC approved the belt freeway, built to parkway standards, across Rock Creek Park. Although the map drawn as a result of the joint staff meetings showed the southeast leg of U.S. 240 meeting the belt freeway east of Wisconsin Avenue, NCPC wanted the connection west of Wisconsin Avenue and entirely outside the park.

Approval of the belt freeway across the park had no bearing on NCPC's view of including the southeast leg of U.S. 240 in the park. However, NCPC had no jurisdiction over the routing of U.S. 240 outside the park; if the Maryland roads commission decided to build the southeast leg across North Chevy Chase, NCPC could not object. However, Bartholomew made clear that NCPC had not given authority for the southeast leg to reenter parkland near East-West Highway.

As Beveridge wrote:

Under these restriction[s], officials pointed out, it would be possible for southeast-bound Route 240 traffic to pass through 8,000 feet of Rock Creek Park on the belt road, then move over an independent route to just north of the East-West highway park area.

This option would work only if projected traffic volumes on U.S. 240 could be handled on the belt freeway and a new terminal for the southeast leg could be found outside the park near East-West Highway.

Bartholomew made one other point clear:

Mr. Bartholomew told *The Star* by telephone from St. Louis that legal questions played a major part in the planners' action. He stressed that attorneys seriously questioned whether the parks could be used for even the belt freeway. The commission's approval of that road as having "parkway standards" was about as far as it felt it could go "at this time," he said. [Beveridge, George, "Officials to Plan Further Action on Route 240," *The Evening Star*, November 1, 1953]

With these understandings in mind, McCain ordered roads commission engineers to shift the southeast leg to East-West Highway outside Rock Creek Park. By keeping the route out of the park, the roads commission would avoid the planning commission's jurisdiction. The *Star* summarized the plan:

The revised plan calls for the southeast leg of 240 to connect with the belt route near Wisconsin avenue, and use the belt roadway to a point where the belt road dips out of the park.

There, the roads commission would build an interchange and divert 240 traffic off the dual-purpose road and to an extension of the 240 leg heading southward. Instead of entering parkland at East-West highway, however, the road would terminate at a new location still to be determined.

This alternative would involve acquisition of costly property that would not have been needed under the original plan using parkland:

Mr. McCain also disclosed, meanwhile, that roads commission engineers have been authorized to begin immediate land purchases in "tight spots" involved in the right of way.

The "tight spots," he said, are land parcels where development already is under way which would greatly increase land costs.

McCain had given orders to his staff after what the *Star* called "a fast-breaking exchange of telegrams" between McCain and Bartholomew regarding NCPC's position on the two routes.

At the same time, the *Star* reported that J. Joseph Barse, the attorney for residents bordering the park where the Inter-County Belt Freeway was to be built, said a lawsuit was "certain to be filed contesting legality of the belt route's use of the park." The new plan for keeping the southeast

leg of U.S. 240 out of the park, Barse said, “bears out my personal opinion that if consent were given for the belt route that Route 240 also would be built. The belt route is the key to the whole thing.” [Beveridge, George, “State Speeds New Plan for Route 240 Leg,” *The Evening Star*, November 7, 1953]

Barse and Edward S. Northrop filed the suit on November 20 against NCPC to block the use of Rock Creek Park for the Inter-County Belt Freeway. Their six plaintiffs, all owners of land abutting the park, contended that the park use violated the Capper-Cramton Act of 1930 and an agreement reached in 1931 between NCPC and the Maryland-National Capital Park and Planning Commission that prohibited use of the park “for other than park purposes.” They wanted the Maryland planners to advise the Maryland State Roads Commission that it could not use the park for the belt freeway or “any similar highways,” a reference to U.S. 240.

The suit also asserted the contention of Parkwood and Locust Hills Estates, located adjacent to the park near Wisconsin Avenue, that property had been deeded to the Maryland planning commission in 1939 “exclusively for park and parkway purposes.” NCPC’s approval of the belt freeway, the plaintiffs argued, violated this restriction.

The definition of “parkway” appeared to observers to be the key to the suit. In approving use of the park for the belt freeway as long ago as the 1950 comprehensive plan, NCPC had indicated it did so because of the “parkway” characteristics the freeway appeared to have. It did not, however, define the term.

The Maryland State Roads Commission and the Maryland-National Capital Park and Planning Commission indicated they would join NCPC as interested parties to the lawsuit. If so, the *Star* pointed out, “the bitterest contestants in the Montgomery County road issues will find themselves allied.” [Beveridge, George, “Federal Court Asked To Bar Belt Road In Rock Creek Park,” *The Evening Star*, November 20, 1953]

The *Star*, in an editorial, summarized the result of the unclear definition of “parkway”:

Two important traffic-relief projects thus will remain in a state of suspended animation until the suit is disposed of. It is to be hoped that the litigation can be settled without long delay. [“To Settle the ‘Parkway’ Dispute,” *The Evening Star*, November 21, 1953]

The Capper-Cramton Act provided for a “comprehensive park, parkway and playground system” for the Washington area. Reportedly, Congress first used the term “parkway” in 1913 when it authorized the Rock Creek and Potomac Parkway connecting Potomac Park and the National Zoological Park. *Webster’s Dictionary* first defined the term in 1914 as: “A broad thoroughfare beautified with trees and turf.” AASHO defined the term as well. A parkway was “an arterial highway for non-commercial traffic, with full or partial control of access, and usually located within a park or ribbon of park-like development.”

By contrast, NPR Director Wirth, the only NCPC member who had voted against allowing the belt freeway to cross Rock Creek Park, defined a parkway as “an elongated park, with a road usually used to connect two or more parks.” The George Washington Memorial Parkway, he

explained, was properly named, because it was “authorized specifically to protect land along the Potomac and to connect historic parks,” but neither Suitland Parkway nor the Baltimore-Washington Parkway met the definition.

Although NCPC had not defined the term while approving the 1950 comprehensive plan, Bartholomew now defined “parkway” as a “special type of automobile travelway of more than ordinary width and having park-like characteristics.” [Beveridge, George, “Roads Dispute Poses a Query on ‘Parkway,’” *The Evening Star*, November 22, 1953]

Despite the lawsuit, the Maryland State Roads Commission began negotiating to acquire more than 20 home sites near Rock Creek Park for the Inter-County Belt Freeway. They were in a new subdivision called Rolling Hills east of Kensington Parkway and south of Rock Creek Park. As then planned, the belt freeway would pass through Rock Creek Park east of Wisconsin Avenue, leave parkland west of Connecticut Avenue, and pass through Rolling Hills and other private land before reentering the park south of Forest Glen. [“Plan Is Pushed To Seize Sites in Freeway Path,” *The Evening Star*, December 6, 1953]

The controversy about the routing, however, was no longer confined to local agencies. The proposed use of parks for roadways in the Washington area and elsewhere was becoming a national issue. A gathering at the Hotel Statler of 39 national conservation and scientific research groups, organized by the Natural Resources Council of America, helped focus national attention on the controversy. On December 6, General Grant, the former NCPC chairman, stressed that if the southeast leg of U.S. 240 were built as far south as East-West Highway, keeping it out of Rock Creek Park in the District would be virtually impossible. He denied that such a use would do little harm to the park, as advocates for the road claimed. Senator Nye urged meeting participants to send protests to NCPC, “where our case rests at the present time.”

Chairman Samuel Ordway of the Natural Resources Council called the dispute “one of the major fights for conservation.” The council’s executive secretary, C. R. Gutermuth, said that the threat to Rock Creek Park deserved “as much concern” as encroachments to Yosemite or Yellowstone Parks would receive.

Tom Wallace, chairman of the National Conference on State Parks, told participants that there “isn’t a city in the United States that isn’t threatened by the blunderbuss efforts of a highway commission.” The Rock Creek Park encroachment was an “outrage that is intolerable, impractical and illegal.”

The National Conference on State Parks issued a statement that did not refer to the belt freeway or U.S. 240, but did say of threats to Rock Creek Park:

Use of Rock Creek Park as a right of way would be in sundry ways calamitous to Washington. The precedent would endanger every national, State, county and municipal park, every scenic recreation preserve in the United States, and subject United States culture to well-founded criticism in capitals of nations of the enlightened world.

Throughout the country, parks were “threatened by exploiters whose argument is that parks are ‘free land’ and should be used for roads and parking lots.” [“Route 240 Plan Held Threat to All Parks,” *The Evening Star*, December 7, 1953; “National Fight On Route 240 Shaping Up,” *The Evening Star*, December 8, 1953]

On January 7, 1954, Judge Matthew F. McGuire held a bench conference on the suit seeking to enjoin NCPC from approving detailed plans for the Inter-County Belt Freeway across a stretch of Rock Creek Park. Both sides recognized that NCPC had approved the use of parkland for the belt freeway. Assistant U.S. Attorney Oliver Gasch argued that NCPC should not be prohibited from taking administrative action while the court deliberates on the case. Barse and Northrup expressed concern that if NCPC approved the detailed plans, Maryland would begin construction immediately without waiting for a court ruling. Under an agreement reached during the bench conference, NCPC was free to approve the detailed plans, but the effective date would be delayed to allow for court action. Judge McGuire set a hearing date for late March. [“NCPC May Approve Belt Freeway Plans in Tentative Agreement,” *The Evening Star*, January 7, 1954]

The third section of the Washington National Pike, a 3.8-mile stretch between Hyattstown and Clarksburg, opened on January 18, 1954. This section was the first completed in Montgomery County. Construction had begun on October 1, 1953, on the next 3.7-mile section, which would take the pike to State Route 118 in Germantown. The road commission had begun planning for the next two sections, each about 4 miles long, that would take the pike to Rockville. [“3.8-Mile Stretch of Route 240 To Be Opened About Dec. 15,” *The Evening Star*, November 26, 1953; “McKeldin Will Open Route 240 Stretch,” *The Evening Star*, January 17, 1954]

### **The Olmsted Brothers**

On March 22, the *Star* reported that Chairman Watkins of the Maryland-National Capital Park and Planning Commission had retained Olmsted Brothers of Brookline, Massachusetts, to prepare detailed development plans for the Inter-County Belt Freeway through Rock Creek Park. As mentioned earlier, Frederick Law Olmsted, who had founded the firm, was a founder of NCPC (then called the National Capital Park and Planning Commission) and a commission member for several years. Olmsted Brothers had been a consultant for development of the 1901 general plan for the District, in 1918 on development of Rock Creek Park, and many other Washington area projects. In a letter to Bartholomew, Watkins wrote:

Because of their outstanding reputation in the field of park design, Olmstead [sic] Brothers were employed to prepare designs which would not only meet the standards desired by your commission and by this commission, but which would be an outstanding contribution to the park and parkway system of the Nation’s Capital . . . .”

The firm would design and locate interchanges and connections with the proposed parkway; landscaping for the area through which the road would pass; the type, design, and location of park and picnic areas adjacent to the parkway; foot paths and bridle paths; and placement of recreation facilities in the two park units. The contract also covered recommendations for relocating any part of Rock Creek that may be necessary to make more effective use of the park.

Watkins also said the plans involved developing about 500 acres of parkland on both sides of Connecticut Avenue from East-West Highway to the Kensington-Garrett Park Road. The road would enter Rock Creek Park at Wisconsin Avenue between Grosvenor Lane and Pooks Hill Road, ending at Connecticut Avenue. A second section would begin about 500 feet east of Kensington Parkway, ending at Jones Mill Road and Beach Drive.

A *Star* editorial pointed out that the Maryland planning officials believed that hiring Olmsted Brothers “should allay the fears and misunderstandings” that had delayed both projects. The detailed plans that NCPC received for the encroachment on the park were to be drawn “by consultants known to be advocates and protectors of park land, here and elsewhere.” [“Firm Named To Plan Road In Rock Creek,” *The Evening Star*, March 22, 1954; “Fortunate Choice,” *The Evening Star*, March 25, 1954]

Judge McGuire heard arguments in the Inter-County Belt Freeway case on March 24. Balse and Northrop argued that building the freeway through Rock Creek Park was inconsistent with park purposes as established by Federal laws. They contended that the term “parkways” referred to roads serving the parks, not commuter thoroughfares. Congress, Northrup said, had established proper uses of parkland; NCPC could not add uses.

U.S. Attorney Gasch moved for dismissal. He said that Federal law clearly gave the planners control over park development. As such, the belt freeway was a legitimate park use. NCPC, in recognition of its legal responsibilities, had approved the route through the park on the condition that it would meet proper standards to serve the park. The Maryland State Roads Commission, he pointed out, had recently hired the Olmsted Brothers to design the freeway in accordance with seven criteria NCPC had established.

After the 1-hour hearing, Judge McGuire took under advisement the government’s motion to dismiss the suit. He said the issue was whether the Inter-County Belt Freeway was consistent with park purposes as intended by Federal law. First, he would have to decide the extent of NCPC’s authority to act. Second, he would have to determine whether the proposed freeway was consistent with the use of the parklands. [“Court Studies Dismissal of Belt Road Suit,” *The Evening Star*, March 24, 1954]

On May 4, Judge McGuire denied the government’s request to dismiss the lawsuit. He also denied the government’s motion for summary judgment. In a notation on the government motions, Judge McGuire wrote: “No ruling possible without plans being extant and submitted.” The Olmsted Brothers’ plan, he implied, was the key. [“Court Denies Motion To Throw Out Suit On Belt Freeway,” *The Evening Star*, May 4, 1954]

While awaiting the court ruling and delivery of the Olmsted Brothers’ plans, citizens associations were issuing statements opposing Alternate B through the park for the Washington National Pike. The *Star* reported opposition by the Federation of Citizens’ Associations (April 18, 1954), the Federation of Civic Associations (April 24), and the Northwest Council of Citizens’ Associations (April 25).

On May 22, Beveridge reported that the Olmsted Brothers’ plan had been submitted:

The Federal planners . . . withheld comment on their first reaction to the plans. But other sources indicated Mr. Bartholomew, at least, was pleased by what he saw.

Maryland citizens fighting the roads, meanwhile, held one of their biggest mass meetings during the week. Spokesmen said it was a strategy session to map new moves. [Beveridge, George, "New Moves Start Speculation On Fate of Park Roadway," *The Evening Star*, May 22, 1954]

After the Maryland State Roads Commission and Maryland-National Capital Park and Planning Commission reviewed the Olmsted plans, officials of the firm and the two commissions flew to Columbus, Ohio, on May 18 to discuss the plans with Bartholomew. He told George Beveridge that the plans had been sent to NCPC staff and that he had instructed them to expedite their review. Neither Bartholomew nor other NCPC commissioners would reveal their reaction to the plans. [Beveridge, George, "Planners Get Detailed Plan On Belt Road," *The Evening Star*, May 21, 1954]

On June 8, the Maryland State Roads Commission and the Maryland-National Capital Park and Planning Commission approved the Olmsted Brothers' plan and rushed it to NCPC.

Olmsted Brothers included an eight-page statement with their plans. Based on the statement, Beveridge summarized the highlights:

#### The Parkway Route.

At its west end, Wisconsin avenue would be elevated and split with separated lanes for northbound and southbound traffic. The belt parkway would pass beneath Wisconsin, connecting west of Wisconsin with the southeast leg of U.S. Route 240.

East of Wisconsin, the belt road would hug the southern edge of the park a few feet above park level, except for an overpass at Cedar lane. About a mile east of Wisconsin, the road would dip out of the park through a corner of the Bethesda Naval Hospital property. It would pass about 3,500 feet across private property, overpassing Connecticut avenue and Kensington parkway, then re-enter the park. It would continue to hug the southern part of the park until overpassing Jones Mill road and Rock Creek at Forest Glen. It would leave the park at that point.

### Connection Planned.

Roads commission plans call for connecting the belt road, at the point it leaves the park near the naval hospital property, with a continuation of the Route 240 leg. The 240 leg would be extended to the East-West Highway, near Beach drive.

The divided lane parkway would have a maximum right-of-way of about 110 feet, with two lanes in each direction. Essentially, the Olmsted firm said, it will be “a border drive,” with its sides “merging naturally with the flattish floor of the park.”

### Park Design.

Olmsted Bros. said Maryland’s Rock Creek Park serves primarily “regional rather than local purposes.” Such local uses as “tot lots” and neighborhood playgrounds, therefore, it said, “should not, in spite of their values per se, be allowed to encroach seriously on the broader over-all values of a naturalistic park of this type and importance.”

On that premise, it proposed four major new recreational areas:

Near East-West highway and Jones Mill road; just north of the parkway near Forest Glen; near Wisconsin avenue north of the point the belt road leaves the park; in a northern park portion paralleling Wisconsin avenue opposite Saul road and Everett street.

### Plan Includes Ponds.

The latter three play areas include large ponds suitable for boating and fishing. The recreation provisions include playgrounds, baseball diamonds, court games, archery, and outdoor theatrical area and craft buildings.

In the northernmost portion of the park at Garrett Park road near Wisconsin avenue, the riding stable would be located.

### Park Access.

Driving access from the parkway to the park would be provided at Forest Glen, Cedar lane, Wisconsin avenue and Connecticut avenue.

Pedestrian overpasses of the parkway would be provided “for the convenience of adjacent householders” near Wisconsin avenue, at Kensington parkway and at Forest Glen.

### Beach Drive.

Instead of Beach drive across the East-West highway and northward into the park, it was suggested that Jones Mill road be widening and improved to link with Beach drive in the Forest Glen area.

Beveridge summarized three points about Beach drive:

1. The present gap between Connecticut Avenue and Cedar Lane should be closed.
2. Beach Drive should be relocated north of the creek where the drive extended south of the creek between Connecticut and Wisconsin Avenues, and
3. The drive should be extended from its terminus at Wisconsin Avenue to Garrett Park Road to open that part of Rock Creek Park to more use.

Exclusive of the cost of the roadway, the improvements included in the plan would cost an estimated \$1 million. [Beveridge, George, "Park Belt Road Put to Planners For Approval," *The Evening Star*, June 9, 1954]

NCPC began considering the plans on June 10. The commissioners also were considering a letter from the Maryland State Roads Commission regarding its plans. The letter said that as traffic increased, the road might have to be widened. Congestion might increase, the roads commission explained, because the Inter-County Belt Freeway would carry traffic from the southeast leg of U.S. 240 through about a mile of the park. The roads commission would deed certain parcels of land to the Maryland planning commission. Trucks and commercial vehicles would be banned. State and county officials would maintain and police the road. The roads commission would submit detailed contract drawings and specifications to NCPC for review. The statements in the letter, the roads commission said, were "a firm commitment."

The Maryland-National Capital and Planning Commission firmly committed to the recreation and other park developments proposed by Olmsted Brothers. [Beveridge, George, "Planners Delay Action to Study Park Belt Road," *The Evening Star*, June 10, 1954]

On June 11, NCPC conditionally approved the Olmsted Brothers' plans for passage of the road across the park. NCPC also indicated it would not object to linking the southeast leg of U.S. 240 to the belt freeway west of Wisconsin Avenue and outside the park. The approval also was given with the understanding that the Maryland roads commission would not build a road south of the park to carry U.S. 240 traffic from the belt freeway to East-West Highway.

Because the pending court case involved only the belt freeway, Federal attorneys planned to move quickly to present the plan to Judge McGuire. However, officials of the Maryland roads commission were reportedly "fighting mad" about NCPC's condition rejecting the link of the southeast leg to East-West Highway. They contended that in the November 1953 exchange of telegrams between the roads commission and Bartholomew, he had not indicated any objection to the link outside the park. Further, Olmsted Brothers had included an interchange in the plan for the connection where the belt freeway dipped south of the park about a mile east of Wisconsin Avenue.

While planners and road officials reacted to NCPC's "bad faith" action, attorneys involved in the court case pointed out that in the end, NCPC did not have any jurisdiction over what happened outside the park. Even with the NCPC condition, Watkins of the Maryland planning commission considered the decision a "clear-cut approval" for the belt freeway. The linkage between the southeast leg of U.S. 240 outside the park was a "matter for the future." [Beveridge, George, "Road Decisions By Planners Renew 2 Fights," *The Evening Star*, June 11, 1954]

On June 30, the Maryland-National Capital Park and Planning Commission began displaying the Olmsted Brothers' model in the commission's Silver Spring office at 8500 Colesville Road. The model, which cost \$7,500, would remain available for public review until July 12. It would then be transported to the U.S. Federal Court for the District of Columbia. ["Maryland Planners Have \$7,500 Model Of Belt Road in Park," *The Evening Star*, June 30, 1954]

After meeting with other roads commissioners regarding NCPC's condition on the southeast leg, Chairman McCain sent a telegram to NCPC:

If press release of your resolution of yesterday dealing with inter-county beltway is correct, we cannot concur with exceptions designated as A, B, and C, as these three sections involve areas outside of park lands, where full jurisdiction is vested in the State of Maryland.

We believe plans submitted are in full accord with your prior commitments. I am authorized to state that these views are unanimously concurred in by the members of the Maryland-National Capital Park and Planning Commission.

The goal of the telegram was to get on the record that the roads commission did not in any way agree with NCPC's conditions. [Beveridge, George, "Roads Officials Ponder Move For 240 Link," *The Evening Star*, June 12, 1954]

Judge McGuire set July 15 for final arguments in the court case, but Maryland roads and planning officials were still angered by NCPC's condition. On June 16, NCPC's meeting included what Beveridge called a "scathing attack" by Maryland officials. Watkins, chairman of the Maryland planning commission and a member of NCPC, read a "strongly worded prepared speech" arguing that the southeast leg conditions imposed "a grave threat" to the belt freeway. He argued that the schedule for constructing the \$29 million belt freeway in the next 4 years was threatened because the Maryland roads commission "might not be able to maintain the present priority" in view of needs elsewhere.

Bartholomew responded that the condition related to the southeast leg was entirely consistent with NCPC's longstanding opposition to encroachment by U.S. 240 on the park. NCPC, he said, was prepared to approve, without conditions, the belt freeway design in the park and a connection for U.S. 240 west of Wisconsin Avenue and outside the park. He pointed out that as an urban planner (and a member of the National Interregional Highway Committee that prepared the 1944 report to Congress on *Interregional Highways*), he was one of the country's foremost advocates of circumferentials; he strongly favored the Inter-County Belt Freeway. However, the design, he said, raised questions about whether the belt freeway was a "true belt distributor route."

Gingery defended the plan to use "this measly 3,000 feet of park" for the southeast leg because of the expense of building it through private residential areas in Bethesda. He contended that NCPC's ulterior motive was the fear that the District would continue the road through Rock Creek Park to downtown Washington.

Engineer Commissioner Prentiss, also a member of NCPC, replied that the District did have such a route in its long-range plan, but not in its work program for the next 10 years.

At Watkins's request, NCPC voted unanimously to support construction of the belt freeway through the park. ["Belt Route Suit Dismissal Plea Set for July 15," *The Evening Star*, June 17, 1954]

The hearing on the belt freeway was extended to July 27 to allow plaintiffs' attorney time for additional depositions.

Judge Edward A. Tamm, instead of Judge McGuire, conducted the hearing. As in the past, the definition of "parkway" was in dispute. Barse had said, "The word 'parkway' has been accepted so widely and used by so many agencies that now it means a hundred different things." The Olmsted Brothers' development plans for the surrounding area were "all window-dressing to try to make this highway fit the category of some sort of parkway." This segment, Barse pointed out, was part of a 36-mile beltline completely encircling Washington. It was, simply, a "major highway" except for the 2.5-mile segment through the park.

Gasch said NCPC's action was consistent with its responsibilities by adding conditions to its 1950 approval. With those conditions, parkways were, in NCPC's view, a "harmonious park use."

Northrop responded that calling the belt freeway a parkway was "just a rose called by another name, and its purpose is not changed in any way." He warned that the project was the "opening wedge to the destruction of our park system."

After hearing arguments for 3 hours, Judge Tamm dismissed the suit, finding that NCPC had acted within its legal rights in approving the use of parkland for the Inter-County Belt Freeway. The arguments by both sides, he said, raised "a number of collateral issues," but he based his finding on congressional action. He referred to laws dating to 1924, as cited by Gasch, as the source of NCPC's authority.

As for the plaintiffs' argument based on conditions placed on sale of the Parkwood land, Judge Tamm advised Barse that this question might better be considered by a Maryland court.

Barse stated that he and Northrop would appeal the ruling and asked for an injunction to halt construction while the appeal was underway. Judge Tamm denied the request. [Beveridge, George, "Appeal Planned With Dismissal Of Parkway Suit," *The Evening Star*, July 28, 1954]

### **Compromise – Pure and Simple**

That Saturday, July 29, in his "This Week in Area Planning" column, Beveridge began:

No matter what happens from now on between Washington's planners and road builders, this qualifies as the week of the big compromise.

For years motorists have been watching a frustrating running battle over major bridge and highway needs. At times the fights have become almost too complicated to follow. And traffic conditions got steadily worse. But within a few days, a basic agreement turned up this week that could serve as a blueprint of future improvements for years to come.

During the week, the Senate had agreed on construction of the Constitution Avenue Bridge just upriver from Arlington Memorial Bridge as well as a bridge at Jones Point for the area's outer circumferential:

Key to the agreement was a general resolution of what will make up the so-called "inner-belt" system of roads around the center of town. The new [Constitution Avenue] bridge, and others agreed to tentatively, will feed directly into the belt. And the belt itself—designed to feed traffic directly to whatever major street the motorist wants to hit—will make up some of the most expensive projects in the city.

It all came about through compromise—pure and simple. Generally, highway officials can see the new routes they want. The plan also preserves the planning principles that have started much of the squabbling.

Beveridge added that, "There's no evidence the bickering is over," since fighting over details was likely:

But, at least, for the first time highway officials have an accepted plan into which the details of specific improvements can be worked out as the city can afford to pay for them.

Also during the week, the bill to establish a presidential commission to study all phases of area transportation problems "came to life." It had passed the House in 1953, but the Senate had added a second commission to regulate bus operations between the District and Maryland. "House-Senate conferees revised the bill Thursday and accepted both commissions." Chances for approval by the House and Senate before adjournment were good.

Then there was the "bitter issue of new roads in Rock Creek Park." Two important decisions had occurred during the week on this issue, "with highway enthusiasts coming out on top in both." In the first decision, NCPC approved plans to extend Rock Creek and Potomac Parkway from its Calvert Street terminus to link up with Beach Drive just south of Klinge Road. Plans included a four-lane tunnel through a rocky hill to get traffic around the eastern edge of the National Zoological Park. The extension would be four lanes as far as the Harvard Street entrance to the zoo, then two lanes wide to the merge with Beach Drive. "Construction is likely to start next year."

Finally, Beveridge highlighted Judge Tamm's finding on the Inter-County Belt Freeway across Rock Creek Park:

Judge Tamm based his ruling on a single point of law—upholding the Planning Commission's right to approve the belt road construction in the park.

But he chastened both sides lightly for “costuming” the facts in “a pageantry type of display,” and added:

I am surprised that counsel on neither side has referred to “the forest primeval, the murmuring pines and hemlocks,” because that seems to be the sentiment that prevails in this argument. [Beveridge, George, “New Belt Accord Eases Traffic Ailments in Area,” *This Week in Area Planning*, *The Evening Star*, July 31, 1954; “Road Extension Plan Approved For Rock Creek,” *The Evening Star*, July 29, 1954. Judge Tamm was quoting the opening line of Henry Wadsworth Longfellow’s 1847 poem, “Evangeline: A Tale of Acadie.”]

(According to the NPS historic resource study of Rock Creek Park, construction of the Rock Creek tunnel was still a few years off:

The impediment of sharp curves and periodic high water levels, which closed the fords on the road in the National Zoological Park grounds, limited the speed and reliability of the route in the 1930s and 1940s. Highway advocates had anticipated the bottleneck and began lobbying for a tunnel link under the zoo as early as 1933. Park planners concerned with the impact of a traffic artery on the character of the park delayed the project. However, as part of the Mission 66 park improvement program commemorating the 50<sup>th</sup> anniversary of the National Park Service, a tunnel and road segment was built and opened under the zoo in 1966. The Service later regretted their support of this project because it greatly expanded commuter use of park roads. Today more than 10,000 cars daily utilize Beach Drive as a connecting route from Maryland into downtown Washington. [Bushong, page 145])

On September 17, the U.S. Court of Appeals rejected plaintiffs’ request for an injunction to block construction in the park until their appeal was decided. This decision prompted the Maryland State Roads Commission to consider developing contract plans for the Inter-County Belt Freeway through the park. Legal counsel, according to McCain, advised the commission that rejection of the injunction put the matter “right where it was before the suit was filed.” He continued:

In view of that, the commission has directed its chief engineer to instruct consulting engineers to proceed as rapidly as possible in connection with completion of detailed contract plans for the construction of the inter-county belt parkway which involves the use of certain parklands.

McCain also advised the engineers to work closely with Olmsted Brothers on the final contract designs.

He declined to tell reporters whether the park section would be the first portion of the belt freeway to go to construction. [Beveridge, George, “Decision Due On Quick Start Of Park Route,” *The Evening Star*, September 18, 1954; “Maryland to Hasten Plans for Contract On Belt Parkway,” *The Evening Star*, September 23, 1954]

## An Election Issue

Soon, the issue became part of the gubernatorial election between Governor McKeldin and his Democratic opponent, Dr. Byrd, who had resigned as president of the University of Maryland after 18 years to run for Governor. The *Star* said of Dr. Byrd:

He has been assailing his opponent's road policies in recent weeks, claiming excessive fees were paid to engineering consultants and implying favoritism with high real estate commissions to a former member of the State roads group.

On October 20, during a campaign appearance in Rockville, he told reporters, "I would appoint a new commission if I am elected." One of the issues he cited in Montgomery County was the need for a belt highway around Washington "with broad avenues leading into the city." As the *Star* noted, the McKeldin administration was working on such a project. In reply to a reporter's question, Dr. Byrd declined to state a position on extension of U.S. 240's southeast leg to East-West Highway. He said the issue was a local one that county residents should decide. [Preston, Alex R., "Byrd Pledges New Roads Commission in Maryland," *The Evening Star*, October 21, 1954; "Dr. Byrd Retires, Symons Heads U. of Maryland," *The Evening Star*, January 4, 1954]

With the issue raised, Governor McKeldin responded by telegram to an inquiry from State Senator R. Lofstrand, Jr., of Rockville:

I have just been informed today that an alternate plan on Route 240 has been submitted to the Maryland State Roads Commission and the Maryland National Park and Planning Commission which would permit the southeast leg of proposed 240 to reach East-West highway without jeopardizing Rock Creek Park.

I shall direct that the State Roads Commission consider this plan in the light of my desire to save the Rock Creek Park.

The chief engineer of the State Roads Commission has just informed me that there has been no attempt at any land acquisition which would be determinative of the route in question, and I have directed that there be no steps taken for any such land acquisition until the matter is finally and I trust satisfactorily concluded.

Initially, the Maryland-National Capital Park and Planning Commission told reporters it was not aware of such an alternative plan. Roads commission officials could not be reached for comment. ["Alternate Plan For Route 240 Being Studied," *The Evening Star*, October 31, 1954]

With the election only 2 days away, Dr. Byrd issued a telegram promising that, "If elected, I will find a way of avoiding the use of Rock Creek Park such as the present Republican administration contemplates . . ." He also said he detected "a change of heart . . . in the Governor's eleventh-hour telegram," which he said amounted to "political trickery."

By this point, reporters had figured out that the alternative plan Governor McKeldin mentioned in his telegram had been submitted by Washington attorney Ernest F. Henry, a civic leader who lived near the parklands in question. His alternative plan, which he had submitted several

months earlier, was to build the belt freeway over mostly undeveloped private land south of the park. The Maryland State Roads Commission and the Maryland-Capital Planning and Park Commission had rejected the plan at the time.

Senator Nye sent a telegram to Governor McKeldin seeking clarification on “apparent inconsistencies.” The inconsistencies were prior rejection of the plan supposedly under study and whether land was being acquired for the belt freeway. Senator Nye also asked Governor McKeldin for a more definite stand on the location of the belt freeway and the southeast leg of U.S. 240.

The former Senator also sent a telegram to Dr. Byrd thanking him for “your forthright statement.” His group, the Citizens’ Action Committee for Fair Road Planning, had printed circulars reminding voters to “stand by our friends,” with Dr. Byrd instead of Governor McKeldin listed. [“Park Highway Becomes Issue In Campaign,” *The Evening Star*, November 1, 1954]

The night before the election, Governor McKeldin replied by telegram indicating he would support any alternative that would be feasible based on cost, engineering, and traffic benefit. But as George Beveridge would say, “his wire didn’t indicate he thought there was much prospect anyone would submit such an alternate.”

On November 2, 1954, Governor McKeldin became the first Republican Governor of Maryland to win reelection. Although the mid-term national election went strongly Democratic in Maryland and elsewhere, Governor McKeldin won by around 60,000 votes. As a sign of the strength of Democrats in 1954, Governor McKeldin’s running mates lost the race for Attorney General to Democrat C. Ferdinand Sybert, and for Controller to J. Millard Tawes. (The Attorney General was the number two person on each party’s ticket. Maryland’s constitution of 1867 had abolished the position of Lieutenant Governor and it was not reinstated by constitutional amendment until 1970.)

In Montgomery County, Governor McKeldin won the race by 5,000 votes, but Democrats “swept into office yesterday, capturing all local offices except one seat in the House of Delegates after eight lean long years,” as the *Star* put it. Among the winning Democrats was Edward S. Northrop, one of the attorneys for plaintiffs in the Rock Creek Park case, who defeated State Senator Lofstrand. [Goodwin, Gene, “Byrd Defeated By Margin of 60,000 Votes”; Hoffman, Charles L., “Democrats Win All But 1 Office in Montgomery,” both from *The Evening Star*, November 3, 1954]

Summarizing the election results, George Beveridge speculated in his weekly planning column:

Despite a brave effort, last Tuesday’s election apparently didn’t net anything for the band of nearby Maryland residents who are trying to block construction of the new inter-county belt road in Rock Creek Park near their homes.

If anything, in fact, their prospects may have become a bit bleaker.

They had pressured Governor McKeldin for months regarding use of the park for the belt freeway and the southeast leg of U.S. 240, but backed Dr. Byrd in the election. When Governor McKeldin raised the prospect of an alternative plan that had, as it turned out, been rejected months earlier, project opponents praised Dr. Byrd and demanded clarification from the Governor.

Beveridge concluded with the observation that “Dr. Byrd, who lost the election, won’t have the job of living up to the flat commitment he made to find” an alternative. [Beveridge, George, “Election Seen Dimming Plan To Block Belt Road in Park,” *This Week in Area Planning, The Evening Star*, November 6, 1954]

## **Undeciding**

Citizens groups continued to express their views. Shortly after the election, the North Cleveland Park Citizen’s Association sent a letter to Governor McKeldin opposing construction of the southeast leg of U.S. 240 in Rock Creek Park as well as extension through the park in the District. [“Opposition to Route 240 Extension to Park Voted,” *The Evening Star*, 1954]

Meanwhile, members of the Rollingwood Citizens Association in eastern Chevy Chase were concerned by reports that the terminus south of East-West Highway would point the highway directly at Rollingwood Elementary School just west of Rock Creek Park. On December 6, officials of the Maryland State Roads Commission attended a meeting with a standing-room-only crowd of 300 Rollingwood residents to assure them that the area south of East-West Highway near the school was not in any danger. The officials read a joint statement from the roads and planning commissions indicating that the routing of the southeast leg would not be decided for 60 to 90 days.

The statement denied that land was being reserved for the leg south of East-West Highway, as the residents had heard. As McCain put it, “The whole idea has been pigeonholed.” In fact, the Maryland-National Capital Park and Planning Commission had approved a plat for a subdivision in the area south of East-West Highway.

Governor McKeldin, according to the statement, had directed the roads commission by telegram to restudy the southeast leg. The delay would allow engineers to complete plans for projects scheduled to be advertised in the near future:

It is obvious that until this additional study is completed, the State Roads Commission is not in a position to make any comments or commitments with respect to the location of U.S. Route 240.

The restudy, McCain made clear, did not preclude the original terminus at East-West Highway near Beach Drive.

Harry Thompson of the NPS informed the audience that his agency was unalterably opposed to the use of Rock Creek Park for an all-purpose highway. He believed that Congress would amend park legislation to define “parkway” in a way that would keep the belt freeway and U.S. 240 out of the park.

Senator Nye addressed the audience in a 25-minute speech. He threatened to use his influence with Congress to secure a change in law that would keep major roads out of parks if the current plaintiffs lose their appeal. The announcement about approval of a subdivision south of East-West Highway was just another attempt to gain support for construction of the road in the park. In addition, he continued his assault on Gingery, saying, “This thing is just as deep in the mud of politics as it can be put there by any one man.” [“Ruling Delayed On Exact Site Of Route 240,” *The Evening Star*, December 7, 1954]

As 1955 began, the Maryland State Roads Commission committed \$59.1 million to area roads, the “most concentrated in Washington area history,” according to the *Star*. This large amount in the overall statewide road plan of \$242 million was because the area experienced the heaviest congestion and had many residential developments underway that would increase the cost of land acquisition for projects unless they could be advanced quickly.

The commission did not include construction of the Inter-County Belt Freeway in the plan. The State hoped to begin construction in 1955, but decided to await court rulings before moving forward on construction of the road between Wisconsin Avenue and Georgia Avenue. The only construction contract on the segment thus far was for a bridge over Cedar Lane just inside the southern boundary of the park west of Wisconsin Avenue, while the State continued surveys, plans, and land acquisition for its 33-mile portion of the circumferential.

Key projects planned for 1955 included:

- Improving River Road as a city street just beyond the District border through a heavily-populated area, and as a dual highway to just beyond Goldsboro. The dual highway would eventually be extended to the southwest leg of U.S. 240 and an extension of Massachusetts Avenue.
- With construction of Washington National Pike underway to north of Falls Road near Rockville (9 miles), the State planned to extend the pike to Tuckerman Lane “and from there southeastward to Wisconsin avenue near Rock Creek Park.” Tuckerman Lane, therefore, would be the dividing point for the pike’s southeast and southwest legs. At Wisconsin Avenue, the southeast leg would connect at a big interchange with the second proposed inter-county belt freeway. Also at Tuckerman Lane, the southwestern leg of U.S. 240 would be built later southward to the Potomac River at Cabin John. [Beveridge, George, “Maryland Plans \$59.1 Million For Area Roads,” *The Evening Star*, January 2, 1955; Beverage, George, “D.C. Area Projects Taking Shape This Year,” *The Evening Star*, January 7, 1955]

On January 26, Bartholomew wrote to the Maryland-National Capital Park and Planning Commission to request that “Maryland authorities continue to defer any further commitments on the inter-county belt parkway” before NCPC’s February 3 meeting. He did so after receiving a letter in December from Senator James E. Murray (D-Mt.), chairman of the Committee on Interior and Insular Affairs, indicating that the committee might inquire into the proposed use of Rock Creek Park for the belt freeway. Bartholomew expected to learn more before the NCPC meeting about Senator Murray’s plans.

The Maryland planners replied on January 27 that they had made “very substantial contractual [sic] commitments,” particularly for the Cedar Lane bridge. At the same time, Maryland roads officials were developing detailed plans and acquiring right-of-way for the belt freeway. The planners wrote that they had no authority to require the roads commission to halt or delay work, especially since the U.S. Court of Appeals had declined to do so.

The planners also pointed out that in 1954, Senator Guy Cordon (R-Or.), chairman of the Committee on Interior and Insular Affairs before losing his reelection bid in November, had sent a similar letter the previous summer, but nothing had come of his inquiry. [“Senate Group May Probe Belt Road Project,” *The Evening Star*, January 28, 1955]

On February 1, Senator Murray went public on the Senate floor about his intentions. He introduced a resolution (S. J. Res. 36) that would require congressional authority for any road built in the District portion of Rock Creek Park. It also would forbid NCPC from approving any highway traversing the park and require it to “withdraw” any prior approvals. The purpose of the resolution was to provide a basis for hearings to determine whether current law was

sufficient to preserve Rock Creek Park against encroachment of its intended purposes. In a statement inserted into the *Congressional Record*, he referred to former Senator Cordon’s concern about “the creation of a new six-lane speedway through Rock Creek Park,” adding:

This modern superspeed highway, while bearing the name of a “parkway,” would of course destroy, in its area of the park, the scenic and recreational purposes for which the park was intended.

Senator Cordon’s inquiry into the matter had not been concluded when Congress adjourned in 1954, but the reports he received “indicate that the threat to the park may be very real indeed.”

Senator Murray praised the “great vision exercised back in 1890 when Congress made possible the creation and continued existence of Rock Creek Park” from the National Zoological Park to the north District line. He pointed out that the Capper-Cramton Act of 1930 made possible extension of the park into Maryland:

Some of the finest residential subdivisions in metropolitan Washington have been developed along each side of Rock Creek Park. These extended acres of Rock Creek Park, were they still in private possession, could not be purchased today for 100 times the cost that was involved when the ground was acquired 20 years ago.

Congress “could not wisely deny the use of Rock Creek Park for crossings by commercial highways.” Many such crossings existed:

But Congress ought to give most serious consideration to the challenge which now prevails in the form of plans which would let expressways and speedways (in this modern day sometimes called parkways) not just cross the park but run through it lengthwise. That challenge allegedly exists at this time with respect to the reaches of Rock Creek Park both in the District and in Maryland.

To supplement his concerns, Senator Murray introduced a letter from former Representative Cramton to NCPC dated June 8, 1954. Representative Cramton, who had been unsuccessful in his bid for renomination in 1930, was “very deeply concerned” about reports of “extensive super-speed highway encroachments” on the park. When he had come to Washington 40 years earlier, he wrote, he had been deeply impressed by Rock Creek Park in the District, but it was clear “that the charm and scenic values of the valley continued into Maryland.” The commission, at the time, “was greatly disturbed about the possible pollution and destruction of Rock Creek by reason of rapid developments of resident sections in Maryland.”

With cooperation from the commission and Maryland officials, Representative Cramton and Senator Capper had created the legislation that allowed for extension of the park beyond the District line:

All of this was park planning, not setting aside a great valley as a possible site for a 4-, 6-, or 12-lane highway. And to open that valley today in any part of it to such superhighway use opens the door wide to ultimate destruction of the most beautiful park any capital city enjoys. There is an attempt in some quarters to call this wonderful park area a parkway. And when they do that they put all the emphasis on the second syllable and would have it become “way,” dropping all emphasis on “park.” It is not a parkway, and was never intended to be a parkway . . . . The Capper-Cramton law says nothing about extending a parkway. It does propose and does extend that great park for many miles not as an avenue [for] easy vehicle approach to a city that already has more street traffic than it can endure.

Representative Cramton called on NCPC “to close the door with definiteness to any alluring proposals that involve preeminence of highway use in any part of this park.” The law anticipated that highways were needed for public use of the park, but pending proposals “would reverse the situation and make highway use preeminent.”

Senator Murray concluded his statement by saying that pending the planned hearings, he wished that planning and highway authorities would “refrain from any action that could in any wise alter the present status of Rock Creek Park until such time as Congress shall have the opportunity to consider the subject and prospect from every angle.” [Preservation of Rock Creek Park, *Congressional Record-Senate*, February 1, 1955, pages 1032-1033; “Senate Move Asks Delay in Extending Route 240 Into Park,” *The Evening Star*, February 2, 1955]

(Senator Nye claimed he had inspired Senator Cordon’s inquiry in 1954 and had spoken with Senator Murray in 1955 about continuing the inquiry. The NPS also had recommended hearings on the subject.)

The target of the hearings appeared to be extension of the southeast leg of U.S. 240 through the park in the District “as tentatively planned by the District Highway Department,” not the east-west crossing by the Inter-County Belt Freeway. A *Star* editorial saw Senator Murray’s planned hearing as possibly serving “a useful purpose,” especially since it would “help to clear up some of the misunderstandings surrounding the project.” The issue was “an old one, involving the weighing of modern traffic requirements against the natural desire to preserve park areas from

encroachment.” The editorial urged Senator Murray to keep in mind that linking the Washington National Pike with downtown Washington “is an urgent need that cannot long be delayed.” The editorial concluded:

If the committee can come up with some practicable alternative to the construction of a parkway approach through Rock Creek Park, it will have made a notable contribution to solution of a baffling problem. [“What Is the Alternative?” *The Evening Star*, February 3, 1955]

Harland Bartholomew was in town during this period. In a speech at a luncheon meeting of AAA’s District Advisory Board, he emphasized that a subway through the central business district for high-speed lightweight rail cars might be the answer to the area’s mass transportation problem. The area needed expressways, but in the future, the expressways might be flanked by room for the rail cars. The area also needed additional Potomac River bridges, including the Jones Point, Cabin John, and Roaches Run structures, as well as a ring of highways for crosstown traffic linking to the radial routes in and out of the city, and a complete parkway system, such as found in Westchester County, New York. He was disappointed that the Fort Drive intermediate ring was not being taken seriously, especially since 98 percent of the right-of-way had already been acquired.

In another speech, to the Joint Committee on the National Capital, he stressed the importance of ring roads. He praised cooperation among planners and road officials for agreement on the inner loop network that would ring the congested central business district. The loop would correct a drastic need for “better crosstown traffic facilities.” The much needed outer circumferential, he said, was well along in Maryland, and he hoped the expected new funds for the Interstate System would spur Virginia to activity. [“Subway Is Called Possible Answer to D.C. Traffic Problem,” *The Evening Star*, February 2, 1955; “U.S. Proposals Seen Offering Hope for D.C. ‘Ring Roads,’” *The Evening Star*, February 3, 1955]

Before Senator Murray could begin his hearings, Maryland scheduled construction to begin on the Cedar Lane overpass inside the park. The contract went to Ralph E. Mills Company of Salem, Virginia, for \$143,000. Contractors were poised to begin clearing land on February 21. Roads commission officials stressed that they had let the contract in December and it had progressed “as any other project would.” They had not, they said, speeded it up to get work underway prior to Senator Murray’s hearings.

In reporting on this development, Beveridge also discussed the status of the controversy. He explained that the Inter-County Belt Freeway was not really controversial. What was controversial was that the southeast leg of U.S. 240 was “bearing down on the Washington suburbs from Rockville.” He explained:

The opponents contend the roads commission’s real interest is not in the belt road itself, but in gaining a means of shooting Route 240 traffic into the main part of Rock Creek Park in the District.

Beveridge summarized the history of the belt freeway, noting that it had been on the highway plans as far back as the 1940s, but located north of Rock Creek Park:

At the end of the decade, however, the Maryland officials said, residential development had expanded to such a point that a suitable route could not be found. Also, they said, topography of the land was found to be not suitable. The National Capital Planning Commission, charged with approving park development, agreed.

The first official map showing the belt freeway crossing Rock Creek Park was the 1950 Comprehensive Plan adopted by the National Capital Park and Planning Commission. Maryland-National Capital Park and Planning Commission added the belt freeway to its official highway plan in May 1953, having “decided that a carefully designed roadway would constitute a legitimate development of the park, opening it for wider public uses.”

The State planned to build most of the Inter-County Belt Freeway in the final 8 years of Maryland’s 12-year plan. However, the State was advancing the section through Rock Creek Park between Connecticut and Wisconsin Avenues, NW., to be completed in the first 3 years. Beyond the Cedar Lane overpass project inside the park, the roads commission had acquired more than \$1 million worth of right-of-way outside the park for the belt freeway and was negotiating for another \$500,000 worth of property. The State was overseeing final touches for construction of the park segment of the freeway, with the expectation that the next construction project could be let in the summer. Plans were being developed in conjunction with Olmsted Brothers. Beveridge, George, “Inter-County Road Belt Work To Start Despite Park Dispute,” *The Evening Star*, February 20, 1955]

### **The Murray Resolution**

Senator Murray opened the hearing on February 25 in the large Senate caucus room to provide room for the many spectators. He explained that the purpose of the hearing was to determine if the Inter-County Belt Freeway and the southeast leg of U.S. 240 would harm the park in contradiction of the Federal interest.

However, he received a surprise from Maryland Senator Butler. In a letter that Senator Beall concurred in, Senator Butler accused the committee of intervening improperly in Maryland’s jurisdiction by attempting to block construction of the Inter-County Belt Freeway across the State’s section of Rock Creek Park.:

Regardless of the merits of the plans . . . this is fundamentally an internal matter . . . . My state has complied with the provisions of the Capper-Cramton Act by obtaining the approval of the National Capital Planning Commission . . . . I respectfully suggest that this committee, by injecting itself into the controversy, may very well be considered to be invading the rights of the sovereign State of Maryland.

Governor McKeldin submitted a lengthy letter, read by Commissioner McCain, objecting on similar grounds to congressional intervention. He cited the 1921 agreement in which Maryland agreed to pay two-thirds of the cost to acquire land for parks and that the parks would be

developed by the Maryland National Capital Park and Planning Commission subject to NCPC approval of the plans.

Maryland, he said, had spent \$1.6 million for Capper-Cramton Act parks, including Rock Creek Park extended, and \$1.5 million for park development. The Federal share of the acquisitions was \$851,000. Governor McKeldin concluded:

The United States is both legally and morally bound by its contracts and it is not only illegal but wrong and immoral . . . to repudiate its obligations.

For these reasons I earnestly suggest . . . that no change in the long-established contractual rights of the United States and this State and its citizens should or can be made without the full concurrence and official action of the General Assembly of this State and with my approval as Governor.

Maryland Attorney General C. Ferdinand Sybert wrote to say that with the matter in court, the resolution was “to say the least, premature and untimely.”

Harland Bartholomew, the first witness, insisted that NCPC’s approval of the belt freeway’s use of the park did not extend to use of the park by the southeast leg of U.S. 240:

Mr. Bartholomew said there was a sharp distinction between building a heavy traffic road in a well established park such as Rock Creek in Washington and the ribbon-like stream valley park extensions in Maryland . . . .

“I want to assure you the Planning Commission is extremely jealous of park values,” Mr. Bartholomew declared. “But it also is aware of severe traffic problems which must be solved.”

In planning road systems, he said, it is not always possible to miss all the ribbon parks in the Metropolitan area, but he promised his group will “always insist on a competent park design before it gives approval.”

NPS Director Wirth testified in support of the Murray resolution. He wanted to keep the belt freeway out of the park because as far as he was concerned, it was simply a stepping stone for routing the southeast leg of U.S. 240 along the western part of Rock Creek Park to the District’s downtown.

Senator Russell B. Long (D-La.) asked Wirth about use of the park inside the District and how much a road would harm it:

Mr. Wirth said only a small portion of Rock Creek, in acreage, was developed for active recreation such as golf and baseball. But he stressed the park was dedicated and set aside in 1890 as a wilderness area for city dwellers. “To that degree,” Mr. Wirth said, “all of the park is being used now.”

General Grant agreed with Wirth, testifying that the belt road would violate the Capper-Cramton Act, which made no mention of building highways across park lands. He supported the Murray resolution because it simply “states explicitly” the intent of Congress in approving the Capper-Cramton Act.

Senator Long replied that he could go along with preserving park values if the park were widely used. Otherwise, maintaining a wilderness in the city “may be trying to do more than you can,” in view of other needs, such as congestion relief.

(Later, Senator Long told reporters that his wife pressured him to oppose the road because their home at 4740 Quebec Street, NW., in the Spring Valley section of the city was near the Maryland section of the park. “He added, laughing, that he refused to do so and ‘ran into real trouble.’”)

NCPC counsel William S. Cheatham told the committee that he doubted the legality of trying to force the commission to withdraw its approval for use of the park by the belt freeway. He mentioned the court ruling on the issue, still pending appeal.

District Commissioner Samuel Spencer declined to comment on the Maryland portion of the park. However, he opposed requiring congressional authority for any road in the Washington segment of Rock Creek Park, calling the requirement “unnecessary . . . and burdensome on Congress.” In any event, because NPS controls the park in the District, city officials would need approval by NPS and NCPC before construction of a road could begin on park grounds. The proposal to build the U.S. 240 extension through the District’s park, he said, was not in the city’s 10-year public works plan, so it was at least a decade from being proposed, yet alone built.

Chairman C. Melvin Sharpe of the Committee of 100 on the Federal City supported the resolution because it was “not necessary to appropriate dedicated park land for highways.” For the record, he read letters from former Representative Cramton opposing such use.

At the start of the second day of hearings, on February 26, Senator Murray responded in a statement to Senators Butler and Beall by declaring that the hearing was “in no way involved” with Maryland’s sovereign rights. Senator Murray pointed out that in the District and Maryland, Rock Creek Park was “part of our national park system.” He had received “several hundred letters” from around the country protesting use of the park for the belt freeway, including letters from park groups in Belgium and Japan.

J. Bond Smith, counsel for the Maryland-National Capital Park and Planning Commission, told the panel that the 1931 agreement between Maryland and the Federal Government was a “solemn contract.” Because Maryland had complied with the terms of that agreement, Congress should not change the rules after the fact.

He added that Senator Nye “didn’t get interested until his house was threatened.” He was confident that no court would allow the resolution to be applied retroactively to the belt freeway project.

Senator Nye testified that routing the belt freeway across the park was purely a “hidden back door” for the road commission’s real desire “to build a high-speed expressway through the length

of Rock Creek Park to downtown Washington.” They have never deviated from “this continuing plan” that would “ultimately destroy all of Rock Creek Park in Washington.” The committee was “the last court of resort to prevent a magnificent expressway from coming all the way down to the heart of Washington through Rock Creek Park.” When Senator Murray said the expressway into the city could be blocked if NCPC and NPS stood firm, Senator Nye replied, “Yes, but they would get their way piece by piece.”

He argued that the Maryland States Roads Commission was not really interested in the belt freeway; it had become interested only when NCPC blocked construction of U.S. 240 along the park. Maryland had begun construction of a single belt freeway bridge merely as a way to get U.S. 240 into the District along Rock Creek Park. If Congress allowed Maryland to build the belt freeway, “there is nothing anyone can do to prevent them from dipping down out of the park to the East-West Highway” and eventually into the city. “It may not be called Route 240, but there would be no way to keep Route 240 traffic off it.”

In response to Smith’s assertion, Senator Nye said he lived nearly two miles from the proposed belt freeway and that U.S. 240 between the freeway and East-West Highway would be 300 feet from his home. “I could live with that,” he said. “I defy anyone to show I have a more selfish interest than contributing to preservation of the park.”

As the *Post* reported, Senator Nye had some predictions:

Nye said he favored a circumferential road around Washington, but not through the park. He predicted Maryland wouldn’t build any more than this one strip for 15 to 20 years. He also predicted that the promised truck ban on the park section would not stand up and that other plans to develop the park won’t materialize “in our lifetime.”

Maryland highway officials said he was wrong on all counts. The entire 32 miles of the circumferential road in Maryland will be completed within 12 years, they said.

Other critics on the second day of the hearing included David R. Brower, executive director of the Sierra Club in California, and Senator W. Kerr Scott (D-NC), a former Governor of North Carolina (1949 to 1953). Brower said, “I hope Maryland and Congress won’t sacrifice so much in park values to gain so little, if anything in traffic movement.” Senator Murray appreciated Brower’s appearance because, “it seems to me you express the views of people throughout the country” on whether roads would destroy parks.

Senator Scott said that during his term as Governor, the city of Raleigh had converted part of its park system to parking lots. The city now regretted that decision. “We should be very cautious before doing anything that could hurt the park.”

In George Beveridge’s view, the hearings ended “in sharp conflict” over Maryland’s rights. Senator Murray had told Assistant Attorney General Joseph D. Buscher of Maryland that if the State’s legal position were correct, “I don’t think the resolution will be passed.” He emphasized, however, that he saw “no merit” in that position. Another question was whether the resolution, if approved, would affect the outcome in Maryland for the Inter-County Belt Freeway. Counsel

Smith said he did not think so. “From a legal standpoint, whether this resolution is passed or not, I do not believe construction of the road is going to be stopped.”

Afterwards, Senator Murray told reporters he had not made up his mind and had only wanted the issue to be explored in a hearing. However, he said he would not drop the resolution simply because Maryland officials objected to it. The question will “require a lot of thinking because whatever is done, someone will be affected.” He ordered “an intensive staff study” of the issues, including the legal issues Maryland raised. [Beveridge, George, “Butler Assails Senate Role in Belt Road Row,” *The Evening Star*, February 25, 1955; Beveridge, George, “Belt Road Plan Probe Defended By Chairman,” *The Evening Star*, February 26, 1955; “Senate Roll In Belt Plan Assailed At Hearing,” *The Washington Post and Times Herald*, February 26, 1955; Beveridge, George, “Belt Highway Inquiry Ends in Row on Rights,” *The Evening Star*, February 27, 1955; Lyons, Richard L, “Belt Route Called ‘Park Destruction,’” *The Washington Post and Times Herald*, February 27, 1955]

According to a *Star* editorial, “the target of the Murray resolution to restrict road construction in Rock Creek Park is as yet without form or substance.” The resolution was really about the plan to extend the southeast leg of U.S. 240 to downtown Washington through the park. “Any legislation to control or ban such a parkway before it is even on the planning boards is premature, to say the least.” However, if Congress is going to force Maryland and the District to reroute the Washington National Pike “through heavily builtup [sic] territory, or over present north-south thoroughfares that cannot be widened except at unacceptable cost,” the Federal Government should pick up the extra costs.

The editorial concluded that the time to consider the impact is when a definite plan is developed for routing the southeast leg “from one end of Rock Creek Park to the other.” With that time still a good many years away, Senator Murray’s two-part resolution “ought to be put in a pigeonhole.” [“Shooting at a Formless Target,” *The Evening Star*, March 1, 1955]

That, in effect, is what happened. According to an NPS history of Rock Creek Park:

The highway issue was thoroughly ventilated in a Senate hearing on the bill, which was not brought to a vote in either house . . . . [Mackintosh, Barry, *Rock Creek Park: An Administrative History*, History Division, National Park Service, Department of the Interior, 1985, page 87]

## **Back to Court**

On March 1, the fight over the belt freeway was back in court. Barse filed a suit in Montgomery County Circuit Court on behalf of Mr. and Mrs. R. W. Brownell of 9702 Parkwood Drive in Bethesda abutting Rock Creek Park, seeking to block construction. The suit against the Maryland road and planning commissions raised basically the same issues as in the Federal court case, claiming the two commissions were “arbitrary and capricious” in approving the belt freeway route through Rock Creek Park.

Judge Thomas M. Anderson ordered the two commissions to appear March 16 and “show cause” why he should not halt the project. Judge Anderson’s “show cause” order did not affect any work undertaken before the hearing. [“Taxpayer Seeks To Halt Work On Belt Road,” *The Evening Star*, March 2, 1955]

After the parties responded, Judge Anderson scheduled further arguments for April 7. On that date, he declined to dismiss the suit as requested by the Maryland roads and planning commissions.

On April 28, the U.S. Court of Appeals for the District of Columbia issued its decision on basically the same issues. It dismissed Judge Tamm’s finding upholding NCPC’s approval of plans to construct the Inter-County Belt Freeway across the Maryland extension of Rock Creek Park:

Since the litigation seeks to declare invalid and to enjoin the National Commission from continuing to approve plans for a project which will in fact be built and maintained by the Maryland [Planning] Commission and other Maryland authorities, we think the questions involved ought not to be decided without opportunity to the Maryland Commission to be heard as a party if that is possible.

The Appeals Court ruling did not address whether NCPC had acted within its statutory authority. The ruling left open the possibility that plaintiffs could return to U.S. District Court for a new hearing, but the implication was that Maryland courts might be just as well suited to hear the case. [“State Role Seen In Road Fight,” *The Evening Star*, April 29, 1955]

(Around this time, Maryland found that right-of-way acquisition required careful oversight. State Senator Northrop raised questions about the contract awarded to two real estate firms that split \$750,000 in 7.5-percent fees for obtaining right-of-way for the Baltimore Harbor Tunnel. One of the firms was run by former Roads Commissioner David M. Nichols, who had resigned in 1954. More worrisome were allegations against Ben Du Pre, right-of-way engineer for the Maryland State Roads Commission. Commissioner McCain revealed that Du Pre had been suspended because of his activities in acquiring right-of-way in Montgomery County for the Washington National Pike. He was accused of tipping off land speculators about the State’s plans, receiving a percentage of commissions for land sold to the roads commission, and of being a part owner of land acquired from one of the speculators. [Associated Press, “Roads Agency Faces Quiz by Northrop on \$750,000 in Fees,” *The Evening Star*, March 21, 1955; “Maryland Road Agency Legislative Probe Urged,” *The Evening Star*, June 30, 1955; “Highway Land Deal Case Goes To Jury Today,” *The Evening Star*, March 15, 1956]

(According to the State roads history:

Following an exposé, DuPre [sic] was discharged from state service and went to Mexico City, his native place. When brought back in 1956 under legal immunity as a state witness, he admitted his part in the transactions and that he was paid \$8,500 for the advance information he supplied. The two real estate men who profited were convicted

of conspiracy and fined . . . . The state's ultimate loss, after recoupments of one kind or another, was approximately \$12,000, according to a board of real estate appraisal . . . .

The Legislature of 1956, at the request of the Commission's Legal Department, moved to plug the loophole revealed by the DuPre case. A statute was passed providing for the preparation of plats or maps showing the location of new highways and the Commission's valuation of each property concerned, such plats to be filed with the Commission "and not to be open to public inspection," with certain exceptions. It was thought that such a procedure would prevent land grabs in the path of future highway construction. [A *History of Road Building*, pages 171-172]

(Once the Federal-Aid Highway Act of 1956 launched construction of the Interstate System, similar right-of-way schemes would be one of the main concerns raising questions about whether the "Greatest Public Works Project in History" was corrupt.)

Meanwhile, Maryland was experiencing a fund shortfall of \$25 million after the General Assembly had rejected Governor McKeldin's tax program. State Senator Northrop headed the special committee established to investigate existing laws providing for mandatory increases in budget items, with the idea of removing some of them. The committee also was to examine distribution of State funds, including receipts from the gasoline tax and motor vehicle registration tax, among counties and municipalities. [Hoffman, Charles L., "Northrop Heads State Hunt for \$25 Million," *The Evening Star*, May 5, 1955]

By the end of May, the Maryland State Roads Commission was facing a \$21 million cutback. The cutback had several causes. Contracts underway were running \$11 million over budget. The State Legislature, which deferred an increase in automobile registration fees, charged about

\$4.5 million in unanticipated, nonconstruction expenses against road construction funds. The State would have to pay \$2.5 million for right-of-way acquisition on the Baltimore Beltway that Baltimore County was supposed to have paid; the schedule had been moved up to accommodate the opening of the Baltimore Harbor Tunnel in 1957.

Ongoing contracts would not be affected. For example, the commission had advertised for bids on the Kenilworth interchange on a 50-acre site, a complex of cloverleaves and bridges linking the Baltimore-Washington Parkway, the Washington-Annapolis Freeway, River Road and Kenilworth Avenue. The estimated cost of the interchange was \$2 million.

(On August 12, 1954, Commissioner McCain announced that the Washington-Annapolis Freeway, then completed between Annapolis and U.S. 301, would be called the John Hanson Freeway. On November 5, 1781, Hanson became the first President following ratification of the Articles of Confederation in March 1781. Maryland had been the last State, on March 1, 1781, to ratify the Articles to begin the "perpetual Union of the thirteen states of America." Hanson's selection as the country's first President may have been a reward for his efforts in securing Maryland's approval of the governing document. The position was mainly a ceremonial post that Hanson held for 1 year, the term the Articles had set for the position. A history of his service stated:

In his capacity as first president of Congress of the Confederation, Hanson established the first cabinet, consisting of secretaries of war, finance, foreign affairs, and state. Ironically, Hanson's first use of the "Great Seal of the United States" was on a 1782 commission authorizing George Washington to exchange war prisoners. Just days before he was to relinquish office, he issued a proclamation authorizing America's first national Thanksgiving Day to be celebrated the last Thursday of every November.

(Hanson had been in poor health during his 1-year term. He retired to his home in Frederick and died on November 15, 1783. [Gay, James Thomas, "Americans: 'first president of the united states,'" *American History*, June 1999, pages 12-14]

(Today, Hanson is largely forgotten outside the Washington area but the name of the first President of the United States survives on a school, a savings bank, other facilities and, of course, the Washington-to-Annapolis Freeway. In the Washington area, the freeway is sometimes referred to as the John Hanson Highway rather than U.S. 50 or I-595, its official designations. [Associated Press, "Annapolis Highway Called John Hanson After 1776 Leader," *The Evening Star*, August 12, 1954])

Several projects set for bids later in the year would be delayed until 1956. These projects included the contract to extend the Washington National Pike from Falls Road near Rockville to Tuckerman Lane and southeast toward an interchange with Wisconsin Avenue near Rock Creek Park. Contracts in 1955 would carry the pike only to Old Georgetown Road, northwest of Wisconsin Avenue.

Roads officials emphasized that the pike project and others in the area were facing "temporary deferral." The cutbacks, while regrettable, would not reduce expenditures during the course of the 12-year roads program. [Beveridge, George, "7 Highway Projects In D.C. Area Hit by Maryland Cutback," *The Evening Star*, May 22, 1955; "Funds Cutback To Delay Roads," *The Evening Star*, May 22, 1955]

## **The Interstate Map**

As discussed elsewhere, BPR released maps of urbanized areas throughout the country in September 1955 with black lines showing proposed Interstate routes. For the Washington area, the map included the circumferential in the general location of today's Capital Beltway with its Potomac River crossings at Alexandria and Cabin John. The Washington National Pike/U.S. 240 to Frederick crossed the belt freeway on a path to Glen Echo where it intersected a route along the Potomac River, roughly parallel to Canal Road, NW., to the planned Inner Loop freeway in the vicinity of the Constitution Avenue Bridge. District mileage totaled about 29 miles.

The map did not include the southeastern leg of U.S. 240 or any arterial interchange in Maryland with the belt freeway between Greenbelt and the southwest leg of U.S. 240. The connection between Baltimore and Washington on the main East Coast route was accomplished by a freeway from Richmond, Virginia, running across the city as part of the Inner Loop Freeway to the Baltimore-Washington Parkway via New York Avenue. A freeway along the east side of the Anacostia River began on the future Capital Beltway east of the Potomac River and ended at the

Baltimore-Washington Parkway. In addition, a northern segment of the Inner Loop Freeway intersected the river route freeway before heading into Virginia in the direction of Strasburg.

BPR said of the maps:

The present approval fixes only the general locations of interstate routes in the urban areas . . . . In many instances extensive studies of traffic needs, right of way costs and design problems must precede fixing the final location. [Douglas, Francis P., "Highway Links OK's for D.C.," *The Evening Star*, September 29, 1955]

The absence of the southeast leg of U.S. 240 was a blow to Maryland, but Chairman McCain was undaunted. Appearing before the Rockville Rotary Club, he said Washington National Pike would open between Germantown and Rockville in the early spring of 1956. Contracts for the extension to Bethesda would be advertised in the early summer, with construction to begin in August. ["Rockville Pike Widening Due In 9 Months," *The Evening Star*, November 20, 1955]

On February 21, 1956, the *Star* carried a photograph of the completed Cedar Lane bridge over the headline: "Montgomery Bridge With No Place To Go." The caption read:

This newly completed bridge is the one to carry the intercounty belt road traffic across Cedar lane north of Bethesda. The bridge is ready, but that's all. The contract for the first section of the beltway, a 2-mile stretch between Wisconsin avenue and Connecticut avenue, has not been let and no date set for receipt of bids.

The Maryland State Roads Commission advertised for bids on the 2-mile section on April 18, 1956. The contract covered drainage, grading, and surfacing for the Inter-County Belt Freeway from Wisconsin Avenue near Pooks Hill to Connecticut Avenue about 1,200 feet north of Jones Bridge Road. The work included grading for the "gigantic interchange," as the *Star* called it, linking the belt freeway, existing Rockville Pike (extended Wisconsin Avenue), and Washington National Pike. ["Bids Asked for First Lap Of Inter-County Beltway," *The Evening Star*, April 19, 1956]

After the real estate scandal involving Washington National Pike, Governor McKeldin had established a Commission on State Programs, Organization and Finances headed by Baltimore attorney Harry J. Green. Based on the Green Commission's findings, Governor McKeldin concluded, "Even more obvious has been the need for a strong hand of direction and authority in the affairs of the [Roads] Commission."

By then, the Maryland State Roads Commission was due for what *Star* reporter Gene Goodwin called a "long-rumored shake-up." Part of the commission's problem was inevitable; the projects in the 12-year program inconvenienced property owners and caused financial losses for many of them. The commission's problems, Goodwin pointed out, "began shortly after the \$568 million program was launched." The feeling of distrust grew with the scandals involving real estate for the Washington National Pike and the Baltimore Harbor Tunnel.

On May 21, 1956, Governor McKeldin announced that he had appointed Robert O. Bonnell, to become chairman of the Maryland State Roads Commission on June 15. Bonnell, a Baltimore banker, had been chairman of the Baltimore Aviation Commission during construction of Friendship International Airport, but had no experience in road building. The Governor also replaced one of the other two commissioners with John J. Mullen, a newspaper publisher from Cumberland. The third commissioner, former State Senator Edward T. Bennett of Wicomico County, remained in his position. "We need a general change in the system of administration and I feel it is best that we start out with an entirely new group of commissioners."

Where McCain had earned \$10,000 a year as chairman of the commission, Bonnell would receive a salary of \$25,000 in his new post. "Leaning back in his vice-president's chair at the Fidelity-Baltimore National Bank & Trust Co.," the 65-year old Bonnell told reporters:

I've worked pretty hard all of my life and I must admit I had looked forward to relaxing a bit. But this assignment is just too much of a challenge to pass up. I hope I can do the job in a way that will be rewarding and helpful to the State.

He added, "But I have nothing to lose. I don't need the job nor the money and if it doesn't work out, I'll quit."

Bonnell would tighten procedures, particularly for right-of-way acquisition, but as the State roads history put it, "The work of the Twelve-Year Program progressed with unabated vigor." [Associated Press, "2 Named to Posts In Roads Shakeup," *The Evening Star*, May 21, 1956; Goodwin, Gene, "Road Group Poses Questions," *The Evening Star*, May 27, 1956; Goodwin, Gene, "Bonnell Defies 'Hot Spot' In Maryland Road Post," *The Evening Star*, May 28, 1956; *A History of Road Building*, pages 172-174]

Construction on the belt freeway contract began in July, with the \$980,000 contract to be completed in late 1957. The right-of-way followed the southern bank of Rock Creek on land approved by the Maryland-National Park and Planning Commission. To protect as many trees as possible, special crews had marked more than 100 trees bordering the right-of-way with white paint. The contractor was instructed to use gravel fill and rock walls if necessary to protect the marked trees. ["Inter-County Parkway Link Gets Under Way," *The Evening Star*, July 11, 1956]

As McCain had indicated, the roads commission advertised in late August 1956 for bids to extend Washington National Pike from Chestnut Street to Pooks Hill (1.3 miles) and to Grosvenor Lane (4.5 miles). From Grosvenor Lane, the pike had only a half mile to go to the interchange with Rockville Pike and the Inter-County Belt Freeway. ["Bids Sought On Pike Job," *The Evening Star*, August 29, 1956]

### **Interstate Program Gets Underway**

By then, President Eisenhower had approved the Federal-Aid Highway Act of 1956, which launched construction of the Interstate System throughout the country. The legislation added 1,000 miles to the Interstate System, bringing it to 41,000 miles, and made a national commitment to pay 90 percent of the cost to complete all the mileage to full Interstate standards.

BPR and AASHO had been working on design standards in anticipation of passage of the legislation, which called for adoption of uniform design standards for the Interstate System to accommodate projected traffic in 1975 – shortly after the entire program was to be completed. As with all such standards, AASHO's Committee on Planning and Design Policies developed them with input from BPR, and then BPR adopted them. The standards adopted by BPR on July 17, 1956, reflected “desirable minimum values” to ensure the new Interstates were “designed with control of access to insure their safety, permanence, and utility and with flexibility to provide for possible future expansion.” The 1956 design standards stated:

Interstate highways shall be designed to serve safely and efficiently the volumes of passenger vehicles, buses, and trucks, including tractor-trailer and semitrailer combinations and corresponding military equipment . . . including attracted, generated, and development traffic on the basis that the entire system is completed.

The 1956 Act had provided maximum weight and width limitations for commercial vehicles using the Interstate System (with a “grandfather” clause for previously legal vehicles). “No funds authorized to be appropriated” were to be apportioned to States that violated these limitations.

The standards focused on rural segments, with urban design standards almost a side issue. For example, design speeds were specified for flat (70 m.p.h.), rolling (60 m.p.h.), and mountainous topography (50 m.p.h.), with adjustments for terrain and development. “The design speed in urban areas should be at least 50 miles per hour.” Medians throughout the network were to be at least 16 feet wide, but narrower medians “may be provided in urban areas of high right-of-way cost.” Similarly, right-of-way width for rural Interstates was detailed in a table listing different numbers of lanes, but in urban areas the width “shall be not less than that required for the necessary cross-section elements, including median, pavements, shoulders, outer separations, ramps, frontage roads, slopes, walls, border areas, and other requisite appurtenances.”

Immediately after the President signed the 1956 Act, Secretary of Commerce Sinclair Weeks announced apportionment of \$1.25 billion in FY 1957 funds to the State highway agencies. On August 1, he apportioned FY 1958 funds, bringing the total apportioned Interstate construction funds to \$2.55 billion. The funds were apportioned based on the same formula as the limited Federal-aid funds the Federal-Aid Highway Act of 1954 authorized for the Interstate System (two-thirds based on population, while area and post-road mileage counted one-sixth each).

Beginning with FY 1959 funds, Interstate construction funds were to be apportioned based on each State's share of the total estimated cost of completing the Interstate System. With this requirement in place, BPR began working with the State highway agencies to determine specific locations for the routes, including those in urban areas, and to estimate the cost of building them to full standards.

By December 1956, Maryland roads officials and BPR were at odds on two routes. One involved the stretch of the Inter-County Belt Freeway crossing Rock Creek Park between Seminary Road and Bradley Boulevard. BPR had deferred approval of this section because the State planned to ban trucks on the parkway section of the circumferential. Under the 1956 Act, the Interstate System was intended to carry all traffic within legal load limits. The head of BPR,

Commissioner C. D. Curtiss, said BPR “has not made a firm decision on whether the park portion could qualify.”

The other dispute involved the 2.3-mile segment of Washington National Pike near Tuckerman Lane in Bethesda and Wisconsin Avenue at Rock Creek Park. Maryland’s Pritchett called it “the most critical road problem we have to resolve in the Washington area.” Tuckerman Lane was the dividing point for the southeast and southwest legs of the pike, but Maryland had not yet scheduled construction of the southwest leg. Construction to Tuckerman Lane was to be completed in 1958, but the lane was not a suitable end to U.S. 240. Pritchett said that without Interstate designation for the segment, “the road couldn’t be built for several years.” [Beveridge, George, “Snarl Threatens 2 Road Projects In Maryland,” *The Evening Star*, December 16, 1956]

(Maryland and BPR also were disputing the location of the Interstate link between Baltimore and Washington. As will be discussed later, BPR wanted to designate an upgraded Baltimore-Washington Parkway as the link – the line shown in the 1955 black line map – thus reducing construction costs. Maryland roads officials vowed to wage a “continuous fight” for construction of a new link. [“Maryland Pledges Fight For New D.C. Expressway,” *The Evening Star*, December 16, 1956])

On January 15, 1957, Maryland and District officials met on the disputes with Federal Highway Administrator John A. Volpe, the first official to hold that newly created title for the head of BPR. (President Eisenhower had selected Volpe as interim Administrator until the permanent Administrator, Bertram D. Tallamy of New York, was able to take the post in mid-February following his confirmation by the Senate). He approved Interstate designation for extension of Washington National Pike between Tuckerman Lane and Wisconsin Avenue at Rock Creek Park. Maryland roads officials expected to award a construction contract for the extension later that year.

Officials discussed the southwest leg from Tuckerman Lane to Cabin John and a link to the District of Columbia. Maryland officials wanted to use the planned George Washington Memorial Parkway to carry traffic into the District. However, NPS officials, who planned to begin construction in the spring, were building the parkway to exclude trucks. They also were not bound by the design standards BPR had approved for the Interstate System. District commissioners had recently approved the extension within the District, and Volpe concurred. The link between the District line and the southwest leg was left open to additional studies that Maryland officials said would take about 3 months.

Volpe left open the designation of the parkway connector between the Inter-County Belt Freeway and the District line.

In addition, officials discussed the Baltimore-Washington link, but left the location up in the air. Volpe approved Interstate designation of the District’s Anacostia Freeway and a portion of New York Avenue between Florida Avenue and Bladensburg Avenue, NE. [Beveridge, George, “U.S. Road Unit Okays Route For Expressway,” *The Evening Star*, January 16, 1957]

On July 19, District, Maryland, and BPR officials convened at the Statler Hotel for a meeting called by Herbert C. Wells, chairman of the Maryland-National Capital Park and Planning Commission, to discuss the issues. The meeting lasted from 9 a.m. to 9 p.m. in an attempt to reach agreement on the U.S. 240 and Baltimore expressway links to the District.

The idea of continuing the southeast leg of U.S. 240 into the District via Rock Creek Park had been raised again in recent weeks. In response to the idea, NPS Director Wirth made clear that the Interior Department opposed any highway through the park. He distributed a letter from Secretary of the Interior Seaton promising to continue opposing any such construction.

The southwest leg also was in dispute. The District had let a contract with Clarkeson Engineering Corporation to study a link separate from the George Washington Memorial Parkway. However, Commissioner Bonnell said the roads commission was opposed to any alternative to the parkway for the link:

We are unalterably opposed to the construction of two facilities between Cabin John Creek and the D.C. line. Such a course would be useless duplication, economically unsound, trafficwise unjustified and would unnecessarily disturb and disrupt a large number of valuable properties occupied by tax-paying citizens of Maryland.

With the District reportedly abandoning Rock Creek Park as a route for the southeast leg of Washington National Pike, the city's focus was on the parkway entrance for the southwest leg. A "prominent possibility [was] a road through Glover-Archbold Park [that] would connect Wisconsin avenue above Van Ness street N.W. with MacArthur boulevard west of Georgetown University." NCPC had approved the link through the park, but seven citizens groups in northwest Washington had denounced the approval as "arbitrary and unnecessarily hasty." They wanted a hearing where they could protest the decision.

The meeting also covered the new Interstate link that Maryland wanted to place between the Baltimore-Washington Parkway and U.S. 29/Columbia Pike. "Maryland officials learned, many for the first time yesterday, from the District's Mr. Robertson that the Federal City connection might not be planned as an interstate link." The District had engaged the Clarkeson firm to study the question.

Most issues remained unresolved, but participants agreed on the location of the Cabin John Bridge that would carry the circumferential across the Potomac River between Maryland and Virginia.

Further, in what participants considered a "major action," they agreed to establish a coordinating committee that would meet monthly to seek solutions to regional differences on highway locations. Officials agreed the action was "overdue." Bonnell headed the committee.

After the meeting, Wells said, "It is possible we have made much progress." Still, he was philosophical about the outcome. "One hundred years from today, there still will be problems about issues like those discussed here." ["Parley Fails to Solve Link to Route 240," *The Evening Star*, July 20, 1957]

## **Glover-Archbold Park**

The idea of building an expressway through Glover-Archbold Park was not new.

In 1924, Charles O. Glover and Mrs. Anne Archbold offered 98 acres that they owned in the Foundry Branch Valley (Massachusetts Avenue to Reservoir Road, NW.) to the government exclusively for park use. Congress acted in June to complete the purchase. Subsequently, the National Capital Park and Planning Commission expanded the park to provide recreation for the surrounding residential district.

By the 1940s, the park, nestled among residential neighborhoods, seemed a perfect location for a freeway. The proposal was called the Arizona Avenue Freeway.

Arizona Avenue was named in 1893 as part of a subdivision that the Palisades of the Potomac Land Improvement Company developed beginning in 1890. [Stewart, page 68] The Palisades is a community located in the western corner of the District along the Potomac River at the city border with Maryland. Because of its location along the Potomac River, the Palisades has been a transportation hub from the start. It was crossed by Conduit Road, as mentioned earlier, the Chesapeake and Ohio Canal (reflected today in Canal Road), and the Baltimore and Ohio Railroad. It included the road to Chain Bridge.

The *Star's* "Affairs in Georgetown" column mentioned creation of Arizona Avenue in October 1893:

The proposed highway over the line of the Foundry branch sewer that is to run from the Loughborough road, near its junction with the Tenleytown road, to the Chesapeake and Ohio canal, at a point near the Independent Ice Company's big warehouse, is to be designated as Arizona avenue. ["Affairs in Georgetown," *The Evening Star*, October 12, 1893]

By the 1940's, the District, like many cities, was developing a highway improvement program. One of the ideas to emerge from this process was the Arizona Avenue Expressway. The idea did not involve converting existing Arizona Avenue to an expressway, but creating an expressway with that name from the intersection of Wisconsin and Nebraska Avenues at Tenley Circle, through Glover-Archbold Park, to Canal Road near the Potomac River. It would provide a bypass of congested Wisconsin Avenue in Georgetown and remove through traffic from Foxhall Road.

The 1946 plan submitted to Engineer Commissioner Young, discussed earlier, presented a plan for post-war highway improvements to take the District to the threshold of the 21<sup>st</sup> century. The plan included "somewhat lesser scale" improvements, such as "the opening of the valley along Arizona Avenue as a parkway to connect Canal Road with Wisconsin Avenue." The 1946 plan was consistent in many ways with the 1941 plan, but studies since then "have changed the plan to some extent, in that the Arizona Avenue Parkway has been approved as a substitute for the formerly proposed improvement of Foxhall Road as the 'major arterial highway' to serve the area west of Connecticut Avenue . . . ."

The pending approval of the Federal-Aid Highway Act of 1948, the first post-war reauthorization of the Federal-aid highway program, would affect the timing of projects. However, Young listed the Arizona Avenue Parkway for construction in 1950, with completion in 1951. [*Twenty-Four Years of Progress*, pages 74-76, 111-112, 114-115; Thompson, John W., Jr., "D.C. Heads Get Highway Plan Costing Millions," *The Evening Star*, December 13, 1946]

By 1947, the proposed Arizona Avenue Freeway/Expressway/Parkway was controversial because of its routing through the park, as the *Star* explained:

A new feud is developing between the District Government on one side and the National Park Service and National Capital Park and Planning Commission on the other . . . . Center of the controversy is the expressway the District Highway Department proposed building through Glover-Archbold Park . . . . [It] would be a dual roadway without lights or intersections and would meet the K street skyway now under construction.

General Grant of the planning commission and NPS Associate Director Demaray were opposed for two reasons:

1. The park, about half of which was donated to the Government by Charles C. Glover and Mrs. Anne Archbold for a children's playground and neighborhood park, is needed, they claim, to provide recreation for the highly developed area through which it runs.
2. The expressway, they maintain, would encourage more District residents to move to Montgomery County because it would make it easier for them to get downtown quickly. This, it is felt, would deprive the District of additional substantial taxpayers through the continued process of decentralization. [Kauffman, Rudolph II, "D.C. Planners Disagree on Expressway," *The Evening Star*, July 6, 1947]

Although the proposal was controversial, especially with park advocates, the Arizona congressional delegation was supportive. In December 1947, Senator Carl Hayden (D-Az.), who had been in Congress since 1912 and in the Senate since 1927, introduced a bill directing the District commissioners to prepare plans and construct the expressway with "suitable grade separations and interchanges at appropriate locations along Foundry Branch, following in general the line of Arizona avenue." The bill also provided that Federal agencies were to transfer to the District any land needed for the freeway. This provision, if enacted, would resolve the dispute over the use of parkland. In addition, the bill renamed the project "Arizona Freeway."

Senator Hayden, long a major force on the Committee on Public Works, complimented the District Department of Highways for its initiative, which "clearly demonstrates the imperative necessity for construction of the Arizona Freeway." He added that the proposal "is a fine illustration of advanced thinking in the highway planning field, where there is still time for corrections in the difficult traffic situation." He added that Arizonans "had waited long enough" for a real District street with its name, instead of the "paper" street shown on maps.

Senator Hayden said the freeway would "not only be a credit to the name of my State, but will materially reduce the hazards to life on other routes of travel to and from the business and

governmental sections of downtown Washington.” [Rogers, Harold B., “Hayden Bill Asks Developing of Arizona Avenue,” *The Evening Star*, December 21, 1947]

Representative John R. Murdock (D-Az) introduced the bill in the House. He predicted that the freeway would be a “well-traveled boulevard to facilitate traffic and help motorists avoid congestion on other streets.” He added that, “Naturally, we feel that the youngest State in the Union ought to have this due recognition in the Nation’s Capital.” [“Arizona Avenue Freeway Bill Before Congress,” *The Evening Star*, January 7, 1948]

His bill was assigned to the House District Committee, which held a hearing on the issue on January 13, 1948. Before the hearing, Chairman Everett M. Dirksen (R-Il.) received letters from Mrs. Ann Archbold, one of the original donors of the park, and from the son of the other donor, Charles Glover, who had died on February 25, 1936. Charles C. Glover, Jr., said that construction would “greatly mar the park and detract from its usefulness as a recreation area, the purpose for which it was given and accepted by Congress on behalf of the District.” His father’s donation, he said, was for a park and a children’s playground.

Mrs. Archbold added that she also intended her gift for a bird sanctuary. She, like Glover, Jr., asked the committee “to prevent the destruction and desecration of the beautiful and natural valley of Foundry Branch by a commercial freeway.” [“Glover-Archbold Park Highway Protested,” *The Evening Star*, January 12, 1948]

Representative Beall, chairman of the Subcommittee on Public Service, Streets and Traffic, conducted the hearing. Captain Whitehurst, who headed the District highway agency, and planning engineer Brinkley used maps and charts to explain the proposal. They explained that based on expansion of population and motor vehicles by 1990, the freeway was needed. They estimated the 3¼ mile freeway would cost between \$3 million and \$4 million.

General Grant led the opposition. He explained the commission’s concern about the use of the park as a right-of-way and indicated that the commission might have a compromise proposal. The implication was that the compromise would be an “express parkway.” [Rogers, Harold B., “Glover-Archbold Park Freeway Plan Pushed, Assailed at Hearing,” *The Evening Star*, January 13, 1948]

The subcommittee approved the bill on February 4, changing only the name of the proposed highway to “Arizona Avenue” instead of “Arizona Freeway.” The bill called for the District Department of Highways to build the project instead of putting it under Federal control as recommended by the National Capital Park and Planning commission. Representative Beall said, “The District has a competent Highway Department and should have control.” [“Arizona Avenue ‘Freeway’ Approved by House Unit,” *The Evening Star*, February 4, 1948]

In March, Chairman Dirksen said he was holding the bill for further study. He had met with the National Capital Park and Planning Commission, which recommended construction of a parkway, and representatives of the original donors of the park. He wanted to look into the issue in greater detail.

Representative Beall postponed a March 23 inspection tour for subcommittee members. He stated that not enough members were able to take the tour that day to make it worthwhile. He planned to reschedule the tour, but does not appear to have done so. ["Glover Park Highway Bill Held for Further Study," *The Evening Star*, March 19, 1948; "Beall Defers Inspection Of Proposed Parkway," *The Evening Star*, March 23, 1948]

On April 16, NPS and the District of Columbia approved a memorandum of agreement containing stipulations for developing Arizona Parkway between Canal Road and Van Ness Street in Glover-Archbold Park. The agreement's series of "whereas" provisions referred to the District's acquisition in March 1893 of a 100-foot right-of-way for the Foundry Branch highway that was "not adequate either in its location or width to construct a properly designed highway and to properly serve traffic and provide for adequate access to the park areas."

The District, another "whereas" stated, was willing to change the name of the highway from "Arizona Avenue" to "Arizona Parkway." The parkway "can be made to serve as an access to the park so as to permit of the full enjoyment of the property for park purposes and at the same time supply the needs for traffic in this section." All parties agreed that an all-purpose highway was not necessary; the parkway would be restricted to passenger-car traffic.

The agreement acknowledged the District's view on the "necessity for a traffic-way between Canal Road and Wisconsin Avenue in the vicinity of Tenley Circle, with appropriately developed connections with the K Street Elevated Highway currently under construction and with suitable grade separation structures and traffic interchanges at appropriate locations."

In view of these and other considerations, NPS agreed to make available sufficient right-of-way within the park for Arizona Parkway. Any land made available, but not needed, would be returned to the park. The District would construct the parkway, but consult with NPS during each stage, including preparation of plans, the width of the roadway, and the location and layout of access roads. The NPS would be primarily responsible for the "architectural design of bridges and other structures, including retaining walls and guard walls, and rate and shape of slopes in cuts and fills, the landscape development of the right-of-way, the location and design of park areas outside the curb limits of the parkway surface areas." The District would request PRA participation in the project on a 50-50 basis under the Federal-aid highway program.

Captain Whitehurst told reporters that the city entered into the agreement with the understanding that PRA would provide 50 percent of the cost. He could not yet estimate the total cost. However, with the agreement, the city could begin developing the plans and specifications, but he doubted construction could get underway for another year or more.

One impact of the agreement was that legislation was no longer needed. Congress would not take further action on the Hayden-Murdock bill. ["District, Park Service Reach Agreement on Arizona Parkway," *The Evening Star*, April 16, 1948; the agreement can be found in District of Columbia Appropriation Act, 1960, *Congressional Record-Senate*, May 26, 1959, pages 9094-9095]

President Truman approved the Federal-Aid Highway Act of 1948 on June 29. The legislation authorized \$450 million in Federal-aid funds for each of FYs 1950 and 1951. The District's share of the funds amounted to \$5,288,000 each year. Captain Whitehurst was ready with 16 projects to advance with the funds, including:

Arizona avenue from Canal road to Wisconsin avenue, including structures, paving and channelization, total cost, \$3,800,000, estimate of the amount included in this program, \$990,000. ["District Eligible For 5 Millions In Road Funds," *The Evening Star*, July 1, 1948]

### **Whitehurst Freeway**

The head of the District's Department of Highways, Captain Whitehurst, was a 1906 graduate of Virginia Polytechnic Institute. During World War I, he had been based in Washington as a combat engineer officer. After the war, he served as head of the construction division for Wilson Dam at Muscle Shoals, Alabama, before being assigned to the District Engineer Commissioner's office in 1926. Captain Whitehurst resigned in 1929 to enter the private sector, but the District commissioners brought him back as chief engineer and coordinator after they read a plan he had prepared before leaving for streamlining highway management. He became director of the Department of Highways when it was formed in 1930. During World War II, he continued to direct the city's highway development while heading the District Department of Civilian Defense.

In the late 1930s and 1940s, he focused on establishing a thoroughfare plan for the city. Working with the Department of Vehicles and Traffic and PRA, he conducted a traffic survey beginning in 1939. In April 1941, he unveiled the plan for a \$44.45 million construction program to achieve free flow of traffic on Washington's streets – to be completed in 8 years, with funding from a 2-cent gas tax increase to match Federal-aid highway funds where eligible.

One of the biggest projects was an elevated highway on the line of K Street, NW., along the Georgetown waterfront. The Department of Highways' history said of the project:

The need for an east-west limited access highway across Washington, which would serve adequately as a high-speed dispersal artery during the morning rush period, and as an equally rapid means of egress from the central business and Government districts during the evening rush period, was recognized by the Department of Highways in its preliminary highway report of 1941.

Whitehurst's idea for Georgetown was to build an elevated "Sky-Road" in the K Street corridor that would take through traffic off local streets, including the main east-west road, M Street, NW. The elevated bypass would connect Key Bridge with the bridge across Rock Creek and Potomac Parkway between 24th and 27<sup>th</sup> Streets, NW. Ultimately, the expressway would continue east beyond the park along K Street, beneath Washington Circle, to connect with an improved thoroughfare extending to the Public Library of the District of Columbia in Mount Vernon Square at the intersection of Massachusetts and New York Avenues.

Whitehurst told a *Star* reporter that he had considered, but rejected, improvements in the M Street corridor:

In selecting the various trunk routes, the problem was to choose as near as possible the most direct connection with the outlying residential areas and to select streets along which traffic could be made to flow most freely. Many of the existing streets, it was found [,] were usable in part, while other sections of them were not suited to convey traffic quickly. This led, the director said, to the selection of K street instead of M street as the radial line to the northwest section west of Wisconsin avenue and Key Bridge.

M street already was highly congested, it was not wide enough for a depressed highway and it was undesirable because of the business interests involved. As still another bad feature, its roadway was heavily loaded with underground construction and, to avoid a bottleneck in Georgetown, a subway [for motor vehicles] would be necessary.

It has been suggested that a bypass for through traffic be constructed north of M street. Capt. Whitehurst said this idea was dismissed because it would require expensive property acquisition, would border a residential area, and the eastern terminus would bring congestion back into Pennsylvania avenue and M street at Twenty-ninth street. Moreover, there would be no connection with Key Bridge.

Some of the routes were so obviously the proper streets for the trunk lines that there was little difficulty in selecting them, the director reported. K street to the east, for instance, has a wide right-of-way and involves virtually no property acquisition. It also taps and connects with other main highways, which would make its usefulness much greater, and will do a great deal toward taking some of the load off the congested portion of New York and Rhode Island avenues. [“\$44,450,000 Street, Bridge Program Proposed to Ease Traffic,” *The Evening Star*, April 25, 1941; Jones, Pat, “Radial Street Plan Designed To Eliminate ‘Bottlenecks’ Here,” *The Sunday Star*, May 4, 1941]

Among planners and highway engineers, the idea of elevated freeways in large cities had been considered since the 1920s. They had to overcome the prejudice against elevated rail lines in cities, as consultant Robert Whitten discussed in the 1930 *Report on a Thoroughfare Plan for Boston*. Elevated freeways, he acknowledged, would be subject to the noise, vibration, and blockage of views and sunlight that had given elevated rail lines, “Els” as they were known, a bad reputation. Still, Whitten argued, they were the best option for fitting a freeway into a built-up urban environment:

As a matter of first impression the erection of additional elevated structures in Downtown Boston is very objectionable. The comparison of course is with the present noisy and ugly elevated railway structures. It must be remembered, however, that the proposed upper level roadway will occupy the central portion only of a broad avenue; that it will be but two-thirds the height of the elevated structure in Atlantic Avenue; that great care will be taken in its design to make it attractive and to reduce noise and vibration; that it will be used by motor vehicles and not by railroad trains; that it is probable that hard tire vehicles would be excluded; that a vehicular subway [for motor vehicles] would interfere

with sewers and with present and future rapid transit subways; and that it is not physically and economically possible to take care of the large volumes of traffic on the street surface.

Despite all the likely criticisms, Whitten argued that in view of engineering and financial constraints, elevated highways were the best way to move heavy traffic volumes through Boston's central business district. [DiMento, Joseph F.C., and Ellis, Cliff, *Changing Lanes: Visions and Histories of Urban Freeways*, The MIT Press, 2013, pages 29-30]

Over the next decade, elevated freeways became an accepted tool in urban planning. In 1937, the American Road Builders' Association (ARBA) established a Committee on Elevated Highways, headed by V. G. Iden of the American Institute of Steel Construction, Inc. Captain Whitehurst was a member of the committee. In his first report to ARBA, Iden explained that beyond a doubt, conditions in cities demonstrated that "the greatest need of the age is express highways that will serve the congested centers." However, completely rebuilding cities to meet the needs of automobiles would be foolish:

We must approach this problem from a rational point of view and construct highways that will fit any need that we already have. If streets are too narrow to accommodate the extra roads, these extra roads must be built above and over the streets. Elevated highways affording all the limited features necessary to cope with the problem, and accommodating swiftly moving through traffic, are possible . . . .

According to present practice, elevated highways should clear the underlying streets by at least fifteen feet, thereby leaving the surface roads free for truck and local traffic . . . . The design should take into consideration the movement of traffic underneath and the types of ramps to and from the elevated highway above, the banking of curves, location of ramps, methods of snow removal and prevention of the formation of ice. The design should fully conform to the purpose of the elevated highway and assure that no matter what the weather conditions, or how heavy the traffic congestion, the highway will prove to be an express highway under all conditions.

Already, engineers were gaining experience in design and operation of elevated highways from examples such as the West Side Highway in New York City, the connecting link in Chicago's Outer Drive, and the Pulaski Skyway over the meadows of New Jersey. [Iden, V. G., "Report of Committee on Elevated Highways," *Proceedings, Thirty-fifth Annual Convention, American Road Builders' Association*, January 17-21, 1938, American Road Builders' Association, pages 492-500]

*Toll Roads and Free Roads* (1939) and *Interregional Highways* (1944), the two reports that provided the basis for congressional action on the Interstate System in 1944, advocated depressed or elevated freeways through big cities, with depressed freeways being the preferred option. Elevated freeways were especially suitable for commercial or business sections of a city.

*Interregional Highways* included a drawing to illustrate an elevated freeway. The six-lane road, built at the second story level, spanned the center of the wide ground-level street. Motor vehicles

entered by ramps to the outside lanes, while exit ramps were in the center. The freeway lacked a median; traffic moving in opposite directions was departed by what appears to be metal fencing. Similar fences were located on the outer edges of the expressway. Light poles were placed on poles built into the center fence posts. The caption described expressway operation:

An elevated section of the interregional system as it might be built according to the standards proposed, with central exit ramps and lateral entrance ramps. The sketch suggests the manner in which new properties might conform to curving lines of the expressway in widened sections at access points, and a show window at the elevated level dressed appropriately with the kind of large display that would be needed for comprehension by express traffic. [*Interregional Highways*, page 80 and Plate VIII, also see page 166]

Thus, as Whitehurst was considered an elevated freeway in the K Street corridor, he was advancing an idea that urban planners and highway engineers considered an up-to-date congestion reliever. He was on a committee studying the idea.

Moreover, Georgetown was not the modern, upscale neighborhood of today:

Both the Dupont Circle area and Georgetown had concentrations of wealthy families, the latter also being home to many prominent New Dealers who encouraged the local historic preservation movement. But the inner parts of the city were home as well to the majority of black Washingtonians, most of whom lived in much more modest circumstances. West of the White House, some four thousand African Americans lived near the utility plants, factories, and breweries of Foggy Bottom. Another substantial, though decreasing, portion of the working-class black population was scattered around the back streets of Georgetown. [Miller, Fredric M., and Gillette, Howard, Jr., *Washington Seen: A Photographic History, 1875-1965*, The Johns Hopkins University Press, 1995, page 158]

Moreover, the once important Georgetown waterfront was in decline. According to *The WPA Guide to Washington, D.C.*, published in 1942, “Along the river, old warehouses – relics of a once extensive commerce – crumble away beside railway sidings and modern industrial plants.” [*The WPA Guide to Washington, D.C.*, The Federal Writers’ Project Guide to 1930s Washington, Pantheon Books, 1983 (reprint), page 346]

Elevated freeways often were desirable along blighted waterfronts such as the one in Georgetown. As in Washington, planners developed elevated freeways along aging, deteriorating waterfronts in cities such as Boston, New York City, San Francisco, and Seattle.

Whitehurst developed the Sky-Road with little controversy. When the city held a public hearing on May 20 to receive comments on the \$44.45 million plan, the primary concern was the 2-cent increase in the gas tax proposed to pay for the projects. Contemporary news articles did not report objections to either the K Street elevated expressway or other specific elements of the plan. The *Post* reported that the plan “received – with minor reservations – wide support of civic and business leaders at a public hearing in the District Building.” The *Star* stated, “Rather

general support was accorded 'in principle' to the comprehensive long-range plan." The articles reported comments by representatives of organizations during the afternoon hearing, many of whom differed on how to pay for the plan without burdening District residents with the added gas tax. If any citizens spoke during the hearing, neither the *Post* nor *Star* reported their comments. [Wentworth, Howard F., "D.C. Highway Report Wins Wide Support at Hearing," *The Washington Post*, May 21, 1941; "Commissioners Study Mass of Testimony On Whitehurst Plan," *The Evening Star*, May 21, 1941]

On December 4, 1941, Whitehurst announced that construction of the K Street Sky-Road, at a cost of \$2 million, would begin in the spring of 1942, with completion expected later that year. The *Post* described the plan as "a graceful, sweeping 'sky-road' along the line of waterfront K Street." The *Post* added:

Traffic along K Street fronting the river will be undisturbed after the elevated structure is placed in operation, Whitehurst said. Motorists may use either route, depending on their destination and hurry. [Wentworth, Howard F., "Work to Begin Next Spring On Washington's 'Sky-Road,'" *The Washington Post*, December 5, 1941]

Three days later, the surprise bombing of Pearl Harbor propelled the United States into war with Germany, Italy, and Japan.

Whitehurst, in early 1942, was still advancing projects from his 1941 highway program. In May, however, he had to postpone the Sky-Road because of diversion of steel for wartime needs. ["U.S. to Pay 2/3 of 4 D.C. Highways," *The Washington Post*, February 2, 1942; "Priority Puts Off K Street Elevation," *The Washington Post*, May 26, 1942]

During the war, the city expanded in population and a proliferation of temporary offices. Heavy traffic endangered safety and congested the road network. Whitehurst, with his Sky-Road on hold, brought in the Baltimore firm, J. E. Greiner Company, to study the feasibility of converting K Street to a through highway from Key Bridge to eastern terminals at Sixth Street, West Virginia Avenue, and at 15<sup>th</sup> Street and H Street via Florida Avenue:

The Department's choice of K Street as best suited for this type of development was endorsed by the consultants on account of width, straight line location and contiguity to the business district, and was recommended as essential to the relief of traffic pressure on congested parallel streets.

Greiner calculated that the new thoroughfare would reduce about 60 percent of the traffic on adjacent streets and arterials.

In this heavily developed part of the city, a K Street viaduct was the best option for relief not only for through traffic but for local traffic. Further, the Arizona Avenue Expressway would provide ready access from the Potomac River entrance to the city via the K Street elevated freeway.

In 1944, Greiner worked with De Leuw, Cather and Company to develop a master plan for developing transportation facilities in the central area of the city. As the plan evolved in a 1946 post-war study, the K Street plan was revised to start at 3<sup>rd</sup> Street, NW, to connect with the Mid-

City Expressway, which, as noted earlier, extended from Canal Street near Independence Avenue across the city to the District line beyond Rock Creek Cemetery. [*Twenty-Five Years of Progress in Highway Development 1924-1948*, District Department of Highways, pages 68-76; “Georgetown Traffic Expediter,” *The Evening Star*, October 8, 1949]

Construction of the \$3.4 million, 1-mile K Street Skyway from Key Bridge to Rock Creek, began on July 7, 1947. The city awarded the contract to Alexander-Repass Engineering Firm of Des Moines, Iowa. The principals were Archie A. Alexander, an African-American, and his white partner, Maurice A. Repass. They had met as freshmen at the University of Iowa, where Alexander was the university’s only black student. A biographical sketch states:

He played tackle for the school’s varsity football team, earning the nickname, “Alexander the Great.” During the summers, Alexander worked as a draftsman for Marsh Engineers, a Des Moines bridge-designing firm, and in 1912 he received a Bachelor of Science degree, becoming the University of Iowa’s first African American student to complete the engineering program.

Alexander worked on bridge projects for Marsh after graduation, but in 1917 formed an engineering firm with a white contractor, George F. Higbee. By the time Higbee died in a construction accident, Alexander had earned a civil engineering degree from Iowa State University in 1925. After forming the partnership with Repass in 1929, their company worked on projects around the country, including several in Washington. In addition to the K Street elevated project, they worked on the Tidal Basin (including the Independence Avenue bridge over the north end of the basin), a grade separation structure for the Baltimore and Ohio Railroad; and extension of the Baltimore-Washington Parkway. Repass said the company liked working in Washington, because the “District is a fair outfit to work for.” [“Alexander, Archie Alphonso (1888-1958),” *Blackpast: An Online Reference Guide to African American History*; “Three-Million Dollar Elevated Highway Nears Completion,” *Afro-American*, December 25, 1948]

The District and PRA split the cost, 50-50, under the Federal-aid highway program. Completion was delayed by bad weather and slow delivery of materials, but was expected in 1949. [Millen, William A., “Weather, Slow Deliveries Delay Work on K Street ‘Skyway,’” *The Evening Star*, June 13, 1948]

On September 1, 1948, Captain Whitehurst died at George Washington University Hospital after a heart attack. He had been stricken at his home at 3115 34<sup>th</sup> Street, NW., and was taken to the hospital where he was pronounced dead at 4:15 a.m. The 61-year old, who had been Director of Highways for 18 years, had just returned from a 2-week vacation and had told associates he had enjoyed excellent fishing.

The *Star* obituary listed many accomplishments, including the Scott and Thomas Circle underpasses, the John Philip Sousa Bridge across the Anacostia River at Pennsylvania Avenue, SE., traffic surveys, his long-range program of street widening and surface improvements, his support for fringe parking garages, and his role in replacing “painted safety zones with the present raised streetcar loading platforms. “At the time of his death, he was supervising

numerous major projects, including the K street elevated highway, the new bridge across the Potomac at Fourteenth street, the Dupont Circle underpass and the South Capitol Street Bridge project.”

The newsletter of the American Road Builders’ Association added that he had served the association for many years, including as first president of its city officials division, treasurer (1940 until his death) and president (1935-1936). He also had been a member of the National Capital Park and Planning Commission and was active in AASHO, which he also served as president (1946-1947). [“Capt. Whitehurst, City Director of Highways for 18 Years, Dies,” *The Evening Star*, September 1, 1948; “Death Halts Distinguished Engineering Career of Capt. Herbert C. Whitehurst, ARBA Treasurer,” *Road Builders’ News*, American Road Builders’ Association, October 1948, page 4]

On September 9, the District commissioners decided to rename the K Street Skyway after the late director: “Whitehurst Freeway.” Engineer Commissioner Young recommended the change. Captain Whitehurst, Young explained, had been more responsible than any one for the city’s “magnificent” system of roads and bridges. “I recommend that the K street structure be named the Whitehurst Freeway, or possibly Skyway or Viaduct. Thus his name will be permanently associated with a structure which is unique in Washington.”

The day before, the commissioners had appointed Robertson, the former engineer of streets, to succeed Whitehurst as Director of Highways.

The *Star* agreed with naming the elevated freeway after the late director:

It was peculiarly the product of Captain Whitehurst’s own thinking in terms of providing in advance the sort of facilities that automobile traffic of the future will make inevitable. Washington owes him much for his courage, his vision and his ability to overcome the resistance of apathy by persuasive assembly of fact. Someday, the “Whitehurst Freeway” will run the course of K street across Washington, dipping below grade or rising above it, to accommodate the sort of unimpeded traffic flow that the future will demand.

The editorial also agreed with the appointment of Robertson, noting that Captain Whitehurst “would have indorsed [him] without reservation.” [“K Street Highway Will Be Named For Whitehurst,” *The Evening Star*, September 9, 1948; “The ‘Whitehurst Freeway,’” *The Evening Star*, September 10, 1948]

As completion of the Whitehurst Freeway neared in October 1949, the District was determining the next big project based on traffic counts in the area and in Maryland and Virginia that planning engineer Brinkley was compiling. As the *Star* pointed out on the eve of completion:

But compiling this report is a vast job and Mr. Brinkley does not expect it to be completed until a year from Christmas. But Mr. Brinkley expects the Arizona avenue Freeway [sic], the next logical step, will be a reality in the near future. This will run through the Glover-Archbold Parkway [sic], through Foundry Branch valley to Tenley Circle, linking up with the Whitehurst Freeway by way of Canal road. [Millen, William

A., “Whitehurst’s ‘Dream’ Freeway Will Be Dedicated Saturday,” *The Evening Star*, October 2, 1949]

The Whitehurst Freeway, the District’s first freeway, opened on October 9 with a ceremony at 27<sup>th</sup> and K Streets, NW. After speeches by officials, Captain Whitehurst’s 4-year old granddaughter Maria Whitehurst Brownnett snipped the red ribbon:

Hazel-eyed Maria, with white ribbons in her blonde hair, stood beside her grandmother, Mrs. Whitehurst, and Commissioner John Russell Young when she cut the ribbon. The big pair of shears was hard to manage but, with determination, she succeeded. The crowd applauded . . . .

After these ceremonies, the principals and guests drove over the freeway and the Key Bridge to Rosslyn at the Virginia end of the bridge. [“Whitehurst Freeway Is Opened to Traffic After Ceremonies,” *The Evening Star*, October 9, 1949]

Whitehurst Freeway carried U.S. 29 through Georgetown; U.S. 29 crossed the Potomac River on Key Bridge.

Generations of planners, Georgetown residents, and writers have loathed the Whitehurst Freeway and, as will be seen, wanted to tear it down – that dislike continues to this day. Nevertheless, it stands, still carrying U.S. 29 across Georgetown. However, it had an unexpected consequence on Georgetown, continuing a trend that had begun in the 1930s, as Gutheim and Lee explained:

Construction in 1949 of the elevated Whitehurst Freeway siphoned traffic off Georgetown’s congested narrow cross streets.

The realization of a new Georgetown, a maturing Georgetown as a distinctive community, had produced a strong concerted voice among residents and supporters against allowing the area north of M Street to be altered at will. Responding to these interests, Congress in 1950 declared all of Georgetown a historic district and placed the design of all future construction under the judgment of the Commission of Fine Arts. [Gutheim and Lee, page 252. Congressional action was in the Old Georgetown Building Height and Exterior Design Regulations Act of 1950 (P.L. 81-808); Secretary of the Interior Stewart L. Udall declared the Georgetown Historic District to be eligible for the National Register of Historic Places as a National Historic Landmark in May 1967.]

As another history put it:

One of the area’s few traditionally integrated neighborhoods, Georgetown, became increasingly wealthy and increasingly white. Following the diversion of most through traffic from Georgetown streets, accomplished by completion of the Whitehurst Freeway in 1949, Congress declared the area a historic district. The Commission of Fine Arts had to approve all physical alterations and new construction in Georgetown. As the neighborhood increased in desirability, housing prices rose, and multi-unit dwellings shifted back to single-family occupancy. In the process, Georgetown’s African American

population fell, from almost a quarter in 1940 to 3 percent in 1960. [Miller and Gillette, pages 222-223]

### **The Glover-Archbold Parkway**

In January 1952, the District unveiled its 10-year, \$140 million highway program. It set four goals:

1. Divert all possible “by-passable” traffic from the downtown area.
2. Create greater street capacity in the downtown area.
3. Improve the present main arteries leading to the District’s boundaries.
4. Develop a cross-town route linking the northwest and northeast sections.

The Regional Highway Planning Committee, including Maryland and Virginia representatives, had helped prepare the plan. Among the immediate needs addressing the first two goals was:

**Canal Road N.W.—Foxhall road to Thirty-sixth street; Arizona freeway, Rock Creek Parkway, Southwest freeway and Potomac River bridge (vicinity of E street)**—Preliminary studies and detail plans for roadways and structures. Cost \$800,000.

A later entry involved construction:

**Arizona avenue. Van Ness street to Canal road**—Construct parkway, two 24-foot roadways with grade separations and interchanges at Reservoir road, New Mexico avenue, Cathedral avenue and Massachusetts avenue, and with connections over street system to Wisconsin and Nebraska avenue.

The estimated cost was \$3.6 million.

Future needs included improvement to Rock Creek and Potomac Parkway and its extension to the District/Maryland line. [Stepp, John W., “Experts Representing Metropolitan Area Draft 10-Year Project,” *The Evening Star*, January 31, 1952; “\$140 Million Road Plan Urged For District; 1-Cent Gas Tax Boost Proposed for Financing,” *The Evening Star*, January 31, 1952]

The National Capital Parks and Planning Commission quickly joined with NPS officials in objecting to plans for construction in parks. They had not been part of the Regional Highway Planning Committee that identified projects such as extending Rock Creek and Potomac Parkway to the Maryland line. As discussed earlier, they also objected to the plan for the E Street Bridge spanning Roosevelt Island. They showed “forbearance” regarding “that portion of the Southwest Freeway project providing an extension from the Fourteenth street overpass encroaching on the Thomas Jefferson Memorial area and slicing through the tourist camps, tennis courts and East Potomac Park to span the Washington Channel.” [Shepard, Nelson M., “Federal Agency Fears Injury To Parkland in Highway Plan,” *The Evening Star*, February 1, 1952]

On February 15, as part of a 1952 series on “Highways of the Future,” the *Star*’s James G. Deane described how the plan for what was still called the Arizona Avenue Parkway fit into plans for

accommodating traffic in the northwest quadrant via Canal Road. “An elevated highway and a brand-new parkway may be in the Northwest’s future.” After summarizing the long history of the parkway, he explained the two-pronged plan:

The elevated would be a westward expansion of the Whitehurst freeway. The new parkway, through Glover-Archbold Park, would link the freeway—and Key Bridge—with the upper Northwest . . . .

Canal road will be widened from Key Bridge to Foxhall road. It will continue to take traffic to and from M Street.

At its west end, the elevated will have three lanes. Midway, one of them will cut across over the canal to carry eastbound cars to M [street]. The other two lanes will connect with the freeway.

Westbound through-traffic will use M street. Eastbound will use the elevated. The structure would be unusual—single-stem piers, supporting the roadway in cantilever fashion. This would leave the canal and its tow-path undisturbed.

Eventually, Canal road will be improved onward up the Potomac, becoming the George Washington Memorial Parkway at Great Falls. It will connect with the new National Pike (Route 240) from Frederick.

Ramps will cross from the elevated to the Arizona parkway. Foxhall road also will connect. [Deane, James G. “Proposed Elevated Highway Along Canal Road Would Link Key Bridge With New Parkway,” *Highways of the Future*, *The Evening Star*, February 15, 1952; the *Highways of the Future* series included 25 installments, running from February 1, 1952, to March 10, 1952]

In the final installment of the series, Deane discussed concerns by park authorities about the E Street Bridge, extension of Rock Creek and Potomac Parkway to Maryland, and the Arizona Avenue Freeway. He explained that the District had owned the right-of-way for a road through Archbold-Glover Park since 1893, that Mrs. Archbold opposed any road, and that Charles C. Glover, Jr., “also once protested a speedway but favors a less elaborate road”:

The planners insist on the road, despite the loss of park value to residents of the area. The main question, assuming the road goes through, is one of ethics: The plan is to call it Arizona parkway, but courtesy to the donors would seem to dictate retaining the present park name, Glover-Archbold, for the road.

District officials, however, were concerned about satisfying the Arizona congressional delegation.

Another concern was that if the parkway were not built, “Foxhall road probably would have to be widened. Foxhall residents don’t want that.” [Deane, James G., “Financing to Be Key problem In \$140 Million Road Program,” *Highways of the Future*, *The Evening Star*, March 10, 1952]

As Deane's series made clear, the road through Glover-Archbold Park was not desired for itself but as a connection in a series of roads linking the Washington National Pike with downtown Washington. On October 27, NCPC approved nearly 74 percent of the District's highway plans, including construction of a dual parkway through Glover-Archbold Park connecting Canal Road with Wisconsin and Nebraska Avenues. [Stepp, John W., "Engineer Group Indorses City's Highway Plans," *The Evening Star*, October 27, 1952]

In January 1953, the *Star* reported that a subcommittee of the Committee of 100 on the Federal City had prepared a "blistering criticism of the District's proposed highway improvement program." The subcommittee members were General Grant, president of the American Planning and Civic Association; John Ihlder, former executive secretary of the National Capital Housing Authority; architect Horace Peaslee; and Tracy B. Augur, a GSA urban planning officer.

Their "scathing, 21-page report" denounced District highway officials for trying to solve immediate problems based on present-day "traffic considerations." Highway planning, the report stated, should begin "with a concept of what the District will be like one, two or three decades hence." They urged the Committee of 100 to reject the overall plan and to endorse individual projects only if they were part of a satisfactory long-range program or were needed because of an emergency. The E Street Bridge was an example of a project that would not be approved in view of its impacts on Roosevelt Island and the Lincoln Memorial grounds

In the long range, the subcommittee expected Federal employment in the city to drop, with employment centers being built "20 to 40 miles, or even farther, from the city." As a result, "the District's primary highway improvement need for the future is a network of . . . expressways, extending radially from points as close to the center as possible outward for distances up to 40 or 50 miles." The report cited such radials as the Baltimore-Washington Parkway, the Annapolis Freeway, Suitland Parkway, Shirley Highway, the Washington National Pike, and a route on the Virginia side of the Potomac River. The radial roads would be linked by "ring roads" that would also serve as bypasses for traffic not bound for the city. The members agreed "in principle" with the inner-belt concept, but did not think the city had proposed a satisfactory plan.

The subcommittee favored converting North Capitol Street as a thoroughfare to carry the Washington National Pike instead of routing it through Rock Creek Park. The use of Rock Creek Park as the District link was, the report said, inferior to a freeway along the Maryland-District side of the Potomac River. A dual, six-lane freeway should run along Canal Road from Foxhall Road to the District Line. Among the advantages cited was that the plan could omit the road through Glover-Archbold Park at a saving of \$3.6 million. ["Federal City Group Blasts Highway Plan," *The Evening Star*, January 30, 1953]

In an editorial on February 2, the *Star* acknowledged "the conflicting views between park conservationists and highway builders over plans for traffic relief." The "steady encroachment" on parks by highways "has been resented, and understandably so" by park advocates. Thus, the subcommittee's "extremely dim view of the Highway Department's construction program for the immediate and near-future traffic needs" was not surprising. "Unfortunately, highway improvements cannot be avoided or left to future generations." The subcommittee "opposed in principle" the continuation of the Washington National Pike through Rock Creek Park and

construction of a parkway through Glover-Archbold Park, while also opposing the E Street bridge designed to relieve traffic in the 14<sup>th</sup> Street corridor.

The District would like to adopt the long view the subcommittee recommended “but it is limited by appropriations and legislative restrictions.” With the funds available each year, it must do the best it can to “design the piecemeal projects so that they will fit into a long-range highway program.” In doing so, “some park properties will be invaded, from time to time.” Unless park advocates can “offer some more reasonable alternatives,” the pressure to use parkland will continue. “The problem of reconciling the divergent schools of thought is a difficult one, calling for dispassionate conferences and study by all concerned.” [“Highways vs. Parks,” *The Evening Star*, February 2, 1953]

The Committee of 100 on the Federal City approved the part of the subcommittee’s report criticizing the District for planning short-range, stop-gap proposals rather than developing a long-range, primary need program. However, the committee rejected the project-specific portions of the report and asked the subcommittee to try to reconcile its differences with District highway officials and redraft it to be more in line with the approved general principles.

Blair Lee III, NCPC’s executive officer, said he agreed with the general criticisms, but in discussing specific projects, the subcommittee “suffers to a slight extent from schizophrenia.” Beveridge explained:

Mr. Lee said the report, with its emphasis on radial highways, should recognize a need for a new “central area” Potomac River bridge to connect with Virginia’s Arlington boulevard. If not at E Street, he said, such a bridge should be elsewhere to serve Washington’s downtown area.

Mr. Lee also attacked as too expensive a subcommittee proposal that North Capitol street rather than Rock Creek park, might be developed as a new northbound thoroughfare. “The report, to be consistent with itself, should say Rock Creek Parkway might be needed if alternatives are found impracticable,” he declared.

Mr. Lee pointed out that the subcommittee based its objections to the park proposal on traffic considerations, not on an encroachment of park land. The discussion that followed, however, brought out strong objections to the basic idea of yielding park lands to highway uses.

General Grant pointed out that the Committee of 100 was a member of a national group opposing the use of parks for highways. “Don’t let us be the people to say the use of Rock Creek Park is to be given over to be made into a highway,” he said.

Lee did not think a 200-foot wide parkway through the northwestern part of the park would destroy the recreation and beauty of the area.

Citing the *Star*’s February 2 editorial, John Remon said, “I don’t want to see parks destroyed. But I think we must give way at times. The greatest enjoyment I get out of Rock Creek Park is

taking a drive through the park from my house to the Interior Building.” [Beveridge, George, “Critical Report on Roads Plan Backed in Part,” *The Evening Star*, February 4, 1953]

The reason the road through Glover-Archbold Park was needed varied as officials debated the central area bridge and the entrance for U.S. 240’s two legs. For example, the District was considering options for increasing the capacity of Key Bridge. Double-decking the bridge had been rejected as too expensive, but by May 1953, the city was considering whether the sidewalks could be converted to traffic lanes, with new sidewalks built on cantilever structures off the bridge. In addition, the city was considering a two-lane ramp, carrying two-way traffic, from the center of the bridge about 300 feet from M Street to Prospect Street in line with 35<sup>th</sup> Street. The ramp, in theory, would divert traffic that presently turned left from the bridge onto M Street.

Already on the drawing board were improvements on both ends of the bridge, including the M-Street-Whitehurst Freeway connections. The plans included an elevated roadway for eastbound traffic on the west side of Key Bridge. Traffic would connect with ramps to Canal Road, Foxhall Road, and the proposed Arizona Parkway. [Beveridge, George, “M St. Overpass At Key Bridge Under Study,” *The Evening Star*, May 14, 1953]

Publication of an article about the concepts in the *Star* prompted immediate opposition in Georgetown. The ramp over M Street would carry unwanted traffic into the community, and possibly reduce property values, prompting concerns by the Georgetown Citizens’ Association, whose president, Frederick S. Hill, said “We have always believed we should try to keep through traffic out of Georgetown’s residential areas.” Stephen P. Dorsey of the Progressive Citizens of Georgetown said the group would always oppose solutions to traffic problems that unnecessarily drew additional traffic into the area. [“M Street Ramp Arouses Fears In Georgetown,” *The Evening Star*, May 15, 1953]

On May 25, attorneys Hugh Obear and Grant Wiprud appeared before the Committee of 100 on the Federal City representing Mrs. Archbold. They made clear that she intended to fight attempts to build a road through the land she and Charles Glover had donated. A letter from Mrs. Archbold to the group said they donated the land for park purposes and “for no other.” She did not object to the type of meandering road that exists through Rock Creek Park, but an express highway would be a breach of faith.

John Nolen discussed the history of the proposal, pointing out that the District and NPS had signed an agreement in 1948 following congressional consideration of a bill authorizing the road to be named after Arizona. The situation was complicated by District consideration of a bridge across the Potomac River that would tie into the road through the park.

Mrs. Archbold and Charles Glover, Jr., had opposed the plan at the time, and she intended to resume efforts to block the plan. If the city persisted, she would seek “the aid of the courts in restoring the property to its proper use,” as her letter to the Committee of 100 stated.

After discussing the controversy, the Committee of 100 adopted a resolution condemning the plan. The resolution suggested the alternative of widening Foxhall Road. [“Land Donor Fighting Plan for Expressway In Northwest D.C.,” *The Evening Star*, May 26, 1953]

In September, the District commissioners announced they would hold a public hearing on October 26 to consider street name changes, including redesignation of the proposed Arizona Avenue to Glover-Archbold Parkway. To return the State name on the map, Dalecarlia Parkway between Loughboro Road and Westmoreland Circle would be renamed Arizona Avenue. ["Street Names To Be Considered At Hearing October 26," *The Evening Star*, September 17, 1953]

The District commissioners heard from individuals on October 26 who favored changing the name of the Arizona Avenue Freeway to the Glover-Archbold Parkway. Representatives of Glover and Mrs. Archbold testified in support of the change, as did the Palisades Citizens' Association, the Progressive Citizens' Association, and others. The Arizona congressional delegation indicated it supported the changes. The Palisades representative, however, favored renaming Wheeler Street and Wheeler Place as Arizona Avenue and retaining Dalecarlia Parkway. The association thought that having a Wheeler Street and Place so close together was confusing while Dalecarlia Parkway was aptly named because it was near the Dalecarlia Reservoir.

On November 4, the commissioners approved the name Glover-Archbold Parkway for Arizona Avenue, NW., between Canal Road and Van Ness Street. They deferred action on the contested name change for Dalecarlia Parkway. ["District Heads Weigh Proposals to Change Names of 2 Avenues," *The Evening Star*, October 26, 1953; "Commissioners Rename Part of Arizona Avenue," *The Evening Star*, November 4, 1953]

The commissioners approved changing Weaver Street to Arizona Avenue on January 12, 1954, only after receiving assurances from the Arizona congressional delegation that the change was acceptable. Senators Hayden and Barry M. Goldwater and Representatives John J. Rhodes and Harold A. Patten had let the commissioners know of the delegation's support. The change became effective on February 15. ["Change of Weaver Street Name Gets Support," *The Evening Star*, January 11, 1954; "Weaver Street Changes To Arizona Ave. OK'd," *The Evening Star*, January 12, 1954]

Despite the accord on the name changes in the Palisades area, the Glover-Archbold Parkway remained controversial. As debate continued regarding connection of the Washington National Pike with downtown, the Glover-Archbold Parkway remained on maps as one way of routing traffic without having to acquire homes. City highway officials continued to promote it, but until other disputes were resolved, it remained in the background.

## **Congress Takes Up the Parkway**

In September 1958, the District's \$54 million highway plan included the Potomac River Freeway, the Washington Circle underpass, the K Street Expressway, and, as the *Star* described it, "another long-delayed project, the disputed Glover-Archbold Parkway to link the new river freeway and Upper Wisconsin avenue:

The new Potomac Freeway will follow the course of the present Canal road along the waterfront of Georgetown. It is planned to connect with the west leg of the inner-loop expressway, also to be started next year, at about Twenty-seventh street N.W. At the other end it will join the new Glover-Archbold parkway, which will run through a wooded park starting at Canal road just east of Foxhall road and running northward toward Wisconsin avenue.

The NPS was expected to extend the George Washington Memorial Parkway to the District line to meet the Potomac River Freeway.

The Glover-Archbold Parkway was to consist of "two park-type, two-lane, non truck roadways from 3 miles northward [from] the new river freeway to Tenley circle on Wisconsin avenue." At a cost of nearly \$5 million, the District expected to complete the project in 1963. [Deane,

James G., "\$54 Million Road Plans Pressed by District," *The Evening Star*, September 24, 1958]

By March 1959, the District had completed tentative plans for the parkway through the 2½-mile long park. The dual, four-lane parkway would consist of two 26-foot roadways along the center of the park, with access roads at some cross streets. The facility was designed for a speed of 50 m.p.h. Plans called for relocating much of Foundry Branch, a "meandering brook," in the *Star's* words, with the two roadways on either side of the stream. The plans were firm as far north as Upton Street, with the city's plans beyond that point uncertain. Connections might be with a tunnel under Tenley Circle or the tentative freeway in the Wisconsin Avenue corridor. Regardless of the ultimate northern connection, the District expected motorists to be using the Glover-Archbold Parkway by late 1963. [Deane, James G., "Glover-Archbold Park To Get 4-Lane Road," *The Evening Star*, March 1, 1959]

According to a *Star* summary of planned major highway projects published at the end of the month, the District planned to begin construction of the Glover-Archbold Parkway in the summer. A map showed the parkway as a dashed line, used to show "highways under construction or planned." It connected with the Wisconsin Avenue Freeway, shown as a dotted line ("proposed highways") carrying the southeast leg of U.S. 240 into the District (to be discussed). [Alibrando, Alfred, "Safer and Faster Travel Promised By 1962 on New Area Highways," *The Evening Star*, March 29, 1959]

National Capital Park's Thompson said in June that he wanted to thoroughly study legal issues associated with construction of the Glover-Archbold Parkway before giving final approval to the District's detailed plans. The study was underway, he said, because "we don't want to run the risk of being enjoined by the donors" of the parkland.

Thompson's announcement infuriated Senator Butler, whose Maryland constituents would benefit from the District parkway with its indirect links to U.S. 240. The legal study was, he said, the NPS's "usual collection of monkey wrenches, legal, political and otherwise, in an effort to stop construction of the parkway." He added that Congress had approved the project, an approval that constituted a "mandate":

The hearings are over, the Congress has made its decision and the District is expediting plans for the parkway. We will not have construction delayed for years while the Park Service rehashes old questions in a lengthy but ultimately futile attempt to deprive this area of the much-needed traffic artery.

He said the "obstinate and irresponsible delaying tactics of the Park Service have got to stop."

Harold L. Aitken, who had been become District Director of Highways and Traffic on March 2, 1959, agreed with Senator Butler. Parkway plans had been modified once to meet NPS objections. The revised plan had been submitted to the NPS 4 months earlier. "It's been over there long enough." ["Maryland Planners Ask For Rock Creek Route" and "Park Service Blasted Over Glover-Archbold," *The Evening Star*, June 11, 1959]

In referring to a congressional "mandate," Senator Butler was referring to the fact that Congress was working on the D.C. Appropriations Act, 1960, with a provision that provided \$880,000 for preliminary work on Glover-Archbold Parkway. The legislation was still under consideration, with Glover-Archbold Parkway one of the stumbling blocks to passage.

As usual with appropriation acts, the House took the initiative. The Committee on Appropriations released a report on the FY 1960 appropriations act on March 13, 1959. From the District's highway funds, the committee set aside \$880,000 for the Glover-Archbold Parkway. The House approved the bill on March 16 without discussion of the parkway during floor debate. [District of Columbia Appropriation Bill, 1960, *Congressional Record-House*, March 16, 1959, pages 4279-4288]

In early May 1959, a new proposal emerged for handling traffic between Maryland and downtown Washington. On May 6, a steering committee for the Mass Transportation Survey approved a six-lane expressway, proposed by Bartholomew, from Tenley Circle at Wisconsin and Nebraska Avenues, NW., along Upton and Tilden Streets, and across Rock Creek Park on a high-level bridge across a section known as the Melvin C. Hazen Park. East of the park, the expressway would continue toward 15<sup>th</sup> Street, then turn south between 14<sup>th</sup> and 16<sup>th</sup> Street to connect with the Inner Loop at T Street. The expressway would carry all traffic, including trucks.

The concept appeared to revive the idea of an expressway in the Wisconsin Avenue corridor to connect with the Washington National Pike, a plan the District had rejected just a week earlier (to be discussed later) in favor of the North Capitol Street corridor. General Welling opposed the Bartholomew plan because he did not think the need for an expressway between Tenley Circle and the Inner Loop had been proven.

District Commissioner McLaughlin, who headed the steering committee, emphasized that the new expressway would not eliminate the need for the Glover-Archbold Parkway. The parkway would connect expressway traffic at Tenley Circle with the routes along the Potomac River.

Federal Highway Administrator Tallamy said that based on information he had seen, the new expressway would qualify for inclusion in the Interstate System with its 90-10 Federal-District matching ratio. The NPS liked the idea of an east-west high bridge across Rock Creek Park because it would end discussion of the north-south route through the length of the park to link the Washington National Pike with downtown. [Deane, James G., "Cross-Park Freeway Project Wins Support," *The Evening Star*, May 7, 1959]

The Senate Committee on Appropriations completed work on its version of the appropriations act on May 21. In discussing the appropriation for the Department of Highways, the committee referred to the \$880,000 for the Glover-Archbold Parkway. Following House approval, the Senate committee had "received an extraordinary amount of oral testimony and also communications protesting the building of this road." Recognizing that these comments reflected the "public spirit of the citizens," the committee asked the Engineer Commissioner about the possibility of an alternate site for the road.

General Welling replied to committee staff on May 15 that, "The parkway is an indispensable feature of our traffic pattern." The 1949 agreement with the National Park Service stated that the parkway was considered essential for vehicular access to the park for the greatest number of people. However, General Welling stated, "There is no sensible alternate solution for handling the traffic." If construction were delayed, traffic would "continue to pile up and defer the reasonable use of the park as a recreation area and as a traffic facility."

The committee report indicated that deciding whether to include this funding item in the appropriations act was "particularly difficult in view of the deep interest of the citizens" in preserving the park. However, the committee left the funding in the bill in recognition of the Department of Highways' careful work, which made "it clear that no solution other than Glover-Archbold Parkway is feasible." [District of Columbia Appropriation Bill, 1960, Committee on Appropriations, United States Senate, 86<sup>th</sup> Congress, 1<sup>st</sup> Session, Report No. 304, page 6]

Opponents such as Wirth of the NPS thought the committee must be misinformed. He said the parkway would "destroy the value of the Park." Further, he was "dumbfounded" by General Welling's statement, quoted in the committee's report, that the parkway was "essential" to recreational use of the park. "I think any kind of road down there is about impossible if you're going to preserve any kind of park."

Mrs. Archbold's attorney hinted at possible legal action to stop construction. Such a parkway would, Hugh H. Obear said, be a "breach of trust." If the government persisted, he would demand return of the land to the donors and sale back to the city at fair market value.

Opponents added that the committee had not considered the new Bartholomew alternative for linking Wisconsin Avenue traffic with downtown Washington via a high-level Rock Creek Park bridge. It was only 2 weeks old, but offered the solution for getting traffic to the Inner Loop without the Glover-Archbold Parkway. [Deane, James G., "Senate Unit Okays Park Freeway Fund," *The Evening Star*, May 22, 1959]

The Senate considered the bill on May 26, with Senator John O. Pastore (D-RI) taking the lead. He summarized the bill's key provisions affecting all aspects of public services in the District, then paused for comments by other Senators. Senator Paul H. Douglas (D-Il.) asked about the plan for a parkway through Glover-Archbold Park. The Senator, who lived near the park at 3812 Fulton Street, NW., called it "one of the most beautiful parks in Washington," but said that if the parkway were built, it would "in my judgment, be spoiled." He pointed out that although the bill contained only \$880,000 for preliminary engineering, the parkway would actually cost as much as \$5 million, and even \$15 million counting the interchanges at either end.

Senator Wayne L. Morse (R-Or.), who agreed with the concerns Senator Douglas expressed, introduced General Welling's May 18 letter for the record. In it, General Welling summarized the history of the project, beginning:

Since 1893, the District of Columbia has owned a right-of-way 100 feet wide through Foundry Branch Valley which includes the area now designated Glover-Archbold Park. The right-of-way is for an all-purpose major highway, including trucks.

Beginning with the donation of property for Glover-Archbold Park in 1920s and the park's expansion through 1943, the 100-foot right-of-way was now surrounded by parkland, but was still owned by the District:

In the opinion of the corporation counsel, the terms of the donation permit the construction thereon of the proposed parkway, for passenger vehicles only, but do preclude the construction thereon of an all purpose highway such as is permissible on the 100-foot right-of-way (the Government-purchased portion of the park land is similarly available for parkway purposes).

In 1948 the District entered into a formal written agreement with the National Park Service for the construction of a four-lane parkway in Glover-Archbold Park subject to the following provisions . . . .

The provisions indicated the parkway would follow the natural contour of the park; be restricted to passenger vehicles; and use a combination of the District right-of-way and park land. The District also agreed to make available for park purposes any portion of the 100-foot right-of-way not used for the parkway.

As noted, General Welling's letter explained that the proposed parkway was a key part of the planned highway network for the area, and its importance was increased by controversies elsewhere:

The possibility of abandoning the Wisconsin Avenue project in favor of the North Capitol Street project makes the Glover-Archbold Parkway facility all the more indispensable for the portion of the city west of Rock Creek park. Furthermore, the parkway is vital to development of the park so as to permit the greatest use, greatest beauty and greatest convenience to the public of Foundry Branch Valley.

Regarding the existing park, a factual memorandum, also printed in the record, stated:

At present park has minor amount of useful, accessible recreation areas and is largely composed of unkempt woodland which is difficult to traverse. Debris clutters some of the area and a sewer line lies on the ground for much of its length.

The District, NCPC, and the consultants on the Mass Transportation Survey agreed that the parkway was "essential for passenger vehicles regardless of the decision concerning any proposed routes in or into Maryland." At NCPC's suggestion, the survey included a link between Tenley Circle and the Inner Loop. "The proposal, intended for interstate traffic, including trucks, was clearly in addition to the need for the four-lane Glover-Archbold Parkway for passenger vehicles."

Senator Douglas, referring to General Welling's comments about the indispensable need for the parkway, warned:

Furthermore, all of us know that engineers love to build highways, and do not have much regard for scenery, trees, or natural beauty. An engineer with a bulldozer tends to be a very ruthless person.

On the day of the debate, McLaughlin, president of the District's Board of Commissioners, wrote to Senator Pastore, who introduced the letter for the record. The Mass Transportation Survey, he said, would urge accelerated highway and parkway construction in the region, with the Glover-Archbold Parkway an "essential item" in the plan. For Congress to defer any item in the survey would "not be in the best interests of the region":

To put it another way, to delete funds from the District's fiscal year 1960 budget for Glover-Archbold Parkway is as unjustified as it would be to delete funds therefrom for the Inner Loop, the Anacostia Freeway, the Potomac River Freeway, and the Southwest Freeway, all of which appear in the final report of the Mass Transportation Survey.

The board, he said, urged the Senate to appropriate the funds for the parkway.

Because of the lengthy debate on the parkway and another issue involving school lunches, the Senate could not complete work on the bill on May 26. [District of Columbia Appropriation Act, 1960, *Congressional Record-Senate*, May 26, 1959, pages 9089-9095]

The Senate returned to the debate on May 28, with Senator Douglas introducing an amendment to strike out the appropriation for the parkway. The current bill asked for only \$880,000, he said, but soon the Senate would be asked for \$5 million for the parkway and that would “probably carry in its wake a later request for \$10 million for interchange connections farther up the line.” He admitted it was “somewhat ridiculous for the United States Senate to be considering a matter of municipal government,” but since home rule in the District of Columbia could not be approved, “we have to act as a board of aldermen for the city.” In view of the controversy and the likelihood of devastation to the park, “the simplest thing we can do is eliminate the appropriation for \$880,000,” at least while other studies are underway.

Senator Morse agreed. “I think the best interests of all interested parties would be served if we postponed this matter for decision for another year.”

Senator O’Mahoney, arguing a procedural point about authorizing in an appropriation act, asked if the appropriation was needed because of an emergency. Senator Pastore replied:

The Senator raises the question as to whether there is an emergency. As a matter of fact, there is hardly an emergency need for any road at any time.

The question is, “When are we to begin it?” The argument is made, “It is all right to build this highway, but let us not begin it this year. It may be all right for next year.”

Senator O’Mahoney protested that he was not making that argument, but Senator Pastore continued:

The argument has been made that the amendment applies only to a postponement. Why postpone? If we are to make the argument that we should never, never, never encroach upon the rustic natural aspects of this particular park, that is one argument. But if the argument is that we must not do it in 1959 but it is all right for 1960, I think the argument which is being made defeats itself.

With other business to consider, some Senators were impatient about the lengthy debate about District matters, but with some interruptions, the debate continued.

When Senator O’Mahoney explained that his only point was that he did not want a highway built through the park, Senator Pastore pointed out:

The question has to be weighed against whether it is desired to facilitate traffic moving into the District. If the Senator wants everybody to walk, and to walk through a park, that is the answer.

Senator Douglas suggested that “better alternative routes” for the needed highway were available that would “not damage the parks and community institutions threatened by the Glover-Archbold Parkway . . . .” He added, as he had earlier, “When a highway engineer makes his plans, he tends to destroy beauty.”

Senator Pastore pointed out that it was “a relative matter,” adding that he did not believe the District commissioners “have any innate desire to rape the beauty of a natural park.” When Senator Douglas pointed out that, “That is what they will do,” Senator Pastore replied:

They have esthetic qualities as the rest of us do. But a time comes when people must either walk or ride, or else not go to work. Either they will have to listen to the birds, or else ring the timeclock and go to work. That is the question. If the Senator from Illinois wants the park kept for the birds, that is his privilege. [Laughter.]

Senator Douglas replied, “I want the parks kept for the people. The autos going to work can take other routes.” The parkway was “only a part of a unified plan” for traffic from the west. The plan included the Bartholomew proposal of an expressway crossing Hazen Park for a link to downtown:

The point is that these highways are not primarily designed for local traffic. They are designed for interstate traffic—to take traffic from Highway 240, the continental highway [sic]; and we are now being asked to approve a little spur here. But if we approve it, that approval may very possibly carry with it approval for bringing the interstate traffic down Wisconsin Avenue, and splitting it there at Tenley Circle, with passenger car traffic destroying the Glover-Archbold Park, and with truck routes across eastward, virtually destroying the usefulness of St. Ann’s School and Church, Immaculate School, Sidwell Friends School, the Hearst School, and destroying Hazen Park, and impairing Rock Creek Park, with all the damage which would be done on the east side of the park and to the zoo.

With the protracted debate finally winding down, Senator Morse suggested that District officials had “plenty to do during the next year” with all the appropriations in the bill. In view of the many objections to the parkway, he thought “that no great harm will result from a year’s postponement, for the consideration of this particular matter.” The delay would allow Congress to consider citizen complaints.

Senator Dennis Chavez (D-NM), chairman of the Committee on Public Works, responded to the idea that consideration of the concerns and complaints of the citizen would result in a solution:

It never will be possible—whether under home rule or under congressional responsibility for the District of Columbia—to get the citizens of the District of Columbia to agree on anything. When someone from the northeast section of the city makes a proposal, an objection will come from a parent-teachers group in the northwest section. I know about that situation; I have served on the District of Columbia Appropriations Subcommittee.

Three or four years ago, we appropriated for, and authorized, the construction of [the Constitution Avenue] bridge; but the bridge has not been built, because it is impossible to get the people of the District of Columbia to agree on where the bridge should be built.

I have seen these proposals come and go. It is necessary to have the engineers report on them, and someone must make the determination.

I wish the District of Columbia could make its own determinations. But so long as Congress has this responsibility, I think it is our duty to try to provide a road which is needed for the traffic.

Finally, after more wrangling, the Senate defeated the Douglas amendment, 23-47. With little further debate, the Senate approved the appropriations act, 68-0, with Senators Douglas and Morse voting for the bill. [District of Columbia Appropriations Act, 1960, *Congressional Record-Senate*, May 28, 1959, pages 9267-9287]

The approved bill would now go to conference with the House to reconcile differences between the two versions.

In describing passage of the bill after “a full day,” the *Star* referred to the “deceivingly unanimous vote,” which was expected to have taken place around noon. The final vote took place at 4:45 p.m., largely because of debate about the school lunch program and the Glover-Archbold Parkway. [Bassett, Grace, “Senate Passes D.C. Budget In Day’s Fight,” *The Evening Star*, May 29, 1959]

Conferrees completed work on July 8. The appropriation for preliminary engineering on the Glover-Archbold Parkway had been in the House and Senate bills and was, therefore, not a subject for reconciliation during the conference.

On July 14, the House and Senate approved the District of Columbia Appropriation Act, 1960. The House did so without debate or a recorded vote. The Senate also approved the bill without a recorded vote following brief discussion that included only a confirmation that the Glover-Archbold Parkway funding was included. [District of Columbia Appropriations, 1960—Conference Report, *Congressional Record-Senate*, July 14, 1959, pages 13316-13318; District of Columbia Appropriation Bill, 1960, *Congressional Record-House*, July 14, 1959, pages 13352-13354]

On July 11, 1959, President Eisenhower had sent NCPC’s Mass Transportation Survey to Congress. As discussed elsewhere, the report called for four high-speed subway and surface rail transit lines, 330 miles of freeway throughout the Washington area, and express bus lines using eight of the freeways to link suburbs and downtown.

De Leuw, Cather and Company had provided the recommendations for the adopted report with one exception:

The exception is the addition of the so-called “Wisconsin avenue corridor” freeway from Tenley circle to the inner loop in downtown Washington.

The highly controversial route was added by the study steering committee as a policy decision, although it was not recommended as necessary by DeLeuw, Cather & Co., which . . . said that a Wisconsin avenue freeway should be built between Pooks Hill and Tenley Circle, but that the Glover-Archbold parkway, the intermediate loop freeway and other routes would be capable of handling traffic from that point without a further freeway link to the downtown sector. In fact, the report showed with traffic figures how a

large amount of traffic could be routed from the Wheaton area to Wisconsin avenue because basic traffic in the Wisconsin corridor was not excessive.

Although the District commissioners were split on the Wisconsin Avenue corridor, the corridor remained in the report. Area officials were split on the issue, but:

District Engineer Commissioner A. C. Welling and Washington resident John A. Remon [of NCPC] filed identical comments saying that a “balanced system” was proposed by De Leuw-Cather and that the additional freeway was “not justified.”

District officials would have to work with BPR to restudy the city’s Federal-aid highway system, including Interstate designations, as a result of the study. [Beveridge, George, “Subway and Road Needs for 1980 Outlined in Survey,” *The Evening Star*, July 12, 1959; along with several linked articles]

President Eisenhower signed the District of Columbia Appropriation Act, 1960, on July 23, 1959 (P.L. 86-104). Mrs. Archbold’s attorney quickly filed suit in District Court seeking to prohibit construction of the Glover-Archbold Parkway. The District Highway Department, NCPC, and NPS had violated terms of the donation of the land by “threatening to use [it] for a major speed highway of from four to nine lanes . . . .” Obear asked for a temporary and permanent injunction, contending that the parkway would violate the terms of the two families’ donation of the parkland.

The complaint sought to limit officials to construction of “a meandering narrow park road in keeping with the character of the park.” According to the suit, Secretary of the Interior Krug had written to Mrs. Archbold in January 1948 stating that “conversion of Foundry Branch Parkway to a commercial freeway would be a violation of the purpose for which the land was donated . . . . This Department will therefore oppose . . . a divided highway.”

The suit asserted that construction of the parkway would “cause irreparable injury in the wanton destruction of the memorial which she created in memory of her father . . . .”

Aitken responded to reporters’ inquiries by saying the District could build the parkway on the 100-foot right-of-way it owned along the centerline of the park, as permitted by the 1948 agreement with NPS. However, doing so would require deep cuts in the hilly terrain of the park:

A divided highway is better suited to the topography. We believe a parkway such as we are planning will improve the park.

Although NPS had backed away from the 1948 agreement, Aitken referred to a White House memorandum covering an agreement reached April 16 regarding the Washington National Pike’s entrance into the District. The memorandum stated that NPS agreed to build a divided parkway along the Potomac River, from Cabin John “to an intersection with the Glover-Archbold Parkway.” This plan would allow pike traffic to follow the circumferential to Cabin John, then proceed to the Inner Loop on the new parkway. The *Star* explained:

As part of this plan, the District agreed to widen Wisconsin Avenue to eight lanes from the District line to Tenley Circle and a “four-lane divided parkway down Glover-Archbold Park for passenger-car and bus traffic only, as per a 1948 agreement with the National Park Service.” [“Donor Fights Highway Plan,” *The Evening Star*, July 26, 1959]

The District, in a motion filed on September 1 in response to the suit, mentioned the 100-foot right-of-way the city had acquired for a highway in 1893, long before the Glover and Archbold families donated their land for a park. Further, because Mrs. Archbold donated the land to the government, she “now has no right of interest” in the land. Further, the District claimed, she could not show how the parkway would “invade any property in which she has an interest.” [“District Claims Right-of-Way,” *The Evening Star*, September 2, 1959]

Charles C. Glover, Jr., joined Mrs. Archbold’s suit on September 2.

On December 10, before District Court Judge Burnita S. Matthews, Assistant Corporation Counsel John A. Ernest contended that the suit had been filed prematurely and should be dismissed. He explained that the parkway plan had not been approved by any agency. NCPC came closest to approval by passing on the “basic concept” of a freeway system in the Washington area that included the Glover-Archbold Parkway.

Mrs. Archbold’s representative, attorney Edmund D. Campbell, informed Judge Matthews that Congress had appropriated \$880,000 for the project, and that the Highway Department’s budget for FY 1961 included \$1.6 million for the parkway. Judge Matthews wondered if waiting for final approval would be too late in view of the concerns raised in the suit. [“Glover Park Road Suite Held Premature,” *The Evening Star*, December 10, 1959; “Parks Group Enters Dispute Over Parkway,” *The Evening Star*, December 11, 1959]

Judge Matthews decided on January 27, 1960, that Mrs. Archbold and Mr. Glover were entitled to a trial on their suit. She questioned the validity of the 1948 agreement between the District and NPS. She doubted their authority to convert parkland to highway use. This finding was, as the *Star* put it, a “set back” for the city. The District would have to put its plans on hold pending the outcome of the trial:

Past law cases generally show that the Government which accepts land for park uses can’t divert it to other purposes except through condemnation, said the judge. [“Glover Freeway Foes Win Right to a Trial,” *The Evening Star*, January 28, 1960]

### **Getting U.S. 240 into the District**

As Maryland upgraded the Washington National Pike to a freeway, it had identified two entrances to the District via southeast and southwest legs. As discussed earlier, both legs were in trouble even before construction began on the freeway’s Frederick end. In 1946, Maryland officials had planned to run the freeway near Gaithersburg, west of Rockville and Bethesda “to take traffic off Wisconsin avenue leading into Washington.” However, protests by property owners in the Bradley Boulevard area prompted the Maryland-National Capital Park and

Planning Commission to propose a route farther west “through relatively undeveloped land.” This western route would extend north from MacArthur Boulevard near Cabin John, continue through Cabin John Run Valley and Thomas Valley to Tuckerman Lane before intersecting with the Washington National Pike near Gaithersburg. [“Threat to Drop Freeway Made By Planners,” *The Evening Star*, May 18, 1947]

In February 1952, the Regional Highway Planning Committee acted on a 10-year highway program for Montgomery and Prince George’s Counties. The program included the following:

Washington National pike – River road via Thomas Branch, Cabin Branch and Bogley Branch, bypassing Rockville and Gaithersburg to present terminus at Germantown road southwest of Hendersons Corner. A limited access divided highway.

Washington National pike truck cutoff – Wisconsin avenue at Grosvenor lane, northwest to Washington National pike south of intersection of Montrose road and Seven Locks road. Will be part of Inter-County freeway.

The program included the Inter-County Belt Freeway (Washington National Pike to Baltimore-Washington Parkway), the Baltimore-Washington Parkway, Washington-Annapolis Freeway, and Suitland Parkway. [“Action in Week Due on Maryland Roads Program,” *The Evening Star*, February 11, 1952]

By 1957, officials had still not pinned down the location for the entrance. In late January 1957, Clarkeson Engineering Company provided a preliminary report on alternatives for the U.S. 240 entrance to the District, favoring a Potomac River route. When the firm’s Harold Aitken, the future highway director, explained the plan to NCPC, Bartholomew said he favored a different alternative, namely running the pike through the Bethesda area to the District line, passing near Wisconsin Avenue to meet the Glover-Archbold Parkway at Tenley Circle. His favored route would follow the parkway to Whitehaven Parkway, then turn eastward to meet the Inner Loop near Sheridan Circle at Massachusetts Avenue and R Street. This alternative would have the advantage of not “dumping heavy traffic downtown.” It also would serve more traffic than a route along the Potomac River.

Aitken explained that Bartholomew’s preferred alternative would result in removal of “hundreds of homes.” The District planned to build the Glover-Archbold Parkway, which would be needed along with the Potomac River Freeway to handle future traffic.

Clarkeson’s preliminary report called for shifting the west leg of the Inner Loop from its approved location between 23<sup>rd</sup> and 24<sup>th</sup> Streets, NW., at Washington Circle in Foggy Bottom slightly west to accommodate the Potomac River Freeway. Connecting the two at the approved location would be “costly and difficult to build, possibly requiring three- and four-level interchanges.” Moving the Inner Loop west of Washington Circle would “be a little less costly to build and have a better design” than at the approved location. [Beveridge, George, “Shift Called Possible In ‘Inner Loop’ Plan,” *The Evening Star*, February 1, 1957]

The day after the Clarkeson presentation to NCPC, General Lane criticized NPS for not extending the Rock Creek and Potomac Parkway northward into Rock Creek Park, a plan that NCPC had approved in 1948. Wirth responded that he had not begun the extension, even diverted funds from it, because he was afraid that extending it would encourage the District to try connecting Maryland's Washington National Pike through the park. He added that with the District now planning the Potomac River entrance, he would move forward on the extension. [Beveridge, George, "Park Officials Push Upshur Street Span," *The Evening Star*, February 2, 1957]

In April 1957, the Palisades Citizens Association opposed the leg through its community in the corner of the District along the Potomac River. The association expressed its views after over 250 residents attended a meeting where District officials and consultants explained the plan. Samuel R. Harrison, deputy director of the District Highway Department, emphasized that the District had not officially adopted the plan to route the highway along the river to join the pike near Cabin John. It was, he conceded, favored over other options for the connection between the Inner loop and U.S. 240 along Wisconsin Avenue, via the Glover-Archbold Parkway, or around the Naval Observatory.

A member of the Palisades association's road committee pointed out that Bartholomew, the new NCPC chairman, had said recently in AAA's *American Motorist* magazine that he was opposed to a road along the river because the area was not densely populated; he favored the Wisconsin Avenue corridor. Clarkeson's Aitken replied that in 1955, Bartholomew had testified before a Senate committee that the Wisconsin Avenue corridor would require far more displacement of homes and stores than the river plan.

Residents wondered why the planned George Washington Memorial Parkway would not be sufficient. Harrison replied that the parkway would not be able to handle the expected explosion of traffic in the area. It also could not carry trucks and would not be eligible for 90-percent Federal-aid because it was not part of the Interstate System.

When Aitken explained that the Arizona Avenue Expressway would extend to a bridge across the Potomac River to relieve pressure on Chain Bridge, association member William Smith said, "I am not prepared as a taxpayer to throw Chain Bridge into the river." Smith added:

The question that has not been proved tonight is why we need this road. At a public hearing you will have to have a better reason for this road than that it will gain 90 per cent Federal aid.

The comment drew strong applause. ["Palisades Group Protests River Route Expressway," *The Evening Star*, April 3, 1957]

### **Alternatives for the DC Entrance**

By June, the National Capital Regional Planning Council was eager for a decision on where the Washington National Pike would enter the District. Gingery, a member of the council, said on

June 17 that the council was planning a top-level meeting with Maryland, District, and BPR officials to decide on the entrance in the next few weeks.

NCPC, which strongly questioned the District's preference for a river route, had established a committee to consider alternatives. The committee, by a 3-to-2 vote, favored a route that went through Glover-Archbold Parkway north to Tenley Circle. The route would follow River Road to the southwest leg of Washington National Pike or east of Wisconsin Avenue to some point in Bethesda to meet the southeast leg. On the south end, the route might leave the parkway to link with the Inner Loop near Sheridan Circle, NW., on Massachusetts Avenue, or continue through the park to an east-west link with Canal Road.

City officials were surprised by reports of the new routing. However, before the full NCPC could consider the proposal, District officials rejected it. City planning engineer Brinkley said it would be more costly, do more damage to the park, and would uproot more residents than the District's preferred river route. Brinkley pointed out that as an Interstate highway, the route would have to carry trucks, doing further damage to Glover-Archbold Park that the city was trying to avoid.

Engineer Commissioner Lane considered the proposal ill-advised. He and a BPR official on the committee had voted against the proposal. The proposal, just a concept, had not been subject to a detailed study. "I don't see how the planning commission can settle anything until we get the report of the consultant."

Moreover, Maryland officials did not want a U.S. 240 connection in heavily built-up Bethesda, and District officials felt the same way about any expressway north of Tenley Circle. Brinkley said that such an expressway would require the taking of many homes and arouse heated public opposition. [Beveridge, George, "Planning Unit to Urge Glover Parkway to 240," *The Evening Star*, June 18, 1957; Deane, James G., "District Balks at Hasty Park Route Commitment," *The Evening Star*, June 20, 1957]

Despite the objections, NCPC voted, 5-to-4, to support the new routing, with Bartholomew casting the tie-breaker. Members voting against the routing were Colonel Thomas B. Hunter, the District's Assistant Engineer Commissioner; John A. Remon, NCPC's Washington citizen member; Colonel G. W. Carlson of the U.S. Army Corps of Engineers; and BPR's H. J. Spelman.

Staff had refined the proposal to present three feasible routings to NCPC for the northern end. Each began at Van Ness Street just north of Glover-Archbold Park, as described in the *Star*:

All three routes terminated just west of Wisconsin avenue at the Maryland line, just across Western avenue from the new Woodward & Lothrop [department store] branch store.

One of the three routes kept to the west side of Wisconsin avenue. The other two tunneled under Tenley Circle to travel east of Wisconsin before crossing back over the

line. The commission said estimated property-acquisition costs of the three ranged from \$1.5 million to \$4.3 million.

As for the southern end, the NCPC majority left open “whether the road should follow Glover-Archbold all the way south to Canal road, or swing eastward on Whitehaven parkway to meet the proposed District inner loop expressway near Sheridan Circle.”

Mrs. Archbold’s attorney urged NCPC to reject the plan, suggesting that legal action might result from this violation of trust.

Wirth was one of those voting for the plan. The decision, he said, put him in “a most difficult” position, because neither alternative – whether through Glover-Archbold Park or along the river – was inviting from a park standpoint.

As for Maryland officials, the *Star*’s George Beveridge said their “precise intentions as to the new road were left thoroughly confused by the discussion.” Maryland had given up on the idea of a river entrance to the city along the Potomac River. The Washington National Pike’s southwest leg was now basically a link in the Inter-County Belt Freeway, providing a bypass for Virginia traffic:

Col. Hunter . . . insisted that the State has assured the District it still could meet the city part of the road near the river at the Maryland line. This, he said, could be done by putting the expressway in the Little Falls Branch parkway, which runs from Bethesda to the Potomac.

However, William C. Burrage, planning director of the Maryland-National Capital Park and Planning Commission, said the Maryland road officials were giving “heaviest consideration” to routes near Wisconsin Avenue and River road.

He noted that Little Falls parkland was acquired under Federal law which might not permit a truck road.

(Little Falls Parkway runs between Massachusetts Avenue and Bradley Boulevard to the Bethesda area.)

NCPC also had before it a minority report. Colonel Hunter urged its adoption because action on the Glover-Archbold Parkway was “premature,” pending receipt of the Clarkeson report on the river route. Bartholomew replied that now was the proper time for NCPC to submit what he called a “planning recommendation.” He said the District was constantly “shoving the commission into a corner” as if NCPC were a “rubber-stamp” for the city’s plans. NCPC’s action was “purely a planning action that always can be reconsidered in light of any later information.” It was, he added, NCPC’s duty to “guide the administrative agencies” at the earliest stage possible of such projects. [Beveridge, George, “Planners Back Park Expressway Route,” *The Evening Star*, June 21, 1957]

Around this time, controversy had developed about the route of the George Washington Memorial Parkway near the C&O Canal from the District line to Great Falls in Maryland.

Senator Murray, chairman of the Committee on Interior and Insular Affairs, had received so many protest letters that he asked NCPC to hold a public hearing to secure reaction to the proposed route and possible alternatives, as described by the *Star*:

1. Along the street car tracks east of the approved route in Brookmont [Maryland].
2. On the high bluff along the river edge of Brookmont.
3. Build the parkway on top of Conduit road (MacArthur boulevard).
4. On the hill above MacArthur boulevard.

NCPC held the public hearing on June 21. Nolen, the commission director, told the 50 or so people in attendance that all the land needed for the parkway in its planned location had been acquired with funds from Maryland and the Federal Government on a 50/50 basis. Maryland, he said, had indicated it could not advance additional funds without new sources of revenue.

According to the *Star*:

The protests fell in two groups. One deplored damage to the natural canal area and the other protested impact on private homes in the Brookmont (Md.) area just across the District line.

There also was scant support, however, for the alternate routes and their further destruction of private property. The most common plea was that the parkway . . . be built along the line of MacArthur boulevard.

Neill Phillips, speaking for 14 groups, asked that the parkway be built at least 300 feet from the canal. Edward J. Seymour, representing the Civil League of Brookmont, suggested that the parkway bypass Brookmont and continue via Little Falls Parkway to MacArthur Boulevard. Anthony W. Smith of the C&O Canal Association recommended that the parkway contain only two lanes, not four as planned, and preferred it be built on the hillside next to MacArthur Boulevard. He also criticized NCPC for waiting so long to hold the public hearing and limiting witnesses to 10 minutes each. [“Two Groups Attack Plans for Parkway,” *The Evening Star*, June 21, 1957; “Commission Reaffirms Parkway Route Approval,” *The Evening Star*, August 2, 1957]

As the public hearing indicated, the narrow corridor where District highway officials wanted to run the link to the Washington National Pike was growing increasingly controversial.

With options for U.S. 240 seemingly closing, David Scull suggested a new alternative. Scull, who worked in real estate and was a member of the Maryland-National Capital Park and Planning Commission, suggested building an elevated 7-mile highway over the Georgetown spur of the Baltimore and Ohio Railroad. The *Star* explained the plan:

The trestled roadway would be about seven miles long starting from Linden or Montgomery Hills where the Georgetown spur pulls off the main line near the head of Sixteenth street extended, and running in a southerly direction around the District, entering near the Army Map Service . . . .

The highway would serve as a collector route for Wisconsin avenue, Bradley boulevard and River road in the west, and provide direct access downtown for Route 29, the proposed northern parkway, Georgia avenue and Connecticut avenue, Mr. Scull pointed out.

“It would,” he acknowledged, “be expensive,” perhaps as much as \$10 million a mile, but if it were approved as part of the U.S. 240 Interstate route, BPR would pay 90 percent of the cost. It had the advantages that it would not cut through any parks, could carry trucks, and would not require taking homes for the right-of-way. The idea was “at least worth exploring.” [“7-Mile Elevated Road Urged as Rte. 240 Link,” *The Evening Star*, July 7, 1957]

Meanwhile, the possible link through Rock Creek Park suffered another blow on July 16 when Chairman Murray introduced Senate Joint Resolution 123, cosponsored by Senators Hubert H. Humphrey (D-Mn.), Thomas H. Kuchel (R-Ca.), George W. Malone (R-Nv.), and Richard L. Neuberger (D-Or.), for the preservation of the park. It was identical to Senate Joint Resolution 36, which Senator Murray had introduced in February 1955. He told his Senate colleagues:

Recently the long-deferred and ill-advised plan to bring Maryland’s Route 240 into the District of Columbia through Rock Creek Park has been revived. Therefore, let the introduction of this joint resolution serve as a “No Trespassing” reminder to those who would invade the park.

He also introduced for the record an editorial, “Highway Keep Out,” from the July 12 issue of *The Washington Post and Times Herald* in which the editors admitted they had been wrong:

At one time this newspaper believed, reluctantly, that the highway might be brought down the rim of Rock Creek Park with minimum damage. We are now convinced that we were wrong to envisage this concession, and the subject is one on which we feel quite adamant . . . .

Regional planning becomes a travesty when a traffic problem that has been building up for well over a decade is allowed to get to the point at which an invasion of park land is proposed as the only alternative to the razing of substantial numbers of homes. Unquestionably a connection with U.S. 240 must be provided, and there now remains a choice of disadvantages. In the circumstances a route through Glover-Archbold Park may be the least disadvantageous course, inasmuch as the park is narrow and undeveloped and its use does not compare with that of Rock Creek Park or the Chesapeake & Ohio Canal.

The point for the future, however, is that highway planners must be given to understand that the area’s parks are inviolable. Foresighted planning can avoid such dilemmas. The response to proposals to bring U.S. 240 either through Rock Creek Park or along the C & O Canal ought to be a flat and resounding “No.” [Preservation of Rock Creek Park, *Congressional Record-Senate*, July 16, 1957, pages 11796-11797]

The *Star* disagreed. Chairman Murray's determination to preserve the park was "commendable," and the public would agree that "any unnecessary encroachment on parkland by highway builders" is unacceptable:

But unless satisfactory alternatives can be found—and the search so far has been in vain – it might become absolutely necessary to use a strip through the park for a city approach to Maryland Route 240.

The right approach was to explore all options, not take one out of consideration. "And serious objections have been raised to all alternative routes heretofore suggested." In choosing among the alternatives, "it is conceivable that an unemotional, objective study of the various routes would find Rock Creek the least objectionable . . ." ["Wrong Procedure," *The Evening Star*, July 18, 1957]

In reply to Chairman Murray's resolution, NCPC's Nolen told the *Star* that the commission favored the routing through Glover-Archbold Park for the link to U.S. 240. The parkway would provide a link to Wisconsin Avenue above Van Ness Street and MacArthur Boulevard west of Georgetown University. "There is no parallel between the Glover and Rock Creek Park proposals. A right-of-way is available for the Glover road and a right-of-way through Rock Creek Park would upset both property owners and nature lovers."

By contrast, the Montgomery County Council, in a closed meeting 2 weeks earlier, had voted in favor of routing U.S. 240 through Rock Creek Park. Council members concluded that the park route would be less disruptive to Maryland communities than a routing through Glover-Archbold Park. ["Congress Ban Asked on Park 240 Link," *The Evening Star*, July 16, 1957]

As mentioned earlier, area officials met on July 19 to discuss several area issues, including the U.S. 240 link to the District. The meeting ended without a decision on the entrance, but with an agreement to form a regional coordinating committee to consider joint highway issues.

Clarkeson Engineering reported to the District commissioners on July 27 regarding its study of the U.S. 240 entrance to the city. The city had told the firm to rule out the controversial Rock Creek Park route. The best alternative, the firm concluded, would bring the all-traffic route into the District along the Potomac River, with one-half mile on structure over the water parallel to the Whitehurst Freeway. The *Star* summarized the 4.6-mile route:

It would extend on the high ground of the Potomac Palisades area from the District line to Dalecarlia filtration plant to the west leg of the proposed innerloop [sic] just west of Washington circle.

It would tie into "feasible" extension [sic] of the highway close to the Potomac in Maryland. State Road [sic] Commission officials have indicated their preference for a riverside location.

By means of a high-level Potomac River bridge in line of Arizona avenue just south of Chain Bridge, the route would provide connections with Virginia portions of the circumferential highway planned to circle Washington . . . .

It would be elevated not only over the Potomac (inbound lane) from Georgetown University to Thirty-fourth street, but over Foxhall road and Glover-Archbold Park. The existing Whitehurst freeway would be modified, especially around Key Bridge, and extended to a point near the university to handle outbound traffic. The “over-the-waves” part of the project would be as much as 125 feet offshore.

The number of lanes would range from four to eight as the freeway approached the Inner Loop. More than 300 homes and businesses would have to be acquired for the freeway, with about half for the downtown connection to the Inner Loop.

Clarkeson determined that this option was the cheapest at an estimated \$44.8 million, would do less damage to existing parks and recreation areas, and would improve access to them:

Noting that location of Route 240 anywhere in Northwest Washington would have a substantial impact on existing land uses in the area, the report asserted the recommended site is “the one location that holds this ‘conflict’ to a minimum and still provides a meritorious improvement from a traffic service standpoint.”

As for the Wisconsin Avenue corridor:

The consultant gave this only passing notice with a conclusion it is “not considered practical.” The required 200-foot right-of-way along this heavily-developed thoroughfare would “literally wreck” business establishments, apartment houses and homes, on at least one side of the avenue whose present width now ranges from only 35 to 60 feet. The firm did not even work up a cost estimate on this one.

The river alternative also had aesthetic advantages. It would be “close enough to the canal to provide an inspiring view, yet far enough away to preserve its natural characteristics.” From the north and west, “the approach will offer an excellent panorama with the Washington Monument as centerpiece.” [Stepp, John W., “Potomac Route Proposed for New Freeway,” *The Evening Star*, July 27, 1957]

Reaction from the Palisades Citizens Association was immediate. Colonel Robert B. Curtiss, who had drafted the Association’s April resolution, said:

It still doesn’t make much sense to taxpayers. Why put the road here? The city is already saturated with traffic and other sections are crying for relief, but they insist on building the road here where it’s not wanted.

He pointed out that counting Canal Road, MacArthur Boulevard, the George Washington Memorial Parkway on the Maryland side, and the proposed new connection for the Washington National Pike, highway officials were planning to channel 20 lanes of traffic into the narrow corridor along the river. He called the plan “ridiculous.” The association’s William G. Smith said, “We’ve known this was what they were going to do, but it is still preposterous.” [“Potomac Route for 240 Raises Citizen Protest,” *The Evening Star*, July 28, 1957]

On August 1, NCPC considered the Clarkeson report as well as the Glover-Archbold Parkway issues. Aitken was on hand for Clarkeson to defend the Potomac River alternative. However, the planners decided to await further studies on their proposal to use the Glover-Archbold Park route as part of the plan to connect U.S. 240 with downtown. Experience, Bartholomew told his colleagues, made it “perfectly obvious that, wherever we go, we will encounter problems and protests.” That, he said, was only one of the many factors that would have to be considered.

At the same meeting, NCPC reaffirmed its support for the 5-mile segment of the George Washington Memorial Parkway bordering canal property. It would stretch from Canal Road at Chain Bridge in the District to the planned Cabin John Bridge carrying the outer circumferential across the Potomac River between Maryland and Virginia.

As explained in a NCPC report, the planners rejected four alternatives that Chairman Murray had suggested they study:

1. Routing the parkway along the streetcar tracks would cut Brookmont in half, take 34 homes, and increase costs by \$1.1 million.
2. Building on the high bluff involved acquiring 38 homes and an additional \$900,000 in estimated costs.
3. Building on MacArthur Boulevard, the NCPC report said, was “entirely impractical and inadvisable. It would cost several millions of dollars (\$5.5 million) to properly strengthen the conduit [under the boulevard], for which money is not available, and it would be impossible to control access to any degree along the parkway road.”
4. Building on the hill above MacArthur Boulevard was “impractical” because it would take 40 homes, involve construction of 17 grade separation structures, and raise costs by at least \$10 million.

Regarding the public hearing, the report stated:

The hearing established that the people living in the area have understood for many years where the parkway was projected through Brookmont and Glen Echo, and that almost without exception they favored the location and desired to have it built. On the other hand, those opposed to the established general location were from organizations of people living in other areas.

As for impacts on the canal, the NCPC report stated that only at Brookmont and Glen Echo would the parkway be within 300 feet of the canal, and it could be effectively screened from the canal. [“Planners Sit Tight On Glover Park Route,” *The Evening Star*, August 2, 1957; “Commissioner Reaffirms Parkway Route Approval,” *The Evening Star*, August 2, 1957]

(As discussed elsewhere, BPR approved Interstate numbers in September 1957 as recommended by AASHO. The Washington National Pike/U.S. 240 freeway became Interstate 70-S. However, accounts of the routing debate continued to refer to the route by its original number as will this account until the public and newspapers began using the Interstate designation.)

On October 25, 1957, Governor McKeldin opened the first 1.5-mile section of the Washington circumferential freeway linking Wisconsin and Connecticut Avenues. The ceremony took place east of where Wisconsin Avenue intersects the freeway at Pooks Hill. His wife cut the ribbon. This first segment, Governor McKeldin said, was a “conspicuous symbol” of Maryland’s continuing effort to relieve the “ever-tightening tangle of traffic around our big cities.”

Because the segment went through Rock Creek Park and could not carry trucks, BPR had not accepted it as part of the Interstate System. However, a few days earlier, BPR had approved the adjacent 2.70-mile section carrying the route from Wisconsin Avenue, where an interchange with the circumferential was planned, west to U.S. 240.

After the ceremony, Governor McKeldin and others formed a motorcade to tour other area projects. The Governor joined Commissioner of Public Roads Charles D. Curtiss of BPR and District Highway Director Robertson to open the Kenilworth interchange connecting the Baltimore-Washington Parkway, the Annapolis freeway, and Kenilworth Avenue. The *Star* explained:

The Kenilworth interchange covers a total distance of 3.5 miles in dualized roads and overpasses. It is Maryland’s biggest highway complex of its kind. [“First Section Dedicated Of Circumference Road,” *The Evening Star*, October 25, 1957]

A few days later, Colonel Welling revealed that he wanted to begin building the U.S. 240 entrance to the city as early as 1958. “I’m anxious to start on it as soon as possible.” He planned to hold a public hearing to consider views on the two controversial alternatives for bringing the freeway into the city, whether along the Potomac River or in a corridor in the vicinity of Wisconsin Avenue through Glover-Archbold Park. He estimated that the river route would cost \$46 million, while construction in the Wisconsin Avenue corridor would cost about \$59 million. In either case, BPR would pay 90 percent since the route would be part of the Interstate System. [Deane, James G., “Welling Acts to Expedite D.C. Link to Route 240,” *The Evening Star*, October 27, 1957]

## **Back to the Public**

On November 25, General Welling announced a public hearing would be held on January 6, 1958, to consider four proposed District connections between the Washington National Pike in Maryland and the District’s Inner Loop. The four were limited access highways that would be open to all vehicles, not restricted to passenger vehicles as would a parkway. Whichever route was selected would be proposed for inclusion in the Interstate System.

Two of the routes were through the Palisades area, as the *Star* explained:

The District’s preferred route begins at the District-Maryland line between the Chesapeake & Ohio Canal and the tracks of the Baltimore & Ohio Railroad. It splits into two roadways, one on the bluff between the tracks and Potomac avenue and the other at the bottom of the bluff along the canal.

The lower roadway meets Canal road at Chain Bridge. The upper roadway remains on the bluff to Glover-Archbold Park.

Then, the westbound roadway would join the Whitehurst freeway; and the eastbound roadway would run adjacent to the freeway.

Director Robertson preferred that route. The Clarkeson proposal was the other choice through Palisades.

NCPC was still working on the third alternative:

This road would run from the District-Maryland line near Wisconsin avenue roughly paralleling the avenue to Tenley Circle; thence along the Glover-Archbold Park to the vicinity of Canal road; thence along the same right-of-way preferred by Mr. Robertson.

The fourth alternative was:

The fourth route to go before the hearing has the same beginning point as the third and then follows Glover-Archbold Park to Whitehaven parkway; thence easterly through Dumbarton Oaks Park across Rock Creek Park and under Sheridan circle.

The expressway was not in Robertson's plans for the next 6 years, but General Welling was eager to develop a construction schedule because the city needed more radial highways to absorb increasing traffic demands between Maryland and downtown Washington. [Bassett, Grace, "Hearings Slated On 240 Links," *The Evening Star*, November 25, 1957]

In early December, NCPC added another aspect to its preferred Wisconsin Avenue corridor routing for U.S. 240. Until this point, the preferred routing split just north of Massachusetts Avenue, with passenger vehicles able to continue on the Glover-Archbold Parkway. All traffic, including trucks, could use the alternative route to the Inner Loop.

The new idea was to build a tunnel from the northwest corner of Massachusetts Avenue and Macomb Street deep under the north side of Massachusetts Avenue for a mile to Normanstone Park near 34<sup>th</sup> and Fulton Streets, NW. Traffic would continue at grade through the Normanstone Valley, cross Rock Creek Park on a viaduct, then enter another tunnel, this one a half-mile long, ending near Decatur Place and 22<sup>nd</sup> Street. The expressway would continue to the Inner Loop at Sheridan Circle. This use of tunnels would reduce impacts to the Washington Cathedral and other facilities on the surface.

The tunnel would consist of two bores, each carrying two lanes, bored as far as 140 below the surface. The tunnels would cost about \$30 million, but the commission believed the entire Wisconsin Avenue routing would cost less than the District's preferred routing along the Potomac River.

NCPC presented the idea as a staff study and did not endorse or reject it, but the commissioners thought it should be presented at the public hearing. Commissioner Welling said he was

“completely open” on the U.S. 240 proposals, but was “disturbed” about the late arrival of this new proposal without detailed cost or engineering studies or even NCPC endorsement.

Bartholomew said that District officials regularly complained about NCPC proposals that lacked detailed studies. “We don’t have the funds to make these studies. And I think that until we can have plans made with the exhaustive study of engineering consultants we will always be in this difficult position.” He repeated his complaint that District officials seemed to think NCPC should simply rubber-stamp whatever they proposed. [Beveridge, George, “Route 240 Tunnel In District Proposed,” *The Evening Star*, December 6, 1957]

A staff report to the Maryland-National Capital Park and Planning Commission a week later also favored the Wisconsin Avenue corridor. The *Star* described the staff’s recommendation:

The recommended route would leave the Pook’s Hill interchange and continue to Cedar Lane where it would split, the northbound lane running on the east side of Wisconsin avenue and the southbound lane running on the west side of Wisconsin.

The southbound lane would cross Wisconsin at Jones Bridge road and run beside the northbound lane through Bethesda along Tilbury and Waverly streets.

The route would cross Wisconsin again at Grafton street and intersect with Western avenue behind the Woodward & Lothrop store.

The staff report rejected the route through Rock Creek Park because it would require eight or ten lanes to handle all the traffic diverted from Bethesda and Silver spring. “We believe, if well handled, this freeway can be the making of the Bethesda business district.”

After the commission meeting on the plan, representatives of the commissioners, the Maryland State Roads Commission, and the Montgomery County Council indicated they would hold a public hearing on the plan after the District’s January 6 hearing. [“Corridor Route Urged For 240 by Planners,” *The Evening Star*, December 10, 1957]

George Beveridge described the scene for the January 6 public hearing:

One of the largest public hearings [sic] crowds in the city’s history jammed the District Building board room today to hear arguments before the Commissioners on the Route 240 controversy . . . .

More than three hundred individual and organization civic leaders—some waving banners—occupied every foot of space in the board room and about 50 sat on benches outside to hear testimony through an amplifying system.

At one point, residents of the Palisades area along the Potomac—irate at expressway proposals through their area—raised banners above their heads from every part of the audience which bore the word “Palisades.”

The display led Commissioner Robert E. McLaughlin to warn that “this is not a political convention. The purpose of this hearing is to advise the Commissioners, not to arouse sentiment.”

The agenda included 58 witnesses, but by the lunch break at 12:15, only the first three had testified.

The hearing opened on a note of bitter controversy, with city highway officials urging a route along the Potomac river to the Maryland line, and Federal park and planning leaders calling for an expressway that would closely parallel Wisconsin Avenue from the Maryland line into the city.

NCPC Director Nolen and traffic planner Robert Keith presented the Wisconsin Avenue corridor proposal that they said would carry twice the number of vehicles near the District line than the river route the city favored. The corridor would relieve congestion on Wisconsin Avenue and other nearby streets in the District and Maryland. It would stimulate business and boost the real estate tax base. By contrast, the Potomac River route would cut through a “low-density, single-dwelling residential area” that should be maintained.

Keith argued that the city preferred the Potomac River route only because of the difficulty of building the needed eight-lane truck-passenger route through Glover-Archbold Park. The recent tunnel option NCPC staff had offered would offset the problem, since it would provide an alternative route for trucks. The suggested two-lane tunnels would not greatly increase the total cost to the District, especially since BPR would pay 90 percent of the cost. He and Nolen emphasized that the tunnel route would not impair the Washington Cathedral, embassies, and other buildings along Massachusetts Avenue.

In the absence of detailed information, they urged the District Highway Department to make obtaining that information a top priority.

The District’s Robertson and planning aide Brinkley defended plans for a six- and eight-lane expressway along the Potomac River and K Street parallel to Whitehurst Freeway, joining the Inner Loop near Washington Circle. “Mr. Robertson attacked the planners’ argument and launched a special criticism against the tunnel route.” Although sufficient studies had not been conducted to determine the feasibility of the route, Robertson said the District had studied the plan enough to know that the tunnels would have to provide at least seven lanes, not just the four being suggested. Total cost would be about \$110 million or more than double the cost of the Potomac River route. The city’s favored route, known as A-2, along Potomac Avenue and Canal Road near the C&O canal, would cost \$13 million less than any Wisconsin Avenue corridor option.

Robertson said that A-2 was better than Route A on the high bluffs overlooking the river and cutting through residential areas in the Potomac Palisades area. Only a third as many residents would be displaced by A-2, which would cause a “minimum net loss of park facilities,” comparable to the loss from NPS plans for the George Washington Memorial Parkway:

Route A-2 would provide a beautifully-dignified entrance to the nation's capital, no other entrance would have a comparable esthetic appeal.

Further, it would provide "the best balance in traffic service" for Maryland and Virginia residents who could cross the river on the proposed new Arizona Avenue bridge.

Harland Bartholomew did not attend, but his statement was read into the record. The Wisconsin Avenue corridor, he contended, was "superior in all respects" to the river route. The first consideration must be the number of motorists served and relief of congestion. On that basis, there was "little question" that the Wisconsin Avenue corridor was the best route because it would draw traffic from a corridor with high residential development.

He would prefer not to see any highway through Glover-Archbold Park, but did not think that concern should rule out the Wisconsin Avenue corridor. "Whatever is best for the community can and must be voted out."

As the day went on, testimony favored the route along the Potomac River or, if not directly in favor of that route, strongly in opposition to the Wisconsin Avenue corridor.

On the second day of the hearing, civic leaders "clashed sharply" on the same issues. Only about 100 people were on hand as the "parade of dozens of witnesses on the 240 controversy moved steadily along at the District Building."

In contrast with the day before, testimony tended to favor the Wisconsin Avenue corridor as the best way to meet the greatest traffic demand. Palisades residents especially attacked the Clarkeson study, which they considered a "misleading and incompetent effort" to justify the decision the District had already made. (District officials later assured reporters that Clarkeson had "a completely free hand" to compare alternatives.)

Overall, the debate featured "bitter attacks and strong defenses":

At one point, the testimony led Commissioner McLaughlin to comment that in two days of testimony he had "not heard anyone say to put this road in his area. Some want to go underground like an ostrich, and others say, just put it somewhere else." [Beveridge, George, "350 Jam D.C. Building For Route 240 Hearing," *The Evening Star*, January 6, 1958; Beveridge, George, "Leaders Clash On 240 Route To Downtown," *The Evening Star*, January 7, 1958]

The Palisades Citizens Association appreciated the opportunity to testify before the District Commissioners. Eight association members had testified. "Our report was good, but we need public opinion to back it up," William G. Smith told reporters. The association would need "a lot of money" to convince the District commissioners to route the road elsewhere. "They'll have to pass it over our dead bodies before we are through fighting." The association was planning an aggressive campaign of letters to newspapers and Members of Congress to stop the river route. ["Palisades Group Lauds Conduct of 240 Hearing," *The Evening Star*, January 8, 1958]

## **The District's Decision**

On January 14, the District commissioners voted to support the Potomac River location for U.S. 240, leaving the District Highway Department to analyze the two options:

The Commissioners expressed strenuous opposition to a location that would follow Wisconsin avenue from Maryland and either pour large volumes of traffic through Glover-Archbold Park or divert it from Wisconsin avenue in a proposed “tunnel route” beneath Massachusetts avenue to downtown Washington.

They said a location along the river within the District “will adequately serve the traffic in the corridor through which it extends and hold to a minimum the conflict with existing land use, land use plans and community development. The engineering, economic and aesthetic values of the selected location are acceptable.”

In a statement, the Commissioners said they “recognize that the construction of an interstate highway anywhere in the District would cause some degree of disturbance and inconvenience to citizens, business interests, and various community programs. The Commissioners are determined the highway will be designed to full respect [sic] to the amenities so important in the Nation’s Capital.”

They added:

“There is unanimous agreement among the Commissioners that legal and moral obligations and sound Government policies dictate against the building of an interstate route in Glover-Archbold Park.”

The Commissioners said their quick decision on the District part of the 240 controversy was prompted partly by the appeal of Maryland officials who have “the real need to set aside as yet undeveloped land for the highway right-of-way.”

The “tunnel route” that NCPC had suggested “has no appeal to the Commissioners”:

“The facility required to serve the traffic assignable to the tunnel is estimated to cost at least \$110 million and is rejectable on the basis of cost alone. Without such capacity there would be a demand for service in Glover-Archbold Park of such magnitude as to be objectionable.

“In addition to the construction cost factor, the tunnel scheme is unsatisfactory because it would put heavy volumes of traffic on the inner loop near the center of the city where volumes assigned by other plans already approach practical capacities.

The commissioners did not offer a view on how the Maryland State Roads Commission should connect U.S. 240 traffic with the river route entrance to the District.

Maryland’s Bonnell said he told District officials that he would give “every consideration to the route they felt was most desirable.” He added, “And we certainly will do that.” He did not say what his preference was, saying he would withhold a decision until after the public hearing the State had scheduled on U.S. 240 for January 29.

Maryland had identified two alternatives:

One plan is to extend the so-called “west leg” of 240 due south from Montrose road to River road, follow River road to the Baltimore and Ohio Railroad tracks and follow the tracks to the District line near the Potomac river.

The other is to extend the 240 west leg due south beyond River road all the way to the Potomac River near Cabin John, then to follow the Potomac shore to the District line in the right-of-way planned for construction of the four-lane George Washington Memorial Parkway by the National Park Service.

The problem with this plan was the NPS restriction on trucks. Given the NPS resistance to any change, Congress might have to be approached to secure approval for trucks on this short stretch of the parkway.

Colonel Welling said he did not know when the District would decide on which river route was best for the link to U.S. 240. The project was not in the District’s 6-year plan, but the link might be substituted for one of the projects in the plan if a decision were made. [Beveridge, George, “Route 240 River Location Backed by Commissioners,” *The Evening Star*, January 14, 1958; Beveridge, George, “Maryland 240 Ruling Awaits Jan. 29 Hearing,” *The Evening Star*, January 15, 1958]

### **Public Hearing in Maryland**

The Maryland State Roads Commission, Montgomery County Council, and Maryland-National Capital Park and Planning Commission held a public hearing in the evening of January 29 at Leland Junior High School in Chevy Chase on the U.S. 240 routing controversy. As Beveridge put it “about 1,000 partisan Marylanders” attended to hear the debate on the “Route 240 wars.”

Roads Commissioner Bonnell chaired the three-agency “jury” that conducted the hearing. He explained that U.S. 240 was part of the Federal Interstate System, which was “not designed primarily for large volumes of local traffic.” It was intended primarily for continuous freeway travel across the Nation and for emergency access for national defense. This did not “mean, however, that the roads commission will close its eyes to any chance for relief to local traffic,” while still meeting the national goals. The roads commission, he said, “has not yet selected a route” and would not do so until they review all hearing testimony about the two alternatives – routing the Washington National Pike in the Wisconsin Avenue Corridor or along River Road.

The Seven Locks Citizens Association was the only group that favored the Wisconsin Avenue corridor outright. The Civic League of Brookmont was the only group to favor construction of the expressway on the west side of Rock Creek Park. No one supported the River road location.

Two options had some support. Ten groups, and a joint committee representing 30 organizations, favored the location along the Potomac River between Cabin John and the District line. Advocates said it was the cheapest alternative, would do the least damage to property values, would meet the national defense goals of the Interstate System, and would line up with the District’s approved route.

“This route also drew vociferous opposition from several speakers,” according to Beveridge in the *Star*. They “blasted it as a ‘foolish waste’ of money” because the George Washington Memorial Parkway is being planned to provide the same connection. It also would not serve heavily populated areas to the north and would wreck the Palisades area.

NPS Director Wirth submitted a letter stating that grading work was underway on the parkway. He warned the Maryland and Montgomery County officials that the parkway “should not be considered as potentially available for the construction of any part of Route 240.”

Also receiving support was a call for a feasibility study of a route east of Rock Creek Park following the Baltimore and Ohio Railroad tracks through Silver Spring and Takoma Park to North Capitol Street at the District line:

Advocates of the B&O route contended that it would pass through a heavily populated area to serve all traffic and particularly serve trucks which, for the most part, are destined for the eastern part of Washington . . . .

One critic of this plan was Mayor Samuel Powell, Jr., of Garrett Park, a town incorporated in 1898 and located between Rock Creek Park and Maryland Route 355 (former U.S. 240). He charged that the “reckless, indiscreet, mad-dog proposal” would wreck his town as well as the communities of Kensington and Garrett Park Estates.

County council member Robert T. Snure also opposed the rail alignment. In a written statement, he said that on behalf of his constituents, he had no choice but to oppose the alignment. It would damage Garrett Park, as Mayor Powell had said, but also would, as the *Post* summarized, “virtually destroy Kensington. It would, he added, erase too much taxable property from the county rolls.” Further, “it would dump too much traffic on ‘already overcongested arteries’ in the Silver Spring-Takoma Park section”:

Snure said he favors a two-pronged road plan – one route going through Rock Creek Park, another feeding into the George Washington Memorial Parkway under construction along the Potomac.

State roads officials did not comment on this new idea “but it was understood that they have apprehensions about both cost and traffic volumes involved in such a route.”

Former Senator Nye testified on behalf of the Citizens Action Committee for Fair Road Planning. He said that “in our estimation,” a superhighway into the city was not needed. Therefore, he did not take a position on the alternatives. He added that he would not oppose an improved parkway, not an expressway, through Rock Creek Park.

Many witnesses, whether they supported an alternative route or not, “blasted either the proposed Wisconsin avenue or River road locations.” These witnesses “contended that the expressway, built through either of the heavily developed areas, would sever the communities and wreck property values.”

One of the many speakers is worth noting, not because what he said was remarkable, but because he would play a prominent role in later years. Beveridge summarized the testimony:

Darwin Stolzenbach, president, Montgomery County Citizens' Planning Association – There is no justification for a Potomac River Route because it would not serve traffic needs. A fast 240 decision should be avoided until B&O route possibility can be studied. This would serve traffic and avoid fights over use of parkland.

The “jury” adjourned the hearing at midnight but announced that it would resume at 8 p.m. the following evening.

Beveridge summarized the result:

At adjournment time [at midnight], 30 persons had spoken, about half of a scheduled witness list. The speakers alternatively praised and attacked a variety of route proposals—with the emphasis definitely on the attack . . . .

Last night's overflow crowd heard overwhelming attacks lodged against proposals to bring the Maryland part of the freeway down either Wisconsin avenue or River road.

The *Post* concluded:

As the hearing neared a close, the two officially proposed routes – an alignment paralleling Wisconsin ave. and another using River rd. – were still unable to muster more than lukewarm support. [Beveridge, George, “Rt. 240 Plans Hit; Hearing Goes on Tonight,” *The Evening Star*, January 30, 1958; Stern, Laurence, and Anderson, J. W., “B&O Site For Rte. 240 Is Assailed,” *The Washington Post and Times Herald*, January 31, 1958]

During the first night of hearings, according to Beveridge, the Wisconsin Avenue corridor drew “the bitterest opposition . . . with hardly a nod of support.” As for the alternatives to that corridor - the river route and the new alternative of running U.S. 240 along the Baltimore and Ohio Railroad parallel to North Capitol Street, “the opposition roof fell in on these, too,” on the second day, January 30:

Citizen representatives of the Potomac Palisades region, joined by conservation and nature groups, turned out in force to deplore the proposal that Route 240 be substituted for the George Washington Memorial Parkway along the river in Maryland.

And the so-called B&O route – proposed for the first time only about a week ago – was roundly castigated as a “disastrous” proposal.

Frank L. Hewitt of the Washington Suburban Sanitary Commission said the rail routing would be an “economic catastrophe” that would affect apartment buildings, shopping centers, parks, a country club, commercial buildings, and Maryland State Roads Commission property along the route.

Many organizations testified against any river route, but some thought the State should study the rail routing. Others opposed any freeway entrance to the city, preferring a circumferential freeway that could feed traffic to arterials:

They unanimously urged that no effort be made to tamper with the George Washington Memorial Parkway, and contended this would help solve any future traffic problems in the river area. They also contended that a 240 route along the river would destroy recreational values of the Palisades parks and would cause heavy disruption of residential communities.

Only about 175 people attended the second evening of the hearing. “In all, nearly nine hours of steady talking was required to complete the testimony of more than 60 witnesses at the two sessions.” Chairman Bonnell ordered that the hearing record be kept open for 10 days to allow for submission of additional comments.

Bonnell promised a decision would be reached “as soon as possible,” which he estimated would take 30-45 days. Wells of the planning commission said officials would take “at least a preliminary look” at the railroad route, which was so new that no detailed study had been made. [Beveridge, George, “State Officials Push Rt. 240 Decision,” *The Evening Star*, January 31, 1958]

### **Decision Time**

Over the next weeks, officials and citizens expressed their views on how to get Montgomery County traffic into and out of the city.

E. Brooke Lee was one of those who endorsed the Baltimore and Ohio Railroad option. He released a statement on February 1 arguing that the route would not disrupt the Kensington-Garrett Park area. The *Star* reported:

His idea is that instead of following the B&O tracks at Randolph road, the 240 expressway would use the Washington Circumferential expressway between Wisconsin avenue at Pooks Hill and Forest Glen. Only at this point – south and east of Kensington – would it hit the railroad tracks, and then follow them through Silver Spring to the District line.

Mr. Lee said this was the “lowest cost per mile and shortest” route feasible unless Congress permits the 240 expressway to be built through Rock Creek Park. He said it would protect River road and Potomac Palisades communities and would not require the National Park Service to “scrap” part of the George Washington Memorial Parkway along the river. [“Modified B&O Route For 240 Is Proposed,” *The Sunday Star*, February 2, 1958]

District planner Brinkley predicted that without two “high capacity” expressways between the county and northwest Washington, the area would be “traffic-clogged beyond any comprehension” in two decades. At present, 29,700 cars and trucks crossed the District line on Wisconsin Avenue each workday, with trucks comprising nearly 10 percent of the traffic.

Clarkeson Engineering Company projected that by 1980, the total would be 70,000 vehicles daily. Closer to the Potomac River, Clarkeson estimated that MacArthur Avenue and Massachusetts Avenue each averaged 16,645 cars daily; by 1980 a river route for U.S. 240 would carry 34,000 vehicles. The District's planned Potomac River route would take 146,500 vehicles off crowded downtown streets. To make his point about the need for two expressways, he cited the current crossing by Massachusetts Avenue of Rock Creek Park. Trying to pass traffic across the park in 20 years would lead to "strangulation" during peak periods. "It would be like trying to accommodate 1980 traffic with existing bridges. People would just not get through." [Stern, Laurence, "Expressway in NW Vital, Official Warns," *The Washington Post and Times Herald*, February 2, 1958]

On February 2, residents of Glen Echo, Potomac Valley, and Palisades staged a protest at the construction site of the George Washington Memorial Parkway. To illustrate their opposition to the Maryland State Roads Commission's plan to ask NPS to cancel the parkway to make way for an expressway in the corridor, the protesters made their point with shovels on Sunday. A photograph in the *Post* showed a line of protesters using their shovels to push dirt in the direction of an idle bulldozer.

A few days later, the Palisades Citizens Association appointed a Roads Committee to lead the opposition to an all-purpose expressway through Palisades park land. The committee's chairman, William Griffith Smith, criticized the city for not considering any options east of Wisconsin Avenue. The committee would study feasible alternatives to a riverside route. ["Women Dramatize Opposition to Palisades Route for 240," *The Washington Post and Times Herald*, February 3, 1958; "Reconsideration Is Asked Of River Route Approval," *The Washington Post and Times Herald*, February 9, 1958]

Donald Gingery and David Scull of the Maryland planning commission criticized the District commissioners for not considering a route through Rock Creek Park for the 240 expressway.

Scull thought that if Maryland chose the route along the river, Congress should allow construction of a parkway for cars-only traffic along the west side of Rock Creek Park. The river route, he said, "would obviously be of no use to commuters in the fast-growing and already traffic-strangled Silver Spring-Wheaton area." Residents of the area "would be deeply grateful if the request [for the river route] could be coupled with a similar request for permission to utilize a strip along the west side of mile-wide Rock Creek Park as a passenger car, park expressway." He acknowledged that the river route was the "line of least resistance," but added that the Silver Spring-Wheaton area was "unquestionably the area of greatest need and will assuredly remain in that category for many years to come." With most existing roads in the area "impossible of widening," Scull urged Maryland and District officials to conduct "an imaginative search" for a way to relieve "nightmare" conditions east of Rock Creek Park.

The District's refusal to consider the Rock Creek alternative to the river route, Scull and Gingery said, did not preclude the planning commission from recommending the park route. Although Chairman Bonnell had said the roads commission would take up to 6 weeks to consider the alternatives, Scull was convinced that the Maryland State Roads Commission "has already made up its mind" in favor of the river route. ["Wheaton Area Freeway Urged," *The Evening Star*,

February 4, 1958; “Planners Hit D.C. Attitude On Route 240,” *The Washington Post and Times Herald*, February 6, 1958]

The *Post*'s editors found it “shocking to hear the continued drumfire of criticism aimed at every route for the proposed expressway to bring Route 240 through the Maryland suburbs and into downtown Washington.” Witnesses cited “a back yard, a golf course, a piece of commercial property or plans for a real estate development.” The editors lamented, “Are there no citizens or groups of citizens who can subordinate personal and neighborhood interests to the welfare of the community as a whole?” The editors were not minimizing the inconveniences, but whichever route is selected “is going to cause distress to a large number of families.” That was the price for “the lack of adequate city planning in the past.” Regardless, the price must be paid “for the sake of many future generations as well as this one.” Experts said that two expressways were needed to meet 1980 needs:

So the question facing the District and Maryland authorities is not whether this golf course or that church property or some other real estate development is to be saved. Rather, it is a question of whether public officials of today have the courage and foresight to build for the future as well as the present. If they try only to heed the interests that are most vocal on issues of this sort, they will do nothing or follow the course of least resistance. What they ought to realize is that a vast host of citizens who have had little to say on the subject are depending on them to raise their sights above relatively petty and narrowly local considerations to the major interests of the city of Washington – in 2000 and 2100 as well as in the 1960s. [“Raise Your Sights,” *The Washington Post and Times Herald*, February 6, 1958]

Representative Hyde, a Bethesda resident (at 5606 McLean Drive), issued a statement on February 10 urging decisionmakers to wait for completion of the Mass Transportation Survey. “I have no desire to add” to the delays, but a delay would be preferable to a mistake. The survey, which began “in anticipation of the very problem we face today,” was embracing “a new form of analysis” that would help officials decide on the best route:

It will conclude that the projected traffic to the central business district will increase to the point where the existing plans for the Inner Loop will break down in the congestion . . . . This collapse of the main feature of our present highway plan will have to be prevented at all costs. An additional central city circumferential is one possibility. The recommendations for the improvement of mass transportation will, of course, be one way to relieve the situation. [“Hyde Warns of Rt. 240 ‘Mistakes,’” *The Washington Post and Times Herald*, February 11, 1958]

The *Post*'s editors agreed with Representative Hyde that “a little delay” was preferable to mistakes. “Perhaps the officials who are to make the decision can get advance data from the experts who are conducting the mass transportation study and whose report is not due until summer.” Regardless, “they should make certain that Route 240 will not be out of joint with the improved transportation system that the survey is expected to envisage.” [“Route 240 and the Survey,” *The Washington Post and Times Herald*, February 12, 1958]

On the same day that Representative Hyde issued his statement, Chairman Murray complicated the decision by announcing he opposed any transfer of park property along the Potomac River for expressway use. He recalled that the Capper-Cramton Act authorized the parkway in Maryland and Virginia. "These would have given our Capital City an unusual park and recreational area extending from tidewater along a beautiful gorge and including a beautiful waterfall." However, "short-sighted opposition" on both sides of the river had stalled the project. "Washington appears determined to throw away its opportunity to be the most beautiful capital city in the world by paving its scenic and recreational areas and making them roadways." Extolling the natural advantages of his home State of Montana, he said:

For some time I have considered a bill to move the Capital of the United States out West, where the climate would be much better and the grandeur of the Rocky Mountains might revive in the minds of governing groups some of the spiritual and social values of the founders of the Republic. If Washington can no longer handle traffic without paving parks and playgrounds, then I shall offer a bill to move the Capitol to Montana, amid the Rockies. The bill will also provide an area in eastern Montana prairies where roadbuilders can [use] flat prairie land with a minimum of tree removal and bulldozers.

Washington would become a place where historians could study "prehistoric things like the mastodon bones at the Smithsonian Institution and Republican economic policies."

Because Chairman Murray's Interior and Insular Affairs Committee would have to act on any transfer of park property, his views were a serious obstacle. District Commissioner McLaughlin thought the prohibition against using park property for expressways might not kill the District's favored split-level routing - a divided alignment, with the inbound lane on Canal Road level and the outbound lane on the Palisades level. ["Senator Murray Set to Oppose Riverside 240," *The Evening Star*, February 12, 1958; Eisen, Jack, "Senator Murray To Oppose Use Of Park Lands," *The Washington Post and Times Herald*, February 12, 1958]

In early March, with the hearing transcript finally available, the Maryland State Roads Commission began studying the comments received. Their task had a serious challenge, as Chairman Bonnell explained. "We can't build 240 until we know where we're going to meet the District of Columbia." The city favored the river route, but NPS was unwilling to yield its park land for the expressway. Bonnell added, "I imagine the District is attempting to reconcile its differences [with NPS] and when that is done I am sure we can agree." ["County Awaits Decision on 240," *The Washington Post and Times Herald*, March 6, 1958]

Pushed by Gingery and Scull, the Maryland-National Capital Parks and Planning Commission expressed its frustration to the White House in a letter asking President Eisenhower on March 12, asking him to bring people together to make a decision. In essence, the planners wanted the President to "knock heads together." County officials saw no point in deciding where to route Route 240 without knowing where the District will want to build its segment. Progress, as Scull put it, was being help in the city by "archaic laws and ridiculous prejudices," with the result that Maryland officials were left to "spin our wheels."

The *Post*, on March 13, explained the origins of the letter:

The Planning Commission's abrupt move to bring the White House into the controversy was inspired by a letter received yesterday from Maryland State Roads Commission Chairman Robert O. Bonnell. He asked for another meeting of his Commission, the Planning Commission, and the Montgomery County Council to discuss testimony received during two public hearings on Route 240 in Bethesda last January.

Informed of the planning commission's letter, Bonnell said the Maryland State Roads Commission would be "delighted to have definite information from the District." [Willard, Hal, "Head Knocking Is Advocated To End Dispute," *The Washington Post and Times Herald*, March 13, 1958]

On February 21, the Committee of 100 on the Federal City had asked General Grant to prepare a resolution on the Route 240 controversy. He had stated that no park land should be used for the expressway, that other expressways should be built before a decision is made on Route 240, and that in any event, officials should not decide the routing until the Mass Transportation Survey was completed. A month later, he completed the resolution, which favored the Wisconsin Avenue corridor, which would connect with the long-planned Fort Drive intermediate circumferential. The road would be located east of Glover-Archbold Park "to comply meticulously with the terms and full intent of the gift" of the land for park purposes. The resolution also opposed "any use of park land, or land given or purchased for park purposes, as rights of way for freeways or main highways."

The Committee of 100 considered General Grant's resolution on March 28, but not without some opposition. Remon, a member of the committee, said, "The use of each park should be decided on its own merits." Calling the resolution "arbitrary and capricious," he suggested that if a decision were ever made to swap park land for other uses, the committee would be left in an awkward position. Pierre Ghent, a planner and civil engineer, said the committee was "putting itself in a foolish position" by adopting the resolution. No one could predict how traffic increases might affect future decisions.

During discussion of the resolution, the subject of Route 240 came up. Some favored the Baltimore and Ohio Railroad route, while architect Arthur P. Davis promoted his plan for an elevated roadway over the Potomac River near the District shore.

In the end, the Committee of 100 approved the resolution, 17 to 7, along with a second resolution opposing construction of any road in Glover-Archbold Park except a two-lane park drive. [Beveridge, George, "Architects Assail D.C. City Planners," *The Evening Star*, February 22, 1958; "Committee of 100 to Get Grant's Route 240 Plan," *The Washington Post and Times Herald*, March 22, 1958; "Federal City Group Asks Park Ban on Main Roads," *The Evening Star*, March 29, 1958; "Use of Parks For Roads Is Opposed," *The Washington Post and Times Herald*, March 29, 1958]

On April 22, 1958, Colonel Welling announced that the District, NPS, BPR, and the Maryland State Roads Commission had reached agreement on the river alternative for the U.S. 240 entrance to the District. The agreement had been worked out with former Arizona Governor Howard Pyle (January 1951-January 1955), Administrative Assistant and Deputy Assistant to

President Eisenhower. (Governor Pyle was the President's coordinator of programs between Federal and State officials. [PYLE, HOWARD: Records, 1955-59, Dwight Eisenhower Library, [http://www.eisenhower.archives.gov/research/finding\\_aids/pdf/Pyle\\_Howard\\_Records.pdf](http://www.eisenhower.archives.gov/research/finding_aids/pdf/Pyle_Howard_Records.pdf)])

The result of the compromise would not be an Interstate route, however, because trucks would be banned. Beveridge summarized the agreed route:

From downtown Washington near Washington Circle, the District will build an eight-lane expressway paralleling the Potomac River's Whitehurst freeway as far as Key Bridge. This portion will be part of the Federal interstate system, and the Federal Government thus will pay 90 per cent of its cost.

From Key Bridge to the foot of the proposed Glover-Archbold parkway, near the intersection of Canal and Foxhall roads, the freeway will continue as eight lanes. This will be built by the District, but financed by both the District (supplemented by Federal aid funds) and the Park Service.

From Glover-Archbold parkway along the Potomac River to Cabin John, beyond Glen Echo in Maryland, the road will be built by the Park Service entirely with Park Service funds.

Between Glover-Archbold parkway and Arizona avenue, where a new Potomac bridge is planned, the road will be six lanes wide. From that point to Cabin John it will be four lanes wide. The Maryland portion of this river route will be the George Washington memorial parkway, on which the Park Service already has started construction.

At Cabin John the parkway will connect with Maryland's long-proposed Washington circumferential freeway, which will connect with Route 240 south of Rockville and cross the Potomac River on a new bridge at Cabin John.

Route 240 trucks may use the circumferential road, but will not be permitted to use the new river route into town. They may either cross the Potomac at Cabin John or, if headed for Washington, use existing streets such as River road, Massachusetts avenue and Wisconsin avenue. These roads all will be improved.

Colonel Welling said the agreement included the District's plans to build the Glover-Archbold Parkway, between Wisconsin Avenue at Tenley Circle and the new river road, with four lanes for passenger vehicles only. Because NPS had agreed to this plan, officials would not seek additional legislation.

The key to this compromise was abandoning the idea of an expressway that could carry trucks from Rockville to downtown Washington. BPR had insisted on truck usage for any route included in the Interstate System. Now, Beveridge wrote:

A bureau official said today that his office definitely has not abandoned the belief that such an expressway may still be needed at some time in the future. The decision,

however, is that it will not be built immediately, but will await future analyses of traffic needs.

Although the agreement did not include construction timetables, all parties hoped to speed up construction plans.

Wirth said the plan addressed concerns in the Palisades area because it meant NPS would not have to acquire additional property along the river. The NPS was planning “a true parkway that will be fitted into the landscape and be a scenic drive. It will not be a highway such as the District intended to build, or as much of a superhighway as is the Baltimore-Washington parkway.” The eastbound lanes near the District would be built on the level of Canal Road while the westbound lanes would be located on the Palisades bluffs. [Beveridge, George, “Potomac Link for 240 Agreed on by Officials,” *The Evening Star*, April 22, 1958]

The agreement pleased *Star* editors who hoped each agency involved would give their part of the plan “the highest possible priorities for construction.” The positive elements, however, involved “temporary abandonment of the crucial factor,” namely BPR’s “edict” that an all-vehicle expressway was needed between Rockville and downtown Washington as part of the Interstate System. “In effect, the real decision has been to forget such an interstate system connection for the present.” Eventually, officials “may still have to face the job of finding an adequate interstate connection to Route 240 in the future, as traffic increases.” The editorial concluded:

It is encouraging, too, that for the second time in a week the powerful influences of the White House have been used to mediate highway controversies. (Last week end, the White House announced a Constitution avenue bridge agreement.) We hope the President maintains his interest in breaking such administrative deadlocks. [“Major Road Solution,” *The Evening Star*, April 23, 1958]

Even with agreement in hand for the western leg of U.S. 240, the Maryland-National Capital Parks and Planning Commission kept an eye on development in the Wisconsin Avenue corridor. By June, planners on the commission staff pointed out that two major buildings were planned in the path of the projected expressway. “We do . . . wish to caution the commission these projects, desirable as they may be, cannot take the place of a freeway through Northwest Washington and the Chevy Chase and Bethesda sector.” Relying on the river route without the Wisconsin Avenue corridor would lull the public into “a false sense of believing that adequate highways had been planned.” An expressway was needed not only in the Bethesda area but even more so in the Silver Spring area. A parkway only for passenger cars through Rock Creek Park was needed, “but this cannot be taken as a substitute for either a Bethesda or a Silver Spring expressway, let alone for both.”

First priority was the Wisconsin Avenue corridor. The planners urged the commission to work with District officials to preserve the corridor between Western Avenue and Tenley Circle. An expressway between Silver Spring and the Inner Loop was needed, but the planners believed it would be “more difficult, more costly, more disruptive of private property” than an expressway in the Wisconsin Avenue corridor. They added that if the Wisconsin Avenue corridor was abandoned “or allowed to die because of inaction at this time,” efforts for a similar expressway

from Silver Spring would be “doomed to failure before they start.” [Hoffman, Charles L., “Plans Unit to Air Rt. 240 Extension,” *The Evening Star*, June 25, 1958]

Commissioner Gingery was one of the strongest supporters of the Wisconsin Avenue corridor. With developers continuing to maneuver in the area, he believed that immediate action was needed to preserve the corridor. On September 13, he accused other commissioners of stalling on plans for the eastern leg of U.S. 240 between Bethesda and the Inner Loop. He thought the Montgomery County commissioners, in particular, owed the public an explanation for their inaction at a time when the situation had reached emergency proportions.

Gingery added that the Mass Transportation Study that would be released soon would demonstrate that relying on the river route for the western leg was an “unrealistic decision.” He urged the commissioners to pressure the Maryland State Roads Commission to include the corridor in its next 12-year highway plan. This step would allow Maryland and District officials to secure Interstate funds for construction. [“Planners Scored On 240 Stalling,” *The Evening Star*, September 13, 1958]

On November 6, the issue came up when the Maryland commission considered a request by developer Alvin L. Aubinoe for a permit for an office building in the proposed right-of-way at Waverly Street and East-West Highway. The resulting discussion of the corridor dominated the all-day meeting. Gingery pointed out that adopting the corridor without acting to advance it would be “frightfully unjust” to the developer. The commissioners decided to seek a meeting with the Maryland State Roads Commission, BPR, the Montgomery County Council, the District Highway Department, and the Bethesda-Chevy Chase Chamber of Commerce to review the alternative. [“Study Delays Planners’ Rule On 240 Path,” *The Evening Star*, November 7, 1958]

### **Locating the Inner Loop**

On January 5, 1959, the District commissioners held a public hearing in the District Building on the Inner Loop. They were considering:

- The eight-lane Potomac River Freeway,
- Upgrade of K Street from the river to Connecticut Avenue, and
- Location of the Inner Loop between 25<sup>th</sup> and G Streets and 21<sup>st</sup> Street and Massachusetts Avenue, NW.

The latter, known as the West Leg, was the most controversial of the three. District highway officials favored a path along 26<sup>th</sup> Street that Douglas Brinkley said would cost \$35.4 million and displace 480 dwelling units.

The public, as might be expected, was divided. The president of George Washington University, Admiral O. S. Colclough, favored the District’s preferred route, while opposing the route that would affect the university’s expansion plans. The Foggy Bottom Restoration Association had favored the 26<sup>th</sup> Street route because it expected that vacant land could be used to relocate displaced residents. However, the District had zoned the land for “high density apartments,” which the association opposed. Now, the association preferred the route through the George

Washington University expansion area. Further, the association urged the District to decide the route soon because in the meantime, Foggy Bottom residents were having difficulty selling or financing renovations due to the uncertainty.

Colonel William E. Shepherd of the Georgetown Citizens Association said his group favored the 26<sup>th</sup> Street route if an expressway had to be built. He said his members preferred improvements to existing streets. "I am not sure we are going to be satisfied with the loop after it is bought and paid for." He asked, "Why should we Washingtonians suffer our fair city to be slashed to pieces so that they [commuters] may tear through it at 50 m.p.h.?"

The Federation of Civic Associations urged the city to establish a relocation service to help displaced residents. The Washington Housing Association, Washington Urban League, National Association of Social Workers, and the National Capital Council of Churches also supported such a service.

The Progressive Citizens Association, out of concern for historic structures, urged that the interchange between the Potomac River Freeway and the West Leg be moved as far east as possible. The current proposal threatened, for example, the Thomas Peter House at 2618 K Street, NW., a colonial house dating to 1795 when the builder gave it to his son, Thomas Peter, and new wife, Martha Parke Custis Peter, George Washington's step-granddaughter. Washington stayed in the house several times while in the area on business related to construction of the new capital city. He stayed in the house on his final visit to the area in August before his death on December 14, 1799. Leo M. Bernstein, whose family owned the house, offered to turn it over to a foundation if it would be used as Washington City Museum. [*WPA Guide to Washington*, page 386]

The Washington Building Congress was concerned that the District's 10 percent share of the \$1 billion Inner Loop might jeopardize expenditures for education, water pollution, police protection, and other city functions only "to shave 20 minutes off commuter's travel time." With the increased number of cars entering the city, the group urged construction of adequate off-street parking, as well as imaginative designs to minimize "this great highway ditch" through the city.

The Washington chapter of the American Institute of Architects questioned whether the Inner Loop would "relieve traffic sufficiently to justify its enormous cost." The group supported the segment south of K Street, but favored holding off on the segment to the north until the city had a rapid transit system, provided more off-street parking, and improved city streets. Spokesman Francis D. Lethbridge said:

There is no point in encouraging the increased use of automobiles by building additional freeways within the city until we have successfully coped with the volume of traffic which existing arterial streets and freeways already pour in upon us. A good rapid transit system is what we need most.

According to the *Star*, "No specific opposition was registered to still another highway project before the hearing—drastic improvement of K street between the Potomac River and Connecticut avenue, including an underpass of Washington Circle." [Beveridge, George, "Loop Network

Plan Backed, Assailed,” *The Evening Star*, January 5, 1959; “Groups Rap Loop Plan For North of K Street,” *The Evening Star*, January 6, 1959]

Despite the District’s opposition, the Wisconsin Avenue corridor was still under consideration, especially in Maryland. The District had abandoned it after holding a public hearing and had reached agreement with NPS and BPR on a river route. Nevertheless, the Maryland-National Capital Park and Planning Commission staff continued to study alternatives for the corridor. A year earlier, the commission had favored Route B, which ran west of Wisconsin Avenue from the District line to Oliver Street (estimated cost: \$31,022,000). It continued along Wisconsin Avenue to Bradley Lane east of Wisconsin to Glenbrook Parkway.

From there, Route B and Route A were identical. Route A began east of Wisconsin Avenue, then paralleled the avenue between Oliver and Hesketh Streets (\$30,640,000). It cut through the western edge of the Chevy Chase Country Club before cutting one block east of Wisconsin Avenue to meet Glenbrook Parkway at the edge of the Bethesda business district.

Route C followed Route A from the District Line to Bradley Lane (\$30,916,000). From there it shifted about a block east of Route A and B to Glenbrook Parkway, then was identical to those routes.

Route D began east of Wisconsin Avenue along the path of Route B (\$31,415,000). It joined the other routes through the country club before shifting along the edge of the club to the end of the Bethesda business district. It then followed the other routes to connect with U.S. 240.

On January 31, 1959, commission staff revealed that they still recommended Route B because it would do the least damage to residential areas. To aid decisionmaking, the commission planned to hold a public hearing on February 21, again at Leland Junior High School. [“Planning Staff Picks Route B Expressway,” *The Evening Star*, January 31, 1959]

About 400 people attended the hearing, “most of them opposed to the proposal . . . to build the four-to-six-lane expressway from the District line through Chevy Chase and Bethesda to Pooks Hill,” according to the *Star* account. J. Newton Brewer, Jr., one of the commissioners Gingery had criticized the previous year, said that one problem was that neither the Maryland State Roads Commission nor District officials had agreed on a path through Washington. “Our big problem is that the District won’t give us any consideration. They won’t even come to the hearing. The best information I can get from the highest District officials is that Route 240 in the District won’t be built for 15 to 20 years.” Brewer added that while he opposed Route B, if the District would support it, “I may even vote for it.” (A District highway official attended the hearing as an observer.)

In introducing Route B, commission planning director Arthur K. Stellhorn warned that unless the State built an expressway in the corridor, congestion would grow even worse. He anticipated opponents’ arguments by pointing out that the county would lose only about \$125,000 a year in taxes from the properties acquired for the expressway. Moreover, it would not be a “Chinese wall” dividing Bethesda because the 10 to 12 crossings of the route would involve underpasses or overpasses for cross traffic.

Opponents argued that improving Wisconsin Avenue could solve problems for 2 or 3 decades along with removal of parking along much of the avenue. A Woodward and Lothrop department store representative said Route B would take 550 of the department store's 771 parking spaces, irreparably damaging the business. A resident of Bradley Boulevard argued that taking country club property would lead to its gradual replacement by housing developments. Others were concerned about the demolition of about \$4 million in property, while some speakers favored the river route, construction of a subway line in the corridor, a route through Rock Creek Park or along the Baltimore and Ohio Railroad line.

Some supporters among the 30 or so speakers mentioned the 90-percent Federal funding for an Interstate route, the inevitable growth of automobile traffic, and the likelihood that the expressway would draw traffic away from residential communities.

Despite the mix of views, the *Star* characterized the hearing in these words:

The sentiment of those attending the hearing was clear at the outset. They listened politely to those speaking on behalf of the expressway but made no demonstration. They loudly applauded those speaking against it.

The commissioners indicated they would decide the issue soon. [Alibrando, Alfred, "Expressway Plan Hit and Defended," *The Evening Star*, February 21, 1959; Alibrando, Alfred, "Civic, Business Interests Oppose Expressway Scheduled Through Bethesda, Chevy Chase," *The Evening Star*, February 22, 1959]

On March 2, 1959, Colonel Welling announced that Harold L. Aitken, formerly of Clarkeson Engineering, would be the new District Director of Highways and Traffic. He would succeed John Robertson, who had retired. Aitken, a Nebraska native, had been a design engineer with BPR from 1931 to 1951. He headed the Nebraska Department of Roads (1951-1953) and was chief of staff to Civil Defense Administrator Val Peterson before joining the District Highway Department in 1958 as a special assistant to Robertson. The new director lived with his wife and two children at 512 Horner Court in Fairfax, Virginia. ["Harold L. Aitken Named D.C. Highway Director," *The Evening Star*, March 2, 1959]

True to their promise at the public hearing, the Maryland commissioners did not take long to decide against adding the Wisconsin Avenue corridor to the map. After a heated debate on March 11, they voted 4 to 1 against the corridor, with the chairman and three members abstaining.

Gingery cast the only vote in favor of the corridor, calling the commission's decision a "rape of the general public."

Chairman Wells said the decision was "the most important thing that will ever come before us." He said that virtually all the engineers and professional planners favored the corridor. "It's got to come. The longer we put it off, the more expensive it's going to be." He said that District officials were close to resolving the issue of tying in with a Maryland route.

Commissioner W. Lawson King, one of the four negative votes, said he favored the Rock Creek Park routing. He did so despite objections from those interested in “birds, bees, snakes and turtles.” Another commissioner, Alva H. Bender, said, “I spent 23 minutes driving [on Wisconsin Avenue] from Bradley boulevard to East-West Highway.” He added, “We’ve got to have some new transportation facilities.”

Pritchett of the Maryland State Roads Commission said after the meeting that the Wisconsin Avenue corridor was “a good route.” He added, “Obviously, if the corridor doesn’t get on the interstate soon, it will be killed.” [“Planners Vote to Abandon Wisconsin Avenue Corridor,” *The Evening Star*, March 12, 1959]

The commission’s decision meant that it would approve Aubinoe’s permit for the office building at East-West Highway and Waverly Street. However, following the commission’s action, Gingery went to court to secure a 23-day temporary injunction to halt the building.

His action “apparently has spurred area officials into a last, sincere effort to find a solution.” Aitken indicated that District studies underway should result in “something in the way of a least objectionable route” for the corridor. He added that BPR had informed him that to qualify for Interstate funds, the route must be continuous from the circumferential to the Inner Loop.

Chairman Wells thought BPR had agreed to 90-percent Interstate funding of a route from the District line to Tenley Circle if District officials agreed to seek a connection to the Inner Loop. He urged a meeting of all parties to try to resolve such discrepancies and reach agreement on the route. [“Parley Urged to Clear Route 240 Impasse,” *The Evening Star*, March 15, 1959]

In a court hearing on April 3, the developer agreed to delay any action on his building for 30 days to allow officials to try to reach agreement on the eastern leg corridor. Pritchett had testified that during a recent meeting of BPR and Maryland road officials, the District said it would come up with an approved route into the city. The court agreed that after the 30 days, the developer could proceed unless Maryland began condemnation proceedings for his property. [“Builder Agrees To Delay Work,” *The Evening Star*, April 3, 1959]

On April 22, District officials and BPR were scheduled to meet at the White House to discuss the District corridor with Gerald D. Morgan, who had become Deputy Assistant to the President after Governor Pyle left the post on January 31 to become president of the National Safety Council. The *Star* reported that following the Maryland commission’s decision to drop the Wisconsin Avenue corridor from the map, the White House had “apparently ordered” the District and BPR to study alternatives. The meeting was canceled, but District highway officials sent the District commissioners a proposed corridor for the U.S. 240 connection between Pooks Hill and the Inner Loop. [“Plan for Corridor Sent D.C. Heads; Road Meeting Off,” *The Evening Star*, April 22, 1959]

A week later, the District commissioners decided not to build an expressway in the Wisconsin Avenue corridor. In a long meeting, the commissioners indicated they would proceed with the Glover-Archbold Parkway. They might at some unknown time build a six-lane freeway from Tenley Circle to the Maryland line near Wisconsin Avenue if Maryland insisted on building a

route to the District line. However, it would not be part of the Interstate System and would not be eligible for 90-percent Federal funding in Maryland or the District.

Moreover, the commissioners concluded that an expressway in the corridor was not needed. The river route would be sufficient for the west leg of U.S. 240, while east leg traffic could be handled by the Glover-Archbold Parkway and Fort Drive, the intermediate circumferential along the District border that would allow dispersal of traffic to several arterials.

The commissioners were aware that the preliminary Mass Transportation Survey, already released, recommended construction of a freeway in the Wisconsin Avenue corridor. They said that their decision did not repudiate that recommendation, but meant only that it would not be part of the Interstate System. [Beveridge, George, "D.C. Rules Out Freeway Along Wisconsin Ave.," *The Evening Star*, April 28, 1959]

On April 29, the Maryland-National Capital Park and Planning Commission, after a lengthy discussion, decided not to map an Interstate freeway in the Wisconsin Avenue corridor to the District border. BPR had indicated the corridor would be eligible for 90-10 Interstate funds only if the District and Maryland agreed on it, the commissioners had little choice but to abandon the Wisconsin Avenue corridor.

Gingery said the District's action in rejecting the corridor made a farce of the preliminary results of the Mass Transportation Survey. "It means the whole mass transportation survey might as well go up in smoke." As the commissioners knew, the survey had emphasized a freeway system as well as mass transit. He lamented the loss of \$40 million in Federal Interstate funds, but could not reverse the decision. "I'm at a loss to say what is an alternative." All the commission could do now was to let traffic become so congested that residents demanded action.

Vice Chairman Brewer suggested that the District's action could revive interest in a Rock Creek Park routing. "In my humble opinion, a good passenger car road can be built without disturbing the value of the park. It would make the park more available to tens of thousands of people who don't see it now." He urged Chairman Wells to have the planning staff study a new freeway route.

The developer, whose plans had been blocked by a temporary injunction secured by Gingery, said he would begin construction of the office building as soon as the court released his permit. He added that if the Maryland State Roads Commission still planned to build the freeway, he would not block it. [Hoffman, Charles L., "Dropping of Corridor Brings Mixed Reaction," *The Evening Star*, April 29, 1959]

In an April 29 editorial titled "No Wisconsin Freeway," the *Star* said the District's action had "slammed the door on the controversial 'Wisconsin avenue corridor' freeway with a resounding bang."

### **Still Thinking of Wisconsin Avenue**

A week later, a steering committee of the Mass Transportation Survey revived the idea. As discussed earlier, the steering committee had devised an expressway from Tenley Circle that

would cross Rock Creek Park on a high bridge over Hazen Park then meet the Inner Loop at T Street.

The idea, which NPS favored, would work only if an Interstate freeway in the Wisconsin Avenue corridor would connect U.S. 240 at Pooks Hill and Tenley Circle. District officials, who were now considering an expressway in the North Capitol Street corridor to connect the Inner Loop with the circumferential, were skeptical. Director Aitken favored the North Capitol Street plan, but Federal Highway Administrator Tallamy was open to Interstate status and 90-10 funding for the steering committee's proposal if the District supported it and the necessary link to the east leg of U.S. 240.

The steering committee's idea caused officials in Maryland and the District to rethink recent decisions. While the District was thinking of North Capitol Street, the Maryland-National Capital Park and Planning Commission had gone on record on May 6 in support of the proposed highway through Rock Creek Park to the Inner Loop. Vice Chairman Brewer had said:

There is not a single expressway in Montgomery County except part of Route 240, which ends nowhere and has taken 11 or 12 years to build. We're not serving the people who need to be served.

As planners interested in Montgomery and getting people to town we should come out in favor of the Rock Creek Park route. It wouldn't disturb the park: it would open it up to thousands who don't see it or enjoy it now.

Of course, NPS remained opposed to the north-south park alternative. Acting Director Elvind T. Scoyen made this clear. "I am sure that the National Park Service always has opposed a speedway through Rock Creek and continues to do so . . . . The only advantage of building a highway through Rock Creek is that it would be cheaper, but it is a firm policy of the National Park Service that the values of the park are greater than the cost of highways." [Deane, James G., "Cross-Park Freeway Project Wins Support," *The Evening Star*, May 7, 1959]

Pressure mounted on the District when NCPC and the National Capital Regional Planning Council, which were conducting the Mass Transportation Survey, voted to place the Wisconsin Avenue corridor on the official freeway map with a link via the high bridge across Hazen Park to the Inner Loop. They did so only after what George Beveridge called "a knock-down-drag-out joint session" on May 7.

General Welling argued against the plan, but only one of the 14 planners at the session, John Remon, supported the District. Remon argued that the plan for an expressway in the Wisconsin Avenue corridor was not popular in the District. National Capital Parks Superintendent Thompson replied that "no freeway routes are likely to win any popularity contests." He supported the new plan.

The joint commissions approved a resolution drafted by Bartholomew stating that the Wisconsin Avenue corridor had been left off the critical official transportation plan because of uncertainty about a route downtown. Now, a feasible freeway location had been found. Bartholomew

contended that both planning agencies had always supported an expressway in the Wisconsin Avenue corridor, believing that an expressway in the corridor and the Glover-Archbold Parkway were both needed.

Bartholomew said “a combination of errors” left the Wisconsin Avenue corridor off the freeway map. Gingery, who led the debate with Bartholomew, agreed that obviously, the consultants who prepared the map had been in error in leaving the corridor out.

Beveridge ended his report on the joint meeting by writing:

In a session filled with harsh statements, one of the mildest—and most influential—came from James L. Shotwell, a Federal Bureau of Public Roads official, who made it clear that the bureau is anxious to see an interstate expressway connecting Route 240 with the Inner Loop downtown.

In view of the commissions’ action, General Welling said the District commissioners would “consider” the new freeway location. [Beveridge, George, “Area Planners Back Wisconsin Ave. Route,” *The Evening Star*, May 8, 1959]

(Shotwell was Assistant Engineer-Coordinator in BPR’s Office of Engineering.)

The sudden reversal came as Aubinoe received his building permit even as Montgomery County officials considered constructing a county building in Bethesda within the expressway corridor. The president of the County Council, Mrs. Stella B. Werner, said, “They certainly keep us stirred up.”

Commission Vice Chairman Brewer said of the recent developments, “I am still violently opposed to putting that Chinese wall through Bethesda.” The rest of the commission remained divided. However, John A. Floyd, who had abstained in the 5 to 1 vote in March against the corridor, said, “Eventually Washington is going to need a minimum of three, and possibly four, high speed highways into the county.” [“Corridor Issue Stirs Nearby Officials Again,” *The Evening Star*, May 8, 1959]

In what Beveridge called “another day of talk and position-jockeying on the freeway controversy,” the commissions issued a joint statement pointing out that the Mass Transportation Survey, still not yet released to the public, recommended a modern mass rapid rail transit line in the Wisconsin Avenue corridor as well as an expressway. Aware that the commissions were about to approve adding the corridor to the freeway map, the District commissioners had voted the night before, 2-1, against adding it to the plan.

The White House, which would be the recipient of the Mass Transportation Survey, had cleared the joint commission statement, but not any other description of the plan. In fact, District Commissioner David Karrick had asked the commissioners to issue the statement because he did not think people realized the survey was going to recommend the mass transit plan for the same corridor.

Commissioner McLaughlin had cast the vote in support of the freeway in the Wisconsin Avenue corridor. He agreed that a mass transit line was needed in the corridor, but thought a corridor would have to be acquired as soon as possible to be used by the rail line and freeway lanes. Otherwise, acquiring the right-of-way would become so expensive that the transit line might be blocked for years.

In a hastily arranged press conference, Aitken said he would have to restudy the city's entire highway program before advising the District commissioners on the issue. Such a study might take 6 months or more. He said the Mass Transportation Survey called for an estimated \$870 million worth of new freeways, while the District expected 90-10 Interstate funds amounting to only \$355 million. The balance of \$500 million worth of freeways would have to be financed on a 50-50 basis under the regular Federal-aid highway program. For example, the District could consider dropping plans for an Interstate highway in the New York Avenue, NE., corridor to allow the funds to be shifted elsewhere. Alternatively, the U.S. 240 eastern leg traffic might be routed around the circumferential to enter the District in "another corridor" on or near North Capitol Street. [Beveridge, George, "Trains to Be Urged For Rapid Transit," *The Sunday Star*, May 10, 1959]

In June, NCPC Executive Director William E. Finley proposed building tunnels under Cleveland Park and the Bureau of Standards to reduce destruction of homes as part of the Wisconsin Avenue corridor expressway link. The Cleveland Park tunnel would begin west of Wisconsin Avenue near Tenley Circle and surface at Reno Road. The second tunnel would begin under the Bureau of Standards and Connecticut Avenue, emerging on Connecticut Avenue near Hazen Park, opposite the bureau:

Mr. Finley envisions this plan as preventing the destruction of many Cleveland Park homes, the Sidwell Friends School, the Home for Incurables and Phoebe Hearst Elementary School. He said no apartment house or homes in the Connecticut avenue area would be disturbed.

Finley also wanted to assure residents that NCPC had no plans for an expressway along Macomb Street. Such a route was shown on a map that had been prepared when Senator Douglas was fighting the Glover-Archbold Parkway, showing alternatives. ["Two Tunnels Proposed for Cleveland Park," *The Evening Star*, June 27, 1959]

### **Premature and Divisive Factionalism**

On July 9, 1959, the District commissioners and the area's planning agencies delivered the 4-year, \$500,000 Mass Transportation Study to President Eisenhower. Commissioner McLaughlin told reporters, "We found that while the President was obviously not aware of the contents of our report, that he foresees all the significant results." The President, the commissioner said, promised to "do everything possible to help in a quick realization of the results of our survey."

According to the *Star*, Gingery "was delighted when the President opened the meeting by asking, "How about this 240 business?" President Eisenhower did not know all the area's roads and bridges, but he was familiar with U.S. 240, the route he took to the Burning Tree Country Club

for golf and on occasion to Camp David. Author Helen Leavitt, a critic of the Interstate System, recalled the incident:

One of the planners who was present at the 1959 meeting recalls that the President also commented at that time about the heavy commuter traffic he observed during his drives to suburban Maryland's Burning Tree Club for a game of golf. Mr. Eisenhower noted that a large number of automobiles was entering the city, but that most of these carried only one person. He suggested that since these automobiles clog streets and demand precious space for parking it might be feasible to limit the number of automobiles entering the city.

Testifying before the Senate Committee on Public Works in 1960, Gingery recalled General Welling's response regarding U.S. 240: "Mr. President, we are going to put it down beside the Potomac River." This response frustrated Gingery, who told the committee:

Now, if that is not utter confusion, when you find the presentation made by the District Highway Department to run it down the central corridor; as late as last August [sic], the District was telling the President of the United States we were going to run it down the Potomac River which had been completely rejected by the State of Maryland.

He added, "We have got to have some idea what we are doing." ["Area Survey Hailed by Eisenhower," *The Evening Star*, July 9, 1959; Location of Interstate Route 70 South (Maryland and District of Columbia), Hearing, Subcommittee of the Committee on Public Works, United States Senate, 86<sup>th</sup> Congress, 2<sup>nd</sup> Session, June 14, 1960, page 49; Leavitt, Helen, *Superhighway-Superhoax*, Doubleday and Company, 1970, pages 298-299]

(During this period, President Eisenhower appears to have realized that, contrary to his vision, the Interstates were being built in cities. Stephen Ambrose, in volume II of his biography of Eisenhower, explained:

Of all his domestic programs, Eisenhower's favorite by far was the Interstate System. By 1959, it was in bad trouble. Construction costs were far higher than had been anticipated, primarily because of the expense of building urban freeways directly through the inner cities, where land acquisition prices and the problems of building the roads were so much greater than in the countryside. In Eisenhower's vision, the superhighways were not supposed to have gone into the cities, but only around them, as in Europe. His objections were not sociological—few if any of those associated with the building of the Interstates anticipated the tremendous effect the urban freeways would have on housing patterns, schools, inner-city conditions, the spread of the suburbs, or the other nearly limitless ways in which the four- and six- and eight-lane highways changed the face of urban America. Eisenhower's objections were to the cost, not the result.

(Why President Eisenhower did not know about the urban Interstates is unclear. He likely was not familiar with the 1939 report to Congress, *Toll Roads and Free Roads*, which discussed the urban freeway network, or the more detailed discussion of urban freeways in the 1944 report, *Interregional Highways*. Members of Congress were well aware of the urban segments as they

debated the proposed program in 1955 and 1956; mayors testified about the benefits their city would enjoy from the urban Interstates.

(President Eisenhower was apparently thinking of Germany's autobahn network that he had seen and used; it was an entirely rural network. General Clay, whose committee put together the President's highway plan, also was fully familiar with the autobahns. However, he may not have understood the urban commitment since the Clay Committee's plan for the program budgeted only \$4 billion for urban feeder and distribution routes over the life of what was thought to be a \$27 billion, 10-year program. If General Clay did not understand the planned urban Interstates, he could not have made it clear to his friend, President Eisenhower.

(Some sources indicate that the President realized the truth about the urban segments during his July 9 meeting with the planning commissioners and District officials about the Mass Transportation Survey as they described the area's freeway network. Ambrose offered another theory:

The evidence that Eisenhower was unaware of this deal [his Administration's promotion of the Interstate System to urban Members of Congress] comes from his reaction to seeing, in July of 1959, while driving from the White House toward Camp David, a deep freeway construction gash in the outskirts of metropolitan Washington. Surprised and appalled by what he saw, when he got to Camp David he called the Director of the Bureau of the Budget, Maurice Stans, to ask for an explanation.

(Ambrose provided an account of the July 9 meeting about the survey:

Unsatisfied with the result [of his call to Stans], he ordered a formal White House study of the urban Interstates [on July 2]. On July 9, he called in the members of the Mass Transportation Survey of the Washington Metropolitan Area and asked them what they were doing about a rapid-transit subway system. The reply was that some \$1 billion would be spent over the next twenty years. The President then "stated his concern that too much of the interstate highway money might be going into connections in the cities." Next, the President asked whether the committee had considered placing a special tax on automobiles coming into the central cities, "it being his observation that it was very wasteful to have an average of just over one man per \$3,000 car driving into the central area and taking all the space required to park the car."

(On April 6, 1960, President Eisenhower participated in a 55-minute meeting with his staff, Secretary of Commerce Frederick Mueller, and Federal Highway Administrator Tallamy to discuss the internal study of the urban Interstates. At the end, he remained unhappy about the urban Interstates, but after Tallamy handed him a copy of the 1955 Yellow Book showing outlines of the Interstate System in urban, conceded they were part of the program. (The Yellow Book will be discussed later.) As a result, the program "had reached the point where his hands were virtually tied." His staff completed a formal report on their review just before President Eisenhower left office on January 20, 1961; President Kennedy and his team ignored the report. [Ambrose, Stephen, *Eisenhower: The President*, A Touchstone Book, Simon and Schuster, Inc., 1985, pages 547-548, citing Memo for record, 9/15, 59, DDE/DS])

President Eisenhower transmitted the Mass Transportation Survey to Congress on July 11 (letter dated July 10). The brief transmittal letter said the report “points out the present and future problems of transportation of people and goods in the Region.” Based on the recommendations in the report, the actions taken in the years ahead “to meet the problems of transportation will have a profound effect on the economy of the entire area, the welfare of its people, and the status of Washington as the Nation’s Capital.” He asked appropriate Federal agencies to study the survey and make such “recommendations as are warranted” to the Congress.

The report, to be discussed later, included a rail transit line and freeway from the eastern leg of U.S. 240 (I-70S) into the District along the Wisconsin Avenue corridor via Bethesda and Chevy Chase, intersecting Fort Drive, and crossing Rock Creek Park to the Inner Loop. The survey also recommended the planned western leg, essentially a segment of the circumferential, and the link from the Cabin John Bridge along the Potomac River to the Inner Loop in the District.

Senator Bible took to the Senate floor on Friday, July 17, to say the Mass Transportation Survey “marks the beginning of a comprehensive long-range program of coordinated action in dealing with these problems.” The Joint Committee on Washington Metropolitan Problems would study the survey report, including its data and recommendations, before holding public hearings. The joint committee “must now face the very largest questions in Washington’s future.” This was because transportation decisions on the area’s transportation were “intertwined with its earlier conclusions on water supply, sewage disposal, land use, and economic development.” Taken together, these matters required “the closest cooperation of all interests, whether Federal or local, urban or suburban, public or private.”

He warned:

Let us not allow ourselves to be diverted, while dealing thus with fundamentals, into the premature and divisive factionalism which invariably surrounds the debate on the merits of specific transportation measures, particular routes, isolated projects, and which many Members of Congress have painfully experienced. What has been shown by the arguments which have raged in recent months over Route 240, Route 66, the Glover Archbold Parkway, except the impossibility of wisely deciding these matters when a comprehensive plan for regional transportation is lacking? We have now the opportunity to create such a plan. If we succeed, it will go far toward solving, or at least putting in proper perspective, not only such difficult past decisions as those involving the location of bridges and expressways, but the still more difficult future decisions our swelling population and the changing times will present. [Washington Mass Transportation Survey, *Congressional Record-Senate*, July 17, 1959, pages 13672-13673]

The Bethesda-Chevy Chase Chamber of Commerce had supported the Wisconsin Avenue corridor for the eastern leg of U.S. 240, but with the qualifier: only “if such a route is necessary.” Now, following release of the survey, the group gave the corridor its unqualified support. A spokesman explained that the members had “determined that something must be done in the immediate future to relieve the rapidly increasing traffic congestion on Wisconsin avenue in Bethesda.” The chamber favored construction “at least two blocks to the east of Wisconsin avenue.” [“Wisconsin Corridor Has Chamber OK,” *The Evening Star*, July 20, 1959]

By November, the Maryland State Roads Commission was ready to complete the segment of U.S. 240/I-70S from the north to the \$2.3 million Pooks Hill interchange, the dividing point for the east and west legs. Officials announced that the northbound lanes would open on Monday, November 9. Governor Tawes was expected to attend a ceremony opening the full interchange at the end of the month. [Herndon, G. O., "Pooks Hill Interchange to Open For Northbound Traffic Monday," *The Evening Star*, November 6, 1959]

### **The Joint Committee Hearings**

The Joint Committee on Washington Metropolitan Problems, chaired by Senator Bible and with Frederick Gutheim as staff director, held hearings on the Mass Transportation Survey on November 9-14, 1959. The hearings, which were primarily concerned with the transit recommendations, will be discussed later. [Transportation Plan For The National Capital Region, Hearings before the Joint Committee on Washington Metropolitan Problems, 86<sup>th</sup> Congress, 1<sup>st</sup> Session, November 9, 10, 11, 13, and 14, 1959]

Despite the survey's focus on mass transit, the hearing provided an opportunity for criticism of the proposal's highway elements. On the first day of the hearing, Roy W. Johnson, chairman of the American Council to Improve Our Neighborhoods or ACTION (and outgoing head of the Pentagon's space program), said that "the full impact of the Interstate Highway System upon this metropolitan area of 2 million people illuminates a national problem. Washington faces what all our large metropolitan areas must face, the challenge—and the opportunity—of modern transportation."

Regarding the survey's finding that the region needed 329 miles of high-speed, limited-access highways, Johnson said this conclusion was "not the novel conclusion it might appear" because all but 70 miles of the proposed 1980 network were already on the books. He asked whether the additional highways "will restore our already maimed city to health—or is it a crutch that merely eases the pain of a last, fatal illness?" As an illustration, he cited Los Angeles which had "probably one of the most acute problems in the country because of all of the highways." The result, he said, was "that the city is choking and we read in the papers every day of the problem it has." [pages 26-31]

Arthur H. Keyes, Jr., of the Washington Building Congress recommended "a financially feasible 'transit dominant' system (bus and rail-subway), rather than the proposed freeway system with a subway added to handle the traffic overflow at great cost to the taxpayer." Aside from the aesthetic impacts, extensive freeways would obliterate tax-producing properties, thereby imposing an "additional financial burden on the city." He urged efforts to "discourage the ever-increasing use of private automobiles for commuting" as well as to steer interstate and inter-suburban traffic away from the central city by the construction of loops and intermediate loops.

He singled out the Inner Loop. The public, he said, was only "beginning to comprehend the radical changes which the inner loop and its approaches will make in the appearance of the city during the next 5 to 10 years." Unfortunately, the Inner Loop had been authorized before the Mass Transportation Survey began "and prior to any public discussion of it." This meant the city was "virtually committed to what might be called the Los Angeles solution." If the Inner Loop

could not be halted, “then at least much can still be done through sensitive and skillful design to soften the impact of the broad highway design problems, their relation to adjoining spaces, the structural shapes, the use of the land, and so forth.” All, he added, “should be openly discussed.” [pages 71-73]

On the second day of the hearings, Chairman David Finley of the Commission of Fine Arts praised mass transit and attacked the freeway elements of the survey. The central area was already “beyond the saturation point.” To reduce the number of automobiles in the center city, he favored “rapid and comfortable means of transportation” and transfer of centers of employment throughout the city instead of its center. He was skeptical that more freeways were needed, but if they were, as the survey suggested, “care should be taken to avoid destroying vistas and causing damaging scars across the city.” He continued:

Such freeways are in principle an extension of the practice started by the inner loop belt, of which sections are now under construction. The city is being changed to fit the standard patterns of highway engineers rather than to conform to the Washington plan so long established. [page 121]

Grosvenor Chapman of the American Institute of Architects, Washington Metropolitan Chapter, favored bus and rail, including subways. “These sentiments are motivated, in part, by the earnest hope that our present heritage of national monuments, vistas, parks, public buildings, and river banks will not be lost in a confusion of highway ramps, loops and interchanges.” He urged Congress to scrutinize each planned freeway carefully to determine if transit could not provide greater service. [pages 127-128]

On November 10, Louis Justement, mentioned earlier in connection with plans for redeveloping southwest Washington, testified on behalf of the American Institute of Architects. The survey, he said, was based on “a projection of existing tendencies, and on an effort to comply with these existing tendencies, instead of providing a solution that would create a new and more desirable growth pattern based on stimulating changes in the mode of travel used to and from work.” That concept may seem reasonable until carried to the point of \$2.5 billion in costs and we “realize the monstrous city we would produce at such a fantastic cost.” Reconsidering the premises is warranted.

Polls showed that people preferred to commute in their private automobile, but they might think differently “if they were called upon to foot their fair share of the bill through increased taxes”:

We are just beginning to realize how horrible the freeway can make the central city, for the freeway, unlike rail transit, needs a tremendously wide right-of-way, and cannot go underground. The costs of going through a slum area can be accepted, since we want to get rid of the slums anyway. But the cost of going through fine residential areas consists of far more than the acquisition of the right-of-way. The destruction of adjacent values is so great that no acceptable solution can be found . . . .

To begin with, let us stop subsidizing the private automobile and endeavoring at great cost to the community to make the use of private automobiles more convenient than mass

transportation. Let us cease the contemplated desecration of parks in the central city with freeways and interloops, and let us merely complete those that are in advanced stages of planning and construction.

If city planning focused on making mass transportation more convenient and efficient, the results would be that “(a) the central city would become a more desirable place in which to live in comparison with the outlying suburbs; (b) the private automobile would become increasingly inconvenient and expensive in comparison with the mass transportation; (c) that mass transportation would be enabled to hold its own and offer better service and/or avoid rate increases.”

In short, “the freeway solution should be rejected because it simply will not do the job.” He cited the Whitehurst Freeway as an example. It was “choked bumper to bumper in the rush hours, not because it is two lanes in each direction or incapable of handling the traffic which seeks to use it, but because the outlets at the east end in the morning and the west end in the evening are incapable of absorbing these two lanes.” Providing four lanes in each direction would only worsen the situation. “And if these bottlenecks at the end are removed, they will simply recur one block farther east or west, for we cannot escape this basic fact.” Ordinary streets cannot absorb freeway traffic volumes. [pages 271-273]

On November 13, Colonel Shepherd testified on behalf of the Committee of 100 on the Federal City and the Georgetown Citizens Association. Attempting to “satisfy the ever-mounting desire of motor vehicle operators for highway capacity and parking facilities will tend to disfigure and bankrupt the city.” He cited the Inner Loop Freeway as an example of his claim that any freeway built in a closely packed urban area “gives rise to serious social and financial problems.” Problems included loss of tax revenue, increased need for parking, dislocated families and businesses, and replacement of public facilities, such as schools, in the path of the freeway. The city cannot, he said, afford to subsidize motorists at these costs:

I sometimes wonder how many taxpayers in this city are aware of these problems and how many know then what the inner loop is intended to do, how much it will cost, and what it will look like when finished.

He stressed that the Inner Loop Freeway was not a single loop, but a double loop:

In order to make room for the freeway and its ramps, block after block of existing buildings will have to be condemned, park land will be taken, and it will all be quite unsightly and enormously expensive, estimated in 1955 to cost upward of \$272,667,000 of taxpayers' money.

Colonel Shepherd pointed out that while the Southwest Freeway was a high priority, its extension west would “squeeze between the Lincoln Memorial and the river,” “pass west of the Lincoln Memorial as a 6-lane depressed facility, open to the sky except for a tunnel approximately 600 feet long,” and “the noise and fumes generated by traffic, particularly trucks using this route, will be most objectionable.” He urged “elimination of highway construction in this area of our city

which could be compared to the sacred precinct of Olympia, now and always protected from incursion by commercial activities.” [pages 782-784]

David Sanders Clark, accompanied by Samuel Spencer, former president of the District’s Board of Commissioners, testified on behalf of the Committee To Oppose the Cross-Park Freeway From Tenley Circle Across Rock Creek Park to the Inner Loop. The committee had formed to protest “attempts by certain overzealous planners” to force approval of “an interstate automobile and truck freeway through the midst of our fine quiet residential areas and through Melvin C. Hazen and Rock Creek Parks, before there had been any public discussion of the proposal, or any proper consideration of the lasting damage it would cause.” Proponents seemed to favor it to secure 90-percent Interstate funding, while the Mass Transportation Survey’s engineering consultants “found no requirement for such a route.” Their statement continued:

Yet this hasty proposal was inserted in the survey report as “The Northwest Freeway Link Between Tenley Circle and the Inner Loop.” This was done despite the vigorous objections of four members of the National Planning Commission and the National Capital Regional Planning Council, including D.C. Engineer Commissioner Welling.

Although the committee had other goals, “we still strongly object to the tactics which were used to promote the Northwest Freeway.” They would present their arguments against the freeway at the appropriate time. [pages 798-799]

### **Aiming Towards The City**

Governor Tawes came to the Washington area on November 30 to open several road projects, each with a brief ceremony. First, he helped remove the last “road closed” sign from a 2.4-mile stretch of Columbia Pike between Cedar Croft Sanitarium and Burnt Mills. It would be designated part of U.S. 29. At a small speaker’s stand erected under a bridge of the Pook’s Hill interchange, he discarded much of his speech on a cold, windy day, but commended the Montgomery County Council for its united front in presenting the county’s needs to the roads commission. Using 4-foot long scissors, Governor Tawes and Council President Werner snipped the ribbon opening the interchange. After lunch, the Governor completed his ceremonial day by opening a 6-mile section of State Route 5 in Prince Georges County between the District and Andrews Air Force Base. [“Tawes Makes It Brief Opening 3 Roadways,” *The Evening Star*, November 30, 1959]

By March 1960, District highway officials wanted to clarify what they had in mind for linking the eastern leg of U.S. 240/I-70S with the Inner Loop within the corridor identified in the Mass Transportation Survey. At the Pooks Hill interchange, traffic would be directed onto the circumferential. At an interchange in Silver Spring where the Baltimore and Ohio Railroad crossed the beltway, traffic would use the North-Central Freeway corridor east of Rock Creek Park to intersect the Inner Loop west of Soldier’s Home. This option, District highway officials believed, would avoid the resistance the Wisconsin Avenue corridor had provoked. [“Route 240 for D.C. Held No New Highway,” *The Evening Star*, March 15, 1960]

When Director Aitken and NCPC Director Finley met with BPR officials to discuss the proposal, Administrator Tallamy rejected it. The link would have to be a direct connection in the Wisconsin Avenue corridor, Tallamy said. Under the Federal-Aid Highway Act of 1944, Interstate routes must be “as direct as practicable”; any other corridor was unacceptable because it would add unnecessary miles to the Interstate corridor. Aitken agreed to study the Wisconsin Avenue corridor and present a routing to BPR. Aitken and Tallamy also discussed a third route for Interstate designation between Baltimore and the District through northeast Washington. This route would replace the Kenilworth and New York Avenue links to the Baltimore-Washington Parkway.

Although Tallamy’s position surprised Aitken, he was willing to study the controversial corridor because its rejection would cost the District millions of dollars (an estimated \$85-\$95 million) in 90-percent Interstate construction funds. The unexpected development prompted some speculation about why Tallamy took the position he did. The *Star* reported:

There is a strong feeling in the District Building that Mr. Tallamy’s decision may have been prompted by pressure from the National Capital Planning Commission, relayed through the White House . . . . [NCPC] has urged a Route 240 connection in the Wisconsin avenue area.

Aitken, aware that finding a suitable routing would be difficult, rejected any thought of expanding existing Wisconsin Avenue to Interstate standards. Construction was not in the current plans, but pinning down the location would at least allow Maryland highway officials to begin planning a connection between the Pooks Hill interchange and the District line. [Alibrando, Alfred, “District Told To Place 240 At Wisconsin,” *The Evening Star*, March 17, 1960; Alibrando, Alfred, “Wisconsin Corridor Proposal Revived,” *The Evening Star*, March 18, 1960]

A *Star* editorial called finding such a link “Washington’s most durable highway controversy.” Tallamy’s position might, the editorial suggested, revive NCPC’s idea of a freeway in the Wisconsin Avenue corridor to Tenley Circle, where links to the Inner Loop would be provided via the Glover-Archbold Parkway and a car-and-truck freeway across Rock Creek Park. [“Straight-Line Freeway,” *The Evening Star*, March 20, 1960]

Even as District highway officials and NCPC staffers considered the corridor, Senator Case expressed doubts. He wrote to Administrator Tallamy and General Welling on April 28, 1960:

I am somewhat concerned by the proposal to follow Wisconsin avenue—either all the way or part of the way, if that were to necessitate going east through a well-developed residential part of the city and would have anything like an overhead expressway crossing Rock Creek Park and many residential blocks east and west of the park.

He thought the routing should target District slums:

It seems to me . . . the routing of a link of the interstate system through a city—and particularly the Capital City—should cure a blight rather than create one. Offhand, it is

my opinion that any overhead throughway similar to the Whitehurst Freeway, if run through a good residential section, would blight the property on both sides to a serious degree.

On the other hand, it seems to me that if the route should go through an area which is marked for redevelopment or slum clearance, to the extent that the construction results in clearance and improvement, a second benefit will flow from the money expended.

He was considering legislation that would give Tallamy leeway to adopt a less-direct route as part of the Interstate System. A North-Central Freeway could, he understood, have more lanes and carry more traffic than the Wisconsin Avenue corridor, while costing less, thus reducing the Federal expenditure. "I want to be sure the basic law isn't injuring the Federal Government and doesn't have something in it that serves to defeat the maximum service of the highway at the most economical cost." [Alibrando, Alfred, "Case Dubious On Corridor," *The Evening Star*, April 28, 1960; "Case Urges Site Leeway On Highways," *The Evening Star*, May 3, 1960; Deane, James G. "Case Asks Hearing On Route 240 Location," *The Evening Star*, June 12, 1960]

### **The Inner Loop**

The loops or circumferentials as urban bypasses and radial connectors had been part of the District's thinking since at least the 1944 Central Area report submitted by J. E. Greiner Company and De Leuw, Cather & Company. Traffic congestion was delaying shoppers in the central business district and workers in the Federal buildings in downtown. The city was afraid that the problem would drive businesses into the suburbs where traffic could move more freely during weekdays.

The 1944 consultants' report proposed a master plan "for the correction and the future development of transportation facilities in the Central Area of the District of Columbia." The District's 24-year history summarized the proposal:

The master plan evolved by the consultants and presented in the Central Area Report, involved extensive improvements in the existing street layout through the construction of grade separation structures and channelized connections, to form convenient inner and outer belt line distributor routes around the central portion of the city. K Street, situated on the northern rim of this area, was earmarked for further improvement as part of the inner belt route and as a surface distributing artery.

Even if the inner belt route lessened congestion within its confines, "parking facilities in the shopping district were entirely inadequate at present." Building throughways into the heart of the city "would be wasted effort, unless storage facilities were provided to accommodate the increased traffic which would be attracted by the improved highways." The consultants suggested a solution:

The consultants also suggested that certain obsolete buildings in this area be replaced gradually by a type of building more in keeping with the character of motorized transportation in this modern age – buildings which would combine small shops and

offices, centralized service, underground merchandise collection and delivery, and offer parking facilities for clients and customers. They further suggested that land in Government ownership be converted into suitably landscaped parking lots for the accommodation of Federal employees. [*Twenty-Four Years of Progress*, pages 72-73]

This wartime vision of boulevards and one-way pairs of roads proved inadequate to the post-war reality. Transit, which had been boosted to high ridership by gasoline and tire rationing during the war, quickly entered a downward spiral that would cause the companies operating streetcars and buses in most cities to cut service and maintenance, raise fares, and eventually go out of business – leaving transit service to local governments. In the Washington metropolitan area, the use of private automobiles continued to grow along with population and government employment.

In December 1946, the consultants upgraded their proposal for an inner belt by proposing the Mid-City Expressway, as discussed earlier, to provide a bypass of the shopping district for traffic bound for the Federal Triangle, the southwest Mall, and other points beyond the central area:

Justification for the high-cost heavy construction work necessary to the execution of this ambitious project was based on [the] assumption that enormous volumes of traffic would be accommodated, to effect a welcome release in the pressure on other streets serving traffic destined for the Central Area, as well as that of a strictly local character. [*Twenty-Four Years of Progress*, page 75]

The National Capital Park and Planning Commission criticized the plan, especially the expressway portions. Traffic volumes in 1965 could not justify the cost, the commission said, while the traffic drawn into the city on them would overwhelm local streets. While improved circulation might increase business tax revenue for the city, “the opposite effect may well be produced on residential areas in the District which supply three-fourths of the District’s real estate tax income.” The commissioners also considered the city’s proposal to build tunnels for streetcars as lacking technical justification. Such a rigid network would prevent shifts in service to meet changes in employment and population centers.

The commission’s J. C. Nichols favored the intermediate circumferential known as Fort Drive. Nichols, involved in real estate, had been with the commission since its start in 1926. In a rare interview, he said the drive was “more valid today than ever before.” By allowing through traffic to bypass the downtown area, it would slow the suburbanization of District residents and businesses. He disputed recent estimates, such as the \$35 million price tag that District Budget Officer Walter L. Fowler had assigned to Fort Drive. In a report to Commissioner John Russell Young, Fowler had called the proposal “chimerical, useless and making no sense today.” Rufus Lusk, president of the Washington Taxpayers Association, estimated the cost to be \$60 million.

Three years earlier, Nichols said, the District Highway Department had estimated the cost of Fort Drive at \$16,800,000. That proposal included 58 grade separations but, Nichols said, “I don’t believe more than 9 or 10 of those grade separations would be needed, at least not until after the drive was built and more became necessary.”

He was concerned, too, about the radial highways contained in the consultants' proposal. They could lead to decentralization:

You've got to remember that the same expressway which makes it easier to get downtown to the big stores also makes it easier for shoppers to live farther out and shop in shopping centers. We shouldn't make it too easy to get out of the District.  
[Kauffmann, Rudolph II, "Planners Blast Road Program, Urban Substitute," *The Evening Star*, March 26, 1947; "Fort Drive Declared By Nichols to Be City's Greatest Need," *The Evening Star*, April 18, 1947]

With the commission developing a broad plan covering all phases of city development in accordance with the Redevelopment Act of 1946, Engineer Commissioner Young wrote to General Grant urging the planners to make "full use" of the 11-year plan developed by Captain Whitehurst for expressways, underground streetcar lines, and terminal parking facilities. General Young also recommended that the commissioners keep in mind the unfairness of current taxation to residents in a city where 50 percent of the land was tax exempt because of public ownership. He urged the commissioners to couple their recommendations with realistic estimates so their plans would not be "futile and academic." The commission had hired Harland Bartholomew as a consultant. ["City Heads Offer Suggestions on Redevelopment," *The Evening Star*, September 28, 1947]

The two bodies—the Highway Department and the planning commission—would remain at odds about the needed transportation facilities. For the commission, shifts in the metropolitan area were a guiding force. Director of Planning John Nolen, Jr., wrote in 1950 that the spread of population was one of the paramount changes. “Thirty years ago only one-fourth of the total population lived outside the District. Now three-eighths live in Maryland and Virginia.” He predicted that by 1980, one-half of the area’s population would live outside the District. One reason for the shift was “a more conscious and definite policy of decentralizing Government activities.” New employment centers in Bethesda and Suitland, Maryland, and elsewhere illustrated the trend. Even so and even with improved mass transportation, “traffic flow will take on characteristics of a circular movement rather than an in-and-out, reversing flow.”

To avoid repeating past mistakes, “we must design our system to separate major movements from the local on-and-off travel which now clogs the existing main routes.” To do this, planners should “encourage suburban focal points for a balanced community life.”

Suburban population centers, as well as the central business and government districts, should be bypassed. “In short, we must have a network of ring thoroughfares with good radials similar to the structure of a spider’s web, with certain routes more strongly emphasizing the form of the basic structure.”

Express highways and parkways would be provided for major movements on radial and circumferential alignments. They would form “the basic structure for the circulation system.” Where expressways were not feasible because of cost or location, major highways with grade separations at select locations were needed as collectors and distributors connecting with the circumferentials:

There will be an outer ring route in Maryland and Virginia about 8 miles out, and an intermediate ring road, the so-called Fort Drive and an inner ring. The latter two ring roads are inside the District of Columbia. [Nolen, John, Jr., “Regional Highway Plan for Washington,” *The Sunday Star*, February 19, 1950]

The idea of a spider’s web was in contrast with the usual contemporary hub-and-spoke concepts of urban transportation planning. It also was inconsistent with the District’s desire to retain population, businesses, and tax revenue.

By 1952, the Inner Loop was the District’s top priority in its \$140 million road program. The *Star*’s James G. Deane, in his “Highways of the Future” series, described it: “The proposed loop runs 10 miles around the city’s heart. Its function would be to shunt motorists away—or help them enter at the right point, faster.” He added:

It would not be a freeway: it would use mostly existing streets. But the benefit would be similar, say city engineers—and cheaper. Even so, the cost would be more than \$24 million.

According to Engineer Commissioner Bernard L. Robinson, the Inner Loop could cut congestion 25 percent in downtown. It was, he told Deane, “all important.” Deane listed the roads included in the loop:

The loop would consist chiefly of one-way streets: Q and R streets in the north, Fourth and Sixth streets east of the Capitol, F and G streets in the Central Southwest, and Rock Creek parkway and Twenty-sixth street on the west. Ohio and Basin drives would be a future link completing the circuit through West Potomac park.

Florida avenue would become the major link on the northeast corner, North Carolina and Delaware avenues in the Southeast. All three, however, remain two-way. In addition, there would be some major construction—an elevated entrance from South capitol street to F, and a bridge across the Washington Channel

The aim is to make the circuit as attractive to potential users as possible; otherwise it won't function.

Only tourists would travel the whole loop; local motorists would use only the portions necessary for their trips.

Deane added that the National Capital Park and Planning Commission agreed with the concept, but its comprehensive plans included a different routing:

There are three major differences: the commission plan shows a new freeway at about T street N.W. instead of Q and R as the north leg; the east leg is a freeway west of the capitol, on Third street N.W. instead of Fourth and Sixth N.E., and the West Potomac Park leg uses Independence avenue instead of Ohio drive, and Twenty-sixth street is not used.

The planning commission position has been that Q and R and Fourth and Sixth streets split residential neighborhoods; the commission frowns on this.

The plan had run into opposition from the area southeast of the Capitol. With private redevelopment expected to turn the area into a “new Georgetown,” the Southeast Citizens' Association was concerned that the loop would bring ruinous traffic into the area. In addition, the national planners were waiting for a report from the RLA on slum-clearance in the Southwest. The highway plan would have to dovetail with the redevelopment plans. [Deane, James G., “Top Priority Given ‘Inner Loop’ To Ease Downtown Traffic,” *Highways of the Future*, *The Evening Star*, February 5, 1952]

Deane also discussed plans for the intermediate loop known as Fort Drive. The first formal plan for the drive was in 1901, “although it had been talked about at least 20 years earlier” as a tourist attraction. The drive would use existing roads and some new streets. Congress authorized acquisition of needed right-of-way in 1930, but the concept gradually became a “belt” as that idea took hold among urban planners. “This is the current conception, and a speedy dual highway is now the design.”

As recently as 5 years earlier, “economy-minded District officials were opposing the project as ‘useless’ and too costly.” They wanted the 700 acres the city had acquired for the drive returned to the District’s tax base. Now, just 5 weeks earlier, the District proposed to spend \$20 million on two major segments of Fort Drive amounting to 8.2 miles of the 23-mile loop: (1) Fort Stevens at Georgia Avenue to Fort Reno at Nebraska Avenue and (2) Fort Totten at South Dakota Avenue to Fort Mahan at Benning Road. Each would be a freeway consisting of two-lane pairs separated by a median:

As a freeway, the drive would help motorists bypass snarls. But it would also be an attractive Sunday drive.

Deane quoted Fowler’s comment from 5 years earlier that Fort Drive “never will be built because there is no need for it and there will be no money for it.” As Deane concluded his article, “It remains to be seen whether he was right.” [Deane, James G., “1901 Plan for Linking Forts Revived as an Aid to Traffic,” Highways of the Future, *The Sunday Star*, March 2, 1952]

### **Evolving Inner Loop**

Cost had been a factor in the District’s thinking about the Inner Loop, but with planning for the Interstate System and its urban configurations, the concept evolved from two-way pairs to an Inner Loop Freeway.

The District hired De Leuw, Cather and Company to design an Inner Loop addressing traffic needs in 1980 without regard to cost. Instead of a single loop, the consultants’ October 1955 report proposed two connected loops that looked like a figure 8 on its side. The western loop had the White House in the center. The eastern loop included the Capitol along the west leg (the segment shared with the eastern edge of the western loop) while the east leg linked Florida Avenue and M Street beyond the intersection of Massachusetts and Maryland Avenues:

The Inner Loop Freeway System recommended herein is approximately 17.6 miles in length—14.6 miles of main freeway roadways, three miles of connecting roadways—and forms a figure 8 around the central district of the city. There are approximately four miles of eight-lane freeway, nine miles of six-lane freeway and 1.5 miles of four-lane freeway. There are six miles of 2-lane, one-way connecting roadways in interchanges and in connections to existing traffic arteries. All traffic lanes are a minimum of 12 feet in width. Center malls separating opposing traffic are 4 feet wide in fill or elevated sections and on bridges and 11 feet wide in depressed sections.

The consultants chose the location for the system based on three factors. The Inner Loop should:

- Be properly integrated with other existing and proposed street and highway facilities,
- Provide for the preservation of historical sites, parks, playgrounds, and institutional buildings insofar as possible, and
- Provide the maximum in traffic service, attracting sufficient traffic to justify its construction in accordance with highest possible standards of design.

They added, "Almost the entire route of the Inner Loop Freeway System is within areas which have been recommended for redevelopment." The system also connected with important arterials:

Routes were selected, therefore, to provide limited access connections between the Inner Loop and the proposed Constitution Avenue Bridge, Whitehurst Freeway, and a new freeway to connect to the Washington-Baltimore Parkway along New York Avenue. Connections are also provided to West Virginia Avenue, Benning Road, John Philip Sousa Bridge, Anacostia River Bridge (11<sup>th</sup> Street S.E.) including a new parallel bridge to the existing structure, and Highway Bridge as proposed to be improved by construction of a second one-way bridge.

Design standards allowed for safe and continuous travel at 50 m.p.h., although at peak periods traffic might move more slowly:

The freeways will be so superior to the parallel surface streets in safety, capacity, and time-saving features that they will attract vehicles from a wide area even at the expense of somewhat greater distances to be traveled by some motorists.

The consultants designated the segments of the system by their cardinal orientation: West, North/Northwest Section, North/Northeast Section, East, Center, South Route/Southwest, and South/Southeast. The report provided an alternate alignment for the center route involving a tunnel under the National Mall instead of passing through the mall at depressed grade. For the Southwest section along Ohio Drive between the Lincoln Memorial and the Southwest Freeway at Maine Avenue, they provided an alternate route via Independence Avenue.

The total estimated cost of the Inner Loop Freeway System was \$272,667,000. With "a vigorous planning and construction program," the system could be completed in 12 years. During construction, parallel two-way pairs would be employed to keep traffic moving a couple of blocks from the freeway corridor.

The consultants, after studying bus service, concluded that "most of the heavier movements are at right angles to the routes of the Inner Loop System rather than tangential." As a result, the Inner Loop would "not be useful for bus operation . . . except in isolated instances." Some express bus services might use the Inner Loop during peak periods:

Buses making such express runs will use the ramps provided for general use. Since no stops will be made by these buses along the freeway routes, no special facilities need be planned.

Construction of the Inner Loop would "not require abandonment or reconstruction of a major length of any streetcar track presently operated." However, if "all parts of the present rail system are still in use" when the Inner Loop is built, "rail and underground power distribution facilities will have to be installed on cross structures" in some cases.

Because one function of a theoretical inner loop was to be a terminal to keep cars out of the central area, the consultants studied whether to build parking structures over the freeway right-of-

way. They found that the cost of building parking garages above the freeways would be “abnormally high” compared with building parking facilities at ground level. Further, spacing for interchange ramps throughout the system did not leave “weaving” room for additional ramps to serve the parking garages. (A weaving section is the area where vehicles maneuver, sometimes crossing each other, to enter or leave a freeway.)

The consultants also were concerned about safety as motorists would operate in bright sunlight, drive into the darkness under the garages, and then move back into sunlight. “While the human eye can adjust to either level, given sufficient time, it cannot change rapidly enough to meet such problems safely at freeway speeds.”

The consultants concluded that parking garages should not be part of the freeway system. “Rather, such structures should be kept far enough away from them to permit the surface streets between to afford a cushioning effect.” [*Report on Inner Loop Freeway System, District of Columbia*, De Leuw, Cather and Company, October 1955, pages 1-3, 8, 13-27, 51-52, 63-64]

In August 1955, as the plan circulated through agencies, Gilmore D. Clarke and Michael Rapuano, New York consultants for NCPD, urged the commission to adopt the Independence Avenue alternative for the Southwest section, rather than Ohio Drive along the Potomac Park waterfront. Both alternatives “would result in a destruction of park values which should not be permitted.” Aside from the removal of trees, the link, wherever located, would form “wide traffic barriers” that would interfere with enjoyment of the park. Independence Avenue would be less disruptive:

Under the consultants’ plan, the inner belt would underpass the [Pennsylvania] Railroad, Fourteenth and Fifteenth streets, as well as Seventeenth street near Washington Monument. The belt also would underpass Arlington Memorial Bridge and Riverside drive by modifying the present structural arches, and would overpass the southeast approach to the Lincoln Memorial traffic circle.

The entire Ohio congressional delegation also opposed use of the road named for its State as a link in the Inner Loop.

Highway Director Robertson responded that from a traffic standpoint, the city did not have a preference between Ohio Drive and Independence Avenue. However, the Ohio Drive alternative would cost an estimated \$4 million less. [“Independence Avenue Urged as Inner Belt Link,” *The Evening Star*, August 3, 1955]

In the Yellow Book released in September 1955, BPR adopted the Outer Loop and the Inner Loop Freeway System, but did not include Fort Drive. As in the consultants’ report, the Inner Loop was a figure eight but with an extended eastern section that put the easternmost leg on the eastern side of the Anacostia River providing a link to the Baltimore-Washington Parkway. The northern leg crossed the city before dipping south to a Potomac River crossing in the vicinity of Theodore Roosevelt Island. The southern leg crossed the Anacostia River in the vicinity of the 11<sup>th</sup> Street/Pennsylvania Avenue, followed the Southeast and Southwest Freeways to cross the

Potomac River on the 14<sup>th</sup> Street Bridge. An Interstate route linked the north and south legs in the center of the city, but no link was provided on the western end.

The Yellow Book map did not include detailed descriptions of the black lines on the map or an accompanying narrative description. The lines for the District and other metropolitan areas were considered aspirational in that the detailed location would be determined by further studies. However, the *Star* summarized the links in the “17.6 miles of limited-access, depressed and elevated expressways” that comprised the Inner Loop:

The network, costing \$15.5 million a mile, is in the form of a giant horseshoe stretching from the Anacostia River to the Potomac River beyond the Lincoln Memorial and back to the Anacostia. Two north-south expressways would connect the long arms of the horseshoe.

More ambitious than any circumferential expressway ever considered seriously for a downtown city area, the road would be four, six or eight lanes wide, depending upon the amount of traffic estimates to use each section.

The freeway loop does not follow existing streets. Instead, it cuts wide swaths through residential blocks, would knock out an estimated 6,800 dwelling units.

The Inner Loop consisted of:

- The projected Anacostia Freeway from East Capitol Street south to the District line. It would connect with the southern sector of the circumferential highway near the projected Jones Point Bridge.
- A cross-town highway using part of the northern sector of the projected inner-belt highway. It would connect with the Baltimore-Washington Parkway by way of New York Avenue.
- The southern sector of the inner-belt highway. There would be a connection across the Anacostia River with the Anacostia freeway, and one across the Potomac with Shirley highway.
- The west sector of the inner-belt. This would have a connection across the projected Constitution Avenue bridge with Highway 50 in Virginia.
- A north-south highway roughly along the line of Third street N.W., which would cut across the inner-belt.
- A highway roughly paralleling Canal road N.W. running from the west sector of the inner-belt to Maryland’s 240.

In 1955, Congress had considered how to fund the Interstate System on a 90-10 Federal-State matching basis, but adjourned without completing the legislation before BPR released the Yellow Book.

As Director Robertson acknowledged, the city would not be able to build the Inner Loop unless Congress found a way to pay for the Interstate System – the issue that killed the legislation in 1955. At an estimated cost of \$272 million, the Inner Loop envisioned by the consultants would take 12 to 15 years to complete. However, the District’s budget could not support the project.

The city received \$5 million a year in Federal-aid highway funds, up from \$3 million a year. District revenue from its gas tax was up \$1 million over estimates. Under the Interstate bill that had failed, the city would have received about \$30 million a year over a 10-year period for regular Federal-aid projects on a 50-50 matching basis and Interstate System projects on a 90-10 ratio.

Robertson was optimistic that Congress would extend the Federal-aid highway program, with “almost a certainty that we will get something more.” He said the Southwest Freeway segment of the Inner Loop through the southwest redevelopment area would get underway in the summer of 1956 regardless of the legislation’s fate. Unlike other District expressways, the Southwest Freeway from the Highway Bridge to South Capitol Street was planned for an urban redevelopment area that had been stripped of virtually all buildings, thus eliminating the source of much of the controversy in other parts of the city. [Douglas, Francis, P., “Highway Links OK’d for D.C.,” *The Evening Star*, September 29, 1955; Beveridge, George, “D.C. Gets Plans for Freeway To Speed Downtown Traffic,” *The Sunday Star*, December 4, 1955; “Loop Road Plan Awaits Decision on Federal Aid,” *The Sunday Star*, December 4, 1955]

Although the consultants’ Inner Loop report was dated October 1955, it was not released to the public until December. Engineer Commissioner Lane told reporters that the report presented “a satisfactory guide” for gradual construction of the Inner Loop Freeway System. Now that “we have the plan,” he said, “we will begin immediately a review of the financial prospects, rated against cost of the program.” General Lane stressed that most of the loop freeway passes through aging areas slated for “urban renewal,” as illustrated by the Southwest Freeway. Construction would be scheduled in conjunction with redevelopment to reduce costs for right-of-way acquisition. [Beveridge, George, “D.C. Gets Plans for Freeway To Speed Downtown Traffic,” *The Evening Star*, December 4, 1955]

### **A Couple Legs**

Almost as soon as the plans were released, the West Leg of the Inner Loop through the Foggy Bottom section of the District became controversial. A NCPC coordinating committee called in developers of two projects to explain their concerns on December 13, 1955. One developer, the Potomac Plaza Corporation, was planning a hotel/apartment/office complex near the intersection of New Hampshire and Virginia Avenue, NW., on the former Washington Gas Light Company property (later to be named the Watergate complex), while Peoples Life Insurance Company had purchased a building site at New Hampshire and F, G, and 25<sup>th</sup> Streets, NW. The western leg of the Inner Loop would be built west of the two developments. The developers said that with construction of the West Leg still years off, they planned to proceed with their projects. They suggested the city abandon the conflicting highway segment.

To avoid the Potomac Plaza development, District officials had identified an eastern alternative, but it would cut through three blocks acquired over the years by George Washington University for its expansion plans. The university’s treasurer, Henry W. Herzog, said the university expected to grow from 13,000 students to 30,000. “We don’t like to have property that cost us \$1 million taken from us and then have to spend \$5 million or \$6 million for land somewhere

else.” [“Developers Ask Truce on Road; Loop Is Issue,” *The Evening Star*, December 14, 1955; “Planners Weigh Inner Loop Plea,” *The Evening Star*, December 16, 1955]

On December 16, NCPC unanimously approved the city’s alternative route for the Inner Loop through Foggy Bottom. Passing between 23<sup>rd</sup> and 24<sup>th</sup> Streets, NW., the route avoided the two private developments, but impacted the university, which owned three of the blocks. This action, the *Star* stated, “resolved one major Washington highway controversy.” [“Planning Board Approves Route For Inner Loop,” *The Evening Star*, December 17, 1955]

George A. Garrett, whom President Eisenhower had asked to work with all parties to resolve issues blocking the southwest redevelopment, submitted a three-page letter to the President on December 21, 1955. Garrett reported that the program “now appears to be fully under way and its ultimate success is assured.” NCPC, Garrett said, had approved the land use plans either finally or tentatively in the case of plans that remained shy of detailed plans.

The final issue had been the dispute between the Zeckendorf plan for a South Mall entranceway in the 10<sup>th</sup> Street corridor and the Smithsonian Institution’s plans for a National Air Museum. Based on a NCPC recommendation, the Smithsonian Institution would find another museum location. Garrett told the President:

Within 10 years, barring a national emergency, the area could be completely rebuilt, a model downtown urban community which could point the way for the salvation of obsolete city cores through the nation.

The President, in Key West recovering from a heart attack he suffered in Colorado the previous September, replied by letter dated January 1, 1956 (released January 6):

It is indeed heartening to know that the efforts of the agencies cooperating in the project will result in early initiation of construction and in a complete rebuilding of the designated area. Certainly the Capital of this great nation deserves to be a symbol of our best efforts to provide decent housing and attractive urban living. [Beveridge, George, “President Cites Southwest Job,” *The Evening Star*, January 8, 1956]

On February 2, 1956, NCPC approved all elements of the southwest redevelopment plan, subject to a final vote after detailed plans were submitted in coming weeks. District highway officials appeared before NCPC during the meeting in an attempt to postpone the feud over whether the Inner Loop would follow Ohio Drive or Independence Avenue, SW. With minor adjustments on the western end of the Southwest Freeway, the city would be able to accommodate either alternative, thus postponing the need for a decision.

NCPC took up the issue in more detail on February 3. Engineer Commissioner Lane told the commissioners that the District favored Ohio Drive, but was willing to postpone the decision. A connection was needed between Southwest Freeway, already slated for construction in the F Street corridor, at 12<sup>th</sup> Street, SW., and the two 14<sup>th</sup> Street bridges over the Potomac:

So he proposed a bridge across Washington Channel, linking the two facilities, and making “temporary connections” to both Ohio drive and Independence avenue. Since the

District has no money to extend the expressway soon anyway, he said, the temporary connections would permit either route to be used when a later decision is made.

The Ohio congressional delegation expressed its view. Representative Thomas A. Jenkins (R), who called himself “the Daddy of Ohio drive,” told NCPC that for many years, “no avenue, street or even alley” was named for Ohio in the District. Now, the two-lane drive along the Potomac River between the Lincoln Memorial and 14<sup>th</sup> Street was the “pride of the people of the great State of Ohio.” He said he was not arguing from an engineering or traffic perspective, only that “we’re proud of it.” He added that Senators John W. Bricker (R) and George H. Bender (R) agreed with him.

Bartholomew, who opposed Ohio Drive for the Inner Loop, was concerned about the District’s new plan to postpone the decision:

He said any connection with Ohio drive was “a foot in the door” toward its eventual construction as an expressway. And—widening the breach—opposed any crossing of Washington Channel until such time as the District agrees to build a Potomac bridge at Roaches Run, Va.

The commissioners could not agree on the proposed postponement plan. [Beveridge, George, “Way Is Cleared For Final Okay On Southwest,” *The Evening Star*, February 3, 1956; “Pride of Ohio’ Injected Into Inner Loop Planning,” *The Evening Star*, February 4, 1956]

In 1949, Representative Jenkins had led the effort to change Riverside Drive to honor his State. Ohio Street, behind the District Building, had been removed during development of the Federal Triangle area. Riverside Drive ran from the John Ericcson Memorial (honoring the inventor of the screw propeller for ships) at the drive’s intersection with Independence Avenue near the Lincoln Memorial through the Tidal Basin across West and East Potomac Parks along the Potomac River. At the time, according to the *Star*, it was “Washington’s most popular ‘hot weather’ drive.” At his urging, the National Capital Park and Planning Commission approved the change to Ohio Drive on August 5, 1949. The signs went up on August 12 in a brief ceremony with Representative Jenkins. With the change, all 48 States had a named street in the District of Columbia.

Over 300 Ohioians, including Governor Frank J. Lausche and Representative Jenkins, formally dedicated Ohio Drive on July 9, 1950. With rain pouring, Representative Jenkins was master of ceremony. Secretary of the Interior Oscar L. Chapman presented a scroll from President Truman to Governor Lausche and extolled Ohio’s contributions to the country. Mrs. Erma C. Marting of Irontown, Ohio, “Ohio’s Mother of the Year,” snipped the ribbon across Ohio Drive at the tip of Hains Point to officially open the road. Following the ceremony, Miss Mary Jane Hayes, “Miss Washington,” presented a three-layer cake to Governor Lausche, who cut it and passed out the rain-soaked slices. [“Ohio Gets Its Name Restored Along Six Miles of Channel,” *The Evening Star*, July 10, 1950]

(The name “Independence Avenue” was only about a decade older. It was an outgrowth of legislation signed by President Herbert Hoover on February 26, 1931, changing the name of B

Street north of the National Mall to Constitution Avenue. Chairman Delano of the National Capital Park and Planning Commission suggested changing B Street south of the mall as well to honor the Declaration of Independence. Senator Capper introduced a bill to change the name in 1933. The District commissioners approved the bill on January 16, 1934. The *Star* explained:

B Street is the south boundary of the Mall and under Mall development plans the street is to be extended from its present western terminus at Fourteenth street to the Potomac River. There would be a jog in the street at Fourteenth street because of the location of the Bureau of Engraving and Printing. ["D.C. Board Approves Street Name Change," *The Evening Star*, January 17, 1934]

President Franklin D. Roosevelt approved the legislation on April 13, 1934. (P.L. 73-150)

### **Getting Underway**

The future of the District's Interstate network depended on approval of the Federal-Aid Highway Act of 1956, which President Eisenhower signed on June 29. During the first 3 years of the construction program, the funds would be apportioned by the longstanding formula for distributing Federal-aid primary system funds. After that, Interstate System funds would be distributed based on periodic Interstate Cost Estimates (ICE) that BPR was to complete beginning in 1959 and submit to Congress for approval. After that, each State's share would be calculated on the ratio of the cost to complete its Interstate segments compared with the national cost.

The legislation meant an immediate boost in Federal-aid highway funds from the annual \$4 to \$5 million the District had been receiving. The District expected to receive \$40.5 million in Federal-aid for the first 3 years under the new law, with \$29.4 million of that amount for the Interstate System. The District's share could increase when the ICE formula was used, but the city expected to receive between \$390 and \$400 million overall, to be matched on a 90-10 basis. [Beveridge, George, "District to Map \$400 Million Road Program," *The Sunday Star*, July 29, 1956]

By late August, the District Highway Department had submitted to the commissioners the largest road construction budget in city history. It covered 13 projects with an estimated cost of \$22.9 million, including \$11 million for three projects on the Inner Loop. Interstate projects included the Southwest Freeway (14<sup>th</sup> Street to South Capitol Street), the Inner Loop segment from South Capitol Street to the Anacostia Freeway), and the West Leg (right-of-way acquisition in Foggy Bottom between E Street, NW., and Washington Circle). The District also planned to use the funds on the Constitution Avenue Bridge (pending congressional action) and replacing the trestle-topped bridge as part of the 14 Street Bridge (minor legislative action might be needed), and the Anacostia Freeway. [Beveridge, George, "\$29.9 Million Asked for Roads," *The Evening Star*, August 31, 1956]

Around this time, the 21 members of the D.C. Auditorium Commission were deciding where to place a proposed civic auditorium and cultural center. The commission, established in 1955, had narrowed the choice to two locations by November 1956. One was in the new Southwest east of

the 10<sup>th</sup> Street “South Mall” south of D Street and north of the Southwest Freeway. The other possibility, the one favored by the auditorium commission, was in Foggy Bottom west of 23<sup>rd</sup> Street and south of Virginia Avenue, NW. The Foggy Bottom location depended on where the District ultimately built the Inner Loop through the area.

On November 3, Chairman Garrett of the Federal City Council sent telegrams to members of the commission stating that the council supported the southwest location. A Foggy Bottom location would “create critical problems” for the private developments underway in the area. By contrast, “the location of the Southwest cultural center envisages a ceremonial entrance and link from the Grand Mall to the Tenth Street Mall. An auditorium on this site will be the focal point of the entire rebuilt area and a great asset to the Capital City.”

Engineer Commissioner Lane said he did not know enough about plans for the auditorium to take a position on where it should be built. As for the Inner Loop through Foggy Bottom, the “present approved location, as far as we know, is the proper one.” He added, “The whole feasibility of a relocation is undetermined. But if there are factors we have overlooked, we will listen to them.” [“Auditorium in Southwest Backed by City Council,” *The Sunday Star*, November 4, 1956]

The auditorium commission decided to delay a decision while advisers made “further studies . . . of the several sites considered suitable, and the commission will determine from the responsible agencies the availability of these sites.” Although the West Leg of the Inner Loop as presently located would cut across the middle of the favored Foggy Bottom site, the commission chairman, Mrs. Agnes E. Meyer, indicated that her talks with NCPC indicated that rerouting the West Leg was possible. [Beveridge, George, “Auditorium Unit Delays Firm Decision on Site,” *The Evening Star*, November 27, 1956] (Mrs. Meyer’s husband Eugene owned *The Washington Post*, serving in various leadership roles with the newspaper until his death in 1959.)

Highway Director Robertson was frustrated by NCPC decisionmaking as he made clear when he testified on November 30, 1956, before the Commissioners’ Citizens Advisory Committee regarding a proposal by former District Commissioner Samuel Spencer that NCPC’s five citizen members should be appointed by the District commissioners, not the President. NCPC Chairman Bartholomew opposed the suggestion, which he said would override Federal interests in the capital.

Robertson argued for a change. He said that “delays in obtaining definitive action by the National Capital Planning Commission have consistently resulted in retarding the highway program of the District of Columbia, have produced a continued economic hardship on the motorists of this area by delaying the construction of needed projects and may very well cause the District of Columbia to have certain Federal funds withdrawn unless allocated monies are soon obligated.”

For example, he said, during the 7 years of controversy over the Highway Bridge at 14<sup>th</sup> Street, rising costs would add \$16 million to the project. “Had the District received greater co-operation and understanding from the planning commission, the District taxpayers would have been saved millions of dollars.”

The controversy over the proposed Constitution Avenue Bridge across the Potomac River “has cost the taxpayers many thousands of dollars thus far on this project without a bridge having been started in this area.” The total was about \$100,000, Robertson said, adding that “this expenditure can hardly be justified as a means of satisfying the NCPC simply because they doubt the integrity or capabilities of responsible public officials or their consultants.”

The West Leg of the Inner Loop was another example. NCPC had approved the location, but was now reconsidering it:

Shifting of this route, he said, would curtail the multimillion-dollar Potomac Plaza project under construction in the area. Also, he said, the proposed Peoples Life Insurance Building would be “endangered by an auditorium site which is astride the original inner loop location.”

“It is difficult,” Mr. Robertson said, “to comprehend how any agencies, private or public, can proceed with any developments in the District with the possibility of this type of action endangering their plans and costing them considerable amounts of money.”

He also cited the District’s preference for routing the Inner Loop along Ohio Drive while NCPC had selected Independence Avenue. “That action will cost the taxpayers \$4.5 million.”

The advisory council decided to send Robertson’s 17-page statement to Bartholomew for his information, but “decided not to request a rebuttal for fear of stimulating continued argument.” [McLean, Hector, “Big Loss Seen In ‘Indecision’ On Planning,” *The Evening Star*, November 30, 1956]

As Robertson’s statement indicated, the location of the West Leg remained controversial and in doubt. NCPC indicated it was reconsidering its approval of the routing in view of its impact on George Washington University. The university added to the controversy in December by announcing a long-range plan for an extensive medical center to be built around the present 400-bed university hospital. Herzog explained that if the West Leg were built as planned, it would leave “no other place in the area where these facilities can be erected and still carry on effective communications and service with the hospital.” He hoped that the route could be shifted to allow not only the hospital expansion but the private developments underway in the area. [Beveridge, George, “GWU Reveals Plans for Huge Medical Center,” *The Sunday Star*, December 9, 1956]

On December 13, the District Auditorium Commission’s concerns prompted NCPC to delay asking the District to consider a location along 24<sup>th</sup>, 25<sup>th</sup>, and 27<sup>th</sup> Streets, NW., for the West Leg. This location, according to a NCPC special committee, would require little property from Potomac Plaza and avoid university property. It also would allow room for an interchange connecting the West Leg to K Street west of Washington Circle.

General Lane responded that the current route had been selected by the city’s consultant as the most feasible. The committee’s suggestions involved “paper plans” that might prove impractical when given detailed engineering review. As far as he was concerned, nothing before NCPC justified additional study. He added that wherever the route is built, “someone will be hurt.”

When NCPC decided to postpone a decision, General Lane said the approved routing remained on the books. The District would proceed accordingly and ask Congress for authority to begin acquiring right-of-way. [Beveridge, George, "Planners Put Off Vote on Inner Loop," *The Evening Star*, December 13, 1956]

The District Auditorium Commission, which was still awaiting a decision on the West Leg, increased the number of possible sites for the auditorium and cultural center to three. The Foggy Bottom site was in an area bounded by Virginia and New Hampshire Avenues on the north, E and Water Streets on the south, and on the east by 23<sup>rd</sup> Street and the west by 26<sup>th</sup> Street. The original southwest location was within 10<sup>th</sup> Street with D Street on the north, Sixth and Seventh Street on the east, and the Southwest Freeway on the south. The commission was now considering a second southwest option, this one bounded by Ninth Street on the east, 12<sup>th</sup> Street on the west, D Street on the north, and the freeway on the south. "Chairman Agnes E. Meyer disclosed that the commission favors Foggy Bottom, but would not be unhappy if one of the Southwest sites are selected." ["3 Cultural Center Sites Are Favored" *The Evening Star*, January 30, 1957]

On February 1, 1957, Harold Aitken, then still with Clarkeson Engineering, told NCPC he was considering a western shift of the West Leg as the best way to connect U.S. 240 along the Potomac River with the Inner Loop at Washington Circle. Based on the city's current plans, the connection was possible, but would be "costly and difficult to build" because it required an interchange that might include three- and four-level structures for all movements. Moving the Inner Loop to the west would "be a little less costly to build and have a better design" than at present.

Bartholomew was not sold on the Potomac River link to U.S. 240. He preferred a route through Bethesda, along the Wisconsin Avenue corridor to Tenley Circle, then via Glover-Archbold Park to Whitehaven Parkway, with a link to the Inner Loop near Sheridan Circle.

Aitken agreed that this routing would serve more traffic than the Potomac River route that he and District officials favored. However, building the section in Maryland would be very difficult and would possibly require the taking of "hundreds of homes" before reaching the District line. He said that the Potomac River Freeway and the routing via the city's planned Glover-Archbold Parkway, exclusive of trucks, were both needed. [Beveridge, George, "Shift Called Possible in 'Inner Loop' Plan," *The Evening Star*, February 1, 1957]

Aitken returned to NCPC on March 8 for a formal presentation of his plan for shifting the Inner Loop's West Leg to the west. Although the proposal would solve some of the issues involving private development and expansion of George Washington University, it would cut through the Foggy Bottom site favored by the District Auditorium Commission. On the plus side, the western shift would permit the Inner Loop to make "full traffic connections" with the proposed Potomac River link to U.S. 240. Aitken expected the proposed route to cost about 10 percent less than the currently approved route through Washington Circle.

The precise impact on properties had not been determined, but the apartment houses on K Street west of 25<sup>th</sup> Street appeared to be in greatest danger. The impact on the embassy area would be

the same as caused by the current plan. Regardless of property impacts, Aitken said, his primary concern was finding “workable connections” between the Inner Loop and the Potomac River Freeway.

For traffic service, he proposed a Potomac River bridge between the Key and Chain Bridges. It would connect with the George Washington Memorial Parkway in Virginia and the Potomac River Freeway near MacArthur Boulevard in the District. He recommended the bridge be an extension of Arizona Avenue.

Members of NCPC reserved judgment, referring the report to a committee for study. [Beveridge, George, “Another Route For ‘Inner Loop’ Road Proposed,” *The Evening Star*, March 8, 1957]

The District Auditorium Commission still favored the Foggy Bottom site over the sites in Southwest, but was disturbed that the District did not seem to give a high priority to avoiding conflicts between the cultural facility and the West Leg:

Mrs. Meyer charged that city authorities and Washington business interests have adopted a “cavalier manner” toward her commission’s desire to locate the cultural center in Foggy Bottom . . . . Mrs. Meyer said the city heads have handled the matter as one “merely . . . of parochial concern to be settled in the haphazard manner characteristic of the District’s chaotic government.”

Another time, she said all the “squabbling and procrastination” over the issue results from “the fact that the District of Columbia lacks an orderly and efficient government.”

As for the Clarkeson proposal, she told NCPC that her group would pay for a new route study if the auditorium commission could select the consultant.

General Lane agreed that the District Highway Department would meet with the commission’s engineer. He pointed out to Mrs. Meyer that the District had not acted on the Clarkeson proposal and did not, at this time, agree that additional studies were needed. If Congress determined the location for the auditorium and cultural center, as NCPC had recommended, the District would necessarily adjust its plans to comply with congressional decisions. [Beveridge, George, “D.C. Officials to Consult Center’s Group About Site,” *The Evening Star*, March 27, 1957]

On May 3, NCPC members spent half the day in the Potomac Palisades area to see where the planned expressways and parkways, including the U.S. 240 link, were to be built. They also heard from citizen groups, such as the Potomac Palisades Citizens Association. Its representative told NCPC that the river location was the “worst possible route” for an expressway. The group favored the George Washington Memorial Parkway if built in the Canal Road corridor, but the link to U.S. 240 should be built where it would serve more people.

Admiral Neill Phillips of the District Audubon Society told NCPC that if the U.S. 240 link must be built along the Potomac River, it should be combined with the George Washington Memorial Parkway. However, he wanted the parkway built along MacArthur Boulevard to reduce impacts on the C&O Canal and waterfront parks. Other groups agreed with the idea of reducing impacts

on the canal and park area. [Beveridge, George, "Planners Ask Adoption Of Lewis Zoning Report," *The Evening Star*, May 4, 1957]

Congress was considering legislation to extend the life of the District Auditorium Commission, which had expired on January 31, 1957. The House-approved bill extended the commission until the center was built. The Senate-approved version extended the life of the commission and directed it to "select and acquire" a site but did not specify where it should be. During the House-Senate conference to resolve differences between the bills, conferees changed the language to direct the GSA to acquire the site in Foggy Bottom favored by the commission. The conferees voted 7-1 for the change. Representative Broyhill, a member of the auditorium commission, was the lone dissenter because, he said, the Foggy Bottom site would be more expensive than a site in the southwest redevelopment area. He also pointed out that the Foggy Bottom site would remove property from the city's tax rolls, thus increasing its true cost.

In reporting the conferees' action, George Beveridge discussed the conflict with the West Leg of the Inner Loop:

It was learned that District highway officials have drawn tentative alternate routes, however, which could permit the auditorium to be built. These plans, still in the study stage, are being worked out with special consultants for the Auditorium Commission and for the big Potomac Plaza private development, which could be harmed by a major road relocation. [Beveridge, George, "Conferees OK Auditorium in Foggy Bottom," *The Evening Star*, May 10, 1957; "Foggy Bottom Site Hit As Too Costly for Center," *The Evening Star*, March 22, 1957]

On May 15, the Senate approved the conference report extending the auditorium commission and directing GSA to acquire the Foggy Bottom site. However, the House rejected the bill by a wide margin on August 9. Representative Broyhill led the opposition, arguing that the specified site would cost too much.

Mrs. Meyer, watching from the House gallery, denounced Representative Broyhill as a "completely irresponsible person." He knew, she said, that the Foggy Bottom site was less costly than the southwest sites. "Therefore, I think all his statements are unreliable and many untrue." She said, "The whole possibility of having a cultural center is lost unless the House reconsiders." ["House Vote Chills Cultural Program," *The Evening Star*, August 9, 1957]

(With the District Auditorium Commission no longer in operation, Congress continued the goal of the cultural center by passing the National Cultural Center Act, which President Eisenhower approved on September 2, 1958. It established a board to maintain and administer the National Cultural Center for the Smithsonian Institution. The law did not address where the center should be built. Gutheim and Lee described the outcome:

After the work of President Eisenhower's DC Auditorium Commission from 1955 to 1958, Commission of Fine Arts chairman David Finley arranged for the review of several possible sites for this facility and recommended the one on the Potomac River to the US Congress . . . .

After the assassination of President Kennedy in 1963, Congress voted to name the center in his honor. [Gutheim and Lee, pages 295-296]

(President Lyndon B. Johnson participated in the groundbreaking ceremony on December 2, 1964. The John K. Kennedy Center for the Performing Arts opened on September 8, 1971.)

### **Searching for Connections**

The District of Columbia was still assembling its full Interstate network for approval by BPR, with the U.S. 240 link still a major concern. In June 1957, District highway officials had finalized their plan for submission to BPR on July 1. These were the routes that would, if BPR approved, be eligible for construction in the next 13 years on a 90-10 matching basis.

The *Star* described the plans:

In broad outline, they connect an inner-loop skirting the downtown district with highways leading to Route 240 to Frederick, Md., to the northwest; to Richmond and points south and southwest, and to Baltimore and New York freeways to the northeast.

The District divided its system into five routes:

Route 1 – The still disputed connection to Route 240, running parallel to the Potomac river, \$47 million. The eight-lane roadway, partly elevated and partly depressed, would run from the District line to the west leg of the inner loop. A unique feature would be an extension of the Whitehurst freeway under one span of Key Bridge, one-way west, and a companion eastbound highway under another bridge span.

Route 2 – The Potomac River bridge leading to the west and north legs of the loop onto New York Avenue to the District line, \$141 million. Highway planners have included the bridge on the Federal plan, although the Senate has before it a bill for a tunnel at the Theodore Roosevelt island site.

Route 3 – The Southwest freeway linking the highway bridges across the Potomac with the center loop leg to the New York Avenue section to Route 2, \$95 million. Part of this alternately six and eight lane highway will shoot underground into a six-lane tunnel in front of the Capitol from D Street to Constitution Avenue under the Mall.

Route 4 – The Anacostia freeway alongside the Anacostia River to tie the projected Jones Point bridge to the new Eleventh Street bridge through the southwest to meet the Southwest freeway, \$55 million. This will join South Capitol Street with Route 3.

Route 5 – A continuation of the Anacostia freeway past the Eleventh Street Bridge on the Anacostia side to the East Capitol Street Bridge, \$12 million. At the latter bridge, the road picks up with widened, limited access Kenilworth Avenue to the interchange fanning to Baltimore.

The proposed District network did not include any Interstate highways in the northwest quadrant other than the Potomac River link to U.S. 240. The New York Avenue link to the Baltimore-Washington Parkway was the farthest north of any route in the northeast quadrant. [Bassett, Grace, "\$350 Million D.C. Plans For Expressways Readied," *The Evening Star*, June 19, 1957]

The New York Avenue expressway was planned from the Inner Loop at Florida Avenue to Bladensburg Road, NE., where it would connect with the Baltimore-Washington Parkway. The expressway would be six lanes for most of its length. District highway planner Brinkley said the expressway would include at least three interchanges as well as access ramps to cross roads.

The District's routes would have to match Maryland's and Virginia's plans for their Interstate networks in the Washington suburbs. During the meeting on January 15, 1957, discussed earlier, Federal Highway Administrator Volpe had approved the U.S. 240 Potomac River link to the Inner Loop and a connection at Washington Circle, but the Maryland routing was yet to be determined. Similarly, Maryland was proposing a separate alignment for the Baltimore-to-Washington line that would require a third east-side entrance across the District line (the other two being U.S. 1 and the parkway), rather than the parkway-New York Avenue link the city favored.

Brinkley said the New York Avenue expressway would also provide the connection to the District if Maryland secured approval of a Baltimore-Washington connection separate from the parkway. However, he said the highway department was studying a different connection with such a link because the present Kenilworth Avenue interchange limited the ability to add a third expressway to its capacity. [Deane, James G., "N.Y. Avenue Expressway In Road Plan," *The Evening Star*, June 16, 1957]

The prohibition of trucks on the Baltimore-Washington Parkway was a major factor in Maryland's thinking. BPR favored converting the Baltimore-Washington Parkway to an Interstate highway. The conversion would require transfer from NPS to the State, upgrading the pavement to carry trucks, and almost certainly an increase in the number of lanes, but the cost would be considerably less than that of a separate expressway link. Nevertheless, Maryland road officials preferred a third expressway connecting with the District near the Montgomery/Prince George's County line.

Colonel Welling wanted to pin down the connection. During a meeting of the regional coordinating committee on October 15, 1957, officials from Maryland and the District discussed the new expressway link between the two cities. The committee advised Welling to study a link to be located between Bladensburg Road, NE., and Kansas Avenue, NW. Director Robertson planned to ask Clarkeson Engineering Company to undertake the study.

The committee also considered the U.S. 240 link to the city, but could not resolve differences between the District, which favored the Potomac River route, and Maryland, which advocated a link in the Wisconsin Avenue corridor. ["Planners Still at Odds On Freeway D.C. Route," *The Evening Star*, October 16, 1957]

On October 18, Secretary of Commerce Sinclair Weeks announced designation of 2,102 miles of Interstate highways. The Federal-Aid Highway Act of 1956 had authorized 1,000 miles of this amount by expanding the Interstate System from 40,000 miles to 41,000 miles. The additional miles came from identifying direct-as-practicable locations for previously designated routes. The *Star* reported that the mileage included about 4 miles for the District of Columbia that were not linked to a specific route. Robertson said he would seek BPR approval to use for the new 4-mile

link to the Baltimore-Washington Parkway. ["More U.S. Road Aid Opened for District," *The Evening Star*, October 19, 1957]

Not long after the District approved the Clarkeson contract, the Maryland-National Capital Park and Planning Commission expressed concerns about the scope of the study. On November 27, the commission asked the District to study the area through the southeast quadrant of the city between Bladensburg Road and Southern Avenue along the southern District line. The commissioners were convinced that with the opening of the Baltimore Harbor Tunnel on November 29, 1957, most of the traffic using the third route between the two cities would come from east of Baltimore. They thought the new expressway should be south of the parkway rather than north as the Maryland State Roads Commission intended. This shift also would avoid the heavily populated areas of Prince George's County and the District and keep truck traffic out of those neighborhoods. In addition, moving the corridor to the southeast would allow it to serve the Anacostia Freeway and the new Jones Point Bridge while providing a better Interstate bypass for East Coast traffic. ["Maryland Planners Oppose D.C. Sector For Expressway," *The Evening Star*, November 28, 1957]

In December 1957, NPS was ready to begin construction of the 3.9-mile segment of the George Washington Memorial Parkway between the District line and Cabin John on land acquired for the project by the Maryland-National Capital Park and Planning Commission. The grading and drainage work would cover only two of the planned four lanes, with the lanes located between MacArthur Boulevard and the C&O Canal. Although building only two lanes initially would reduce local objections to the project, Director Wirth said the main reason for limiting the lanes was the NPS had only enough funds for four lanes. If the project remained on schedule, the two lanes carrying traffic in both directions would open in the spring of 1960 carrying two-way traffic. The second set of lanes would be built after the two-lane section reached Great Falls.

Wirth intended to have plans drawn at NPS expense to extend the parkway into the District as far as Glover-Archbold Parkway, but this routing conflicted with the District's plans for carrying U.S. 240 along the Potomac River. Further, the District's Robertson said he understood NPS would stop the parkway at the District line, with the city responsible for its extension. NPS opposed the city's plan for carrying U.S. 240 along the river, favoring instead the Wisconsin Avenue corridor for the link to the Inner Belt Freeway. [Beveridge, George, "Bids Open Tuesday On River Parkway," *The Evening Star*, December 8, 1957]

On the other side of the city, Clarkeson Engineering Company submitted plans for a 4.5-mile partly elevated New York Avenue expressway between Florida Avenue and a connection with the Baltimore-Washington Parkway. District highway officials were considering the plan. The elevated 1.5 segment would carry traffic from Fairview Avenue to beyond Bladensburg Road. Robertson, who expected the plan to be approved for 90-10 Interstate funds, said construction was not in the current 6-year plan. ["4½-Mile Road In N.E. Weighed," *The Evening Star*, December 19, 1957]

The Foggy Bottom controversy was resolved in November 1958 when District highway officials and NCPC agreed on the location of the West Leg of the Inner Loop. Under the plan, the northbound and southbound lanes of the eight-lane freeway would be close together on the west

side of 26<sup>th</sup> Street, NW., near the K Street interchange. The expressway would connect with the approach roads for the Constitution Avenue Bridge and meet the eight-lane Potomac River Freeway in what the *Star* called a “gigantic interchange” at 26<sup>th</sup> and K Streets. The Whitehurst Freeway would provide four of the lanes for the Potomac River Freeway, with the remainder to be built on a new structure.

The plan reduced the cost of the expressway by \$4 million, in part by reducing the impact on buildings in the area. Aitken, now the District’s planning chief, said the plan would not affect any “substantial building now existing in the Twenty-sixth street area.” It would require the taking of a “medium-sized apartment” building west of 26<sup>th</sup> Street between I and K Streets and a “small apartment” building under construction across the street from it. In addition, the expressway plan required the taking of the Indonesian Embassy, the former home of Evalyn Walsh McLean at 2020 Massachusetts Avenue, NW. (She was a wealthy heiress best known today as the former owner of the Hope Diamond, which is now the cornerstone of the Smithsonian Institution’s gem collection.) [Beveridge, George, “Expressway Okayed For Foggy Bottom,” *The Evening Star*, November 6, 1958; “D.C. Set to Order Expressway Plans,” *The Evening Star*, November 7, 1958]

The *Star*, acknowledging that some of Washington’s highway disputes can “produce irritating delays in needed traffic improvements,” said that in the case of the West Leg, the delay had resulted in “a superior plan which was well worth the waiting.” The earlier plans, with their drastic impacts on the area, “would have been a tragic mistake.” The new expressway “still will cause severe hardships, and this is one of the unfortunate prices the city must demand in order to obtain the traffic relief which only can come from the huge modern superhighways.” Officials, however, “must never relent” in the search for locations that would serve traffic while minimizing “possible disruption of surrounding community values.” [“Success in Foggy Bottom,” *The Evening Star*, November 10, 1958]

In December, Clarkeson Engineering Company submitted a progress report on a connector with Maryland’s third expressway, part of I-95, between Baltimore and Washington. As called for in its contract, Clarkeson identified routes between Bladensburg Road, NE., and Kansas Avenue, NW. The four possible routes through the District’s northeast quadrant linked the Inner Loop with the Maryland expressway, but were oriented to the District links to the Baltimore-Washington Parkway. Clarkeson was to narrow the selection to a single route in its final report in several months. [Barron, John, “Four Routes Drafted For New Expressway,” *The Sunday Star*, December 29, 1958]

Within the District, the Brookland Citizens Association objected to one of the routes because it would cut through property used by public and parochial schools. The route cut through the community between 10<sup>th</sup> and 12<sup>th</sup> Streets, NE., with Crosby Noyes School, St. Anthony’s High School, Brookland School, and St. Anthony’s Elementary School in the expressway’s path. [“School Damages By Route Cited,” *The Evening Star*, February 10, 1959]

While District officials were debating alternatives, Maryland selected a route for I-95 in Prince George’s County to the circumferential that BPR had approved. Inside the circumferential, Maryland was unsure, but the *Star* summarized:

However, present thinking is that the freeway would pass east of Knollwood and New Hampshire Estates. It would cross University boulevard West close to University Hills and pass west of the new Princes Georges Plaza shopping center. At the District line the highway would cross at either Gallatin street N.E. or near Michigan avenue N.E.

Maryland is waiting for the District to come up with its route. There is a possibility of an entirely new freeway route in the District or a connection combining a new freeway and a New York avenue expressway from some point west of West Virginia avenue.  
[Alibrando, Afred P., "New York Avenue Crisis Doubles," *The Sunday Star*, July 12, 1959]

In July 1960, Clarkeson Engineering Company offered a new alternative for the Northeast Freeway connection to I-95 in Maryland, the "third route to Baltimore." The best option, the company concluded, was to build it along the Baltimore and Ohio Railroad tracks running through the northeast quadrant, one block east of Catholic University. The freeway, with a mix of six- and eight-lane segments, would begin where the North and East Legs of the Inner Loop meet at Florida Avenue and K Street, NE.:

From there, the freeway would go along Montello avenue, curve north just beyond Holbrook terrace and go over New York avenue and Kendall street on a 1,950-foot viaduct.

At W street, the freeway would go under Brentwood road, Rhode Island avenue and Irving street. From there to Varnum street, the freeway would run alongside the railroad tracks except for skirting around the Catholic Sisters' College and the northwest corner of Providence Hospital.

The freeway would swing east at Varnum and hook up with Maryland's extension just south of Galloway street.

The freeway extension of I-95 would have eight lanes north of New York Avenue, and six to the avenue's south. Interchanges would be built at New York, Rhode Island, Michigan, and South Dakota Avenues as well as Fort Drive. The width of the freeway would be expanded 51 feet to accommodate rapid transit in the median.

The 4.14-mile, \$74-million route would cost more than other options, but Clarkeson concluded it was the best bargain. By running along the railroad tracks, it would be less disruptive to homes and businesses already accustomed to railroad noises. The routing avoided schools, playgrounds, and shopping areas, but would require the taking of 1,095 homes, 103 apartment buildings, 39 industrial sites, and one church, but no schools. The report estimated the cost of acquiring the properties to be \$30.8 million.

At a projected 108,000 vehicles a day, it would handle more traffic than the other options and "affords excellent connections for the urban dweller in his daily commuting to the downtown area." The preferred alternative avoided the Catholic University campus and would be built

below ground level in an open cut “to reduce the disturbance to serenity in the neighborhood.” The route would require use of some undeveloped land of the Catholic Sisters College.

District Engineer Commissioner Welling, who was about to step down, said he wanted to get the study “out on the table” before leaving his post. He planned to submit the study to NCPC for review. One point he was “particularly insistent” about was that the median be wide enough to accommodate a rapid rail line. [“Survey Backs B&O Route For Proposed New Freeway,” *The Sunday Star*, July 24, 1960; Eisen, Jack, “Third Route to Baltimore Would Skirt Catholic U.,” *The Washington Post and Times Herald*, July 24, 1960]

For one of his final acts, General Welling participated in the groundbreaking ceremony for the Potomac River Freeway at Rock Creek and Potomac Parkway and K Street, NW. On July 25, 1960, District Highway Director Aitken staged an elaborate ceremony for the groundbreaking because it would be Welling’s last in the District before he left for his new post commanding the Corps of Engineers Ballistic Missile Construction Center in Los Angeles:

In addition to two 75-mm. salute guns, which fired off five rounds, a miniature “guided missile” was fired.

The “missile,” about a foot long, was launched by Gen. Welling’s [9-year old] son, Peter, who attended the ceremony. After he pulled the cord, the “missile” went about 30 feet in the air, and then came down again.

As a final touch, Gen. Welling got into the driver’s seat of a caterpillar front-end loader tractor, and picked up the first mechanized shovel-full of the new freeway.

General Welling teased reporters, telling them, “One thing I don’t want you to write is that ‘Gen. Welling held his last groundbreaking as commissioner.’ You can never tell if this is the last.” [“Welling Starts Potomac Freeway,” *The Evening Star*, July 26, 1960]

His successor, Colonel Frederick J. Clarke, had spent 10 years in the Washington area on three previous assignments. He was coming from Fort Leonard Wood in Missouri where he was chief of staff at the U.S. Army Training Center. He said of his new assignment that the post was “one of the choice jobs of the corps of engineers. I was very glad to get it.” A profile in the *Star* said he expected to feel at home in dealing with the District’s construction issues because of his experience in the field. “I strongly favor working with the neighboring town, county and State Governments on such matters as reducing traffic congestion and improving water supply.” He added, “I recognize that many of these things cannot be solved unilaterally.”

Colonel Clarke, who would take his oath of office on August 1, 1960, was meeting with General Welling to discuss the issues facing the District. On August 19, he took a helicopter tour of the city for an aerial view of public works projects. He observed the Jones Point Bridge/Woodrow Wilson Memorial Bridge project, Glover-Archbold Park, and the Pooks Hill terminus of I-70-S in Maryland. After the flight, he commented that there is “not a great deal of room in the Glover-Archbold Park” for the planned parkway. [Pierce, Charles D., “Clarke Sees Joint Action Cure to Area Problems,” *The Sunday Star*, July 24, 1960; “Col. Clarke Takes Oath As New

Commissioner,” *The Evening Star*, August 1, 1960; “Clarke Gets Copter View of Projects,” *The Evening Star*, August 20, 1960]

On August 29, the Senate confirmed Colonel Clarke’s promotion to Brigadier General.

By November, opposition to freeway construction in northeast was growing. At an all-day public hearing on November 7, 1960, the District Commissioners heard 35 witnesses discuss the East Leg, which was to run along 11<sup>th</sup> Street from the Anacostia River through Lincoln Park in a tunnel to Florida Avenue, and the Northeast Freeway. One common theme heard during the hearing was to leave Lincoln Park alone. NPS describes Lincoln Park as “the largest Capitol Hill Park,” located “directly east of the United States Capitol Building at East Capitol and 11<sup>th</sup> Street in the Northeastern quadrant of the City.” The park, which was part of Pierre L’Enfant’s 1791 plan for the national capital, was renamed for President Lincoln in 1867.

William Finley, NCPC’s executive director (1958-1962), testified that his agency would offer modifications for the East Leg to avoid Lincoln Park and 16 homes in the 100 block of 11<sup>th</sup> Street. The homes, known as Philadelphia Row, had been built shortly after the Civil War in the Federal style of the 19<sup>th</sup> century. The National Trust for Historic Preservation had designated the row as worthy of preservation. Trust historian Hellen [sic] Deprey testified that the road “has great architectural merit and still retains much of its original quality.”

Witnesses emphasized the hardships the recommended route for the Northeast Freeway would cause businesses, churches, and property owners. Walter B. Lewis of the North Michigan Park Civic Association opposed the route, which he pointed out would take homes owned mainly by non-white residents. “The problem of the race of displaced families cannot be overlooked in the Washington area.” He added, “The housing available to Negroes is practically limited to that found in the District, since very few housing opportunities are offered to Negroes in the suburbs.”

Frank Coleman of the Brookland Civic Association raised the same issue. “Many of these citizens either will be forced to move to areas already congested, or by reason of such a mass migration, will cause congestion in the areas to which they move.” He recommended that the commissioners appoint a housing committee, including white and Negro members, to study the problem.

The “spirited public hearing,” as the *Star* described it, left the commissioners to consider whether to change their plans. [Gimble, Gilbert, “Route Change Pondered For Northeast Freeway,” *The Evening Star*, November 8, 1960]

In March 1961, General Clarke decided on new routes for the East Leg of the Inner Loop and the Northeast Freeway. The East Leg would be placed between 10<sup>th</sup> and 11<sup>th</sup> Streets. He disregarded suggestions from citizens who wanted to move the freeway to the 19<sup>th</sup> Street corridor; his concern was that it would cut into the National Arboretum. He also proposed to include two spurs to serve the new District of Columbia Stadium, then under construction at East Capitol Street. The spurs would follow Benning Road on the north and Potomac Avenue on the south and end in stadium parking lots. (The stadium, which opened in October 1961, housed

Washington's baseball and football teams. In 1969, the name was changed to Robert F. Kennedy Memorial Stadium.)

For the Northeast Expressway, General Clarke recommended that I-95 cross the District line just east of Sargent Road, proceed through the wooded Fort Drive right-of-way to the Baltimore and Ohio Railroad tracks. It would stay on the east side of the tracks and cut across Harmony Cemetery, which had been cleared, to avoid residential disruption in Brookland. After crossing the Pennsylvania Railroad tracks, the freeway followed along the east side of West Virginia Avenue to the link with the East Leg at Florida Avenue.

General Clarke submitted his recommendations to NCPC for consideration. [Gimble, Gilbert, "Clarke Shifts East Leg of Inner Loop," *The Sunday Star*, March 26, 1961]

The *Star* appreciated General Clarke's effort to "ease the impact of this major thoroughfare," including preservation of Philadelphia Row. "It also is good news that a proposed route . . . has been laid out, ending uncertainty that was unfair to property owners in that area." Unfortunately, some "disruptive effect" was inevitable, "but we are convinced that the inner loop in the end will benefit the whole Metropolitan Area." ["To Ease the Impact," *The Evening Star*, April 3, 1961]

On April 6, NCPC approved the shifts in the East Leg and the Northeast Freeway, with one exception. Because of NPS objections, the section through wooded Fort Drive was left pending further discussions. In addition, NCPC conditioned its approval on Maryland roads officials providing the I-95 link to the Northeast Freeway without seriously harming Northwest Branch in Prince George's County. [Gimble, Gilbert, "Planners OK Route Change For Inner Loop," *The Evening Star*, April 6, 1961]

Opposition to the plan arose quickly from the Northeast Washington Citizens Association. It joined the Capitol Hill Citizens Association on April 18 in opposing the 10<sup>th</sup>-11<sup>th</sup> Street routing of the East Leg. The two associations called for a public hearing to consider the routing. ["Northeast Group Joins Opposition To Freeway Plan," *The Evening Star*, April 19, 1961]

Later in the year, the Capitol Hill Southeast Citizens Association joined the opposition to the East Leg because it would "make Washington a key military as well as political target." As part of I-95, it could be bombed. The association's resolution suggested that "ordinary prudence and a sense of economy would seem to indicate that heavy through-traffic freeways could be built some miles distant from the capital at less expense and remain clear of rubble and open to military, trucking and other traffic in time of emergency." The association asked the District commissioners to determine whether "it is in the best interest of the national defense to locate the principal Maine-Florida truck route through the heart of the Nation's Capital." ["East Leg Protested As Military Target," *The Evening Star*, October 10, 1961]

The Baltimore and Ohio Railroad also was concerned about the routing of the Northeast Freeway. The company wanted to build a spur off Porto Rico Avenue and Taylor Street, NE., to serve the industrial area, but the tentative location of the Northeast Freeway would take this property to avoid taking nearby residences. The company had attempted to secure legislation allowing it to construct the railroad siding. Congress had completed work on the legislation with

Senate approval on September 7. However, President Kennedy had vetoed the bill on September 22, saying, “For the government to encourage the private development of property which it plans to acquire for public use seems inappropriate.” By “public use,” he meant the right-of-way of the Northeast Freeway. In vetoing the bill, President Kennedy took the advice of NCPC’s executive director, William Finley.

A railroad spokesman, Laidler B. Mackall, said the company would build the spur anyway. The route of the Northeast Freeway had not yet been approved. In response, District highway officials said that regardless of the railroad’s action, they would acquire the property rather than displace the many families in the area.

On October 11, Mackall asked the District commissioners to shift the freeway alignment. If the commissioners insisted on retaining the current freeway routing, the railroad recommended an elevated structure similar to the Whitehurst Freeway that would allow the property to remain available for industrial purposes. [“Third Baltimore Route Briefing Slated Friday,” *The Evening Star*, September 27, 1961; “Freeway Shift Asked by B&O,” *The Evening Star*, October 11, 1961]

NCPC also was considering whether the East Leg would harm the city. The manager of the District division of AAA, John W. Childress, said “it is inconceivable” that officials would drop or delay the Inner Loop. [“Freeway Shift Asked by B&O,” *The Evening Star*, October 11, 1961]

### **Preserving the Lincoln Memorial**

The NPS was still looking for ways to avoid traffic impacts on the Lincoln Memorial from the new Theodore Roosevelt Bridge.

On September 26, 1960, NPS Director Wirth held a press conference to announce that he would submit plans to NCPC for a tunnel under the Lincoln Memorial grounds. The tunnel was part of an overall plan for the grounds because, as Wirth said, “There are moments when the memorial is engulfed in a sea of cars . . . . It is time that we restored the calm tranquility of the scene by eliminating the buzzing traffic between the Memorial and its reflecting pool.” The plan included:

- Replacing a portion of the traffic circle with a plaza between the memorial steps and the Reflecting Pool, eliminating the traffic that designers had called “a vexing and hazardous” condition;
- Roadways on each edge of the pool with parking lots for memorial visitors, leading to a circle around the Washington Monument grounds with feeder connections to downtown;
- Independence Avenue would be carried through the 1,435-foot tunnel as a link between the Roosevelt Bridge and the Inner Loop;
- The tunnel would consist of two driveways of three lanes each, with traffic out of view;
- The tunnel, designed by the New York firm of Singstad and Baillie, would be built under the memorial grounds but not under any portion of the Lincoln Memorial itself;
- The tunnel entrances would be hidden from view by plantings and grading, with no traffic noise reaching the monument;

- A 212-foot underpass would carry Ohio Drive traffic underground between the Rock Creek and Potomac Parkway bridge leading to the Lincoln Memorial to the north entrance of the tunnel;
- Temporary government buildings on the south side of the Reflecting Pool area would be eliminated as part of the project.

As Wirth saw it, traffic on Arlington Memorial Bridge would be reduced significantly when the Theodore Roosevelt Bridge opened, but motorists using either bridge would follow the Reflecting Pool roads between the Lincoln Memorial and the Washington Monument circle. Wirth wanted to secure approval of the \$16-million tunnel plan as soon as possible so the tunnel could be completed before the Roosevelt Bridge opened. (Other aspects of the overall plan increased the total estimated cost to \$20 million.)

The overall plan, he said, would preserve “the dignity, beauty, serenity and magnificent setting of the Lincoln Memorial.” [Gimble, Gilbert, “Tunnel Plan Ready For Lincoln Shrine,” *The Evening Star*, September 26, 1960; Gimble, Gilbert, “‘Bonus’ Seen in Lincoln Memorial Road Plan” *The Evening Star*, September 27, 1960]

The District generally supported the Wirth plan as long as the city would not have to pay for it, but wanted to provide for other traffic movements. During a meeting, General Clarke and Wirth agreed on several points. One concern was that the tunnel plan did not include a direct connection between Arlington Memorial Bridge and the State Department. The District agreed to try to add a direct connection from the north entrance of the tunnel to E Street, NW.

Wirth agreed to a ramp allowing traffic on the Roosevelt Bridge to use the George Washington Memorial Parkway on the Virginia side of the Potomac River. He was concerned the parkway might be overwhelmed by increased commuter traffic, but reluctantly agreed as part of the District-NPS compromise after District officials agreed to yield somewhat on approach roads. The District agreed to seek approval from Virginia and BPR for two-lane ramps from the bridge to Arlington Boulevard that would attract more motorists than the single-lane parkway ramp.

Another gap in Wirth’s plan was a link for westbound traffic on Independence Avenue bound for Rock Creek and Potomac Parkway. The District and NPS agreed to design an intersection at 15<sup>th</sup> Street for this link. [Gimble, Gilbert, “Parkway Link For New Span Wins Approval,” *The Sunday Star*, October 2, 1960]

NCPC approved the NPS tunnel plan on October 6. Wirth told the commissioners that the Bureau of the Budget appeared favorable to the plan but had not yet approved it. [Gimble, Gilbert, “Planners Okay Tunnel Project,” *The Evening Star*, October 6, 1960]

## **Part 2**

### **Official Challenges to the DC Freeways**

During the 1940s and 1950s, District officials, BPR, and National, Maryland, and Virginia road and planning officials struggled among themselves to plan a freeway network that would address the city's chronic and growing traffic congestion while minimizing impacts on parks, historic sites, homes, and businesses. Maryland and Virginia highway officials had their own problems developing highway plans, but their concerns often were directly affected by the District's ever-changing plans. Citizens expressed their views, generally to protect their homes, businesses, and communities.

Highway officials believed they must try to minimize harm, but the road network was too important to be blocked. In the interest of the greater good, as they saw it, they continued with their plans.

In the late 1950s and early 1960s, many officials and government organizations turned against the highway plans in favor of transit, especially rail rapid transit. In many cases, the issue was no longer where to build Interstate expressways but whether to build them at all.

#### **Mass Transportation Survey**

NCPC and the National Capital Regional Planning Council established a Joint Steering Committee for the survey. The committee identified four major study areas: (1) planning the future region, including land use, the economy, population, and employment; (2) the region's future travel demands; (3) design of physical facilities to meet the projected requirements; and (4) design of machinery for financing and administering the proposed transportation system. For this work, the committee engaged several consulting firms and undertook a traffic survey with the cooperation of Maryland, Virginia, and District of Columbia highway authorities and BPR.

In 1955, BPR had completed studies, based on home interviews, of employees' place of residence and mode of travel to work as affected by the decentralization of government employment centers in the Washington area. The study found that the residents who were employed in the central area lived throughout the city and region "in the same proportion as general population distribution":

However, as agencies are relocated at increased distances from a central point, a larger number of employees have residences in the area of the new office location, with a secondary group having residence in the area of greatest population density near the central business district. When place of employment is removed approximately 8 to 10 miles from the central business district, most of the employees live in the vicinity of employment or in the semirural area beyond. As the distance from the central business district increases, there is a corresponding increase in the proportion of the work trips made by automobile. [Annual Report, Fiscal Year 1954, Bureau of Public Roads, Department of Commerce, page 35]

The traffic surveys helped BPR and State and local officials develop the initial plan for Interstate highways in the metropolitan area. In *General Location of National System of Interstate Highways*, released in 1955 and referred to as the Yellow Book because of the color its cover, BPR displayed a map of the Washington area showing an extensive Interstate network similar to the plan outlined in the Comprehensive Plan of 1950. An inner belt surrounded the White House and central core, with the Potomac River occupying one segment. A second, outer belt, later named the Capital Beltway, was shown entirely outside the city except where it crossed the District at its southernmost tip on what would be named the Woodrow Wilson Memorial Bridge. Neither the third outer beltway shown in the 1950 plan nor the intermediate beltway known as Fort Drive was included in the Interstate System.

Radial Interstates linked the two circumferentials:

- One of the radial left the western leg of the inner beltway and continued on the District side of the Potomac River to the outer beltway on its way to Frederick, Maryland (loosely I-270 in today's numbering plan).
- Where the Potomac River served as a quadrant of the inner belt, the eastern and western legs of the inner belt continued into Virginia (loosely I-66 and I-395/95).
- A route entering the area from the northeast crossed the outer beltway and split in the vicinity of Bladensburg, Maryland, north of the District line:
  1. One route continued east of the Anacostia River (I-295) and ended on the outer beltway near what is now the Woodrow Wilson Memorial Bridge.
  2. The other route coming from the northeast continued through the city, roughly in the New York Avenue corridor, to the inner belt (part of I-95).
- A short route linked the Anacostia Interstate with the inner belt (I-295 linked with I-395).

The map did not show any Interstate routes in northern Washington other than the Potomac River route in northwest and the New York Avenue corridor in northeast.

The *Post* described the routes in terms of existing roads that readers were familiar with:

Sanctioned was the north leg of the Inner Belt which general runs along Q and R sts. nw. and down 24<sup>th</sup> st. nw. to the proposed Constitution ave. bridge. Third st., which connects the north and south legs of the Inner Belt, also was approved.

New York ave., linking the Inner Belt with the Washington-Baltimore parkway, was designated an interstate highway. Also included were the Kenilworth-Anacostia Freeway and the Southwest Freeway which links the 14<sup>th</sup> st. bridge and the Anacostia Freeway

.....

The final road project inside the District made part of the interstate system was Canal Road which will connect the Inner and Outer Beltways. It generally will follow the north bank of the Potomac.

Maryland's Interstate System included the outer beltway, the roads connecting to Canal Road and New York Avenue, and a short stretch of the Kenilworth-Anacostia Freeway connecting to the outer beltway.

Virginia's network included the outer beltway, Shirley Highway and U.S. 50.

The District portion of the network totaled 22 miles (the District had requested 28 miles).

(The Interstate numbers employed here did not exist in 1955; they are intended to help with visualization of the Yellow Book map of the Washington area.)

Bartholomew appeared before the Joint Committee of Congress on Washington Metropolitan Problems, chaired by Senator Bible, in May 1958 to discuss the mass transportation survey. Transportation, Bartholomew said, "is the lifeblood of the community." An appropriate plan would "be of inestimable significance and benefit," while an "an inadequate or haltingly ineffective approach will be extremely costly and will be damaging to the community welfare." The key was to gather accurate information:

Mass transportation has been undergoing such a profound change in character in all American cities, particularly since World War II, that there is evident need for clarification of where we are heading and what should be the specific form of plan to be adopted and enforced. We must know whether or not individual automobile transportation can take over the full burden of transportation in a large metropolitan area such as Washington. If so, we will need many new expressways.

If not, we need to know what traditional forms of mass transportation such as the streetcar or the motorbus should be retained, and what particular function either or both should play in any new comprehensive plan. In addition to this, considering the demands of our 1980 community, which will be greatly enlarged both in total population and in area development, we need to know whether any new forms of mass transportation would be justified. And likewise, considering both total demand and alternate types of physical facilities, what is the most economical and effective means of providing the standard of service that will be required.

He emphasized three points. First, he said that as yet, "no American city has devised and constructed a mass transportation system geared to the needs and requirements of the modern metropolitan community now in process of formulation." That was why the "exhaustive survey" then underway on population and employment, and the dispersal of both was vitally necessary.

Second, the study was "the first profound attempt to ascertain the relative scope and function of the automobile, the bus, the streetcar, rapid transit, and other newer concepts of transportation." The result would be an areawide transportation plan showing the approximate location of highways and high-speed transit, "particularly any which may be located on separated ways either on the highway network or elsewhere." The report also would discuss parking needs, the cost of needed facilities, and basic plans for financing them.

Finally, he told the Joint Committee of Congress that, “There will be no quick or simple solution adequate to the need.” Transportation was as important to the community as “an adequate water supply and proper sanitation.” Creating the needed network would “be a most difficult undertaking, requiring extraordinary effort and cooperative endeavor.” [*Washington Metropolitan Area Transportation Problems*, Hearings Before the Joint Committee on Washington Metropolitan Problems, Congress of the United States, 85<sup>th</sup> Congress, 2<sup>nd</sup> Session, 1958, pages 15, 18]

While the surveys were undertaken mainly for mass transportation, BPR’s release of the Yellow Book established the first version of the area’s Interstate freeway network. Subsequent passage of the Federal-Aid Highway Act of 1956 provided the funds that Maryland, Virginia, and the District would need to begin planning, designing, and constructing the Interstate network.

### **Transportation Plan for the National Capital Region-1959**

On July 11, 1959, as noted earlier, President Eisenhower sent *Transportation Plan for the National Capital Region: The Mass Transportation Survey Report—1959* to Congress. His brief transmittal letter, dated July 10 and addressed to the President of the Senate and the Speaker of the House of Representatives, said:

Sir,

I herewith transmit for the consideration of the Congress the report of the National Capital Planning Commission and the National Capital Regional Planning Council on the Mass Transportation Survey of the Washington Region.

The report, the end result of several years of intensive study and research by the Planning Commission and Council, aided by experts drawn from public agencies and private concerns, points out the present and future problems of transportation of people and goods in the Region. The report also proposes a plan to meet the transportation problem and makes recommendations for organizing and financing the creation of the proposed transportation system.

The actions which may be taken in the years ahead to meet the problems of transportation will have a profound effect on the economy of the entire area, the welfare of its people, and the status of Washington as the Nation’s Capital. Accordingly, I am requesting the various Government agencies to make a detailed study of the Mass Transportation Survey report and the Planning Commission and Council’s recommendations. Such recommendations as are warranted will then be made to the Congress.

Sincerely,

Dwight D. Eisenhower

On July 15, President Eisenhower designated Maurice H. Stans, Director of the Bureau of the Budget, to screen the comments and recommendations received from other Federal Agencies. In effect, the bureau would serve as a clearinghouse for the ideas that might be submitted to Congress. ["Stans Is Designated For Transit Review," *The Evening Star*, July 15, 1959]

The \$500,000 plan was based on predictions about the region's development through 1980:

1. Population would increase from 2 million in 1959 to 3 million in 1980. "This increase in the number of persons to be served is the most important single factor in creating the need for new transportation facilities."
2. The outer spread of population would continue. "More than 80 per cent of the added population will be outside the original 10-mile square (the District of Columbia, Arlington County and part of Alexandria)." This dispersal would spread more in some directions than others, based on terrain, water availability, sewer services, and zoning. An especially large population will lie to the north and northwest of Washington in Montgomery County. Since suburban residents will make more and longer trips than at present, total daily person-miles will triple by 1980.
3. The downtown area (the area bordered by the Inner Loop Freeway) would remain the largest employment center in the area, with jobs increasing "moderately" by 1980. Work trips to downtown would increase by about 20 percent by then.
4. Most new jobs, however, would be located outside of downtown and, in fact, outside the District. "The large increase in trips to dispersed places of work will lead to a tremendous growth in peak hour trips through, around, or just short of the downtown area." Home-to-work movement across the 10-mile-square will increase more than 200 percent by 1980, but 24-hour travel volume into downtown will increase only a little more than 25 percent. "This type of dispersed traffic flow will place new demands on the transportation system, of a much different sort from the radial flow in and out of the downtown area that is so prominent today."
5. Automobile ownership and use throughout the region would increase as people "rely more and more on the private automobile for most kinds of travel," especially shopping, recreation, and social trips, as well as trips outside of downtown. "More than 80 per cent of the total regional travel will be in automobiles even with the proposed transit system in operation." Truck traffic also was expected to increase.
6. About half of the travelers during peak periods would be able to choose between the automobile and transit. They will base their choice on "the relative speed, cost, convenience and comfort of these two modes of travel." Of the other half, about one-fourth will have to use their automobile because they need it for work or for some other reason. In addition, one fourth will use transit, "many of them because they will not have automobiles available."
7. Peak volumes of travel (nearly half of all travel in a 24-hour period) in 1980 would occur during morning and afternoon weekday peaks. "These are the critical volumes that the transportation system must be designed to accommodate." Radial routes leading into the District will carry the heaviest peak-hour volumes.
8. Many key segments of the existing highway network "are rapidly nearing capacity, and some are already carrying more traffic than their rated capacities." Improving existing

roads and streets would “accommodate only a small part of the anticipated traffic increase.”

Because of these factors, the area’s transportation system must have greater capacities on all main routes of travel, including:

- Increased highway capacity throughout the region “since public transit can only serve economically a small proportion of the trips originating in the suburbs;”
- Larger capacities on the main radial routes;
- Emphasis on circumferential highways;
- Increased capacity serving areas north and northwest of the District;
- And “many new highways [that] must be built promptly” as well as high-capacity transit service to meet peak demand.

The Mass Transportation Survey considered three alternatives:

1. Auto-dominant with little change in transit – This alternative was “infeasible” because officials could not provide the number of freeway lanes needed to carry all the automobiles.
2. Express bus system – Providing express bus service on radial freeways would reduce the number of lanes needed by encouraging commuters to leave their automobiles, but more highways would be needed to accommodate the inevitable increase in automobiles and trucks, as well as the new express buses. Further, providing lanes for express buses would run into the same problem as freeway construction within the District’s built-up areas to accommodate traffic from the north and northwest.
3. Rail transit system – Rail transit could accommodate large volumes of passengers where express bus service would be inadequate, but construction of rail lines in the District would be very expensive, in contrast with buses that can be accommodated on existing freeways at little additional cost. Buses, therefore, had the advantage where they can accommodate all potential transit riders.

Because none of these alternatives was altogether satisfactory, the survey settled on a fourth alternative that combined the best features of the other three:

The most important conclusion to be drawn from the evaluation of the three alternatives and the recommended system may be stated as follows: An adequate transportation system for the National Capital Region must include a new form of express transit service, capable of attracting a large number of riders who would otherwise travel by private automobile from the suburbs to points in or near downtown Washington during the rush hours. Only if many of these people are induced to use public transit can the highway system within the 10-mile square accommodate the people who are not in a position to travel by transit.

Therefore, the recommended system consisted of an express system of rapid transit rail lines, express bus lines, and an extensive freeway and parkway network. Initially, express buses would serve the rapid rail corridors while the rail lines were under construction. Local bus lines would

serve as feeders for rail and bus lines and as distributors within the central business district. Buses also would serve areas in the District and the suburbs where express service could not be justified. Other streets and highways would need additional capacity to supplement the freeway/parkway system for shorter trips and to provide capacity beyond the limits of freeway construction.

Rail rapid transit lines would serve as radials linking downtown to points in Maryland and Virginia:

- Wheaton, Maryland, to Alexandria, Virginia; and
- Pooks Hill north of Bethesda to a point just beyond the Anacostia River, southeast of the central business district, to a feeder bus transfer station and parking lot.

To the extent possible, the trains would operate in the median of the new freeways. Within the center city, the rail lines would be built in cut-and-cover tunnels that, when covered by a deck would resume carrying surface traffic. Officials considered technological alternatives such as monorail, moving belts, automated buses, helicopters, and greater use of existing railroad service or right-of-way, but none was satisfactory.

The recommended network included 33 miles of rail rapid transit, 66 miles of express bus routes, and parking for the rail and bus passengers at an estimated cost of \$564 million.

However, transit could not serve commuters who needed their vehicles during the day and those beyond the range of feasible transit lines. It also could not serve traffic passing through the region or the movement of commercial vehicles. (The survey estimated that in 1980, trucks would constitute one-sixth of all trips.) Therefore, even with this mass transit network, the area would need freeways and parkways.

The report on the Mass Transportation Survey called for a freeway component of 326 miles at a cost of \$1.8 billion and \$119 million for related downtown parking facilities. To supplement existing freeways, area highway agencies were planning 179 miles of freeways and parkways in the next 10 years, but another 66 miles would be needed. Existing freeways would have to be widened to accommodate growth in population and, therefore, traffic. In addition to the planned inner and outer beltways, the report included the Northwest Freeway in the Wisconsin Avenue corridor.

Creating the area's modern transportation system should proceed in three steps. First, existing public transit should be improved. It should be organized on a regional instead of jurisdictional basis as at present, to eliminate barriers to crossing State, District, and county lines. Traffic controls and regulations should be employed to increase speeds, while detailed planning for new express transit facilities should get underway. Efforts should include reserving right-of-way on new freeways for transit service, with freeway construction completed well ahead of the present schedule. Quick opening of freeways would increase service by express bus lines.

Second, express bus service should be included in new radial freeways, beginning in the early 1960s. The accelerated highway construction should continue even as construction of subways

gets underway in the mid 1960s. Radial freeways should be built with increased demand in mind by building wide medians where additional lanes can be provided as needed. Alternatively, the wide medians could be used as reversible one-way freeways.

Finally, rail transit should begin service no later than 1970.

The survey also considered downtown parking needs. About the same number of downtown all-day parking spaces would be needed in 1980 as at present. However, many current spaces on temporary parking lots and on-street parking would be lost. About 22,000 new spaces would be needed for all-day spaces, mostly in multi-level structures, with 27,000 new short-time spaces to replace existing spaces and meet new demand downtown.

The survey estimated the cost of the recommended system would be approximately \$2.5 billion:

- \$1.8 billion for highways
- \$664 million for express transit facilities
- \$119 million for parking facilities in the downtown area

About three-fourths of the funding should be spent in the first 10 years. More than half of the funds (or \$1.3 billion) would be expended on transportation facilities in the District of Columbia.

Some funds could be expected under current laws but, for example, about \$500 million that would be needed for highway construction was not covered by present arrangements. New sources, such as 30-year bonds, would have to be considered.

The survey's assumption about transit costs and revenue indicated that "revenues would be sufficient—when the region's population reached 3 million and the transit and freeway systems are in full operation—to cover operating costs and a substantial part of the yearly payments of interest and principal [estimated: \$26.7 million a year] on the initial investment." The deficit would be about \$16.1 million in 1980.

The two most likely sources of added revenue for costs beyond present projections were increased Federal contributions and taxes and charges imposed within the region. Examples of taxes and charges included a regional motor fuel tax, motor vehicle license fees, special parking fees, payroll taxes, and real estate taxes. The best option would "probably consist of a combination of several of them." Governing bodies in the area would have to decide on the best mix, but serious doubts existed on whether they could provide the entire amount of additional revenue needed.

Considering the strong Federal interest in improved transportation within the area, the survey found that strong arguments could be made to support Federal loans and contributions. At the time, the Federal Government did not have a transit-aid program, but should contribute toward the planning and design of the rapid rail system, as well as the early construction stages undertaken by an interstate agency capable of raising funds within the region. The Federal Government also should identify a way of providing the necessary added revenue to pay for the additional highway mileage needed by 1980.

To carry out the plans, the survey projected several organizational stages. First, Congress should ratify the interstate compact approved by Maryland and Virginia to establish an agency to regulate transit throughout the area. This compact would allow for integration of transit lines across jurisdictional borders.

Second, Congress should authorize a temporary public corporation to begin planning, design, right-of-way acquisition, construction, and even operation of transit facilities. The corporation also would review ways of linking highway and transit service.

Third, the first two steps should end when local jurisdictions agree to an interstate compact to form an organization that would carry out all activities, including the financing, construction, operation, and maintenance of transit facilities. This organization would be in charge of the rail rapid transit system, including the subway segments. [“Summary of Mass Transit Program for Capital Area,” *The Sunday Star*, July 12, 1959; the summary provided the text of the summary in the Mass Transportation Survey report]

Harland Bartholomew said the report resulted from an “evolution of successive studies and steps” involving the top transportation, traffic, and urban development experts in the country. It was, he believed, the first such study based on widespread consultation with experts.

Gingery, chairman of the regional council, said the study had “developed the answers to any pet theory that anyone wants to throw at us.”

Engineer Commissioner Welling, however, was concerned that the funding goals would be impossible without substantial Federal assistance. “For the future, I foresee an increase in District tax rates and a heavier distribution to the Highway Fund of available revenues. Even so, it is reasonable to assume that the residents and business enterprises in the District cannot afford the cost of constructing the recommended system in the District, or even a major portion thereof.”

Senator Bible indicated that his Joint Committee on Washington Metropolitan Problems would hold hearings on the survey report in the fall. [Beveridge, George, “Subway and Road Needs for 1980 Outlined in Survey,” *The Sunday Star*, July 12, 1959]

## **Highways and Transit**

Chairman Bible’s joint committee held hearings on November 9-14, 1959, on the transportation plan. Overall, witnesses supported the proposed mass transit network, although they differed in some aspects of it. Witnesses were generally concerned about the inclusion of freeways, such as the Inner Loop and Northwest Freeway, in the plan.

On November 9, Elmer B. Staats, Deputy Director of the Bureau of the Budget, was the first witness. He recalled that in transmitting the survey report to Congress, President Eisenhower had indicated he would ask government agencies to review the survey and submit recommendations, which he would then send to Congress as warranted. Staats reported that the results of agency reviews indicated that the proposed comprehensive transportation system was

“a constructive approach,” with highest priority to be given to the proposed rail transit facilities. He emphasized that this support was general, not linked to any specific transit line or highway.

Staats encouraged Congress to ratify the interstate compact approved by Maryland and Virginia to regulate fares and determine routes of private carriers. Beyond that, Staats supported the proposed temporary Federal corporation to plan the express transit facilities, acquire right-of-way, and begin building the system. After the groundwork was in place, a permanent interstate agency should be established by compact among the jurisdictions to succeed the regulatory agencies and transit corporation.

He acknowledged the call for substantial Federal contributions to the capital costs of the new system. “As a general rule, the Federal Government does not assume responsibility for financing highways designed primarily to meet mass transportation or other predominantly local traffic requirements.” However, additional aid, especially for the rail rapid transit system “may be justified by the special Federal interest in the Nation’s Capital.” He cautioned that “long-term reliance on Federal financing should be avoided.”

He emphasized:

The objective would be furthered by making every effort by Federal and local agencies to emphasize or encourage the use of rail transit, express buses and outlying terminal parking, rather than emphasizing additional highways which tend to encourage automobile commuting.

In the absence of detailed plans, Staats could not talk dollar amounts, but agreed that initial Federal financing of the corporation for rapid transit would be necessary. “At the same time we believe that the scheduling of capital outlays for rapid transit services and the development of fare schedules should proceed on the basis that the corporation will ultimately be self-supporting.” He also wanted to ensure that “every opportunity” was given to employing private enterprise in operating and financing the integrated mass transportation system, “especially the express bus service and downtown parking facilities.” [pages 14-15]

As the *Star*’s George Beveridge explained, the Eisenhower administration was developing legislation providing for Federal aid to the corporation:

“The bill simply would authorize the Treasury to loan to the corporation,” Mr. Staats said, in answer to questions. “That is why we say the transportation system eventually must be self-supporting—so that receipts can repay the Federal loan.”

Budget Bureau aides explained they envision the set-up here as a parallel to financing the St. Lawrence Seaway. [Beveridge, George, “White House Backs Rapid Rail Plan Here,” *The Evening Star*, November 9, 1959]

(The St. Lawrence Seaway Bill (the Wiley-Donero Act, P.L. 83-358), approved by President Eisenhower on May 13, 1954, established the United States St. Lawrence Seaway Development Corporation to construct the seaway on United States territory. The project was to be self-liquidating in that the corporation would sell up to \$105 million in interest-bearing revenue

bonds to the U.S. Treasury to be paid back within 50 years through the collection of tolls, negotiated with Canada, for shipments on the seaway.)

As Beveridge pointed out, the first 2 days of the hearing were devoted to the planners' recommendations, "and some differing opinions are likely from planning and transportation experts who did not participate in the four-year study."

These differences were apparently on Bartholomew's mind when he testified after Staats concluded his presentation. He summarized the history of the survey, the "high caliber of technical competence engaged" in preparing the plan, and how the consultants and professional firms involved "exceed in their qualifications any group ever assembled for such an undertaking." They were mindful that:

Providing for a good transportation system in a great, growing, dynamic community such as this is, at best, a most complex undertaking. There is no patent readymade solution that can be pulled out of the hat, nor created by a single legislative or administrative edict.

The result of 4 years of work involved "an infinite number of meetings, as well as laborious staff work," and an "areawide cooperative endeavor":

Furthermore, we would call to your attention that this is a balanced transportation plan, wherein, probably for the first time, experts and qualified authorities in the fields of transit and automotive transportation both endeavored seriously to determine where, in this changing urban scene, these two forms of transportation meet and overlap.

The plan, he said, anticipated regional growth to 3 million people in 20 years, and possibly 5 million in 40 years. Traffic estimates based on those increases were realistic. "It takes no expert to demonstrate that, with an approximate 65-percent increase in total population, provision for the added traffic load necessitates bolder measures than have yet been taken, both in the new highways and in adequate rights-of-way for some form of rapid transit." The proposed plan, in short, "is conservative, especially since we cannot assume that future growth will cease by 1980, the target date of this plan."

NCPC and the Regional Planning Commission concluded that "our first obligation was to devise an adequate metropolitan areawide mass transportation plan." As shown by experience elsewhere, public financing would be required, especially in acquiring right-of-way. He thought that operation of the express bus system, and possibly the rail system, "might conceivably, and profitably, be by private enterprise."

The proposed rail system was "based on the use of the latest technological developments." Bartholomew said, "It is our firm position that only subways would be acceptable in the central city and that no so-called modern elevated structure should be used."

He emphasized jurisdictional cooperation, supported the idea of an interim agency referred to as a Federal Corporation to keep things moving as rapidly as possible until a permanent metropolitan agency could be created by compact. [pages 18-20]

As mentioned earlier ACTION's Roy W. Johnson was concerned by the superhighway elements of the comprehensive plan. He emphasized the importance of using science to find answers in "an era of great technological change." Transportation had been "revolutionized by the internal combustion engine," but society had not explored all applications of electricity, nuclear energy, computer technology, and new fuels. "Vistas of automation in transportation, offering dramatic advances in safety, comfort and economy, stretch out before us." He added, "We shall not solve the problems of metropolitan transportation by denying ourselves the resources we are employing to do the many modern scientific tests."

The worsening transportation situation in the metropolitan area was steadily "creeping along." Every day, people adjusted to it: "mostly bad adjustments," as reflected in the flight of people, businesses, and industry out of the city:

The city cripples itself. It limps more and more. Its capacity to recover, to combat further deterioration weakens. The very adjustments it made further complicate the disease as everyone who had grappled with financing the full range of Government services for sprawling suburbs knows. We are traveling a road to metropolitan disorganization and disaster.

As for building more superhighways, people should ask "whether it is wise to destroy many values of our Capital City" to accommodate commuters:

Is there an alternative to building expressways into the heart of Washington? Surely, it is the simple, obvious one of rapid transit. With all the possibility of developing transportation technology . . . we have in our hands today the means to build efficient, attractive, economical rapid transit that can be augmented as time goes on to an even greater degree.

Rail rapid transit should be not seen only as a means of transportation, but rather "as a means of organizing the future growth of the Washington metropolitan area, not merely the millions new population of the report—but far more in the future." With rail rapid transit beginning to solve urban transportation problems, "the city will build from strength to strength." In so doing, officials will halt suburban sprawl, build communities, reverse the decay of the center city, and "substitute for an uneconomic and hopelessly frustrating illusion of personal freedom on the highway the reality of comfortable and convenient journeys to work by mass transportation." [pages 27-30]

Other witnesses on this first day questioned some of the survey's projections of population and traffic, including the number of transit passengers, and the methodology used to arrive at them.

The second day saw additional attacks on estimates and projections. For example, Stanley D. Forsythe, general superintendent of engineering for the Chicago Transit Authority, questioned predictions of passenger numbers, the use of private rights-of-way, and the schedule for building the rail rapid transit system. The Mass Transportation Survey estimated that by 1980, with full implementation of the plan, "only 45 percent of the people coming into the central district" would use mass transit. He was surprised by the "pessimism of the report on that phase."

Experience elsewhere, including Chicago, suggested the percentage would be much higher – 79 percent in Chicago during peak hours and even higher, 87 percent in the Loop (the city’s central business district). Other cities were experiencing similar percentages. Forsythe cited Philadelphia (between 66 and 75 percent) and Boston (66 percent), as well as increases in Cleveland and Toronto. Even in Los Angeles, “where there is no rapid transit . . . today 54 percent of the people come in by mass transit.” [pages 137-138]

Forsythe stressed the value of putting rail rapid transit in the median of superhighways. As experience in Chicago with the Congress Street Expressway demonstrated, it was “an ideal combination, and no one is more enthusiastic about it in Chicago than the highway planners themselves, who see in that combination of rapid transit in the median strip and the terrifically expensive expressways an opportunity to increase the capacity of the highway, particularly in the last few miles as you come into the center area.”

He knew that debates occurred over whether to include rail rapid transit at the start of a transportation plan or the end. However, “any sort of prudent planning” would include rail rapid transit, or at least part of it, in the “very earliest part . . . and let it demonstrate itself.” It would prove to be a municipal asset, but he cautioned the joint committee:

You are going to find nobody operating rapid transit that will make any money out of it. You will have to subsidize it, the same as you subsidize your highways, but it is a municipal asset that is quite valuable, in my judgment. [pages 141-142]

Chairman Finley of the Commission of Fine Arts also testified, indicating that members of the commission “firmly believe that a rapid transit system is the most logical means of meeting these traffic needs.” The central area’s ability to absorb more vehicles had long since “gone beyond the saturation point.” One option that Finley said should be considered is “to organize the centers of employment and at the same time to retain the unique features of the Washington plan.” As for the centers of employment, he said:

For instance, if Government buildings were erected east of the Capitol, outside of the Mall, with residential areas adjacent to them, much could be accomplished to avoid congestion that results when all these employment centers are located in one general area far from adequate housing.

The city, Finley said, “was made by Washington, Jefferson, and L’Enfant, and further developed by their successors for a special purpose.” He continued:

It reflects our early aspirations that our Capital City should be worthy of this great Nation; and to this end it provides a harmonious relationship of streets, buildings, and parks to give to Washington the beauty and dignity so admired by visitors. This plan should be treated with the utmost respect. Washington, himself, said with reference to it:

. . . no departure from the engraved plan of the city ought to be allowed unless imperious necessity should require it or some great public good is to be promoted thereby.

The Mass Transportation Survey had applied to the District “the factors used in planning for the average city where commercial rather than governmental factors are dominant.” In seeking solutions to the area’s transportation problems, special emphasis should be given to a “solution to traffic problems which would preserve the unique character of Washington as the Nation’s Capital.” Fortunately, “a rapid underground transit system is excellent, so far as it goes, and should receive the first consideration.” As noted earlier, he added that the freeways planned for the area, such as the Inner Belt Freeway, would change the city to reflect the considerations of highway engineers, not the vision of the Washington plan. [pages 120-122]

On November 11, Virginia State Senator Fenwick told the joint committee that Virginia wanted to ensure that the Federal Corporation envisioned by the bill would be an interim agency. Virginia had reluctantly gone along with the idea on that basis alone. The Federal Corporation could work in the District, but he said that during meetings on the plan, “representatives from Maryland and Virginia were emphatic in their position that, under no circumstances, would they be willing to give to the Federal corporation the necessary powers to carry out the mass transportation plan which probably would include acquisition of rights-of-way by eminent domain, the levying of taxes, and control of such highways.”

They believed that “a compact with representatives from the jurisdictions involved was workable and acceptable.” Further:

In recommending the establishment of a Federal corporation it was their understanding that such a corporation would recognize the establishment of a compact and would go out of existence upon such compact being formed.

Any attempt to supplant such a compact would result in “vigorous opposition” not only from the local jurisdictions but the States:

The very idea of giving to a Federal agency the right to come into thickly populated areas and construct great barriers of concrete irrespective of property rights in zoning and residential areas would create such resistance that the whole concept of a mass transportation plan would be defeated. [pages 382-383]

On the same day, representatives of two private bus lines operating between Virginia and Washington testified that private companies should retain their rights. Attorney Manual J. Davis said on their behalf, “We are opposed to the rapid transit plan as it is not only infeasible, but will ultimately destroy existing private enterprise.” He added:

We are in general agreement to a plan of expressways with a privately owned transit system providing an expressway bus system and continuing the existing transit service. We cannot support parts of the proposed plan which do not support themselves.

He recommended that the plan include measures to discourage unlimited automobile use by removing free off-the-street parking. By staggering work hours in downtown government buildings, and including space in Interstate medians to operate transit, the plan would go a long way to relieving congestion. [pages 276, 289, 293-294]

Representative Howard Smith, a member of the Joint Committee, said during the question period that he wanted to comment on rail transportation:

I make [this comment] out of a long experience and from long observation from the time of the horse-and-buggy days with respect to rail transportation from Alexandria to Washington.

(Representative Smith had been born in 1883 and was in his mid-70s at the time.)

Now, I recall the days when the horse and buggy were fading, and the automobile was coming along, when an automobile was so rare in Alexandria that everybody would go to the window when there was one rattling down the street.

The Washington, Alexandria & Mount Vernon Railroad back then “was a gold mine.” He recalled the first bus he ever saw, which carried about 10 passengers on King Street and they had the “thrill for the first time of riding on a vehicle that did not have a horse attached to it.” The buses “began to prosper, and that has been history all over the country of these rail lines, as I understand it, particularly the suburban lines, and everyone of them around here went broke when the bus started.”

The reason he was recalling these experiences was:

If that has been the experience with rail transportation in the suburban areas and they failed and went completely broke, what has happened since [then] that will make anybody think that they can prosper again? I just do not see it. That is all. [pages 303-304]

The following day, November 12, O. Roy Chalk, the owner of the D.C. Transit System, Inc., was the primary witness. His predecessors, the four Wolfson brothers, had earned a fortune buying and selling surplus Florida shipyards. In 1949, they purchased a controlling interest in the D.C. transit company because they considered it another under-valued property. They spent much of the company’s profits in large dividends. Professor Zachary M. Schrag, in his history of the Metro System, explained that these payments were legal, but “were regarded by the public and many politicians as the plunder of what had been a prudent, conservative company.”

When operators went on a 7-week strike in 1955, Congress terminated the franchise, which the District sold to Chalk, an airline entrepreneur. Congress approved the transfer in the Washington Metropolitan Transit Authority Act (P. L. 84-757), which granted a franchise to D.C. Transit System, Inc., to operate a mass transportation system for passengers within the District of Columbia and between the District and points within the area. President Eisenhower signed the legislation on July 24, 1956. The law required Chalk to replace the system’s streetcars with buses:

Getting rid of Washington’s streetcars had been a top priority for the District commissioners as soon as they decided to revoke the Capital Transit franchise. Streetcars, they believed, were in the way of automobiles. A street with two-way streetcar tracks could not be converted to auto-friendly, one-way operation, and streetcar boarding platforms occupied traffic lanes. With congressional approval, the

commissioners required that any new franchise promise to sell off Washington's streetcars and remove the tracks. Within two years, Chalk would fight to keep his streetcars, but the District government and Congress were adamant. It seemed as though the era of rail transit in Washington was over. [Schrag, Zachary M., *The Great Society Subway: A History of the Washington Metro*, The Johns Hopkins University Press, 2006, pages 29-30]

Officials had been glad to see the Wolfsons go, but they soon came to regret the arrival of Chalk, whom Schrag called "the infamous transit baron." He said, "Many in Washington speculated that his true interest in D.C. Transit lay in selling off its valuable real estate: streetcar barns that could be converted to offices, shops, and even apartment buildings." The usual mix of declining ridership, increasing fares, and deteriorating service that many other cities had experienced undermined the company's finances. [Schrag, page 175]

In his testimony, Chalk rejected the Mass Transportation Survey's \$2.5 billion transportation plan for the area. He was "shocked and amazed" that the survey had placed overriding emphasis on public ownership, which he said was "inconsistent with American traditions of free enterprise." The assumption behind it, that "private industry either cannot, or will not, supply the mass transit needs of this area," reflected a "complete lack of faith in the ability, capacity, and ingenuity of American business." He was, he said, "alarmed by the ease with which the sponsors of this plan have departed from the fundamental principles of our national heritage."

He contrasted public ownership, as in New York City, with its "ever-increasing annual deficits, and their lack of imagination, efficiency, and ability," with the job done by private enterprise. "Throughout the country privately owned transit facilities have been operated profitably, while the municipally owned systems have averaged a loss of 16.3 percent on their operation."

Chairman Bible interrupted to point out that other witnesses had testified to the struggles of the private companies. When Chalk said he was referring only to cities comparable to Washington, Chairman Bible suggested that staff might examine operations in the 17 or so comparable metropolitan areas. Chalk suggested they had only to look at the District of Columbia, where the transit experience was "a record of progress and achievement—a subject of great interest and encouragement to the industry throughout the nation." [pages 595-597]

In any event, D.C. Transit's franchise was "a binding contractual obligation." Public operation of mass transit in the metropolitan area "would be a breach of this contract. It would be confiscatory and unconstitutional." This reality had been "ignored by the pending proposal."

Beyond the legal issue, he said, "we consider the total plan lacking in imagination." The planners appeared "to adopt a theory of status quo, so far as facilities are concerned" and were "still tied to the cast-iron age." He added, "it is inescapable, that, contrary to long-standing American tradition, the report with one fast brush stroke has pushed aside all thought of progress, innovation, and pioneering, and has gone forward on the assumption that the automobile is the ultimate, most desirable means of transportation." In fact, 72 percent of the recommended expenditures under the plan were for highway construction, and a "mere 28 percent" for all

public transportation. “In reality, a more appropriate name for the survey,” he said, would be “Superhighway Planning in and Around the Washington Metropolitan Area.” [pages 598-599]

He offered two alternatives. The first was to “exclude all but public transportation traffic from the central portion of the city during the rush hours of 7 to 10 a.m. and 4 to 7 p.m., when the mass transit job must be done.” Downtown street parking must be eliminated, fringe parking should be provided, work hours staggered, and commercial loading and unloading restricted during the peak hours. With those conditions, “D.C. Transit could, without question, provide really effective rapid transit throughout the metropolitan area, and not wait for 1980.”

He acknowledged that “such a project would be far from painless.” Doubtless, it would be met by “violent objections from the automobile and petroleum industries, their suppliers, and the automobile associations.” Still, considering the cost of the survey’s plan, he said, “I suggest trading \$2.5 billion for some guts.”

If Congress preferred to spend the money the survey suggested, he had a better alternative. In the spirit of innovation, he proposed to operate a monorail system:

We are not talking about the monorail system investigated by the survey’s engineers and found to be unsuitable for Washington. We present instead a system which has been designed, engineered, and perfected by one of the Nation’s leading aircraft manufacturers, the Lockheed Aircraft Corp. D.C. Transit is prepared, with appropriate Government assistance, to go forward with the installation of the system. With such aid, the first line could be constructed and in operation within 2 years following the acquisition of the necessary rights-of-way.

He displayed a scale model of the monorail and presented a brochure on the plan to the committee for review. The brochure outlined a 116-mile monorail system with cars riding about 20 feet above ground, 2 miles in tunnels through downtown, and another 2.7 miles in an uncovered cut below ground. Two lines intersected in downtown. One from Viers Mill in Montgomery County passed along 7<sup>th</sup> Street, NW., with branches to Andrews Air Force Base and Jones Point, the new CIA headquarters in Langley, Virginia, and Dulles International Airport. This route passed by the Pentagon and Falls Church and was the first priority in Chalk’s plan. A second U-shaped route ran between Rockville via a route west of the 7<sup>th</sup> Street line to Fort Meade and Friendship International Airport in Maryland:

Included in our proposal would be approximately 2 miles of tunneling through the heart of the city to avoid the necessity of having the monorail on the pillars in the center of the city.

He estimated the system would cost \$250 million.

Representative Broyhill asked if Chalk had checked with the Commission of Fine Arts about the aesthetics of a monorail in Washington. Chalk said the plan was so new, he had not yet checked with the commission, but would do so after the plan was completed. He was certain “they may

have some very fine suggestions for, possibly, beautifying various aspects of our proposal.”  
[pages 600-604]

Harvey Speak, counsel for D.C. Transit System, appeared on the panel with Chalk to attack the prospect of an interstate compact to operate the transit system. A tri-State commission would be “unconstitutional and an improper delegation, even if Congress retained approval authority. D.C. Transit System had an exclusive franchise for at least 20 years, running to 1976. The Mass Transportation Survey plan “represents a breach of contract, a breach of franchise, and hence a violation of the terms of the contract to which Congress is committed.” In the absence of a remedy for D.C. Transit System, the plan would give “cause of action for damages in the eyes of the law.”

Aside from the legal issues surrounding violation of the franchise contract, Speak argued that the District’s unique constitutional status was another issue. The Constitution created the District “for the benefit of the 50 States, and the Supreme Court . . . has in several opinions held that the District . . . must be operated for the benefit of all 50 States, not to the advantage of any one or two and, in particular, that Congress could not delegate to the control of one or more of the States control over the District at the expense of the other of the 50 States.” A compact authorized by Congress among the District, Maryland, and Virginia “would then be unconstitutional.”

He referred to State Senator Fenwick’s testimony that Virginia would not yield its sovereignty to a Federal agency or the other jurisdictions that would be party to the compact. As a result, the compact “is already a dead duck, because it serves no purpose . . . . It is a waste of time which creates legal complications, which will only delay the next stage, and I would suggest that in terms of the legality of this, if the committee were to take the entire project, grapple with it and come up with one solution, the legal problems raised, the unconstitutional problems, would be significantly diminished.” [pages 622-625]

Under Secretary of Commerce John J. Allen, Jr., testified later in the day, accompanied by Commissioner of Public Roads Ellis L. Armstrong and Garland E. Marple, Chief of BPR’s Planning Operations Branch, Division of Highway Planning. (During this period, the title Commissioner of Public Roads, once held by the BPR head, was a secondary title below Administrator Tallamy.) Allen had served in the House representing Oakland, California, from January 3, 1947-January 3, 1959 (R-Ca.), before taking the sub-Cabinet post after losing his reelection bid. The Commerce Department’s interest in the survey’s plan stemmed from BPR’s role in highway planning and financing for the road elements “and through our general responsibility for a coordinated national transportation policy to meet the needs of our Nation for effective and economical transportation.

His personal interest stemmed from his service on the House District Committee “and from being a citizen and representative of another great metropolitan center with similar transportation problems.” (He lived in the District’s Capitol Hill neighborhood at 110 Fourth Street, NE.)

He was impressed that the District, Maryland, and Virginia had agreed “to pool their power . . . to continue a common program of transport planning and regulation.” He urged Congress to

follow the example of the District and State officials “and also ratify the compact in behalf of the District of Columbia”:

So far the transportation plan is an outstanding accomplishment in intergovernmental relations. An act of the Congress can now make it a landmark in metropolitan regional government; a system of common planning and administration will be created among three independent jurisdictions and the Federal Government itself.

The proposed regional transportation plan was “an outstanding example of the art of city planning, a worthy successor to L’Enfant and the other great plans that have shaped the Nation’s Capital.”

That highways constituted 72 percent of the cost of the plan was appropriate because the survey predicted that by 1980, about 80 percent of all travel in the metropolitan area would be by motor vehicle on roads. “Anyway you look at the highway phase of the plan it is a large undertaking, considering both the volume of construction and the financial requirements.”

Under Secretary Allen praised the rail and transit elements of the plan, calling the rapid transit system “the boldest conception yet by advanced officials for solving the Washington commuting problem.” For rapid transit to succeed, the community must stay united even though patronage of transit would be concentrated in the few peak hours during the week, “a fact which defies the economics of most business enterprises and throws some of the cost on the community generally.” Beyond cost, “The community must furthermore cooperate by encouraging rapid transit use by coordinating traffic regulations, other transit operations, parking facilities, and in some instances zoning.”

Senator Bible asked if the panel could comment on the general feeling of many other witnesses that “we are overemphasizing the highway program, putting all this emphasis on a highway dominant program and we will end up with something like the Los Angeles situation which they point to as a horrible example.”

Under Secretary Allen replied that the Commerce Department did not have a preference among transportation modes. Instead, the objective was to promote “those transportation facilities which best serve the need for which they are made available.” He deferred to Commissioner Armstrong and Marple.

Armstrong explained that in trying to move people, “we in the highway field have been up against the very real problem of trying to do that in a way that will solve the problem, that is, it is one of trying to provide what people want.” The automobile age had introduced something to the American way of life “that all of us like quite well, and that is the freedom of movement of the individual.” He said:

And if we provide facilities that people won’t use, it doesn’t solve our problem. So in this plan the approach has been to try to realistically analyze what we are up against, what we think people will do if they have facilities, what their choice might be. And I don’t think we are going to, by any means, end up with a big sea of concrete.

The plan provided “a reasonable balance” for the region:

I think the approach has been quite sound, approaching it from the standpoint of first the travel that is done in automobiles by folks who will not be living within any reasonable distance of a mass transit system, they would still have to drive considerable distances in their automobiles, and they would probably prefer after they start, to come on downtown, if there are reasonable facilities available.

In addition, the plan considered people who used their automobiles during the day, such as salesmen. “Then the remainder was analyzed on the basis of a choice between driving an automobile and riding the rapid transit.” He emphasized:

There is no magic in this thing. You can’t say here is a better way to do it for the downtown area, and expect people automatically to agree.

We are quite independent, I think, in our individual thinking, and the growth of the automobile use in America has resulted because of that. So I think it is a realistic approach and one that is in the realm of a solution to the problem.

Marple, speaking briefly, said BPR did not have any basis for improving the methods used by the Mass Transportation Survey for projecting travel. He noted:

The report shows that the estimated volume that would be handled by mass transit coming to the downtown area in the peak hour will increase considerably between 1955 and 1980. That is somewhat contrary to the trend that we have experienced before.

I would think that we might well expect a lower percentage of traffic to be handled by mass transit in the Washington area than in some of the other cities because of the nature of the proposed land utilization. [pages 695-699]

On November 13, Darwin Stolzenbach represented the Interfederation Council of the Greater Washington Area, a group comprising 361 local citizens organizations. The council endorsed the rapid transit system, including plans for a Federal Corporation to get work underway. He said the council was worried that negotiating the interstate compact could take 5 to 10 years and felt that “such a delay in getting on with the planning and development of an integrated transportation system would adversely affect the welfare of all the citizens of this area.”

The council wanted the agency resulting from the compact to “have the power to make decisions on the establishment and operation of specific regional highway and transit facilities, whether or not all the local authorities agree.” The members were concerned that the survey had “placed a disproportionate emphasis on private auto transport as opposed to other forms of transportation, and failed to consider seriously public policies that would tend to increase the utility of mass transit relative to the automobile.” [pages 774-780]

Former District Director J. N. Robertson, now chairman of the Transportation Committee of the Metropolitan Washington Board of Trade, testified in support of the survey, the mass transit

plans, and the corporation-compact sequence of development. However, given projected population increases, “it is obvious that both highways and transit facilities will be inadequate”:

Therefore the board of directors urges that the present highway program in its entirety be vigorously pushed to completion before the 1980 date, if possible, and that none of the highway funds be diverted either directly or indirectly for any purpose other than that of highway construction. [pages 786-787]

Engineer Commissioner Welling opened the afternoon testimony. The District commissioners supported the mass transit elements of the survey plan and creation of a compact to establish an organization to build it. Given the time needed to create such a compact, the commissioners suggested that the District or the U.S. Army Corps of Engineers might serve as the construction agency. The commissioners emphasized that “payment therefore shall be predominantly with Federal funds in relation to the full financial obligation imposed by the survey as a whole.” The benefits of the system were “grossly disproportionate to the relative benefits which could accrue to the District,” considering real estate to be consumed by the facilities and disruption to established communities and community facilities.

The District could not commit to the entire plan, which the commissioners believed represented “the outer limits of a regional transportation system from which there will evolve practical action programs of lesser magnitude.” The commissioners supported the rail rapid transit plan, but “if the Federal Government—or the region—does not intend to make massive financial contributions toward providing transportation facilities in the District,” the area should consider more modest alternatives. [pages 833-834]

[The discussion of the Joint Committee hearings was informed by daily articles by George Beveridge and Grace Bassett in *The Evening Star*: “White House Backs Rapid Rail Plan Here” (November 9), “Rapid Transit Estimates Too Low, Hearing Told” (November 10), “Limit Transit Agency to D.C., Virginia Asks” (November 11), “Chalk’s Transit Plans Stress Private Funds” (November 12), “Regional Unit Backs Rapid Transit Idea” (November 13), “Metropolitan Area Transit System Cost Upheld by Planner” (November 14)]

### **Introducing Peter S. Craig**

Professor Schrag explained that the reaction to the report revealed that District residents, particularly those in the path of the suggested freeways, “were having second thoughts about highways, only a short time after the passage of” the Federal-Aid Highway Act of 1956:

If the Inner Loop was designed to save the center of the city by building a wall around it, it necessarily abandoned those neighborhoods outside the wall to the ravages of the automobile.

As an example, he cited residents of Cleveland Park, located in northwest Washington along Connecticut Avenue near Rock Creek Park:

First developed in the late nineteenth century and named after President Grover Cleveland, who kept a summer residence there during his first term as president [March

4, 1885 to March 4, 1889], the neighborhood had been largely built up by the end of the 1920s. In the 1950s, it was home to white professionals—lawyers, doctors, journalists, and not a few members of Congress—and their families, whose large, detached houses were dwarfed by thick oaks and punctuated by private schools. Bartholomew saw in these houses the straightest path between the booming suburbs of western Montgomery County and downtown, just the place for the six-lane southern spur of Interstate 70, to be called the Northwest Freeway. Cleveland Park disagreed.

One concerned Cleveland Park resident was Peter S. Craig, who would become one of the District's most persistent anti-freeway fighters. A graduate of Yale Law School, he had moved to Washington in 1953 as a junior attorney in Covington and Burling, then and now one of the city's most powerful law firms. He lived in Georgetown for a year, and in Fairfax County after that, but moved to Cleveland Park, "attracted by the ease of getting downtown via the Wisconsin Avenue streetcar," according to Professor Schrag:

After seeing a map of Bartholomew's plan in the *Washington Star* [sic], David Sanders Clark of Tilden Street began pounding doors, warning neighbors of the multilane highway. One of his knocks was answered by Peter Craig . . . . Horrified by the prospect of a freeway ripping through his neighborhood, he quickly agreed to help Clark fight it.

Residents banded together to fight the proposed freeway by forming the Committee to Oppose the Cross-Park Freeway, later renamed the Northwest Committee for Transportation Planning:

In 1959 such a group was quite novel; not until 1962 and 1963 would such freeway complaints become widespread nationwide. But the professionals of Cleveland Park knew how to make themselves heard, and at the hearings on the Mass Transportation Survey in 1959, Craig castigated the Highway Act of 1956 for forcing cities to choose between 90 percent federal funding for highways or no aid at all for transit. "[I]n my heart, I feel certain that Congress never intended that the Federal-aid highway act would be used as a device for burying our cities in concrete."

Chairman Bible acknowledged that "the impact of superhighways on many of the city's best residential areas and parks has brought many thoughtful citizens to the appreciation that such improvements are not an unmixed blessing."

The rapid transit element of the new plan proved far more popular than the expressways and parkways, especially if subways were included to minimize surface disruption:

Typical was the reaction of District commissioner Robert McLaughlin, who worried about both the construction cost and collateral effects. He pointed out that the District would lose land to the freeways, which would then abet the flight to the suburbs by "middle and high income families," leaving the District with a greater proportion of poor people. A subway would be preferable, he suggested, and in any case, if the federal government wanted to cut freeways through the District, it should expect to pay for them. The city would not fund its own destruction. [Schrag, pages 40-41]

## **The I-70S Hearing**

On June 14, 1960, the Subcommittee on Public Roads, Senate Committee on Public Works, held a hearing on the location of Interstate Route 70 South (U.S. 240) in Maryland and the District of Columbia. Senator Edmund S. Muskie (D-Me.) chaired the hearing. Chairman Muskie explained the purpose of the hearing:

This subcommittee is concerned principally with two points: First, whether the selection as recently announced by the Bureau of Public Roads was made in accordance with the procedure set up by the cooperation between departments, and I am referring particularly to the language in section 103(d), reading as follows:

The routes of this system shall be selected by joint action of the State highway departments of each State and the adjoining States, subject to approval by the Secretary as provided in subsection (e) of this section.

We are interested also in determining whether or not there is a statutory obstacle to the selection of what might otherwise be the best route in terms of the best interests of the area and the people concerned.

He asked the Ranking Member of the subcommittee, Senator Case, for his comments. Senator Case said he had called for the hearing after reading news reports saying BPR had approved a route for I-70S to the inner loop that “would injure the tax base of the city.” The subcommittee wanted to be certain that BPR had followed the statutory requirement that route selection for multi-State routes was to be by the joint action of the State highway agencies of adjoining States and the Secretary of Commerce, represented by BPR.

He also wanted to know if the deadline for submitting the next ICE to Congress should be extended to allow more time to consider the route.

Federal Highway Administrator Tallamy was the first witness. Since 1956, he said, BPR had made considerable progress in establishing locations for most Interstate highways, including those crossing State lines:

However, there are a few cases where such detailed locations have not yet been established. The Interstate System concept was developed with a corridor area as being the consideration for a highway between principal points of origin and destination of traffic . . . . The law, as we interpret it, indicates that in selection of a route within a corridor we shall determine it in the most direct manner practicable – which is practical – and we do have a corridor for the area between Frederick, Md., and downtown Washington which is generally called the route 240 location. There is no detailed agreement as to the specific location of this highway as it extends from Pooks Hill into downtown Washington.

The two jurisdictions had agreed on a route between the two points and the most direct corridor should be established under the legislation:

However, we recognize that there may be a deviations [sic] in physical location of the detailed route within that corridor or even extending outside of a most direct corridor if detailed engineering studies reveal that it is impossible or not practicable to go in the most direct manner.

One force driving the discussion was the next ICE. While working on the next ICE, BPR had not received any indication from either jurisdiction that “there is no practical, reasonable way of following a direct corridor between Frederick and downtown Washington.” For apportioning Interstate construction funds, the ICE would estimate the cost of the route that followed “the direct corridor in view of the fact that it is not demonstrated that it is impractical physically and otherwise to develop a route along the direct corridor.”

Tallamy had met with highway officials from Maryland and the District as well as NCPC about the route. He told the subcommittee that the meeting included “general discussions . . . as to the possibility of moving the corridor to the east of Rock Creek Park location, running more or less directly from downtown Washington to Silver Spring and thereby connecting with an outer loop, and through the outer loop going westerly to the Route 240 corridor.”

However, Tallamy did not want to let local needs preempt the national purpose of the Interstate program. The basic purpose was “to provide for expeditious and efficient movement of people and goods from one region to another.” In doing so, “the law recognizes that to the extent that it is practical and feasible, we should give equal attention to local needs . . . but we should not, in our interpretation of the law, give primary consideration to local needs and make the Interstate System movement of traffic secondary to local needs.” He added:

I advised them that so far as the estimate of cost is concerned that I saw no reason for them not to follow an alinement in the general Wisconsin Avenue corridor because that is the more direct one; it is the one which will move interstate system traffic most directly from Frederick to downtown Washington, to connect with the inner loop and nothing was presented which would indicate that there was not a practical way of accomplishing that. There appeared to be a practical way of accomplishing it, although I made it very clear that adjustments in any specific location within the Wisconsin Avenue corridor could certainly be done in the future.

He recognized that future engineering studies, deliberations, or considerations might demonstrate that the Wisconsin Avenue corridor was impracticable:

But until such time as a decision can be made on sound engineering and economic considerations, as the planning basis, until we are convinced on such a basis, we feel we have to follow the most practical and direct, as we see it, route.

He concluded:

I would like to say in closing, Senator, that in my opinion the law is adequately flexible now to permit proper engineering and city planning and economic judgments on the location of highways. The problem that we have now is that still further engineering and

economic and city planning studies would have to be submitted to us to demonstrate that it is not practical and by using the word “practical,” I mean in a broad sense, to follow the direct route which is the route which we feel under the law should be built if practicable. So far no evidence has been indicated to us that it is not practicable. But I do think the law as it is written now is liberal enough to permit adequate consideration of all the engineering and economic factors in making the location. [Location of Interstate Route 70 South (Maryland and District of Columbia), Hearing before a Subcommittee of the Committee on Public Works, United States Senate, 86<sup>th</sup> Congress, 2<sup>nd</sup> session, June 14, 1960, pages 1-11]

John B. Funk, the new Chairman-Director of the Maryland State Roads Commission, testified next before the committee. Following Bonnell’s resignation on February 15, Governor Tawes had appointed Funk in May 1959; he took office on June 1. A Virginia native, Funk was a civil engineer who had served in the Maryland State Senate (1939-1946) and as Secretary of State in 1947 under Governor Lane. He was chief engineer of the State Department of Public Improvements, a department he had helped organize, until 1950. At the time of his appointment as chairman of the Maryland State Roads Commission, he was Director of Public Works in Baltimore County. [“Tawes Appoints Funk As Highway Director,” *The Sunday Star*, May 3, 1959]

Funk testified that his agency was primarily interested in the Wisconsin Avenue corridor, but he recognized that Montgomery County “by its zoning, by its land use, by . . . policy has concentrated its people in a Wheaton-Silver Spring corridor to a great extent and as they move westward, that particular segment west of Wisconsin Avenue, zoned and established a land use density which is very light.” Generation of traffic west of Wisconsin Avenue, therefore, would probably remain light. The county’s policy would be undermined by construction of I-70S in the Wisconsin Avenue corridor.

The State was leaning toward the Silver Spring alignment because the county was directing development into that corridor. Funk wanted to resolve the disagreement to avoid confusion that would occur if the State had to protect right-of-way in the Wisconsin Avenue corridor “and then a determination is made at a later date for some other corridor.” Time remained to study the best location because the State’s 5-year highway construction program did not include the extension of I-70S beyond Pooks Hill. [pages 11-16]

Director Aitken of the District’s Department of Highways and Traffic testified that in 1956, the city had employed a consultant to study the location of an Interstate highway between the Potomac River and Rock Creek. The best location from Maryland was along the river “and coming into the inner loop down near where Rock Creek flows into the Potomac River.” Following a public hearing, the District commissioners adopted that route. It was not necessarily the most direct route, but it was the best alignment considering “grades, cost, the impact on the area it traverses, esthetics, and the relationship of such facilities to the areas to which they extend.”

BPR accepted the river alignment for the first ICE in 1958. However, during a meeting with Tallamy, NPS, and District and Maryland highway officials in April 1958, the NPS objected to

the alignment because it was planning the George Washington Memorial Parkway along the Potomac River. The District then began studying other alignments as far east as the North Capitol Street corridor, but also the Wisconsin Avenue corridor in the city. One line followed Wisconsin Avenue “clear down to Glover-Archbold Park,” while another “came across around White Haven,” but the department settled on “a line just to the west of Wisconsin Avenue, and in back of Observatory Circle and into the inner loop.”

The North Capitol Street corridor, which better matched Maryland’s apparent interests, was being considered for an eight-lane roadway, but only four lanes were under consideration for Wisconsin Avenue because of the expense of building through this affluent, heavily developed area. In the end, the District commissioners rejected the Wisconsin Avenue corridor, prompting Aitken to pursue the North Capitol Street corridor for I-70S.

Asked why BPR was counting the Wisconsin Avenue corridor as the route of I-70S, Aitken said the meeting Tallamy had mentioned took place on March 17, 1958:

I proposed this North Capitol Street corridor and indicated in a summary sense . . . the length, the cost, the traffic needs, and I had pictures showing a comparison between the properties affected on the two lines . . . . Despite this presentation and my recommendation, I still received the decision for the direct line.

That was the basis for the District’s alignment in the ICE. Aitken did not feel bound by Tallamy’s decision for the ICE and was continuing to consider the North Capitol Street corridor while Maryland, he said, did the same. However, the District had not budgeted funds for a detailed study of the North Capitol Street freeway, in part because of uncertainty about whether BPR would approve it. He believed that if Maryland joined with the District in recommending the North Capitol Street corridor, BPR would consider it. He added:

Well, sir, from my discussions with many people in Northwest Washington, I think that they would feel very much relieved if the estimate did not include an estimate on a line through their property or through their neighborhood. I suspect that they would feel that the prospect, then, of the interstate going somewhere else would be much better.

Joseph Barnett, who was now BPR’s Assistant Deputy Commissioner, Division of Engineering, attempted to clarify what Tallamy had said:

Sir, the important point of Mr. Tallamy’s testimony has been overlooked in your question to Mr. Aitken about how long it will take to make the North Central estimate. He has got to get the North Central estimate location approved by the Bureau first and to do that Mr. Tallamy would expect to have some evidence that the Wisconsin Avenue corridor location is not feasible. That doesn’t just include costs. It includes a lot of other things. We have requested the Highway Department to make that study for a long time and they have just not made it. [pages 16-34]

Chairman Gingery of the National Capital Regional Planning Commission testified along with commission members from both States and the District. Harland Bartholomew, NCPC chairman,

and Engineer Commissioner Welling participated in the panel. Asked whether, if forced to choose one, the commission would select the Wisconsin Avenue or North Capitol Street corridor, Bartholomew said:

Our commission believes that in the public interest, both routes need to be built and both are going to be needed very badly, so that it is not a question of either or, but a question of whether we can get both.

He conceded that both could not be included in the ICE (i.e., be eligible for Interstate construction funds). The heaviest traffic demand, he said, would be in the north-central corridor, slightly less in the Northwest corridor. In that case, he was asked, why not select the north-central route for I-70S. He replied:

Because you have to understand the entire mass transportation plan, to understand our recommendation in that regard. We do not consider that it is feasible to cross up various of these routes in a helter-skelter pattern merely because there happens to be some particular funds under a program available at this time.

He thought shifting the northeast Interstate (I-95) to the north-central corridor made more sense than shifting the Northwest route to north-central. “It does not involve such a great deviation. It would serve relatively the same area where the northwest route does not serve a similar area.”

Bartholomew explained that with 3 million people in the metropolitan area, “there will be full warrant for express highways.” He was concerned that as population increased between Rock Creek Park and the Potomac River, “this proposed deviation to the north [via North Capitol Street] will not satisfy that traffic demand and as the population increases and buildings come, the traffic will attempt to come down to the central part of the city.” He was not concerned about the term “direct” as discussed by Administrator Tallamy earlier in the day. “I am concerned however with the satisfaction of the traffic demand between Rock Creek Park and the Potomac River”:

Now, the satisfaction of the traffic demand for this entire area is not going to be satisfied by a distorted deviation of this route, 70-S, over through the Silver Spring district. Nobody in their right mind here—that is, to the west of the National Health Institute for instance, is going to go out Wisconsin Avenue, to the outer belt, clear over to Silver Spring and then endeavor to come down via the north central route.

There is a tremendous local demand as well as the through traffic, that comes on the interstate route from Frederick. There is going to be a tremendous local demand generated in this entire Northwest section which can only be satisfied by a route which comes approximately through the center of that area. The demand is not going to be satisfied by any rapid transit line, even though we have a good interstate highway with a subway, which will operate in an open cut from Tenley Circle, let us say, to the north.

This is the age of the automobile and we cannot ignore it. People are going to have cars and they are going to wish to drive them.

He hoped to encourage some people to shift to transit, but as the population grew, an Interstate in the Wisconsin Avenue corridor was needed. The traffic in Northwest bound for the central city “is not going . . . clear out to the outer belt and over around Silver Spring in order to come down the north central corridor.”

The Northwest routing had been selected “by necessity.” Given the inevitable population increase, not building I-70S through Northwest “is going to have a much more severe effect on the development of the Northwest area than any damage that may be done by the proposed 70-S.”

Opponents, he said, say, “Please push this off on to somebody else; just so long as you leave it out of our area.” The complaint was not fair because it ignored the public interest. “I don’t think they themselves are aware of the fact that if their district gets more and more crowded with traffic on their local streets, that it is going to have an adverse effect upon their housing.”

A change in Federal law was not needed, Bartholomew said. He had worked on route selection in enough cities to know any thought of a statutory change was based on a “misconception of what can be done.” He concluded his remarks by saying:

I do not believe that you can solve this problem in the Northwest area by ignoring it and attempting to push it off on somebody else. The problem is there and it must be solved by direct action and not by trying to ignore it.

Gingery said he was against extending the ICE deadline. Maryland and the District had been working for 2 and a half years on the location of I-70S, which he referred to as Highway 240. He recalled the meeting in July 1959 when President Eisenhower asked, at the start, why officials could not do something to improve the route. A year and a half later, they still had not reached agreement on a connection. [pages 34-52]

The final witness was Peter Craig, representing the Northwest Committee for Transportation Planning. He said the committee “represents 3,500 residents of the District who are both concerned and distressed over what we believe to be an overemphasis on freeways in the Nation’s Capital.” Some members would be affected by the Northwest Freeway, but most would not. They objected to what they “believed to be a terrible error in transportation planning.”

In a move that would be characteristic of Craig’s anti-freeway work, he submitted several lengthy, legalistic, detailed statements for the record. “I believe the committee will find them instructive on the issues posed by this hearing.” The statements covered:

The Northwest Freeway Controversy  
Statement of Peter S. Craig  
Comments and Proposed Amendments to S 3193 Submitted by Northwest Committee  
For Transportation Planning  
Legal Memorandum on the Proposed Northwest Interstate Highway  
Report on Location of Interstate Route 70-S, June 1, 1960

In the committee report, the statements began on page 62 and ended on page 98.

In his oral statement, Craig said the Federal-Aid Highway Act of 1956 Act “not only authorizes but indeed properly requires that the Bureau of Public Roads give controlling weight to the decision of the local Maryland and District authorities that Route 70-S should be located in the north central rather than Wisconsin Avenue corridor.” Both jurisdictions favored the north central corridor.

He pointed out that the Wisconsin Avenue corridor would take over 2 miles of public lands, including portions of Rock Creek and Hazen Parks. It would “result in a severe loss not only of the property taxes also of income and sales taxes to the District of Columbia, since it would mean taking a wide belt of land now beneficially used for residential areas and successful business areas.” It also would undermine rapid transit:

A subway line is also planned in the North Central Corridor but because of the demand in the central area, which is twice as great, if any corridor can support the competing services of subway and arterial freeway, it would appear that it would be the north central area.

He objected to earlier statements that Northwest residents were only trying to move the freeway to somebody’s else’s backyard. “This is wrong and it is also unfair” since Maryland and the District agreed that a freeway in the north central corridor “has to be built to meet the present needs in the area.” They all had rejected the Wisconsin Avenue corridor:

The real question, therefore, is whether there should be just the North-Central Freeway in which case it would be 70-S, or whether there be two huge freeways, both the North Central and the Northwest and on this Maryland and the District residents appear agreed there should be only one. In our judgment, a Wisconsin [Avenue] Freeway would be a monument to waste and destruction. At a time when Washington needs urban renewal and prevention of any new blight to halt the flight to the suburbs, it would subject the one major area of the District that has escaped decay to the destruction of parks, playgrounds, schools, hospitals, churches, and private homes that only an auto and truck highway can cause . . . .

If, in this instance, the combined judgment of Maryland and the District cannot stop the construction of a freeway that is neither needed nor wanted, then, most certainly, the Federal-Aid Highways [sic] Act should be amended to clarify the intent of Congress.  
[pages 99-102]

A few days after the hearing, Tallamy relented. Reportedly with encouragement from the White House, he dropped his insistence on the Wisconsin Avenue corridor and indicated that BPR would consider a routing east of Rock Creek Park – the so-called North Central corridor. For purposes of the ICE, the city would estimate the cost of building I-70S/U.S. 240 in the Wisconsin Avenue corridor, but that was only for purposes of establishing the apportionment formula for Interstate construction funds. The ultimate corridor would be determined after further study.

In view of the shift, Senator Case said that he would not pursue a change in Federal-aid law to clarify that directness was not the only criteria for locating an Interstate route. At the same time,

Tallamy knew that Senator Case and Senator Edmund S. Muskie (D-Me.) were working on a proviso to ensure BPR kept open the location of the U.S. 240 entrance to the city, even though they did not favor a specific routing. Director Aitken said the District would employ a consultant to study alternative locations. He also promised to work with Maryland and BPR officials to settle on a plan. [“U.S. Ends Fight On 240 Route,” *The Evening Star*, June 19, 1960]

On June 22, the Committee on Public Works inserted Senator Case’s language into the report on the Federal Highway Act of 1960. The language explained that as a result of the recent hearing on the location of I-70S, the committee became aware that BPR and State highway officials appeared to believe that the provision directing them to use “direct routes where practicable” might be interpreted to mean “where possible” – that is, where a road could be built, regardless of any other factors.

In the case of Maryland and the District of Columbia, this interpretation appeared to prevent consideration “of the best route from the standpoint of traffic service, minimum cost for rights-of-way and minimal disruption to property use and value.” However, the language about directness “where practicable” should be interpreted in light of language in Section 116(b) of the 1956 Act. Section 116(d) explained the policy of ensuring prompt and early completion of the Interstate System within 13 years, “and that the entire system of all States be brought to simultaneous completion.” This language was followed by:

Insofar as possible in consonance with this objective, existing highways located on an interstate route shall be used to the extent that such use is practicable, suitable, and feasible, it being the intent that local needs to the extent practicable, suitable and feasible, shall be given equal consideration with the needs of interstate commerce.

In view of this existing statutory language, the committee did not recommend a change in law to address the “directness” issue in Maryland the District of Columbia, “but does recommend to the attention of the responsible and respective agencies that full consideration be given to the provision cited.”

To make the point as clear as possible, Senator Muskie added language referring directly to the controversy about the Wisconsin Avenue corridor as discussed during the hearing. The language stated that the committee was aware that BPR, NCPC, and the two highway agencies were compiling data for the next ICE:

The tentative use of the Wisconsin Avenue corridor for the making of the cost estimate for completion of the Interstate System, to be submitted to the Congress in January 1961 as required by law, does not and should not in any manner preclude the eventual consideration of some other location for this section of interstate highway should further studies indicate that another location would be more in accord with the general directives of the law, and the public interest. The committee is further advised that the hearings resulted in clearing up some uncertainties on procedure and in producing a spirit of cooperation that, it is believed, will bring about earlier selection of a fixed route than had seemed likely. [Federal Highway Act of 1960, United States Senate, 86<sup>th</sup> Congress,

2d Session, Report No. 1725, June 24, 1960; “Senators Back Corridor Foes In Road Fight,” *The Evening Star*, June 23, 1960]

(Senator Muskie, who was known as an environmentalist, lived in Bethesda at 5404 Ridgefield Road. Thus, the outcome of the debate over routing would affect his daily commute while Congress was in session.)

### **National Capital Transportation Act of 1960**

On March 14, 1960, Chairman Bible and Representative Broyhill introduced identical bills, drafted by the Bureau of the Budget, to aid in development of a unified and integrated system of transportation for the national capital region. The Declaration of Policy and Purpose stated:

Sec. 102. The Congress finds that an improved transportation system for the National Capital region is essential for the continued and effective performance of the functions of the Government of the United States and of the District of Columbia, for the orderly growth and development of the National Capital region, and for the preservation of the beauty and dignity of the Nation’s Capital. The Congress further finds that improved transportation of persons requires coordination of the planning, financing, construction and administration of highways and public transit and railroad facilities; and that improved transportation also requires coordination with other public facilities and with the use of land, public and private.

The Congress, therefore, declared that the Federal Government had a responsibility to work with State and local officials in the region to develop “a unified and integrated system of transportation of persons in the National Capital region.”

The National Capital Transportation Act of 1960 called for creation of a Federal agency called the National Capital Transportation Agency (NCTA) to determine routes for a rapid rail transit system. NCTA would be headed by an Administrator (salary: \$20,000) and Deputy Administrator (\$19,000), both to be nominated by the President subject to Senate confirmation. Neither was to engage in any other business, “but shall devote himself to the work of the Agency.” The President also was to appoint a five-member Advisory Board, with the advice and consent of the Senate, to advise the Administrator on general policies; policies in connection with acquisition, design, and construction of facilities; fees for use of facilities; planning and administration; and such other matters as the Administrator may refer to the board.

NCTA was to develop a Transit Development Plan “indicating the specific location and extent of facilities in which the Agency will participate for the transportation of persons within the National Capital region, a timetable for the provision of such facilities[,] and comprehensive financial reports including costs, revenues, and benefits.” The agency also could contribute funding for construction of freeways, parkways, and other arterials to allow room on the right-of-way for transit facilities.

In addition, the agency:

. . . shall cooperate with government agencies to facilitate coordination of location, design, and construction of freeways, parkways, and other arterial highway facilities with the Transit Development Program. The purpose of such coordination is to assure the comprehensive development of transportation facilities best suited to meet the objectives of this Act and to achieve maximum benefits from moneys available for such purposes. The responsibility and authority for location, design, construction, and operation of freeways, parkways, and other arterial highway facilities shall remain with the government agencies having jurisdiction thereof, but all Federal agencies' plans for location and design of highway facilities shall be forwarded to the Agency, and all State and local agencies' plans for location and design of highway facilities may be requested by the Agency for its review and comment. The Agency shall cooperate with all planning agencies of the National Capital region and the appropriate government transportation regulatory agencies including the Washington Metropolitan Area Transit Commission in the development of transportation facilities and, wherever feasible and desirable, develop joint plans with such agencies . . . .

(Maryland, Virginia, and the District had joined the cities of Alexandria and Falls Church in Virginia and the adjacent counties in the two States in a compact establishing the transit commission to regulate the area bus companies' fares, routes, and connections. The Washington Metropolitan Area Transit Commission began operation in March 1961.)

The agency could initiate proposals "for regulating and coordinating the flow of traffic . . . to promote the optimum use of the highway network and other transportation facilities."

With the consent of the governors of Maryland and Virginia, the agency could begin construction of transit facilities, pending creation of an interstate compact for a successor agency to take over and complete the work.

Chairman Bible, in introducing the White House bill, said, "I hope Congress, before the end of this session, will act on the transportation legislation . . . . It is likely there will be many differences of opinion. So it is up to Congress to develop these ideas fully through hearings." Representative Broyhill called the bill a "very sound approach."

After conferring with Chairman Bible and Chairman McMillan, Engineer Commissioner Welling said, "The draft legislation represents a masterful job of reconciling many of the divergent points of view expressed in recent months. At the same time, it offers an effective, well-founded proposal for a greatly augmented transit service." He added, "There may be legal and jurisdictional angles which will be debated. But the need for improving transit facilities in the area is so great that I would like to see the essentials of this latest proposition moved promptly forward." [H.R. 11135, March 14, 1960; S. 3193, March 14, 1960; Bassett, Grace, "Transit Agency Bill Filed in Both Houses," *The Evening Star*, March 14, 1960; Lindsay, John J., "Sen. Bible Urges 'Prompt Action' On Area Rapid Transit Proposal," *The Washington Post and Times Herald*, March 15, 1960]

On June 14, 1960, the Joint Committee on Washington Metropolitan Problems approved the National Capital Transportation Act of 1960. The committee report explained that the Mass

Transportation Survey “produced abundant evidence that a new system of high-speed express transit service is essential to preserve the District of Columbia and its environs as a good place in which to live and do business, and as a beautiful and dignified Capital City of our great Nation.” Moreover, the Joint Committee found “well-nigh universal support for a rapid transit system.” This support spanned all Federal, State, and local governments, business and civic groups, labor unions, planners, transportation experts, and average citizens.

The day when private enterprise could provide a modern rapid transit system and operate it at a profit “has long since passed.” The District of Columbia, which did not have the authority to issue bonds, could not take the necessary steps. “It is squarely up to the Federal Government, the largest employer and landowner in the metropolitan area, to take the first step.”

Members of the Joint Committee did not mean to imply that the Federal Government should subsidize transit in the area:

There is reason to expect that, if the Federal Government will make its credit available to create such a system, it will receive its money back, with full interest. It is true that the Transportation Plan predicted that annual operating revenues of a rapid transit system, while they would be sufficient to pay all operating costs and some principal and interest, would not cover all capital costs. But the prospective deficit might be turned to a surplus if a somewhat more modest system were built initially, or if a somewhat higher fare were charged.

The Bureau of the Budget, recognizing this fact, told the joint committee that, over a period of 50 years, a rapid transit system would not only pay its operating costs, but would repay a large part of its capital costs, and perhaps eventually all of them. [National Capital Transportation Act of 1960, United States Senate, 86<sup>th</sup> Congress, 2d Session, Committee Print, Joint Committee on Washington Metropolitan Problems, June 15, 1960, pages 5-6]

The bill established a “National Capital Transportation Agency” (NCTA), headed by an Administrator and Deputy Administrator, to review the Mass Transportation Survey, make any needed changes, and carry out the detailed engineering and design work to identify the best locations for the rail lines. It would submit a transit development program to the President and Congress, and begin building and operating the transit facilities until the local jurisdictions complete an interstate compact to set up an agency to replace NCTA.

The measure established a prohibition on freeway construction in northeast Washington:

A proviso prohibits the construction of any new freeway or major parkway in a large sector of Northwest Washington until the use of railroads and subways has had a full trial. This proviso would prohibit the construction on Interstate Route 70-S along the Wisconsin Avenue corridor, or along any alignment west of 12<sup>th</sup> Street NW. It would also prohibit the construction of the closely connected Glover-Archbold Parkway. Such highways might offer serious competition to the use of subways and railroads to carry

people between downtown Washington and the western portions of the outer District of Columbia and Montgomery County . . . .

The joint committee believes that the use of existing railroads and new rapid transit lines to carry people between downtown Washington and the suburbs may permit a substantial reduction in the number of highways that must be built into the city, leading to a substantial saving in public funds and avoiding the harmful effects often attendant on the construction of freeways through residential areas. In any case, any additional highways that will eventually be built should be deferred until the railroads and rapid transit lines have had an opportunity to develop their full patronage, since experience has shown that a new highway provides competition that no rail line can meet.

This provision did not specify an end-date for the moratorium, but was not a permanent ban on freeway construction in northwest Washington. “Once the use of rail transportation has had a fair trial, the prohibition terminates.” If rail transportation proved successful, “the highway agencies will no doubt prefer to spend their money elsewhere.” If, however, a new freeway is needed, “they will be free to request appropriations and, if these are granted, to build under the usual procedures.” If a subway is not built to serve the northwest quadrant, rail transportation “will still have had a ‘fair trial’ within the meaning of the provision, and the highway agencies should be free to proceed with their own plans for the area.”

One reason for the ban was BPR’s decision that, under its interpretation of Federal-aid law, I-70S must be routed west of Rock Creek Park:

Since revised cost estimates on the Interstate System, based on the latest ruling, are to be submitted to the Bureau in August, the freeway might become immovably fixed in the so-called Wisconsin Avenue corridor before the new Agency has even had a chance to consider the use of rail transportation to serve that area, unless Congress intervenes.

The bill also called for the use of freeway medians for rail transportation. The Joint Committee’s report cited three freeways that were “now under construction or in the advanced planning stage”:

- I-66 in Virginia from the Potomac River to the Capital Beltway – “This freeway should be designed to incorporate express transit facilities in a wide median strip, and to include bus stations and other facilities for high-speed, high-volume transit service.”
- Anacostia Expressway in the District south of the South Capitol Street Bridge – “This highway also should be designed and built with median strips wide enough for express transit service, and with provision for bus stations.”
- George Washington Memorial Parkway in Montgomery County, Maryland – “The transportation plan calls for express bus service on the parkway, requiring not median strips but bus stations off the parkway.”

In the case of the Anacostia Expressway and the George Washington Memorial Parkway, the report continued, construction was about to begin. Officials needed to know as soon as possible whether transit lines would be included within the right-of-way. “While the joint committee

believes that no land acquisition or construction should be authorized until it has been well substantiated and Congress has approved it, these three highways do pose a special problem.” The bill, when enacted, “should be taken as an indication of an intent by the Federal Government to aid in the provision of express transit facilities in conjunction with freeways and parkways, and those agencies should allow for such facilities in their current planning and design work, so far as may be possible.” [National Capital Transportation Act of 1960, pages 9-10]

The Joint Committee was concerned about construction of a 12<sup>th</sup> Street expressway tunnel across the National Mall from Constitution Avenue to Independence Avenue. This corridor was an ideal location for a subway line, but the expressway tunnel may block construction of a subway tunnel under the National Mall at this location. Alternatively, building the expressway tunnel now and the subway tunnel later would mean this area of the National Mall would be “dug up not once but twice, thereby causing an additional disruption of traffic and delaying the time when the Mall will be free of obstructions.” Some construction of the expressway tunnel was underway, the Joint Committee recommended that the District of Columbia and NPS “give serious consideration to rescheduling the completion of the Expressway, taking temporary measures to restore the flow of traffic, and the appearance of the Mall, and working with the new Agency in the preparation of a plan for any subway to be built in the 12<sup>th</sup> Street alignment.” [National Capital Transportation Act of 1960, pages 10-11]

The House and Senate considered the bill on June 27, each considering somewhat different versions of the bill. The House took up the bill first. It included the prohibition of freeway or parkway construction in northwest Washington:

*Provided*, That no freeway, or new parkway more than two lanes in width, shall be built within the District of Columbia west of Twelfth Street, Northwest, and north of either the north or the west legs of the proposed Inner Loop Freeway, the proposed Potomac River Expressway, or the proposed Palisades Parkway, until after the Agency shall have reported to the President that the use of rail transportation to carry passenger traffic to points northwest of downtown Washington has had a fair trial.

Representative George H. Fallon (D-Md.), chairman of the Subcommittee on Roads of the Public Works Committee and one of the primary authors of the 1956 Act, questioned the moratorium, asking how long it would be in effect. Chairman McMillan of the House Committee on the District of Columbia explained that the Joint Committee had spent a great deal of time on this point. The committee had been advised that construction of U.S. 240 in the Wisconsin Avenue corridor was not contemplated for at least 5 years. “I notice the Senate amendment to a similar bill provides for a 2-year freeze and, so far as I am concerned, I have no objection to it being 2 years.”

Chairman Fallon suggested that the delay meant that the freeway, if needed, “is going to cost more than \$100 million. It will cost double that.” Chairman McMillan said that because Maryland and the District could begin planning the freeway, but were not planning to build it in the next 5 years. Therefore, a 2- to 5-year delay in construction pending a decision would not affect the cost. Chairman Fallon responded that since Maryland and the District had rejected the

Wisconsin Avenue corridor as the proper place for the freeway, they would not be doing any planning for it.

He also objected to the assumption that the results of rail and rapid transit in the corridor would be known in 2 years. "It will be many years before the railroad and the subway will be completed, so that there will not be any highway built in the northwest section of Washington and Maryland, probably one of the most difficult traffic problems as anywhere in the country; so that there will be no highway construction for at least 10 years." He added:

I might say further, I hope that this does not set a precedent for all urban areas of the Nation, and that they give up the idea of bringing traffic in and out of the city by automobile. I hope that it does not set a pattern for all other urban areas.

Chairman McMillan agreed, but added, "I also hope that the people of the cities will discontinue trying to build freeways in the metropolitan areas that cost \$10 million a mile.

Representative Gross objected to the bill. He listed the officials the bill called for and their proposed salaries. "I will say to my colleagues that if you vote for this bill you are voting to spend \$500,000 of the taxpayers' money gathered from all over the country to set up administrative agencies that will serve the interests of the District of Columbia and the States of Virginia and Maryland. This is another cute little raid on the taxpayers of all the country."

Despite his concern, the House passed the bill by a vote of 72 to 42. [National Capital Transportation Act of 1960, *Congressional Record-House*, June 27, 1960, pages 14561-14576]

Less than 2 hours later, Chairman Bible introduced S. 3193 on the Senate floor. As Chairman McMillan had stated, the bill's moratorium on freeway and parkway construction in northwest Washington had been amended:

*Provided*, That no freeway, or new parkway more than two lanes in width, shall be built within the District of Columbia west of Twelfth Street, Northwest, and north of either the north or the west legs of the proposed Inner Loop Freeway, the proposed Potomac River Expressway, or the proposed Palisades Parkway, before July 1, 1962; and the Agency shall not later than January 10, 1962, submit to the President for transmittal to Congress, its recommendation as to whether any such freeway or parkway should thereafter be built.

The only objection to the bill came from Senator Morse, who objected to the absence of a provision in the bill covering labor relations. He warned:

If the Senate today passes the bill without laying down at least the framework of a labor policy which is going to exist once operating personnel start to be hired by any operating system which may result from passage of such a measure as this, we shall be sowing the seeds today, for labor unrest in the Capital Transit System . . . .

He offered an amendment to reassure workers and their unions that worker protections were in the law:

*Provided, Before the Agency moves into the operating stage, Congress shall establish for the Agency a labor relations policy, defining labor's right to organize, to bargain collectively, to arbitrate disputes, and to safeguard job rights."*

He explained the rationale for the amendment:

It will make it perfectly clear that the operating Agency cannot use the law as a subterfuge to adopt what could become a union-busting bill, if a situation arose, in a future Congress, under which some operating facility might want to use it so. I think it is necessary to include such a check in the law . . . .

The amendment simply provides that the transit development program to be developed by the Agency shall be referred not only to the transit companies but to the unions representing the workers as well.

Chairman Bible agreed to the amendment.

With that one change, the Senate approved the bill by standing vote. [National Capital Transportation Act of 1960, *Congressional Record-Senate*, June 27, 1960, pages 14486-14505]

Conferees appointed to resolve differences between the two bills reached agreement on June 30. Regarding the moratorium on freeway or parkway construction, the conference committee retained the moratorium but extended it until July 1, 1965, adding that "the Agency shall not later than January 10, 1965, submit to the President, for transmittal to Congress, its recommendation as to whether any such freeway or parkway should thereafter be built." The committee also retained the Morse amendment on labor relations. [Conference Report, National Capital Transportation Act of 1960, U.S. House of Representatives, 86<sup>th</sup> Congress, 2d Session, Report No. 2061, June 30, 1960]

The House and Senate approved the conference committee report on July 1. In the House, Chairman McMillan introduced the conference report in the routine manner often used for a noncontroversial bill. The only dialogue was with Representative Gross, who requested a brief explanation of the differences between the House-passed version of the bill and the conference committee report. Representative Broyhill replied:

Mr. Speaker, if the gentleman will yield, in conference the Senate receded from practically all of its amendments and accepted the House version almost in toto. The main amendment that was adopted by the Senate was to eliminate the feature of the House bill that required further authorization on the part of Congress for any construction that took place; merely requiring an appropriation. They receded from that amendment and agreed to the original House version. That was the main difference between the two bodies. Another difference was in the House version we restricted the construction of freeways and expressways in Northwest Washington until the subway system had received a fair trial. The Senate required a 2-year waiting period, and we compromised and made it a 5-year waiting period. The rest of the changes are minor.

Representative Gross asked if the conference committee retained the same appropriations in the bill “for the commission or whatever it was, the advisory board,” an apparent reference to the salaries he had criticized during the June 27 debate. Representative Broyhill replied that, “There was no difference between the versions of the two bodies in that regard.” As a result, the conference committee did not change the language.

Representative Gross asked, “So far as expenditures are concerned?” Representative Broyhill replied:

Well, the main difference, as I tried to explain was that we required further authorization before any land acquisition or construction could be commenced. The Senate just struck that portion and just required an appropriation. The Senate receded from that and adopted the House version, which was far more restrictive.

With that lone colloquy, the House approved the conference report without a recorded vote.

In the Senate, Senator Case raised concerns about the moratorium. “I personally regret the freeze on highway construction in the northwest part of the city is made as long as it is.” He was concerned that until the matter was resolved, “there will be some uncertainty in the minds of property owners, developers, business interests, schools, hospitals, and churches centering upon just where the connection for Interstate route 70-S will come into the city.” He recognized that compromise was needed on the issue, and that the compromise in the bill was reasonable; he was speaking only for the legislative record.

He also was concerned that the moratorium would block the Glover-Archbold Parkway. Because the fate of the parkway was in the courts, he wanted to go on record in support of the parkway. If it emerged from the trial, he hoped that “a resolution of the legal points involved . . . would be noted by the agency in its study, and that matter might receive separate and special attention.”

With Senator Case on the record, the Senate agreed to the conference report without a vote. [National Capital Transportation Act of 1960, *Congressional Record-House*, July 1, 1960, pages 15493-15496; Coordinated System of Transportation for National Capital Area-Conference Report, *Congressional Record-Senate*, July 1, 1960, pages 15379-15380]

The final bill included the language from Section 102 on the congressional finding that an improved transportation system for the area “requires the planning on a regional basis of a unified system of freeways, parkways, express transit service on exclusive rights-of-way, and other major transportation facilities.” It included language urging NCTA to give “special consideration” to, among other things:

Early development of a subway from Union Station capable of rapid dispersal of passengers from the railhead to the principal employment centers in the District of Columbia and its immediate environs and capable of being extended to serve other parts of the region.

This language was immediately followed by the “*Provided*” language imposing a moratorium on freeway and parkway construction in northwest Washington.

The bill also retained the Morse amendment on labor policy.

### **NCTA Gets Underway**

On August 17, 1960, President Eisenhower asked Congress to appropriate \$500,000 for NCTA in a planned supplemental appropriations act for fiscal year 1961. The funds were needed before he could name an Administrator and Deputy Administrator to begin operations.

On August 26, the House of Representatives approved a bill that cut the NCTA appropriation in half, largely because Chairman Albert Thomas (D-Tx.) of the subcommittee of the Committee on Appropriations considered the planned expenditures wasteful. The bill also limited NCTA to a 25-employee ceiling, instead of the 54 employees included in the White House plan for getting the agency up and running quickly. Chairman Thomas was concerned that NCTA would use the funds to undo the work of the joint committee that prepared the Mass Transportation Survey. [Deane, James G., "Transit Agency Fund Chopped To \$250,000," *The Evening Star*, August 26, 1960]

Federal officials and mass transit advocates urged restoration of the full amount, which the Senate did when it passed its version of the bill on August 28. However, the House measure prevailed in conference committee. Congress completed work on the supplemental appropriations bill on August 31, then adjourned on September 1.

With funds assured, the White House announced the appointment of H. Holmes Vogel as the NCTA administrator. The President sent the nomination to the Senate for confirmation along with the names of the members of the advisory board, including Harland Bartholomew. With Congress having left town to campaign, confirmation of the nominees would not be possible; they would act on the basis of recess appointments.

Vogel, 62 years old, was a vice president of the Chesapeake and Potomac Telephone Company. A Republican with a long history of involvement in civic affairs, he had been on the board of directors of such organizations as United Givers Fund, Maryland Utilities Association, Washington Criminal Justice Association, the Salvation Army, and the Better Business Bureau. His salary at NCTA would be \$19,000 a year. [Pierce, Charles D., "Vogel May Get Transit Post," *The Evening Star*, August 18, 1960]

He told reporters, "This job is more than just a challenge to those of us who will be connected with it. It is going to be a model for mass transportation planning for communities throughout the entire Nation." NCTA's primary job was to send Congress recommendations on the proposed transit program. "I do not intend to prejudge any of this. Making these decisions will be the job of the agency in the months ahead." NCTA would begin, he said, by updating the Mass Transportation Survey. "What we have to do is take an objective look at the entire report from the standpoint of transportation." [Gimble, Gilbert, "New Agency Head Sees Transit Plans as Model," *The Evening Star*, September 1, 1960]

President Eisenhower signed the supplemental appropriations act on September 8 (P.L. 86-722). On September 15, he signed a Joint Resolution granting "the consent and approval of Congress

for the States of Virginia and Maryland and the District of Columbia to enter into a compact related to the regulation of mass transit in the Washington, District of Columbia metropolitan area, and for other purposes” (P.L. 86-794). As noted earlier, the Washington Metropolitan Area Transit Commission began operations in March 1961.

Vogel took his oath of office on September 16 in the District Building.

On November 1, Vogel met with the advisory board to discuss ways to get NCTA off to a running start. They agreed on:

- Purchase of 50-foot median strips for use by express buses on I-66 and I-95 in Virginia, as well the proposed third route to Baltimore.
- NCTA would purchase land along the Anacostia Freeway and the George Washington Memorial Parkway in Maryland for “pretty fancy” bus stations.
- Determine how to improve and expand existing bus and commuter railroad service.
- Identify subway lines that, optimistically, begun operating in 1968. As directed by Congress in the National Capital Transportation Agency Act, NCTA would study a subway between Union Station and downtown Washington. [Landauer, Jerry, “Transport Unit Goes Into Action,” *The Washington Post and Times Herald*, November 2, 1960; “Mass Transit Plan Backed by Agency,” *The Evening Star*, November 2, 1960]

At the time, NCTA did not have funds for the first two goals.

President Eisenhower, with only a few weeks remaining in office, formally nominated Vogel and the members of the advisory board to Congress at the start of 1961. With President-elect John F. Kennedy awaiting inauguration, Congress chose to await the new President.

### **President Kennedy’s Interest**

Presidents have traditionally not focused on District matters, but President Kennedy took an interest in the city’s affairs. As a member of Congress beginning in 1947, he had lived in Georgetown at 3307 N Street, NW.; he and his family departed from there for his inauguration on January 20, 1961. The house is located a few blocks from Wisconsin Avenue on the east, Georgetown University on the west, and several blocks north of Canal Road, M Street, the elevated Whitehurst Freeway, and the Georgetown waterfront.

One of his best-known initiatives was revitalization of Pennsylvania Avenue. By the time of his inauguration on January 20, 1961, the avenue connecting the Capitol and the White House had become a shabby street lined by pawnshops, souvenir stores, and boarded up buildings. The result was the Pennsylvania Avenue Development Corporation, which strived to restore the avenue to a “grand and majestic avenue.”

Less well known is President Kennedy’s role in the transportation life of the District and other elements of its daily life. As Professor Schrag explained:

Under previous administrations, and at the start of Kennedy’s term, matters concerning the District of Columbia had been passed to whichever White House aide was available.

Area residents had long wanted one person to handle such questions, and in 1962 Kennedy agreed, naming Charles Horsky adviser for national capital affairs. [Schrag, page 45]

Horsky, a Montana native, had graduated from Harvard Law School, moved to Washington during the New Deal of the 1930s, and then joined the influential law firm, Covington and Burling, where Peter Craig became an associate many years later. During the 1950s, Horsky was president of the Washington Housing Association, where he lobbied for relocation assistance for residents displaced by government projects, including freeways:

He had been alarmed to learn that the D.C. Highway Department was planning to displace thousands of people to build the Inner Loop without provision for relocation, and further alarmed by the release of the Mass Transportation Survey in November [1959], though his testimony before Congress consisted of a quiet plea for more emphasis on rapid transit that was easy to ignore.

President Kennedy attended Horsky's swearing in ceremony on September 28, 1962, for his \$20,000 a year post. The President said, "I don't think we have paid enough attention to the District." The new position was not intended to supplant the District Commissioners, but to assist them. The President hoped Horsky would "bring to my constant attention" local problems requiring Federal action. As an example, he cited school dropouts and said that in a nonindustrial city such as Washington, he wanted to be sure schools provided the necessary skills, including vocational skills for dropouts. The District's three commissioners attended the ceremony for Horsky.

Horsky, who lived at 1227 Pinecrest Circle in Silver Spring, Maryland, replied that with the support of the President and the three District commissioners, "we can and will make this a Nation's Capital of which you can be proud and all of us can be proud." After the ceremony, he told reporters that his duties would involve the entire region, not just the District of Columbia.

Horsky's office was in the Executive Office Building where, as Schrag explained, "his White House letterhead brought him more notice." [Schrag, page 45; "Kennedy Aide Takes Office," *The Evening Star*, September 28, 1962; Clopton, Willard, "Horsky Sworn in a JFK D.C. Adviser," *The Washington Post and Times Herald*, September 29, 1962]

On March 3, President Kennedy nominated C. Darwin Stolzenbach as NCTA administrator and Joseph G. Matthews as deputy administrator, a post that President Eisenhower had never filled. Stolzenbach, who had lived in the Washington area since 1934, had a degree from George Washington University and had served in the Federal Government as an economist and an Asia expert. At the time, he was an economist and senior staff member of the Johns Hopkins University Operations Research Office in Silver Spring. As Schrag explained, "At a time when operations research and systems analysis were being adapted from their military origins to civilian problems, Stolzenbach's economic credentials qualified him to manage a major engineering project." Stolzenbach lived with his wife and three children in a two-story brick home at 10515 Meredith Avenue in Kensington,

He was a controversial choice. As a resident of Montgomery County and president of the Montgomery County Planning Association, he had opposed the Northwest Freeway in 1958. A year later, Stolzenbach testified before the Joint Committee on behalf of multiple citizens associations, saying as Schrag summarized:

[The] region needed more than “a system that merely superimposes mass transit on top of an already preconceived regional highway plan,” and, in words that would be later used against him, that “highways and mass transit are and will always be competing facilities for mass transportation.” In other words, more transit meant fewer freeways. This was enough to earn Stolzenbach the lasting enmity of the highway lobby, as well as the Montgomery County political establishment.

According to Schrag, Stolzenbach’s Cleveland Park allies recommended him to the Kennedy Administration and he was nominated “over the objection of the Democratic Central Committee of Montgomery County, but with the endorsement of D.C. Democrats.” [Schrag, pages 45-47]

The Cleveland Park residents who had lobbied to include a moratorium on the Northwest Freeway in the 1960 Act also had tried to give NCTA a veto over local freeway plans. The legislation watered the veto down by providing only that NCTA should evaluate transportation plans, alternative facilities, and kinds of service, a requirement that Stolzenbach interpreted as giving him veto power.

Matthews was assistant to the vice president of the Association of American Railroads, a post he had assumed in 1957. He was born in Sheffield, Alabama, held a law degree from Blackstone College of Law in Chicago, and had served in the Army’s Transportation Corps during World War II before joining the Southern Railroad System. Matthews was an active leader of the Democratic Party in Virginia; he lived in Alexandria at 417 Wake Forest Drive. His position came with an annual salary of \$18,500.

Administrator Vogel announced his resignation the same day as the nominations.

The Kennedy Administration also had plans for Peter Craig, as Professor Schrag described:

Peter Craig, one of the loudest voices against expressways in 1958-1960, declined a job in the new administration, but he did gain listeners. Turning down the chance to become NCTA general counsel, he suggested his Covington and Burling colleague, Ed Seeger, for the job and kept in touch with Seeger as he continued the highway fight. Horsky, at the White House, was equally easy to get on the phone. For example, when the District of Columbia Highway Department officials tried to withhold data from Craig, Craig simply contacted Horsky, who scolded the engineer commissioner for denying Craig’s rights “as a citizen of the District. [Schrag, page 47]

Seeger was sworn in on May 31, 1961.

At BPR, President Kennedy appointed Rex M. Whitton to the post of Federal Highway Administrator. Whitton was born on a farm in Jackson County, Missouri, worked his way through the University of Missouri, graduated in April 1920 with a bachelor of science degree in

engineering, and began working for the Missouri Highway Department 11 days after graduation. His initial salary was \$110 a month as a levelman on a 15-mile stretch of road in Johnson County, but he rose through the ranks to become Chief Engineer in 1951. He was president of AASHO in 1955, a post that occasionally brought him to Washington to testify before Congress in support of what became the Federal-Aid Highway Act of 1956.

In Missouri and as head of BPR, he was dedicated to building the Interstate System by its scheduled completion date in the early 1970s, but by the time he took office in 1961, freeway revolts were common in the country's big cities. Whitton initially took the point of view, shared by many long-time highway engineers, that the reason for the opposition was that the critics did not understand the benefits their cities would receive when the Interstate System was completed. He joined with the highway community in public relations initiatives to promote the benefits of highways while countering what referred to as the myths and misinformation about the freeways; in this role, he probably attended more opening ceremonies of Interstate highways than anyone in history, each opening an opportunity to speak glowingly about the Interstate System. [Larson, Thomas D., "The Man Who Saved the Interstate System," Highway History Web site, <https://www.fhwa.dot.gov/infrastructure/whitton.cfm>]

While in Washington, Whitton and his wife lived in an apartment building at 4201 Cathedral Avenue, NW., in the Cathedral Heights neighborhood of alongside Glover-Archbold Park. (The building is now called the Towers Condominium.) Despite his freeway advocacy, he and his wife used freeways only when he was in a hurry. "We take the back roads," he explained. "That's the finest way to travel unless you're in a big hurry to get somewhere." He and his wife collected antique glass and, as he told a reporter in 1964, ". . . you don't find antique shops on the big new interstate highways."

That same year, President Kennedy also appointed a new chairman to the NCPC. Elizabeth Rowe, who had grown up in the District's Adams-Morgan neighborhood and now lived in Cleveland Park, had been on the commission she would now lead. Her views had been formed in part by her service on the D.C. Auditorium Commission after her friend, since the 1930s, Senate Majority Leader Lyndon B. Johnson had appointed her in 1954. While on the Auditorium Commission, according to Gutheim and Lee, "she noticed the 'spaghetti' of bridges and approaches planned to span the city and affect many settled areas." Professor Schrag said, "she had been horrified by three-dimensional models of proposed highways in downtown Washington." She joined NCPC with "an idyllic view of the city as a collection of neighborhoods, defined by tree-lined streets and handsome buildings." This vision was in contrast with NCPC's highway-oriented concepts of the Bartholomew era. [Gutheim and Lee, page 296; Schrag, page 45]

### **Thinking About the Future**

On June 11, 1961, NCPC and the National Capital Regional Planning Council released the Year 2000 Plan. It was intended to provide a framework for change over the next 40 years.

The report projected the basics of the region in 2000, and described how to plan for the inevitable changes. Population would expand from the present 2 million people to 5 million. Employment

would increase to 2.2 million jobs, from the current 940,000. Already, 350 square miles had been consumed by development, but by 2000, the growth will have expanded to 1,700 square miles.

The region was the 10<sup>th</sup> largest in the country, and a good place to live:

But, like every metropolis, it has problems – traffic congestion, water pollution, vanishing open spaces, crowded schools, rising taxes, obsolescence, blight.

The main reason is *growth*. People keep coming to Washington, and the people who are already here keep having children. The region's population will double within a generation through natural increase alone. Growth means more people making more demands on a limited amount of land, on limited amounts of water and air, on public facilities that can only be expanded slowly and at considerable cost, and on public revenues that never seem to grow as fast as the need for them . . . .

Our future depends, in a word, on the *design* of the region – on the creation of a pattern that will produce the next possible environment for ourselves and future generations. Good design will reduce traffic congestion, protect water supplies, provide adequate space for parks and recreation, create efficient commercial centers and livable residential neighborhoods produce a suitable setting for the Nation's Capital, meet the needs of new industry, and reduce the costs of local government . . . .

The guiding policies for development must look far beyond the near future, which will largely be shaped by decisions already made, to a time when needs and conditions are different from today. The 40-year period has been chosen because great changes are sure to take place, and these changes can be very greatly influenced by public policies.

One thing was clear. “The need for action is urgent.”

To achieve the goals in a diverse region with overlapping jurisdictions, officials and planners had two levers. Jack Eisen described them in the *Post* as:

The construction or withholding of the transit routes, and the location of outlying Federal office centers.

The Year 2000 Plan called for:

- Shift of Federal “employment centers” to city-like communities along the corridors or spokes. The centers would have apartments and other features to justify construction of transit.
- Local governments would use zoning, acquisition of land, and other ways to restrain residential development within the “wedges” between the spokes.
- Federal offices in the central core – Capitol Hill, the Mall, the Federal Triangle – should be completed. Additional Federal office space should be put in clusters of buildings around what the plan called MetroCenter, “the heart of the Nation's Capital City.” New buildings housing agencies with “purely operational functions” should avoid the

“monumental” style of recent additions. Locating these buildings in “clusters” in the central business area would create “prestige centers” that would encourage increased density to contain the commercial area within current boundaries.

- Central Washington would decline in importance but still provide offices for 50 percent of the area’s government employees. Use “large-scale public and private” urban renewal techniques to support redevelopment.
- Encourage “small urban open spaces” around new government, institutional, commercial and apartment buildings.
- Build public rail transportation parallel to highways in spoke-like patterns. The four lines described in the Mass Transportation Survey should be built along with two additional routes.
- Freeways now planned should be built, but no more except for a freeway into southern Prince George’s County, Maryland.

Uncontrolled sprawl was the biggest danger. As development spread outward, transit would not be able to serve the less densely populated areas. “Someone has called this the Los Angelization of the Washington area,” NCPC Executive Director Finley said. “I don’t think this is intended to be a compliment.”

He said that in presenting the Year 2000 Plan, “Our role is to clarify the issue, and let the politicians and the people make the decisions. But the report will make it more difficult for the politician not to face the future and make the decisions.”

He anticipated that as planners and area officials studied the plan, they would see it as a basis, first, for discussion, but eventually for “a concert of policies” that they could adopt.

Gutheim and Lee explained the wedges and corridors concept:

Drawn along the proposed rapid transit routes and a parallel highway system, the radial corridor policy plan expressed the concept [that] the central city should be the primary focus or hub of the metropolitan region. The corridors were to be created by linking major development centers; each corridor or spoke would be separated by wedges of open countryside. In design this would produce something similar to the idealized nineteenth-century radial transit city, a snowflake pattern where open space was readily accessible to the urban and suburban population . . . .

Diagrams of the radial corridor plan showed more specifically how the radials would embrace clusters of public buildings and services, private office buildings, shopping centers, various housing and apartment types, industrial complexes, schools, and community centers, all of them linked by the kind of urban “greenways” popularized in Philadelphia’s redevelopment planning.

Wedges of open space on undeveloped Federal tracts, such as the Agricultural Research Center in Beltsville, Maryland, should be preserved through acquisition or other means.

The Year 2000 Plan abandoned the idea of shifting government offices to the east of the Capitol, a concept that had been included in the Mass Transportation Survey and other planning documents. The plan recommended, instead, construction of apartment buildings for about 10 blocks between the Capitol and Lincoln Park.

[“Year 2000 Plan Sets Area’s Growth Aims,” *The Sunday Star*, June 11, 1961; Gutheim and Lee, page 289; Eisen, Jack, “Sprawl Growth Perils District of 2000 A.D.,” *The Washington Post and Times Herald*, June 11, 1961; “Planning Ahead For 2000 A.D.,” *The Washington Post and Times Herald*, June 22, 1961; italics in original]

Not everyone liked the Year 2000 Plan. At the second annual Community Appearance Conference of the Metropolitan Washington Board of Trade, speaker Victor Gruen, an influential architect best known for systemizing the shopping center to the possibilities of the Interstate era, was asked about the plan. He called it “a little plan, full of inherent contradiction, and schizophrenic.” The “radial corridors” were “nothing but a schematic drawing of the growth pattern which our metropolitan areas have followed in the past.” The 40-year plan was “killing, from the outset, any chance of reshaping the metro center into a truly compact organism.”

Gruen questioned some of the plan’s assertions about transportation, as the *Star* summarized:

He said the National Capital Planning Commission’s plan “professes” that only public transportation can fully serve the central area, but added that it “proposes new superhighways from the corridor towns, thus putting the two modes of transportation into direct competition.

Quoting the plan as saying most automobile users will be converted to a transit system “only after congestion on the highways reaches intolerable levels,” Mr. Gruen commented:

It seems to follow that if the highways would not be built at all, then the rapid transit system would have a chance to exist economically before intolerable levels of traffic on the highways are reached.

General Clarke, also on the program, was asked to comment on Gruen’s views. “I did not hear all that Mr. Gruen said, but I am afraid that he and I do not see eye to eye on this. I am prepared to support the concepts outlined in the Year 2000 Plan.”

General Clarke, in his presentation, defended the city’s highway plans in the context of improving the city’s appearance:

In my opinion, traffic is more unsightly in congested streets of a neighborhood than it is on expressways screened from the eye and ear. [“40-Year Plan Denounced as Schizophrenic,” *The Evening Star*, January 5, 1962]

## Defining the District's Freeway Network

An extensive freeway network had evolved from Bartholomew's earliest projections. In a letter dated June 30, 1960, to Aitken, from BPR Commissioner Armstrong confirmed the descriptions and numbers of the designated Interstate System routes in the District for purposes of compiling the next ICE. The District's routes were:

- 66 – From the D.C.-Virginia line at the west end of the Theodore Roosevelt Bridge to a junction with FAI Route 95 in Washington.
- 70S – From the D.C.-Maryland line en route from Frederick, Maryland to the inner belt in Washington.
- 95 – From the D.C.-Virginia line at the south end of the 14<sup>th</sup> Street Bridge to the D.C.-Maryland line en route to Baltimore.
- 266 – Extending from a junction with Interstate Route 66 in the District of Columbia to the D.C.-Virginia line en route to a junction with Route 66 in Arlington County, Virginia.
- 295 – From the D.C.-Maryland line at the vicinity of Oxon Run to a junction with FAI Route 95 in Washington.
- 495 – On the Woodrow Wilson Bridge from the D.C.-Virginia line to the D.C.-Maryland Line.
- 695 – Portion of south leg of inner belt from FAI Route 95 to FAI Route 295.

The letter added a paragraph about I-266:

There is hereby designated Interstate Route 266 extending from a junction with Interstate Route 66 in the District of Columbia to the D.C.-Virginia line en route to a junction with Route 66 in Arlington County, Virginia. The general location is shown on the map dated May 25, 1960, prepared by the District of Columbia, except that for purposes of preparation of the estimate of cost to complete the Interstate System in accordance with Section 104(b)5 of Title 23, U.S.C., the location to be estimated shall be via Key Bridge.

Later that year, on October 21, Federal Highway Administrator Tallamy wrote to Aitken approving the city's request to modify the I-295 description to read:

We approve, effective this date, the removal of the Anacostia Freeway between the Anacostia Bridge (11<sup>th</sup> Street) and the District of Columbia-Maryland line, as the location of Interstate Route 295. This approval will permit transfer of Interstate funds previously authorized for projects on the Anacostia Freeway, as requested in your letter of September 16 to Division Engineer Hanson.

On June 20, 1961, Administrator Whitton approved a modified description of I-695. His letter to Aitken provided that:

695. South leg of Inner Belt from FAI Route 66 at the east end of the Theodore Roosevelt Bridge to FAI Route 295 in the vicinity of 11<sup>th</sup> Street, S.E., excluding the coincident section of FAI Route 95.

These were general descriptions, rather than precise definitions. For example, the description of I-70S could apply to a link along the Potomac River, along the Wisconsin Avenue corridor, or east of Rock Creek Park in the North Central corridor.

### **Transition at NCTA**

Shortly after being nominated as NCTA Administrator, Stozenbach talked with reporters. He considered the Mass Transportation Survey to be the framework for NCTA's studies, but did not consider it "to be a fully detailed blueprint." In particular, he questioned the survey's balance between freeways and rapid rail transit. NCTA, he said, should be "the voice of those who favor mass transit as a means of funneling off" the heavy traffic on the roads.

He emphasized that he is not against highways. He worried, however, that too many highways would create a series of "Chinese walls" dividing the city. Moreover, an over-emphasis on freeways would turn the Washington area into a vision of Los Angeles, which has many freeways but "still the cars move bumper to bumper." As a result, freeways would be part of the transportation system, but the system would not rely on them. "A highway system," he said, is like a bottomless pit." The *Star* summarized his view:

The more highways built, the more traffic they generate; the more traffic, the greater the need for parking facilities, he believes. And as a consequence of highway construction, the city "gets more and more chopped up," he said.

At any rate, Mr. Stolzenbach stressed, the various alternatives will be examined in developing a balanced transportation system and these factors will constantly be placed before all the planning agencies and governing bodies in the Washington region.

In developing that balance, he said, "I would like to try some experiments," as the *Star* described:

Convince the Baltimore & Ohio Railroad to try running more commuter trains in the Maryland area and have O. Roy Chalk put D.C. Transit buses at the stations to wait for incoming trains and take commuters to designated Government building centers.

"I don't know if it would work or not, but I think some things should be given a try at least," he said. [Gimble, Gilbert, "Chinese Walls' Feared In Highway Building," *The Sunday Star*, March 5, 1961]

These remarks prompted the District's Aitken to tell reporters that solving congestion would "vary from city to city," but in every case, freeways must play an important role. While "highways cannot do the total job," modern freeways carrying buses and automobiles "can go a long way toward meeting mass transportation needs." He stressed that already, freeways had helped eliminate unsightly slums and blighted areas in the southwest quadrant and other parts of

the District. That was because highway engineers design freeways to be “functional and still attractive.”

In response to a question on WWDC radio’s Report to the People program, he said he lamented the “unfortunate” use of “catch phrases” such as “Chinese Walls.” Such phrases could harm the vital Interstate freeway program that should “not be tilted or warped by catch phrases.”

Unlike Stolzenbach, Aitken was not concerned that the Washington area would turn into another Los Angeles. The two cities were different, with centralized employment in Washington while most employment in the Los Angeles area was decentralized.

Aitken had never met Stolzenbach, but looked forward to getting together with him soon to discuss “broad policies” for mass transit planning. [“Aitken Stresses Role Of Freeways For Area,” *The Sunday Star*, March 12, 1961; “Aitken Hits Attacks on Freeways,” *The Washington Post and Times Herald*, March 12, 1961]

The Kennedy Administration would not file the NCTA nominations with Congress until April 27, but the Senate District Committee held a hearing and approved both on March 24. The goal in the speedy approval was to get NCTA, with its new leadership, moving as fast as possible.

Chairman Bible told Stolzenbach that his job would be difficult, as the *Post* summarized:

The agency is charged with planning, winning approval of and finding means to finance a suitable mass transportation system for the Washington area.

Bible also agreed that the major part of the problem will be finding the money to build the transportation system for the expanding metropolitan area.

Bible, who helped draft the legislation establishing the Agency, said he expected it to “move ahead with top speed” despite the admitted complexities of the job.

Senator Beall illustrated one of the complexities:

Beall told Stolzenbach that he had some misgiving about maintaining a 5-year “freeze” on parkway construction in Northwest Washington because of the undesirable – particularly uncertainty – it is causing in the future of the Glover-Archbold Parkway and related highway construction.

Beall said he was interested in taking a “new look” at the Northwest highway freeze and would ask the District Committee staff to determine whether new legislation is needed to “end or change it.”

Stolzenbach replied that he did not consider the ban to be permanent and “it is far from being a ban on all highway construction.” NCTA would review the moratorium as part of its coordination with other highway and planning organizations to find the best solution to the area’s transportation problems.

Having approved the two nominees, the committee would have to wait until receiving their formal nominations to take them before the Senate for confirmation. [Lindsay, John J., "2 Chiefs of Area Transit Agency Win Senate District Unit Backing," *The Washington Post and Times Herald*, March 25, 1961]

Even before the paperwork arrived in the Senate, Matthews asked that his name be withdrawn. Jack Eisen reported in the *Post* that Stolzenbach and Matthews had been under consideration for the top spot in NCTA "until a few hours before the President made his announcement on March 3":

Stolzenbach, a Marylander, won his main support from District Democrats. Matthews, a Virginian, had broader political support, including backing from both Virginia and Maryland political figures.

According to the *Star*:

Mr. Matthews . . . was understood to have agreed to take the second spot in the agency if he could veto any major decisions made by Mr. Stolzenbach. Mr. Stolzenbach reportedly accepted the arrangement.

The plan apparently fell through, however, when Mr. Stolzenbach sought to name an individual employed at the Johns Hopkins University Research Office in Bethesda as his special assistant. Mr. Stolzenbach had been a senior staff member at the research wing of the university prior to his nomination by President Kennedy.

Eisen reported that the White House was "acutely embarrassed over the incident." Further, Matthews' resignation "revived efforts by some of Stolzenbach's foes in Montgomery County to head off the nomination." Stolzenbach was unperturbed, telling Eisen that the plan was to move as fast as possible to complete the tasks that Congress set before NCTA, without seeking deadline extensions. As Eisen added, time was "beginning to run out" on deadlines such as the requirement that NCTA submit "recommendations for organization and financial arrangement" to the President by November 1, 1962. "Already seven of those 28 months have slipped past."

Any delaying in forwarding the recommendation "could mean that hopes for getting the area's first subway line running by 1968 also may be set back." [McKelway, John, "Transit Agency Aid Quits in Row Before He's Officially Nominated," *The Evening Star*, March 29, 1961; Eisen, Jack, "Matthews Quits Rapid Transit Job," *The Washington Post and Times Herald*, March 30, 1961; Eisen, Jack, "Problems of New Transit Agency May Mean Delay in Subway Plan," *The Washington Post and Times Herald*, March 31, 1961]

The White House finally forwarded Stolzenbach's nomination to the Senate on April 27. The Senate confirmed his appointment on May 4 without discussion or debate. [National Capital Transportation Agency, *Congressional Record-Senate*, May 4, 1961, page 7302]

On May 12, 1961, Supreme Court Justice William O. Douglas administered the oath of office for Administrator Stolzenbach at NCTA's headquarters at 926 Jackson Place, NW.

At a press conference after the swearing in, Stolzenbach said he planned to visit other cities that had or were planning rapid transit systems. He would visit San Francisco in the following week and then travel to Philadelphia and Toronto. He also would meet with area officials, including the governors of Maryland and Virginia.

He said that NCTA was not simply a mass transit agency. “We have to create a practical plan for a metro form of organization so that all the beneficiaries . . . can participate both in its management and paying for it.”

He also planned to visit Seattle in 1962 to see the monorail that was being erected from downtown to the entrance to the 1962 World’s Fair. Stolzenbach said that whenever he talked to people who were not in the transit field, they ask about monorail. Thus far, it had seen used mainly as an amusement ride, as in Disneyland. He wanted to know all about it. NCTA “certainly” had not ruled out monorail as an option for the Washington area. “I think we ought to become the world’s expert on monorail as fast as possible.

In the immediate future, NCTA would initially seek authority to acquire median strips in freeways for transit, with I-66 in Virginia and I-95 between Baltimore and Washington being prime candidates because officials had not yet agreed on their routing.

Stolzenbach predicted that construction of a downtown subway could get underway as early as 1964, with operation beginning in 1968 or 1969. He acknowledged that there was “still some question” whether a subway is needed, but he planned to give special attention to the subject. The goal was a “balanced system,” with the difficult question being how to decide where balance existed. [Gimble, Gilbert, “Transit Unit Seeks New Right-of-Ways,” *The Evening Star*, May 12, 1961; “Transit Chief Sworn, Plans Monorail Study,” *The Washington Post and Times Herald*, May 13, 1961]

On June 16, the White House announced that Warren D. Quenstedt was the President’s choice to be Deputy Administrator of NCTA. The 50-year old Quenstedt was an attorney with the firm of Smith, Hennessey and McDonald. Since 1946, he also had been an independent insurance broker and agent. The Virginia native lived with his wife and two children at 1319 Park Terrace Drive in Alexandria.

Quenstedt was a transit booster. The *Post* quoted him as saying, “Even if the Potomac River were roofed over with bridges,” highways could not do the whole job.

Stolzenbach was “most pleased” with the nomination. “I know him and I like him.” [“Quenstedt Is Chosen As Transport Deputy,” *The Evening Star*, June 16, 1961; “Quenstedt Gets Post in Transport,” *The Washington Post and Times Herald*, June 17, 1961]

Following a routine June 27 confirmation hearing, the Senate District Committee sent the nomination to the Senate floor on July 10. He was confirmed in a brief colloquy the following day by unanimous consent of the few people on the Senate floor at the time. [National Capital Transportation Agency, *Congressional Record-Senate*, July 10, 1961, page 12256]

(Quenstedt had been the Democratic challenger to Representative Broyhill in the 1956 election. The race turned on many issues, including civil rights and schools. However, Quenstedt also charged Representative Broyhill with being ineffective in Congress, as the *Star* reported:

In a separate television appearance over Station WMAL last night, Mr. Quenstedt continued his attack on the legislative record of his opponent.

Mr. Quenstedt recalled that “more Potomac River Bridges” were part of Representative Broyhill’s campaign platform four years ago.

“Well, what do we have?” asked Mr. Quenstedt. “We have the same number of bridges as we had in 1952, but we have more people using them . . . . How long does it take to plan a bridge? How long does it take to build one?”

He was particularly critical of Representative Broyhill’s role in the central area – or Roosevelt Island – bridge. “Here Joe Broyhill’s record is one of inconsistency and confusion,” said Mr. Quenstedt. “Repeated attempts to get action here have failed mainly because Joe Broyhill first opposed a tunnel in favor of a bridge and after it looked like this would become a reality, he suddenly threw the whole matter into a turmoil by advocating construction of a tunnel. How long must people of the 10<sup>th</sup> district put up with this failure to produce? We have no new bridges and we have no tunnels despite Joe Broyhill’s four long years in Congress.” [“Broyhill Cites Democrats to Defend Record,” *The Evening Star*, October 13, 1956]

(In November, Representative Broyhill defeated Quenstedt – 53,148 to 40,553.)

### **The Cost of Right-of-way**

By the early 1960s, the District’s extensive freeway network was facing problems, including what to do with people displaced by the planned highways. The 1950s urban renewal plan had nearly wiped out southwest’s African-American and low-income neighborhoods, leaving room for Zeckendorf’s vision of the area. Because virtually the entire area had been leveled for urban renewal, the Southwest Freeway was an exception to the revolt against freeways that was underway around the country. No one was left to object to the destruction of their homes or businesses.

By contrast, other Interstates in the Washington area and around the country were proposed to be built in the midst of neighborhoods and business development that had not been cleared. The desire to protect homes and businesses was at the heart of the freeway revolt.

From the earliest years of the Federal-aid highway program, States had been responsible for providing right-of-way. The Federal Highway Act of 1921 explicitly exempted the “rights-of-way” from Federal-aid highway fund reimbursement. Because Federal-aid funds could not be used in cities, State highway agencies often relied on adjacent property owners to donate the land in exchange for access to the new or improved road.

During World War II, Congress began to modify the Federal role in highway right-of-way acquisition. The Defense Highway Act of 1941, enacted just before the attack on Pearl Harbor, authorized Federal reimbursement up to 100 percent for acquisition of right-of-way for defense access roads and up to three-fourths of the cost for acquisition on projects on the strategic highway network. Where States could not provide the right-of-way due to restrictions in their constitution, PRA was authorized to acquire the land. For regular Federal-aid highway projects, Federal law in 1943 and again in 1944 modified the definition of "construction" to include the cost of right-of-way, with the restriction to one-third of the cost. Provisions were not made to help home owners or businesses relocate. [*America's Highways, 1776-1976, page 357*]

When construction of the Interstate System began, old ways of right-of-way acquisition no longer worked. Full control of access meant that adjacent property owners were no longer willing to donate property. Under the Federal-Aid Highway Act of 1956, BPR would pay 90 percent of the cost of right-of-way acquisition, but not the cost of relocation or help to displace to find new homes or locations of businesses.

On February 28, 1961, just 5 weeks after taking office, President Kennedy sent a Message to Congress on the Federal Highway Program. It began, "Our Federal pay-as-you-go highway program is in peril" and focused on funding options for putting the program back on a sound financial footing. Completing the Interstate System "at least as fast as originally scheduled is essential to our economy." He opposed "stretching out or cutting back" the program, two options that critics had suggested. Instead, he recommended making a temporary 1-cent increase in the 3-cent gas tax permanent.

The President's message also addressed urban development issues. He directed Secretary of Commerce Luther H. Hodges, whose department included BPR, and Housing and Home Finance Administrator Robert C. Weaver "to increase their joint planning at every level, to improve coordination of urban renewal and freeway construction plans in the same area, and to invite the cooperative efforts of State and local highway and housing officials and private experts."

Moreover, Federal urban renewal law, enacted in 1949, required that every contract for Federal assistance include provisions assuring the availability of decent, safe, and sanitary housing at reasonable prices in suitable locations for all families displaced by urban renewal projects. This law did not apply to the Federal-aid highway program. President Kennedy recommended legislation to help families displaced by highway construction find "reasonable housing at reasonable costs, a problem that he said "has been largely overlooked."

Secretary Hodges and Administrator Weaver submitted their recommendations to the President on March 28, 1962. "Transportation," they said in the transmittal letter, "is one of the key factors in shaping our cities." Their report covered many topics, including the need for Federal aid for mass transit. The report included several recommendations for urban highway programs, the most important of which involved planning:

Beginning not later than July 1, 1965, approval of Federal-aid highway programs for projects in any metropolitan area should be made contingent upon a finding by the Secretary of Commerce that such projects are consistent with adequate, comprehensive

development plans for the metropolitan area or are based on results of a continuing process carried on cooperatively by the States and local communities and that the Federal-aid system so developed will be an integral part of a soundly based, balanced transportation system for the area involved.

Secretary Hodges and Administrator Weaver also recommended relocation assistance for those displaced by highway or mass transit projects. They wrote that according to BPR, 15,000 families and 1,500 businesses will be displaced each year in the next 6 to 8 years by Interstate construction:

Under the federally assisted urban renewal program, families must be assured the availability of decent, safe, and sanitary housing when they are displaced by demolition, code enforcement, and other urban renewal activities. Also the moving expenses of families and businesses are paid from Federal urban renewal program funds. For families needing such assistance, the average payment is about \$65. The average payment to businesses is about \$1,150.

In order to alleviate hardship caused by public action and to provide equity in treatment, provisions similar to those for urban renewal should be made in the Federal-aid highway program and also in other federally assisted programs causing displacements.

Hodges and Weaver also recommended additional funds for research and demonstration projects in urban transportation and especially mass transportation. "It is essential to stimulate and support experimentation with new equipment and systems to test their practicality and demonstrate their effectiveness in improving and reducing the total cost of urban transportation." ["Urban Mass Transportation Act of 1962," *Congressional Record-Senate*, September 13, 1962, p. 19339-19343]

On April 5, 1962, President Kennedy submitted a message to Congress on "The Transportation System of our Nation." The message began:

An efficient and dynamic transportation system is vital to our domestic economic growth, productivity, and progress.

The message was a broad statement that covered a wide range of topics, including freight shipments by land, air and water; international aviation and maritime issues; and labor relations for transportation workers. Among many recommendations, however, the President reiterated his concern about "the problems of families displaced by new highway construction." He cited Secretary Hodges' estimate that 15,000 families and 1,500 businesses were being displaced by Interstate construction each year.

In the interest of equity, President Kennedy recommended that "assistance and requirements similar to those now applicable to the urban renewal program be authorized for the Federal-aid highway program and the urban mass transportation program." The White House would submit legislation "to authorize payments not to exceed \$200 in the case of individuals and families and \$3,000 . . . in the case of business concerns or nonprofit organizations displaced as a result of

land acquisitions under these programs." (The payment for businesses could be higher based on moving costs.)

The President's message continued the pressure to find decent, safe, and sanitary homes for those displaced by highways. A June 1962 *Post* editorial illustrated the problem affecting the District's planned expressways:

After having waved off warnings for years the District Building, to its great surprise, is faced with a crisis. It cannot build further expressways until it is able to relocate the families displaced. And it has no very clear idea how to accomplish that feat.

The District had another problem:

Several new officials with a dislike in principle for highways took office just as the threatened neighborhoods were beginning to seek political spokesmen. Two of the three [District] Commissioners now decline to defend even their own highway budget requests, as though relocation were a hopeless task.

Horsky, not yet in his White House post, did not see the issue as impossible of solution. The editorial quoted a statement he had made a few days earlier:

I do not believe, that the relocation and housing problems to which government has suddenly waked up are insoluble—I do not believe we need abandon any of our fundamental plans—for the Inner Loop or anything else. The relocation and housing problems are ever so much more difficult than they should have been, but they can be met and solved. We can relocate and rehouse people displaced by government action, including highway building, if we are willing to recognize what has to be done, and then get together to do it.

The editorial concluded that, "there is no reason either to postpone highway planning or to delay a comprehensive housing program." ["No Excuse for Delay," *The Washington Post*, June 15, 1962]

The Federal-Aid Highway Act of 1962 (P.L. 87-866), which President Kennedy signed on October 23, included two important provisions his message had requested. Section 5 addressed the growing concern, cited by the President and many critical articles, about relocated individuals and businesses. Before approving a project, the Secretary would have to receive assurances that the State highway agency would provide advisory assistance for displaced families. He also was required to approve Federal-aid participation in relocation payments by the State to displaced individuals, families, business concerns, farms, and nonprofit organizations. The new law adopted the \$200 limit for individuals and families and \$3,000 for business or nonprofits that the President had proposed.

Even more important was Section 9, "Transportation Planning in Certain Urban Areas." It addressed the President's call for a means of ensuring that Federal-aid highway and mass transportation projects were part of a comprehensive and balanced urban transportation plan. The provision added Section 134 to Title 23, United States Code:

It is declared to be in the national interest to encourage and promote the development of transportation systems, embracing various modes of transport in a manner that will serve the States and local communities efficiently and effectively. To accomplish this objective the Secretary shall cooperate with the States, as authorized in this title, in the development of long-range highway plans and programs which are properly coordinated with plans for improvements in other affected forms of transportation and which are formulated with due consideration to their probable effect on the future development of urban areas of more than fifty thousand population. After July 1, 1965, the Secretary shall not approve under section 105 of this title any program for projects in any urban area of more than fifty thousand population unless he finds that such projects are based on a continuing comprehensive transportation planning process carried on cooperatively by States and local communities in conformance with the objectives stated in this section.

This section launched modern transportation planning by calling for what became known as the “3C” process (for continuing, comprehensive, and cooperative). The 3C process remains the core of Section 134, which now contains nearly 20 subsections.

This emphasis on metropolitan planning was one outgrowth of changes in attitudes toward the Interstate System. Once the impact on cities became real in the 1950s, city officials and others began calling for a moratorium to rethink the idea of urban expressway or consider canceling the controversial segments. The 3C planning process was seen as a way of rethinking the urban transportation network.

The problem local official faced was that aside from the 3C process, they would lose the Interstate funds if they did not use them to build unwanted Interstate segments. The funds would simply be shifted to other areas, including rural areas, where Interstate highways could be built.

Congress returned to the subject of relocations in the Federal-Aid Highway Act of 1968 (P.L. 86-657). The legislation included the first mandatory payment program for those who must relocate because of a Federal-aid highway project. The goal was to provide every citizen with decent, safe, and sanitary housing and to reduce the inequities of a strict application of the fair market value concept to right-of-way acquisitions. The 1968 changes were at the heart of the landmark Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (P.L. 91-646, Uniform Act), which covered all Federal agencies involved in right-of-way acquisition.

### **Awaiting NCTA’s Report**

The District, BPR, and Members of Congress proceeded with confidence that the freeway plans could be modified to mollify critics and then would be built. They thought the critics, as the *Post* editorial suggested, were misguided and misinformed.

This view was reflected in comments by Senator Jennings Randolph (D-WV), chairman of the Committee on Public Works, and a longtime road supporter dating to his days in the House of Representatives, during consideration of the proposed Urban Mass Transportation Act of 1962. (As discussed earlier, while in the House of Representatives in the 1940s, Randolph had played a key role in the debate over replacement of the Highway Bridge.) The proposed legislation would

provide a permanent program under the Housing and Home Finance Administration for aid to mass transit. He was responding to a NCTA request to delay action on the East Leg of the Inner Loop, the Northeast Freeway, a massive interchange “C” linking the Inner Loop with the Southeast Freeway via the East Leg, and the Three Sisters Bridge until NCTA completed studies due on November 1, 1962.

Senator Randolph said he was “much concerned about the consequences and disputes growing out of the quest for a utopian ‘balanced’ transportation system in urban areas.” Instead of “striving for so-called balance,” planners should be focusing on “an all-modes and all-facilities system based on progress, adequacy, and ability to meet needs.” He stressed that when he said “adequacy to meet needs,” he did not mean only rail and bus transit. The term also embraced accommodating the automobiles and commercial trucks that “will continue to virtually clog the highways of urban areas, no matter what is done in the field of mass transit by bus or rail.”

He strongly opposed halting planned freeways “while there is a search for a transportation system with a magical term,” namely balance. Instead of searching “for a will-o’-the-wisp ‘balanced’ transportation system embracing all appropriate modes of transport,” they should be searching for “something practical.”

He had to agree with a *Post* article that morning that described the Nation’s Capital as a place “where highway and transit partisans have been locked in a bitter dispute that has brought the city’s freeway program to a near standstill.” More so than any other urban area, the District was plagued by “the vexing problem growing out of exercises in semantics and of highway stagnation as a consequence of the efforts of mass transit advocates of delay.”

That very day, in fact, he had discussed the subject in a letter to Senator Robert C. Byrd (D-WV), chairman of the Subcommittee on District of Columbia, Committee on Appropriations. Referring to NCTA’s request for delay of the four projects, Senator Randolph said those trying to delay the District’s freeway program “apparently are obscuring a number of facts which should be brought into focus”:

The program was based on the balanced transportation system called for by the Mass Transit Survey Report, 1959, and approved by the National Capital Regional Planning Council. The proposed freeway network for the District of Columbia has been designed as part of a transportation system that is expected to include rapid transit by rail and nonrail. Actually, if there should not be brought into being a rapid transit program, the proposed freeway planning will of necessity have to be much enlarged.

Those who sought delays in highway development on the premise that “there is a question of highway versus nonhighway facilities” were subject to “an unfortunate mistake” because their view now threatened freeway construction and could threaten the rapid transit program. In establishing NCTA and directing it to study transit needs, Congress was calling for “the second part of the overall transport plan” because the highway phase had already begun.

Another misunderstanding was that transit could substitute for highways. Rail transit was being planned to accommodate commuters, but that was only one aspect of modern transportation.

Chairman Randolph said “an ever-growing volume of motor vehicle traffic of all types” must be served, and unless it was, the Washington area “will be faced with a staggering problem of traffic congestion.” Delaying the highway program until Congress decided on a subway system would mean that “no provisions will have been made for ever-mounting motor vehicle traffic that is not and never will be susceptible to subway travel.”

He urged Senator Byrd to ensure that the District’s highway program is “kept on schedule” in legislation appropriating the District’s matching share for Interstate and other Federal-aid highway projects:

Delays doubtless will lead to ultimate added costs rather than savings. Another probable byproduct of delays doubtless will be further deterioration of the downtown section and a resultant loss in revenues. And there should be avoidance of the possible loss of Interstate Highway System funds. [“Urban Mass Transportation Act of 1962,” *Congressional Record-Senate*, September 13, 1962, p. 19380-19381]

(Congress adjourned without approving the Urban Mass Transportation Act of 1962. It was revived in the next Congress and, with some modifications, approved by President Lyndon B. Johnson on July 9, 1964. The landmark Urban Mass Transportation Act of 1964 (P.L. 88-365) provided the foundation for all subsequent Federal-aid for transit.)

Congress did not take Senator Randolph’s advice. The House had deleted FY 1963 funds in compliance with a last-minute split among the District commissioners, two of whom had asked for delay until the housing issue could be resolved. The Senate, according to Senator Byrd, went along with the House because the commissioners had not asked his subcommittee to restore the funds. The subcommittee retained \$300,000 for the Three Sisters Bridge, contingent on NCTA’s support for the bridge.

### **Battle over the Inner Loop Freeway**

The National Capital Transportation Act of 1960 had called on NCTA to continue the work begun by NCPC and the National Capital Regional Planning Council in the Mass Transportation Survey:

. . . and shall include further studies as may be necessitated by changed conditions, the availability of new techniques, and the response of Government agencies and the public to the transportation plan adopted by the Commission and Council. The Agency’s studies shall also include evaluation of the transportation system recommended in the transportation plan, and of alternative facilities and kinds of services.

In addition, NCTA was to complete a report to the President by November 1, 1962, containing “recommendations for organization and financial arrangements for transportation in the National Capital region”:

*Provided*, That any recommendations submitted by the Agency shall provide as far as possible for the payment of all costs by persons using or benefiting from regional

transportation facilities and services, and shall provide for the equitable sharing of any remaining costs among the Federal, State, and local governments.

In early 1960s, opposition to the Inner Loop began to grow as the District prepared to move forward. And Inner Loop had been part of the city's thoroughfare/freeway plans since the mid-1940s – a way of keeping through traffic out of downtown. The 1959 Mass Transportation Survey confirmed the concept by not only endorsing the Inner Loop but expanding it into a double loop as shown in BPR's September 1955 Yellow Book.

By then, however, cities around the country were experiencing protests against urban Interstates as well as the demand for mass transit as a substitute. In Washington, opponents could look to the pending NCTA report as grounds for delaying action on the freeways.

On October 5, 1961, NCPC took the surprise action of voting 4 to 2 to defer approval of four projects connected with the Inner Loop until NCPC's next meeting:

- East Leg running north-south between 10<sup>th</sup> and 11<sup>th</sup> Streets, SE.;
- Interchange "C" connecting the Southeast Freeway, the East Leg, and the 11<sup>th</sup> Street Bridge;
- Center Leg, a north-south route under the National Mall just west of the Capitol; and
- South Leg of the Inner Loop between the Lincoln Memorial and the Southwest Freeway.

Commissioner Alexander C. Robinson III, an architect who lived in Cleveland, Ohio, and had joined NCPC in fall of 1959, had proposed the delay:

I've watched the damage done in other cities and I'm wondering whether there aren't better ways. I believe we are justified in taking another look at this, in the light of what is happening elsewhere, and finding out whether we really need all the Inner Loop projects that have been proposed, and whether we may not be spoiling the City of Washington.

NCPC staff had recommended approval of the four projects, but the majority of NCPC members decided to withhold action.

Lt. Colonel H. O. Webb, the District's Assistant Engineer Commissioner, voted against Robinson's motion. "If these projects are recommended to be cut out, this just further delays the planning of the work." He was confident NCPC would approve the projects for inclusion in the District's budget. By the time of NCPC's next meeting, he added, the four links would have been considered during a planned public hearing on the District's 1963 budget proposal to Congress (Colonel Carl H. Bronn of the U.S. Army Corps of Engineers was the other "no" vote.)

While deferring action on the Inner Loop, NCPC approved including \$3 million in the District's 1963 budget request for the start of construction of the Three Sisters Bridges. [Lewis, Roger J., "Damage by Inner Loop Feared by Planners," *The Evening Star*, October 6, 1961]

Shortly after NCPC's decision to delay action, other groups expressed their views on highway projects versus other needs in the city. The Parent-Teacher Association (PTA) and others attending the budget public hearing on October 10 urged the District to shift money from the

Highway Department's "hog-wild" construction program to school construction. District funds for highways came from its highway fund, but these commenters observed that the city used general revenue to supplement the highway fund to pay for items such as street lighting and traffic police. They wanted the city to use the general funds for schools and for the highway fund to repay the city for general revenues used for highway purposes.

The PTA's Dr. Ellis Haworth told the District commissioners that if the Highway Department were allowed to continue with its plans, they would "leave the District with no land privately owned." He said, "The whole question reduces to a matter of relative values: People versus highways." Mrs. Rolland G. Lemensdorf, legislative chairman of the Ben Murch Home and School Association, added that, "the fight for our civilization will not take place in new cars on new highways; it will take place in the minds of men."

Arnold Sternberg of the District Democratic Central Committee suggested that some sewer projects the city was financing with general revenue should be charged to the highway funds. He cited the sewer work that would be included in the four Inner Loop freeway projects included in the budget.

The *Star's* coverage of the hearing added:

At the end of the day-long hearing, a weary Engineer Commissioner Frederick J. Clarke, who has jurisdiction over the Highway Department, rose and remarked wryly: "Well, back to the drawing board."

Speaking seriously, Gen. Clarke said he believes that the highway program recommended is "properly balanced." ["Roads Funds Transfer Sought for D.C. Schools," *The Evening Star*, October 11, 1961; "Divert Funds For Schools, District Urged," *The Washington Post and Times Herald*, October 11, 1961]

The Fine Arts Commission issued a statement saying the Inner Loop system would cause "irreparable damage to the city's appearance." The commission appreciated NCPC's decision to defer action. Chairman Finley said:

The Commission of Fine Arts has never approved the Inner Loop . . . which we feel will be destructive to the beauty of the city. The commission has advocated instead, an underground rapid transit system which, if adopted, we feel would meet our traffic needs without irreparable damage to the city's appearance. [Lewis, Robert J., "Fine Arts Unit Hits Plan for Inner Loop," *The Evening Star*, October 18, 1961]

The American Institute of Architects also urged the city to adopt rapid-transit instead of the Inner Loop. "If we adopt the rapid-transit solution as a first resort—instead of as a last resort—we may never have to go ahead with any part of the Inner Loop system that is not now under construction." ["AIA Asks Rapid Transit Priority, Opposes Loop," *The Evening Star*, October 21, 1961]

The Committee of 100 on the Federal City called for "a thorough evaluation of the probable impact of the Inner Loop on the appearance of the National Capital and the lives and property of

its inhabitants.” At the same time, the Northwest Committee for Transportation Planning issued a 50-page study opposing the Inner Loop and calling for a “complete re-evaluation” of the District’s highway program. “The Inner Loop and related street widenings and arterial freeways would not solve traffic congestion problems, but would create an even worse strangulation of automobile traffic,” according to the report. [“3 Groups Join Protest Of Inner Loop Plans,” *The Evening Star*, October 27, 1961]

In reaction to NCPC’s deferral of a decision, the *Star* described “a chain reaction among groups who have opposed freeway construction.” Nevertheless, the District commissioners voted on October 28 to include funds in the 1963 budget for freeway construction. The request included \$700,000 for the Inner Loop. A District highway official said, “Our highway program faces its most critical period.” Engineer Commissioner Clarke hoped that the “swelling of sentiment” against freeways would not block construction of the Inner Loop. [Gimble, Gilbert, “Funds for Inner Loop Are Sought by D.C.,” *The Sunday Star*, October 29, 1961]

NCPC met on November 9 to consider the deferred highway projects. Engineer Commissioner Clarke defended the Inner Loop, saying its critics lacked facts. “I do not know of any facts or studies which are available today upon which one could logically base a request for reconsideration.” Opposition by NCPC “would be a renunciation” of its responsibility to provide sound planning guidance. “It would create an atmosphere of uncertainty throughout the region and a loss of faith in the guidance of the National Capital Planning Commission and the Regional Planning Council,” as reflected in the Mass Transportation Survey.

He responded to those who objected to the Inner Loop on aesthetic grounds by saying that the District had appointed an advisory board of architects to review all designs. He also supported rapid transit:

In this manner, we can provide, on a timely basis, the highways that are needed in addition to rapid transit. At best rapid transit is a substantial number of years away but also needs to be energetically planned and developed.

He continued, “The fact that freeways are designed to correct ugliness and congestion should in the long run tend to overcome most, if not all, the short run disadvantages so often cited by those directly affected.”

If NCPC approved the delay, the same groups pressing for delay now would “press for continual delay or abandonment.” He added, “Delay, once initiated, could well be prolonged until the crisis in transportation dictated that a crash program be undertaken.” Failure to build the freeways would “make the city a less desirable place to live and visit in and thereby reduce business activity, property values, and offer further encouragement to the growth of slum areas.”

Testifying during the hearing, NCTA’s Stolzenbach called for a 1-year delay in new freeway construction to allow his agency to re-evaluate all transportation planning for the region. Delaying the Three Sisters Bridge was “absolutely essential if any serious re-evaluation is to be made” of the 1959 Mass Transportation Survey. The Year 2000 Plan “postulates a whole new

set of assumptions as to the future growth of the region,” requiring NCTA to rethink all decisions:

Do we want a strong central city? Do we want to limit urban sprawl? If we do, we have to design a transportation system to accomplish these goals. The 1959 transportation plan made no such effort. It is merely a stepping stone.

The studies NCTA was undertaking would determine which freeway projects should continue:

The important point is that the agency and others concerned with regional planning should have a year’s time in which to develop recommendations. There is no pressing need for either of these projects [the Three Sisters Bridge or interchange “C”]. Both are links connecting roads whose construction will not begin until fiscal year 1966 – four years from now.

On the other hand, construction of these two projects will mean that the 1959 transportation plan has become a reality.

BPR’s Joseph Barnett, an alternate member of NCPC, said that failure to complete the Inner Loop would mean that the Three Sisters Bridge and the Potomac River Freeway leading into the K Street Expressway would no longer qualify as part of the Interstate System – they would not be connected to it. Without them, the District faced the “horrible prospect” that trucks would have to be allowed on the Theodore Roosevelt Memorial Bridge and the roadways around the Lincoln Memorial. Without the North and West Legs of the Inner Loop, I-66 would not have an entrance into the city. Barnett said NCPC had a responsibility “to support, rather than hinder, the agencies now executing the very plan we ourselves helped to create and which we approved” in the Mass Transportation Survey. Not doing so would be “sheer folly and a waste of funds.”

Downtown Progress, formally the National Capital Downtown Committee when established by downtown businesses in July 1959, supported the Inner Loop, saying that failure to build it could mean the death of downtown. The freeways would “identify clearly the boundaries of the urban renewal areas in the downtown” and help finance the cost of renewal. (Established over 2 years earlier, Downtown Progress was an organization of businessmen working under the auspices of the Federal City Council and NCPC.)

Finley of the Fine Arts Commission told NCPC that, “The city is being changed to fit the standard pattern of highway engineers, rather than to conform to the Washington plan – so long established.” He felt that Congress had given NCTA a “mandate” to re-evaluate the “entire transportation plan for Washington and the surrounding area.” He said, “That mandate should be carried out.” As for the Inner Loop, it would “not only mar the beauty of Washington but will be destructive of the L’Enfant Plan.” Rapid transit would be “the most effective and least damaging means of providing access to those parts of the city where Government buildings or commercial interests are located.”

Finley said that the beauty of the National capital “should not be sacrificed by cutting the city into islands in an effort to meet the traffic needs of local inhabitants or those who live in nearby

suburban areas.” He urged the District Highway Department to submit a scale model of the Inner Loop “showing the full extent of the proposed changes and citing also the number of houses and families to be displaced, the loss in taxable property and the added expense to the city in maintaining these freeways.” These were facts the public and the Congress deserved to have when “faced with such vast changes in the city’s appearance, accomplished piecemeal.”

NCPC voted unanimously on October 10 to approve the Inner Loop projects. The vote on the Center Leg was unanimous, but the new NCPC chairman, Mrs. Rowe, abstained; she later said she opposed the Center Leg. (The White House had announced her elevation from member to chairman on October 9 while NCPC’s all-day hearing was underway.) The vote for interchange “C” was tied to three stipulations. Before NCPC would approve advertising for bids, NCPC wanted to see a model of the interchange and the East Leg to ensure it would “enhance the beauty and livability” of the city. The architectural treatment also would be subject to NCPC approval.

With NCPC’s approval, the District was free to include funds for the projects in its 1963 budget proposal. The District had intended to do so in any event, since NCPC’s views were only advisory, but its support was helpful during congressional review of the budget requests.

Commission members Robinson, who had requested the deferral of a decision, C. McKim Norton, and A.M. Woodruff issued a statement saying, “No fresh evidence has been presented yet which casts any doubt on the validity of the general concept of the Inner Loop.” However, Robinson said that planners would “watch very carefully just what the impact of the loop is going to be on the city.” He appreciated the opportunity to reconsider the plan. “It has been a most useful timeout.”

NCPC took no action on the Three Sisters Bridge, leaving in place its October approval of the District’s budget request to begin construction in place. [Gimble, Gilbert, “Clarke Assails Effort to Delay Loop Freeway,” *The Evening Star*, November 9, 1961; Gimble, Gilbert, “Planners Approve Inner Loop Projects,” *The Evening Star*, November 10, 1961]

(On November 9, in the midst of the hectic NCPC hearing, a letter designating Mrs. Rowe as chairman arrived around 2 p.m. Daniel H. Shear, NCPC’s general counsel, read the letter to the record-breaking crowd, which applauded the announcement that she now was chairman. Later, she told reporters, “I was shaking in my shoes but I tried not to show it.” The *Star* reported:

Her first day as chairman was one of the busiest and most controversy-filled commission meetings of recent years. It took up the much-debated Inner Loop expressway issue, and was forced by the wealth of testimony to postpone a final decision until a second-day session this morning.

“In spite of the differences of opinion expressed on the Inner Loop question, there was not any name-calling or wrangling—and for this I was very glad,” Mrs. Rowe said. “I would hate to have to gavel anyone down.” [Lewis, Robert J., “Mrs. Rowe Presides Over Planners On Hectic Day, But Keeps Aplomb,” *The Evening Star*, November 10, 1961]

In an editorial, the *Star* concluded that the flareup of opposition between the October and November NCPC meetings “has done more good than harm.” That was because NCPC had approved inclusion of the Inner Loop projects in the 1963 budget request:

Had the commission suddenly turned about-face and asked pointlessly for delay in what it long since had tacitly approved, it would have invited a storm of protest capable of doing great injury to the commission’s own prestige and lessening its influence at a time when it should be strengthened.

One advantage of the month-long delay was that the highway planners now “have been made fully aware that a considerable body of public opinion is increasingly skeptical” of their claims for urban freeways.” Highway engineers had “doubtless” explored and disposed of, to their own satisfaction, criticisms about displaced families, the land to be seized, aesthetic impacts, and the “huge expenditure required.” However, the engineers need to seek better understanding by the public. The editorial concluded:

What is done in Washington must be the best that can be done. If the many agencies involved, including the Planning Commission and the Fine Arts Commission, work together with that end in view, there is considerable assurance that only the best will be acceptable. [“Wise Decision on the Loop,” *The Evening Star*, November 11, 1961]

### **Trying to Get Started**

With the NCPC clearance, the District commissioners approved the routes for the East Leg of the Inner Loop and the Northeast Freeway on November 14. The *Star* reported:

The route of the east leg, which includes a massive interchange near its southern end, will run between Tenth and Eleventh streets S.E. from the Anacostia River to Tenth street and Florida avenue N.E.

The Northeast Freeway shoots northward from the east leg to tie-in with the third route to Baltimore. It will run just east of Gallaudet College and then run parallel to the Baltimore & Ohio Railroad tracks in Brookland before reaching the District line.

The approved budget proposal for 1963 included \$1.5 million for engineering work on the Northeast Freeway as well as \$3 million for right-of-way acquisition. It also included \$700,000 for engineering work on the East Leg, \$1 million for acquisition of right-of-way, and over \$2 million to acquire right-of-way for interchange “C” as well as \$3 million for its construction.

With this funding, the city expected to begin construction of the East Leg and the Northeast Freeway in July 1964, subject to congressional approval of the District matching funds. Aitken promised “we will make a sincere attempt to make them esthetically acceptable. They will be designed to make surrounding areas livable.” [“City Heads Approve Two Highway Links,” *The Evening Star*, November 14, 1961]

Despite these actions, Stolzenbach took his request for a delay on the Three Sisters Bridge and interchange “C” to the Budget Bureau. He met on December 11 with the bureau’s Phillip S.

Hughes, District commissioners Walter N. Tobriner and General Clarke, and NCPC chairman Rowe. However, the bureau rejected the request to remove funding for the projects from the District's 1963 budget request. ["U.S. Insists On Highway Projects Here," *The Evening Star*, November 15, 1961]

The Committee of 100 on the Federal City also refused to give up. Late in December, the committee's chairman, Neill Phillips, wrote to Rowe urging NCPC to withdraw approval of "all pending highway projects" in the District, particularly the four Inner Loop projects included in the District's 1963 budget proposal. NCPC, Phillips wrote, should direct its staff to study land-use in the District and how transportation projects of the past 20 years had affected the city's fiscal affairs. The Inner Loop and all future projects should be evaluated based on their total impact on the District and surrounding communities. This would be in contrast with the District Highway Department, which "expedited" projects by "several years" and considered them only based on impacts on motor vehicles. In addition, NCPC should consider planned highway projects in consultation with NCTA.

The committee's road committee had drafted the letter. Peter Craig, a member of the committee, said the Committee of 100 would discuss the issue in January. ["Planning Unit Asked to Halt Loop Backing," *The Evening Star*, December 29, 1961]

On January 15, 1962, the Committee of 100 held a special meeting to reconsider its letter to NCPC. Harland Bartholomew told the 50 members in attendance that the letter to Mrs. Rowe contained what he called "misinterpretation" and "mis-statements." He said NCTA was not created to develop a new transportation plan but only to proceed with the transit development program. NCPC's William Finley agreed with committee members who were concerned about the beauty of the city. He urged the committee to remain concerned with the "beautification and design" of freeway and rapid transit projects. However, NCPC was not reconsidering its decision to approve inclusion of Inner Loop projects in the 1963 budget proposal.

Toward the end of the 2 and a half hour debate, Bartholomew offered a motion urging close cooperation among NCPC, NCTA, and BPR in developing a transit program. In the end, the committee adjourned soon after, leaving the motion without a vote and leaving the letter to NCPC as the Committee of 100's position. ["Road Stand Unchanged By Federal City Unit," *The Evening Star*, January 16, 1962]

On February 16, the Committee of 100 adopted a resolution urging NCPC, NCTA, and BPR to make "every concerted effort to work out" a transportation plan for the area. [Lewis, Roger J., "Biddle Urges Support Of Roosevelt Memorial," *The Evening Star*, February 17, 1962]

On January 25, Downtown Progress released its plan, "Downtown Streets and Places," for transforming central Washington's downtown core. Doxiadis Associates, headed by internationally known city planner Constantine Doxiadis of Greece, had developed the plan.

As Gutheim and Lee explained:

Downtown Progress was prompted by what ailed the downtown. Not only was retail activity leaving the downtown, but also the downtown was expanding to the northwest, from the White House westward to Rock Creek Park. In 1963 Architecture Forum reported that although \$228 million of new construction occurred west of 15th Street, only \$32 million was invested east of 15th Street. Corporations and trade associations facilitated the shift of downtown along K Street, Connecticut Avenue, and Farragut Square, where land was cheaper and easier to assemble.

The plan, developed at a cost of \$500,000, called for a subway and expressways, the use of rapid transit buses, and a system of 10-seat jitneys operating every minute. Several streets would be rebuilt in tunnels (14<sup>th</sup>, 13<sup>th</sup>, 9<sup>th</sup> and 6<sup>th</sup> Streets) between E and H Streets below the central shopping district. The area would be reserved for pedestrians and jitneys. Other streets would be combined in one-way pairs that, along with the Center Leg, would free the central area of through traffic. The plan supported the Inner Loop in its entirety.

The plan went beyond transportation in calling for a Massachusetts Avenue visitors' center near Union Station and a new central library, convention hall and exhibit space, law school, churches, and an apartment complex in Mount Vernon Square East and South.

In January 1963, one small part of the plan was launched. D.C. Transit Systems, the city's bus company, began operating a jitney or minibus on F Street, NW., with 14 more due to extend the route to G Street in midsummer. The company planned to operate them in a loop on the two streets between 6<sup>th</sup> and 15<sup>th</sup> Streets. The fare was 5 cents.

Downtown Progress's plan called for F and G Streets to be predominantly for pedestrians and minibuses. Parking garages would be built on E and H Streets to accommodate the vehicles that would no longer be permitted on F and G Streets. The sizable passageways or arcades between F and G Streets would provide easier access for shoppers. Downtown Progress saw the pedestrian zone as a demonstration for full-scale implementation of the idea in other parts of the city. Expansion was dependent on construction of subway lines along F and 12<sup>th</sup> Streets, construction of the Center Leg Freeway along 3<sup>rd</sup> Street, adoption of one-way streets, provision of underpasses for streets in the downtown core at 6<sup>th</sup>, 9<sup>th</sup>, 14<sup>th</sup>, and 13<sup>th</sup> Streets, and tunnels for truck deliveries to F and G Street stores.

In the organization's third annual meeting at the Statler Hilton Hotel on January 31, 1963, Executive Director Knox Banner said "the key requirement" for further elements of the plan was congressional action to declare the downtown core an urban renewal area:

Only under an urban renewal plan will it be possible to construct the public improvements, to accomplish the needed zoning changes and to provide positive guides for the co-ordination of public action and for the development of private property that will be required to accomplish the revitalization of downtown.

According to Gutheim and Lee, the plan was more descriptive than effective:

Although no direct result can be ascribed to the action plan, it consolidated many recommendations and observations of the early 1960s and described the downtown at the time: a place with waning businesses, declining property values, and a poor appearance. The action plan also made the case for designating the downtown an urban renewal area so that public powers could bring about land acquisition and clearance.

[Lewis, Robert J., "Plans Drafted To Modernize Business Area," and Gimble, Gilbert, "One-Way Street Plans To Get Prompt Action," *The Evening Star*, January 25, 1962; Lewis, Robert J., "Minibus Test Begins Change for Downtown," *The Evening Star*, January 31, 1963; Gutheim and Lee, pages 293-294]

On January 31, Miss May Craig, a reporter known for asking tough and oddball questions at presidential press conferences since the early days of President Franklin D. Roosevelt, asked President Kennedy:

Mr. President, visitors who go out to visit Lincoln Park on East Capitol Street are dismayed to find it a slum. Congress has authorized and the National Council of Negro Women will erect there a memorial stadium and a statue of the great woman educator, Mary Bethune. Now the transit company [sic] proposes to put an eight lane freeway between the park and the Capitol, cutting it off. Could you inquire into that, and see if the freeway could be put further out beyond the park?

President Kennedy replied, "Yes, I will," with the transcript noting: "[Laughter]." He added, "You're very gentle today, Mrs. Craig."

The President's aides asked the District Highway Department for information on the issue. The District provided the information comparing the costs and impacts on homes of the three East Leg routes that had been studied. The chosen route was the least costly and disruptive of the three. ["White House Gets Loop East Leg Data," *The Evening Star*, February 21, 1962]

Miss Craig's question also prompted the Capitol Hill Community Council to follow up with a letter to the President opposing the planned location of the East Leg, which would eliminate Lincoln Park. In addition, J. Richard Earle, the president of the Capitol Hill Southeast Citizens Association sent a telegram to the President on February 23 asking him to turn down the East Leg route proposed by the District commissioners. No decision, Earle said, should be made before NCTA releases its report. The chosen Eleventh Street route "fails to provide for the convenience of patrons and relief of heavy street traffic" from motorists using the National Guard Armory, D.C. Stadium, and the roads to Annapolis and Baltimore. The route should be moved east to service these facilities and freeways. ["Capitol Group Hits Road Plan," *The Evening Star*, February 22, 1962; "Kennedy Receives East Leg Route Citizen Protest," *The Evening Star*, February 23, 1962]

On March 13, those two associations met with three others to unite in opposition to the East Leg of the Inner Loop. Their initial goal was to delay planning, right-of-way acquisition, and construction of the East Leg, including interchange "C," until NCTA released its report. The *Star* reported:

Last night's discussion brought out agreement on the need for an Inner Loop system, but the proposed Eleventh street route was unanimously rejected. A majority felt a route along the Anacostia River to the East Capitol Street Bridge would cause less tax loss, property depreciation and rehousing difficulty. However, the group decided not to seek a specific route now.

The Public Interest Civic Association, the Dupont Circle Citizens Association, and the Southeast Kiwanis Club also joined the fight. ["Inner Loop Route Opposed by Citizen Delegates," *The Evening Star*, March 14, 1962]

District highway officials reached out to the groups to counter the criticism of the East Leg routing. On March 13, Lloyd A. Rivard, assistant chief engineer for planning and programs, addressed the Southeast Business's Association and Southeast Council of Citizens Association. The East Leg, he said, would be depressed 20 feet for much of its length. "This will minimize noise and unsightliness." He added that the highway system would "benefit everyone in the D.C. area."

On March 21, General Clarke went to St. Luke's Church to address 300 Capitol Hill residents, mostly members of the Capitol Hill Community Council. The *Star* described his presentation:

Brandishing a pointer at charts of the loop, the Commissioner indicated a black line stretching between Tenth and Eleventh streets, seven blocks from where he stood.

"This area is comprised of property which has less value historically and financially than the alternate nineteenth street route."

He added, "It's cheaper":

Gen. Clarke outlined the history of the plans for the loop, showing color slides of property on the Eleventh and Nineteenth street locations. The slides, said Gen. Clarke, were shown to the Commissioners as evidence to support the property value theory which in part influenced their decision.

The Commissioner faced an hour-long question period in which citizens claimed that the current trend of restoration on Capitol Hill, if allowed to continue eastward, would increase general property value in the neighborhood.

Residents had been encouraged by the White House review that Miss Craig's question to President Kennedy had prompted:

The President directed an inquiry, but a letter from the White House to the council read to the group last night, indorsed the Commissioners' plans for the east leg. ["East Leg Held Not Disruptive," *The Evening Star*, March 14, 1962; "Hill Community Hears Clarke Defend East Leg," *The Evening Star*, March 22, 1962]

General Clarke did not convince the Capitol Hill Community Council. On April 2, its president, Paul Beatley, asked the Public Interest Civic Group to join its efforts to shift the route of the East

Leg. He told the group that only a concerted effort could stop the planned path. The group accepted the invitation unanimously. ["United Effort On Loop Advised," *The Evening Star*, April 3, 1962]

The Committee of 100 on the Federal City continued its opposition on April 25, again urging NCPC to reject acceleration of construction plans for I-266 (the Potomac River Freeway including the Three Sisters Bridge) and I-95, "which would include the East Leg of the Inner Loop and the Northeast Freeway [extending] from the proposed Interchange 'C' at the foot of Eleventh street N.E. north through the eastern part of the city and provide a third route to Baltimore." The plans were, the committee stated, "completely premature." ["Committee of 100 Hits Expressways Speedup," *The Evening Star*, April 26, 1962]

As the House District Appropriations Subcommittee prepared to open three days of hearings on the District highway budget on May 22, District officials received an advance warning about what to expect. Representative Frank W. Burke (D-Ky.) inserted a 30-minute colloquy into the *Congressional Record* on May 21 with Representative Basil L. Whitener (D-NC), a lawyer from Gastonia and a State legislator who had been elected to the House in 1956. According to Schrag:

He was a freeway skeptic, having represented law clients displaced by highway construction. Moreover, his administrative assistant was a train buff who urged his boss to support rail transit. [Schrag, page 48]

Representative Burke was a member of the District Committee's Subcommittee on Traffic, Streets, and Highways, of which Representative Whitener was chairman. "At this moment," Representative Burke said, "proposals are pending in the Congress which will determine the future of the Capital City for generations." He wanted to take this time "to make abundantly clear exactly what is involved" in the District commissioners' request for financing of highway construction.

He summarized the District's highway proposals. In January 1961, the commissioners asked for \$9.8 million for highway expenditures in FY 1963, to match \$13 million in Federal-aid highway funds for a total expenditure of \$22.8 million. In January 1962, the commissioners asked for \$10,723,000 of District funds to combine with Federal-aid highway funds for a total of \$64,758,000 for 1963. "The striking fact" is that in 12 months, the District commissioners had increased their request for 1963 by nearly \$23 million, "and the important factor to note about this frantic effort is that a similar increase is proposed for each of the next 5 fiscal years." He added, "There is a great deal more involved here than expenditures of large sums of money."

As Representative Burke began discussing NCTA's legislative mandate, Chairman Whitener asked him to yield. He recognized that Representative Burke was "sounding a warning here about a matter which can have serious repercussions in the District of Columbia," especially in view of the "many unresolved issues with reference to the mass transportation policies which we shall follow in the future." From discussions with NCTA, Chairman Whitener understood "they are ambitious to have a program which will move great masses of people with great speed in and out of the District of Columbia." Details were yet to be worked out:

It seems to me, however, that until we have a fixed policy established as to what mass transportation steps will be taken, it is rather difficult for anyone to project his mind into the future and determine just how many of these expressways or superhighways, which swallow up so much valuable taxable property and displace so many people, should be adopted as a policy with reference to vehicular traffic.

Representative Burke agreed. With NCTA not scheduled to report on the balance of transit and highway needs and present a mass transit program until November, "I think the gentleman has put his finger right on the key matter involved here in this greatly accelerated proposal for highway construction."

Chairman Whitener said:

I think it is no secret that the chairman of our committee has suggested to the subcommittee that within the next few weeks we commence a study of the street and highway problem here in the District. No one can seriously question that some changes and some improvements need to be made.

He was not taking a position on whether Congress should stand completely by, but rather urging that Congress make haste "with judgment and with discretion." Proceeding in the haste of the District commissioners and other governing authorities in the city might lead to "things which would not be in the best interests of the public and things which we would hope [the city] would not do which would prove to be inordinately expensive and not bring about the results which we all, I am sure, join with the Commissioners in hoping they will bring about."

Returning to congressional intent with NCTA, Representative Burke explained that Congress "stated that an improved transportation system for the National Capital requires, with planning on a regional basis, a unified system of freeways, parkways, express transit service, and other major transportation facilities." Implicit in this mandate was that "additional highways should be built in accordance with a program which would allow the National Capital Transportation Agency to perform effectively the job which Congress gave it":

Under the accelerated highway program which would be undertaken if the Congress approves the current District budget request, construction would very likely make obsolete the November report of the National Capital Transportation Agency even before it is completed.

The request for interchange "C" was an example. The District requested \$3.2 million to begin construction in 1963:

Once this key interchange is committed, the whole interloop pattern is established to a degree which would be beyond reasonable adaptation no matter what might be discovered by virtue of the transit study which the law requires be delivered to Congress in less than 6 months. To take 40 acres of completely urban, intensely developed, densely occupied land in southeast Washington at this time is a step which should not be taken until everyone is completely certain that it is a proper step.

The result would be the displacement of large numbers of families and loss of valuable properties from the tax rolls – all so interchange “C” can “be built ahead of its originally proposed date for suggested reasons which are wholly inadequate.”

Displacement of people was a serious problem:

Those who have been forced from their homes by highway construction, by the construction of public buildings and by urban renewal programs present one of local government’s most vexing problems, and yet in a pell mell rush to accelerate the highway program[,] multiplication of the problem of relocation is obviously done for no adequate reason.

He emphasized that he was not opposed to the District’s highway program; he was saying only that “the proposed acceleration which would be brought about by the budget requests is poorly timed and extremely unwise.” He cited the expressways to be built just west of the Capitol grounds and between the Tidal Basin and the Washington Monument:

It may be necessary to build every one of these roads; it may be necessary to displace the additional thousands of families who would be involved; it may be necessary to remove these millions and millions of dollars worth of property from the tax rolls; it may be necessary to surround and bisect the very heart of Washington with highways, but it is not necessary to commit the District government to these specific plans from which deviation would be almost impossible, in advance of the submission to the Congress of the report of the National Capital Transportation Agency next November. One is tempted to say to the Commissioners, “What’s the big hurry?”

When the District’s budget for 1963 was considered, the Members of the House should understand that the proposed acceleration of highway expenditures involved “obviously the tying down of future major roads.” Not approving the accelerated funding would allow “full benefit to be taken of “NCTA’s report “so that all of the planning for every means of moving persons and goods in the District be used to its fullest benefit.” [Governing the District of Columbia, *Congressional Record-House*, May 21, 1962, pages 8836-8828]

## **The Switch**

On May 22, the District Appropriations Subcommittee, headed by Representative William H. Natcher (D-Ky.), began public hearings on the full range of the District budget. On this first day, however, most of the 33 witnesses addressed the freeway debate. Subcommittee members did not reveal their views or even question the witnesses. The *Star* summarized the witnesses, such as:

F. Joseph Donohue, Citizens Traffic Board—If the program for freeways is destroyed it will destroy the core of the city. Don’t slow it down.

Peter Glickert, Capitol Hill Southeast Citizens Association—Traffic problems have been created by poor planning. The east leg of the Inner Loop should be placed on the west bank of the Anacostia River.

Eugene I. Kane, D.C. Trucking Association—Expeditious construction of the proposed freeway system in the District is essential to the continued growth and development of the Metropolitan Area, and most important to the preservation of the downtown section of the city.

Arthur E. Miller, American Automobile Association—Both freeways and subways are needed. But I cannot stress too strongly the importance of completing the Inner Loop without any period of delay.

Mrs. Harold Hinton, Georgetown Progressive Citizens Association—The Three Sisters Bridge should not be built. It would only serve to draw more traffic into Georgetown and we've got all we can take now.

Peter S. Craig, Northwest Committee for Transportation—We support the city-wide revolt against the hasty construction of freeways. Recommendations by NCTA should be awaited. By moving ahead, tax revenues for schools and public welfare will be diverted.

James H. Flanagan, Vice President, D.C. Transit—Highway plans should be approved. Rapid bus service over freeways is a prime requisite if more people are to be persuaded to leave their automobiles at home and use transit.

Among the divided voices, the *Star's* Lee Flor highlighted two first-day witnesses. One was Mrs. Polly Shackleton, a member of the executive committee of the Democratic Central Committee. During testimony on May 23, she made clear to the District Appropriations Subcommittee that her group was not simply waiting for a balanced system:

Not only are we deeply concerned about the overall dollar cost—which is way out of proportion to the funds proposed for the education, welfare, recreational, and health needs of the District—but we are shocked by the inhumanity and utter ruthlessness of this highway program.

Because of the impact on displacees, she urged the subcommittee not to fund five projects:

1. Interchange "C"
2. Potomac River Freeway
3. Three Sisters Bridge
4. Northeast Freeway
5. East Leg, Inner Loop Freeway

She added:

I do wish to make clear that we are not opposing these expenditures because we are against progress, or, as has been bruited about, that philosophically we just are 'agin highways."

Clearly a solution must be found for the area's transportation problems. "Certainly this is what Congress had in mind when it created the National Capital Transportation Agency and directed it to establish and coordinate a balanced transportation program." In defiance of this congressional intent, the District proposed to accelerate these projects. She speculated that "one of the tricks of the trade when massive long-range highway programs are projected is for the roadbuilders to get

certain key elements such as interchanges and bridges into place as quickly as possible, thereby committing [sic] irrevocably the overall program.” But whatever the motivation, she said:

I think there is far too much at stake, in human terms, to assume at this juncture that the Highway Department’s solution to the area’s transportation problems is correct, much less that it is the only solution.

If the Highway Department was correct, why did Congress go to the trouble of creating NCTA; was it “a useless gesture”?

Although NCTA was not going to report until November, NCTA had already publicly opposed the Three Sisters Bridge and interchange “C.” In a statement on November 9, 1961, to NCPC, NCTA said, “delay of these two projects is absolutely essential if any serious reevaluation is to be made of the 1959 transportation plan.”

Mrs. Shackleton applied the same reasoning to the Potomac River Freeway, which was so closely linked to the Three Sisters Bridge. The District Highway Department, she said, was “quite responsive to the assumed needs of automobiles,” but exhibited “no concern over the effects of its program on one of the Nation’s Capital [sic] most compelling human needs—the need for decent, safe, and sanitary housing for its residents.” At a time when housing for low-income families was “at crisis stage,” the District already planned to evict 90 families from the Ellen Wilson public housing project to make way for the Southeast Expressway. It was too late to stop that project, but not too late to delay the East Leg and Northeast Freeway.

She said the District had not revealed how many people would be displaced by the East Leg, but the Washington Urban League’s block-by-block analysis based on the 1960 census reveals that the East Leg and Northeast Freeway would displace about 10,680 people. “Where will these people go to find decent and sanitary housing in the District of Columbia?” [District of Columbia Appropriation Bill, 1963, Committee on Appropriations, U.S. House of Representatives, 87<sup>th</sup> Congress, 2d Session, Report No. 1906, June 22, 1962, pages 1325-1328]

Flor also cited Harland Bartholomew, once again primarily an urban consultant. He said that postponing the freeway projects until NCTA reports its findings in November would be “the height of absurdity.” He did not believe NCTA would devise a radically new plan, and any differences between that plan and the Mass Transportation Survey’s plan could easily be settled.

The District, Bartholomew added, should take advantage of the additional appropriations Congress had authorized for the Interstate System. L’Enfant’s 1800 street plan stands as a monument, but must be updated to meet modern needs. Doing so would inevitably disrupt some aesthetic values, families, and businesses, but good design can enhance appearances and relocation initiatives can help families and businesses. He added that the Inner Loop will not be the disruptive force its critics claim. [District of Columbia Appropriation Bill, 1963, pages 1385-1389; “House D.C. Unit to Explore Potential of 1-Way Streets,” *The Evening Star*, May 23, 1962; Flor, Lee, “Debate on D.C. Roads Flares at Budget Airing,” *The Evening Star*, May 23, 1962]

During the evening public hearing on May 23, citizens offered views on a variety of subjects. A few speakers addressed the freeway program, with most supportive, while a few urged delay.

However, the big freeway news was a shocking reversal reported on May 24 on page one of the *Star* and on page one of the *Post* on May 25. The District's Board of Commissioners had attended a closed session of the Appropriations subcommittee on May 21 to discuss the 1963 budget. Reporters saw General Clarke arrive carrying rolled highway maps he planned to use to defend the 11<sup>th</sup> Street routing of the East Leg.

As reported on May 24 based on an anonymous subcommittee source, Commissioner Tobriner told the District Appropriations Subcommittee that he had changed his mind. He now wanted to halt plans to build the East Leg of the Inner Loop in the 11<sup>th</sup> Street corridor. He wanted to shift the freeway to a location west of the Anacostia River. Such a shift would require major rethinking on the design of interchange "C," which the *Post* called "the massive interchange which would be the capstone of the Inner Loop."

The following excerpts of the discussion, released in June, is from the three District commissioners' testimony before Chairman Natcher and Representative John J. Rhodes (D-Az.):

Commissioner Tobriner: I do feel that some pause ought to be given to the location of the east leg. Of two routes considered, the Eleventh street route is the best. There is a third choice which would dislocate fewer families. This would go along the [Anacostia] parkway, past the stadium, into the Arboretum and back to the other line of the Inner Loop.

Chairman Natcher: Do you want the \$546,700 for interchange "C" and \$170,000 for the east leg held in abeyance?

Tobriner: I would have to say so, sir.

Representative Rhodes (R-Az.): How many families will be displaced by the two projects?

General Clarke: About 350 families

Tobriner: That is only part.

General Clarke: Mr. Tobriner speaks, of course, as only one member of the Board of Commissioners.

Tobriner: The possibility that the National Capital Housing Authority will catch up with the dislocatees is very remote.

General Clarke: Very frankly, we are talking of a three-year delay as a minimum in the highway program, with much disadvantage to our neighboring States who are building to meet us at the District line. While Mr. Tobriner has discussed his concern about the displaced families with me, I must admit I am caught by surprise by his recommendation that we abandon the program completely.

Commissioner John B. Duncan: Being unprepared, the only thing I could ask at this time is an opportunity to think it through further and submit a statement for the record.

He later informed the subcommittee, "After giving this matter a great deal of thought, I agree with Mr. Tobriner":

Representative Rhodes: To clarify the disagreement, is Mr. Tobriner opposed to interchange "C." [sic]

Tobriner: No. I am in favor of a redesign so it will be a T-shape interchange. The original interchange would take about 38 acres, and the redesign about 22 acres.

Representative Rhodes: Mr. Tobriner, this makes me wonder what you are for. I know what you are against. Tell us what you are for.

Tobriner: I am for a redesign of interchange "C" and the running of the east leg up the parkway along the Anacostia River.

Representative Rhodes: Mr. Duncan, what is your stand?

Duncan: I do not look toward discontinuing a total highway program which we all have believed is a good program. There should be a temporary delay while a restudy goes on.

Representative Rhodes: How long has the Inner Loop been under study?

Director Aitken: The Inner Loop study was released in 1959.

Representative Rhodes: Mr. Tobriner, are you in favor of the center leg of the Inner Loop?

Tobriner: Deep down in my heart, I am considering the possibility of abandoning the center leg.

Later, Representative Rhodes asked when the budget proposal was prepared:

Duncan: In November.

Representative Rhodes: I guess all three of you supported the budget.

Tobriner: We did.

Representative Rhodes: Have those people just recently moved in there?

Tobriner: No, sir. I was not aware of the extent of the dislocation last November.

Representative Rhodes: Is your change in position political?

Tobriner: No. It is the greater part of my duty to reflect the opinion of a substantial and respected part of the population of the city.

Representative Rhodes: This plan was prepared in 1959. The opposition should have known the routes. You should have known, Mr. Tobriner. I think you have lived here all your life. You should have known the number of people in the area. I, for one, do not appreciate having the problem shifted to the shoulders of the committee at this late hour.

The action was not called for. We are entitled to feel, when a budget is submitted to us the budget is final as far as the Commissioners are concerned. [District of Columbia Appropriation Bill, 1963, pages 1081-1144]

This reversal was especially shocking since the Board of Commissioners had endorsed the 11<sup>th</sup> Street corridor for the East Leg many times. The commissioners requested funds for the corridor in their January budget request for 1963, defended it in public comments ever since, and had endorsed the routing as recently as April 18 in a letter to the White House. The letter stated that the Anacostia River location would take the freeway through park lands, adding, "you must be aware of how carefully the National Park Service guards against encroachment, especially by highways." As a result, the city was not likely to secure NPS approval to build the East Leg along the river.

This surprise was, the source said, the first time in recent years that the commissioners had not presented a united front on any issue before the subcommittee.

Because Tobriner apparently had not discussed his reversal with the two other commissioners before the closed session, the subcommittee asked the commissioners to report back on their formal position on the matter. [“District Heads Ask Delay in Loop East Leg,” *The Evening News*, May 24, 1962; Eastman, Sam, “‘East Leg’ Freeway Facing Long Delay,” *The Evening Star*, May 25, 1962; “Why the Switch?” *The Evening Star*, May 25, 1962; Stern, Laurence, “Commissioners Split by 2-1 to Scrap 11<sup>th</sup> st. Route for Inner Loop East Leg,” *The Washington Post and Times Herald*, May 25, 1962; Flor, Lee, “House Unit Shuns Key Role In D.C. Road Controversy,” *The Evening Star*, June 13, 1962]

The editors of the *Star* were among the many people surprised by the turnabout. The same edition carrying the article about Commissioner Tobriner’s change of heart contained an editorial, “Attack on Highways,” written before the editors knew of the change. The editors warned readers:

There should be no misunderstanding about the intentions of those who are asking the House District Appropriations Subcommittee for a “delay” in the District freeway program. Their true goal is not to seek a brief postponement, but for a variety of reasons to scuttle as many as possible of the major radial and circumferential freeways which are essential—along with an effective system of rapid transit—to the growth and well-being of the Washington community.

The attacks were not new. The District commissioners had heard them all before and “wisely rejected” them. The criticism about the lack of funds to assist those who must be relocated was valid:

Fortunately, this conclusion has been reached by the Commissioners, who on April 14 ordered the development of a central relocation service. Since these expenditures are legitimately a part of the cost of highways, they should be borne in part by Federal highway aid funds, as President Kennedy has proposed for the Nation as a whole, and as already is provided by law for urban renewal.

Other than that, delaying the East Leg pending the NCTA report was not acceptable:

There is nothing on the record to suggest that the rapid-transit proposals to be submitted to Congress in November will affect the need for the inner loop. On the other hand, a delay in those portions of the inner loop which have come under such strong attack, including the so-called “Interchange C” in Southeast Washington, would disrupt the entire program of freeways. Of course the opponents of major highway construction in Washington know this. That is why they have selected their targets so carefully. [“Attack on Highways,” *The Evening Star*, May 24, 1962]

The next day, the editors reacted to the news of the two commissioners’ switch. In “Why The Switch?” the editors called the reversal “astonishing in view of their record with respect to this

project . . . especially in the case of Mr. Tobriner.” The issues today, the editors pointed out, “are the same as those that existed” at every point where they endorsed the location of the East Leg. The editorial asked: “What led Mr. Tobriner last Monday, without consulting his fellow Commissioners, to suddenly ask the House District Appropriations Subcommittee to kill the project?”

In view of Mr. Tobriner’s sudden concern about displacees, “we think the better course would have been to accept the appropriation, and simultaneously to make its expenditure dependent on development of an effective relocation program . . . .” As for the Anacostia River location, the fact that the route would be located almost entirely on park land raised real concerns about its prospects:

It is all very well to say that Congress by law could make these parks available for the freeway. But in view of the park-highway controversies of the past, we will be convinced that such a route is available when the legislation is signed and sealed—not before. [“Why the Switch?” *The Evening Star*, May 25, 1962]

The equally surprised *Post* editors called their editorial “An Error Compounded.” The decision was a “serious setback” that would delay the East Leg for “many years.” Although the plight of displaced families was the basic objection to the 11<sup>th</sup> Street routing, the change of position “does nothing to provide new houses for the families to be evicted by the hundreds.” District highway officials had “shown disregard” for these families, but “it is not the Highway Department that will suffer the consequences of further delay and indecision in the completion of a badly needed highway. The penalty will be inflicted upon the economic and cultural health of the city.”

While the 11<sup>th</sup> Street routing would displace about 930 houses, an Anacostia River routing would displace about 500 houses. The city’s public housing agency already had 8,000 families on its waiting list, suggesting the city would be able to make no provision for housing highway displacees, regardless of the final routing. “If this city wants to build roads, it is going to have to build houses.”

Further, the Anacostia River route should be “hastily abandoned” because it “constitutes a massive intrusion on park land”:

It must be observed that the Commissioners, who decline to run highways through a prosperous neighborhood park, like Glover-Archbold, seem distressingly ready to lay concrete through the parks available to the poor of eastern Washington.

The proper course of action for Congress was to provide regular appropriations for the East Leg, “but with the addition of a statutory requirement that no house may be taken until its inhabitants have been decently relocation, and their moving expenses paid, by the District. [“An Error Compounded,” *The Washington Post and Times Herald*, May 26, 1962]

City highway officials estimated that the Board of Commissioners’ decision would put plans back by 3 to 5 years before construction of the East Leg could begin. The engineering study the commissioners requested for the Anacostia River route was only one step in the process. They

would have to hold a public hearing and secure approval from NCPC, BPR, and NPS. They also might have to secure congressional action to overcome NPS reluctance to grant right-of-way through park land for the freeway. [Eastman, Sam, “‘East Leg’ Freeway Facing Long Delay,” *The Evening Star*, May 25, 1962]

On May 28, the *Star*’s editors were still looking for answers. The editorial pointed out that private citizens who oppose a project often propose an alternative, although usually without providing information to support the feasibility of the suggested location. “But for a District Commissioner to follow this procedure, as Walter Tobriner has done in the case of the east leg of the inner loop freeway, is unusual indeed.” He apparently conceded that legislation would be needed to overcome NPS reluctance to allow access to park land. Any assumption that such legislation could be obtained without the concurrence and support of NPS was “questionable”:

Anyone remotely familiar with the history of highway disputes in the Nation’s Capital can attest to the traditional opposition of the Park Service to highway encroachment, and, for the most part, to the success of these positions.

Thus far, “we have been aware of no shouts of joy from the Interior Department at the prospect of an eight-lane freeway . . . coursing through the west-side parks of the Anacostia.”

The editors recommended that the Appropriations Subcommittee order the commissioners to present “firm evidence” that the river route could use park lands “without objection from park officials” and would meet Interstate standards. This evidence would be “essential . . . if the subcommittee has any thought of sustaining the Tobriner position.”

As for the concern about displaced families, previous studies of the river route found that about 60 [sic] families would be displaced if the Anacostia River routing were chosen. Thus, “the District government would have to develop precisely the same kind of relocation machinery to assist these displacees as it would to help those on the Eleventh street route.” The subcommittee should appropriate the funds requested in January for the 11<sup>th</sup> Street route of the East Leg, but condition it on a program of “adequate relocation procedures before any families are displaced.” The editorial concluded, “Fortunately, such a program is now in the process of development.” [“More Facts, Please,” *The Evening Star*, May 28, 1962]

(On May 25, Chloethiel Woodard Smith (“the city’s foremost redevelopment architect”) called for demolition of the Whitehurst Freeway as the “necessary key to renewal of the Georgetown waterfront.” Her proposal was in a plan the Georgetown Canal and Riverside Council submitted to NCPC seeking renewal of the area. The council’s report called the Whitehurst Freeway an “enormous obstacle” and “unattractive.” Smith also rejected the suggested four-lane addition to the elevated freeway. The report said that “Efforts to live with this major scar . . . are misguided.” Further, efforts to “minimize its impact” would be ineffectual or cost far more than demolition of the existing freeway:

An elevated 8-lane structure will eat up at least a tenth of the Georgetown waterfront area and will blight at least twice that amount.

She added, “There is no use talking about urban renewal of Georgetown’s waterfront so long as this obsolete elevated structure remains to blight the area permanently.” [Lewis, Robert J., “Georgetown Unit Asks Razing of Whitehurst,” *The Evening Star*, May 25, 1962]

As might be expected, the groups opposing the East Leg were pleased by the Board of Commissioners’ reversal. One of them was the Democratic Central Committee, which supported transit over freeways. Joseph L. Rauh, Jr., the committee’s vice chairman, said, “We’re delighted. Our position has been that the entire acceleration of the District Road program should be held up until we get the mass transit report. Then the two programs can be made to work together.”

He made clear that the Democratic Central Committee also opposed the Anacostia River route for the East Leg:

We fought the freeway for Glover-Archbald [sic] Park, and will fight harder against a freeway through Anacostia Park.

The neighborhood around Glover-Archbald [sic] is a high-income area. It’s much more important to preserve Anacostia Park for its low-income neighborhood.

NPS Director Wirth did not want to say whether he would oppose or support use of the park land. He said, “Sound planning requires looking at any proposal.” But he added:

I don’t see how they can get it through the John Philip Sousa bridge area, or by the Stadium and parking lot. Maybe they’ll put it on pontoons and float it up the river. [“Anacostia Park Route Opposed for Inner Loop,” *The Evening Star*, May 26, 1962]

Commissioner Tobriner relented in his opposition to the extent of saying that if safe, sanitary, and decent housing could be found for displaced families, he would join with General Clarke in approving interchange “C” and the routing of the East Leg in the 11<sup>th</sup> Street corridor, SE. On May 29, Tobriner and General Clarke met with Walter Washington, executive director of the National Capital Housing Authority. They learned that finding homes in the city for displaced families was not going to be easy. They said they were working on meshing highway construction with public housing availability, as well as “finding new sites for public housing.” They also wanted to encourage private enterprise to supply housing for low-income families.

They could not say when the highway projects might be resumed, but the *Star* reported on a report by the District Department of General Administration that shed light on the difficulties of coordinating highways and housing:

The report states that there is a waiting list of around 8,000 families for public housing. Around 515 of these families have first priority for vacancies because they have been displaced by Government action. The critical need is for three, four and five bedroom units. The rate of placement and waiting time for public housing for some of these high priority families is five years or more.

The report then states that an additional 10,611 families will be displaced by Government action in the next five years. [Flor, Lee, "D.C. Seeks to Dovetail Housing and Highways," *The Evening Star*, May 29, 1962]

On June 5 and 6, Chairman Whitener's House District subcommittee held hearings on the highway program. The subcommittee included Representatives Burke, Broyhill, and Charles McC. Mathias (R-Md.). (The fifth member, Representative Fernand J. St. Germain (D-RI), did not attend the hearings.)

Edwin Seeger, NCTA's general counsel, and Director Aitken were among the witnesses on June 5. Seeger asked the committee to delay Interstate projects until NCTA released its report in November. As an example of how the analysis might change since the Mass Transportation Survey, he pointed out that the 1959 recommendations had not considered maintenance costs or tax losses from highway construction. NCTA was working on a comparison of these costs for highways and transit.

With the recent acceleration of highway plans in the District, NCTA could not be sure which decisions were final. However, he estimated that highways would remove 400 of the 2,000 acres currently on the District's tax rolls, while the subway, being underground, would not remove any property. Highway maintenance would cost between \$2 and \$3 million a year, but the subway would be able to pay for maintenance from farebox receipts. He added, in response to a question from Chairman Whitener, that NCTA believed the rapid transit system could pay for its construction costs from fare revenue over a 50-year period.

Representative Broyhill told Seeger that his comments on the role of NCTA on highway development were inaccurate. Congress, Broyhill said, had spent \$500,000 for the Mass Transportation Survey, then passed a law to develop the mass transit program. NCTA's role was not to rethink the highway program.

Aitken quoted from the National Capital Transportation Act of 1960 to show that NCTA was not responsible for highway planning or development. The 1960 Act was focused on creation of a Transit Development Program and, as noted earlier, language extending its mandate to planning freeways had been dropped from Senator Bible's early version of the legislation. It now stated, Aitken reminded the subcommittee, that in planning the Transit Development Program, NCTA could acquire or construct transit facilities, including right-of-way for joint use with freeways:

The Agency may contribute funds for the acquisition of rights-of-way for, and the construction of limited amounts of freeway, parkway, and other arterial highway facilities, including construction incidental to the use and protection of such rights-of-way for transit facilities, to the government agencies having jurisdiction thereof if, in the opinion of the Agency, such contributions are necessary to the fulfillment of the objectives of this Act . . . .

The legislation also stated:

The responsibility and authority for location, design, construction, and operation of freeways, parkways, and other arterial highway facilities shall remain with the government agencies having jurisdiction thereof, but all Federal agencies' plans for location and design of highway facilities shall be forwarded to the Agency, and all State and local agencies' plans for location and design of highway facilities may be requested by the Agency for its review and comment. The Agency shall cooperate with all planning agencies of the National Capital region and the appropriate government transportation regulatory agencies including the Washington Metropolitan Area Transit Commission in the development of transportation facilities and, wherever feasible and desirable, develop joint plans for such agencies.

Aitken said his staff was refining traffic forecasts, but that NCTA staff had made some "assumptions" that might require minor changes in the 1959 plan. "The nub of the new assumptions do [sic] not require any major changes in the recommendations for highways."

He also addressed the claim that the District was accelerating the freeway program to get construction underway before the NCTA report. To complete the Interstate program on schedule, Congress had recently increased authorizations for Interstate construction, along with an increase in the excise tax on gas. The District's budget recommendations reflected the increased funds. ["Officials Trade Transit Arguments At Congressional Hearing on D.C.," *The Evening Star*, June 5, 1962]

On the second day of hearings, General Clarke discussed opponents of the highway program. Some wanted a delay until NCTA released its report in November while others wanted to delay the freeway program until the subway was in operation in the 1970s. "It will take a long time for rapid transit plans to be approved by all the reviewing agencies and by Congress."

The relocation problem came down to moving an average of 700 families a year between 1962 and 1974. Of these, about 350 families will need relocation assistance and of these, about 240 will need public housing. By keeping the problem in perspective, the city can solve it.

General Clarke also addressed the allegation about speeding up the program. Like Aitken the day before, General Clarke said the District was using the increased congressional authorizations to make up for earlier delays. The District's program was far behind the States, he said, and the city was trying to do what Congress indicated it wanted done when it increased Interstate funding.

Chairman Whitener said that delaying freeway work until November was "a very definite possibility." He explained that, "What worries me is what do you do with 28,000 people displaced by these highways." He added that, "We may try some gentle persuasion after talking with the House District Appropriations subcommittee, to hold up the projects." [Flor, Lee, "Road Jobs Delay By Congress Seen Definite Possibility," *The Evening Star*, June 6, 1962]

Chairman Whitener wrote to NCPC on June 12 to request clarification of its position on the Inner Loop, particularly regarding the availability of housing for families displaced by the project. On

June 14, after what the *Star*'s Robert J. Lewis called "a two-hour wrangle," NCPC unanimously adopted a resolution:

Every action we take necessarily has an impact on people, and when we are asked to approve a plan that will displace thousands of people from their homes, we must be sure that our decision is taken only after we have had an opportunity to examine alternatives to the solution of the transportation.

NCPC, the resolution continued, had approved the Inner Loop "in principle," but not specific locations for its segments. In view of "changing conditions," namely the housing issue, NCPC decided more time was needed before completing review of the Inner Loop. In short, NCPC wanted to wait for NCTA's November report. At the same time, the resolution conceded that "the east and south legs of the inner loop would be needed whether the rest of the inner loop was constructed or not . . . ."

The resolution directed Mrs. Rowe to inform Chairman Whitener that NCPC "recognizes that its responsibilities for comprehensive planning transcend consideration of traffic projects and transportation alone, and require dedication to both definition and achieve of desirable goals for the Nation's Capital and residents."

According to the *Star*, the "anti-expressway members of the National Capital Planning Commission won a battle." [Lewis, Robert J., "Inner Loop Delay Urged by Planners," *The Evening Star*, June 14, 1962]

The *Star* editors described the resolution as "a masterpiece of gobbledygook," but at least it made clear that the East Leg was needed. Now, the editors suggested, if Chairman Whitener wanted to be constructive, he would help the city develop the relocation machinery needed before advancing the freeway. ["Chance to Help," *The Sunday Star*, June 17, 1962]

On June 22, the Committee on Appropriations approved a report on the District of Columbia Appropriation Bill, 1963. It covered, of course, many subjects, but in discussing the Inner Loop Highway System, the committee's annoyance came through stemming from the Board of Commissioners' reversal of position:

During the hearings the partisans of rapid transit and the proponents of the highway program used every political issue and every possible source of opposition to bring about confusion and disorder—all to the detriment of the Capital City. The rivalry between these two groups is dangerous to the future development of the city.

To add to the confusion, the National Capital Planning Commission decided recently that more time is needed before a final decision can be made on the Inner Loop highway system . . . .

During the hearings two of the [District] Commissioners requested that certain sections of the Inner Loop be held in abeyance at this time. This action of course was unexpected. Since the Committee is not a policymaking Committee, it does not intend to decide this issue at this time. However, to expedite this matter, following the report from the

National Capital Transportation Agency and the additional studies pertaining to routing and a proper removal of people displaced, if any, there will be an adequate amount in the [District] highway fund to solve this and other important problems which will confront the District highway officials in the near future.

Due to the indecision noted above, the Committee recommends the deletion of \$170,000 for the East Leg; \$450,000 for the Northeast Freeway, and \$546,700 for Interchange C.

The committee recognized the need for “every precaution” to be taken before freeway construction begins to protect people forced out of their homes.

Simply making the city more convenient for automobiles, as some critics charged, would be a mistake. “District officials must not place themselves in a position of being accused of attempting to handle traffic without any concern for the forces generating the traffic or for the manifold purposes that transportation, private and public, should serve.” Further, “Those who are opposed to highways and hope the temporary delay in the Inner Loop program will destroy the Freeway system should be disappointed.” The committee hoped that NCTA’s report in November “will assist in the solution of this problem.” [District of Columbia Appropriation Bill, 1963, pages 3-4]

Despite deleting funds for the East Leg, interchange “C,” and the Northeast Freeway, the Committee approved appropriations for the Three Sisters Bridge, the Potomac River Freeway, the Center Leg, the Southeast Freeway, and the 11<sup>th</sup> Street Bridge.

Commissioners Tobriner and Clarke issued a statement on deletion of funding for the East Leg-related projects. (Commissioner Duncan was on vacation.) They understood the committee to make two key points, namely that the NCTA report may help solve the problem and that Congress wanted adequate provision to be made for those displaced by freeway construction. If Congress did not pass the legislation under consideration for relocation help, the commissioners would continue “their efforts to provide legislation to furnish administrative machinery and moving allowances and to insure that adequate housing will be available for persons displaced.” These efforts would include a central relocation service and encouraging of private investment in low-income housing:

The commissioners feel confident that it will be possible to provide for these people while maintaining required progress in the highway system. [McKelway, John, “District Budget Cut \$9 million By House Unit,” *The Evening Star*, June 22, 1962]

### **Enter Chairman Natcher**

One of those concerned about the District’s freeway problems was Representative Natcher, who had become chairman of the Subcommittee on District of Columbia Appropriations, Committee on Appropriations, after the death of Chairman Louis C. Rabaut (D-Mi.) on November 12, 1961. While in Washington, he lived in the Berkshire Apartments at 4201 Massachusetts Avenue, NW.

Schrag described Chairman Natcher as “obsessive, stubborn, suspicious, and vain,” a former prosecutor “who grouched privately about left-wingers, beatniks, and the Warren Court.” One of his obsessions was his voting record:

Most famously, from his arrival in Washington in 1953, he never missed a single roll-call vote, eventually making it into the *Guinness Book of World Records* with 18,401 consecutive roll-call and quorum votes cast.

Representative Natcher, who had been born in Bowling Green in 1909, served in the House from August 1, 1953, until his death on March 29, 1994. He was buried in Bowling Green “with his voting card after serving more than forty years in the House.”

The chairman of the subcommittee was in “a position of essentially autocratic power.” This power was based in the constitutional requirement that all appropriations must originate in the House, but the District’s lack of congressional representation amplified the Natcher subcommittee’s power:

Natcher so dominated his subcommittee that it often dispensed with formal votes. The full appropriations committee rarely overturned decisions of a subcommittee, which was presumed to have the most expertise, and Natcher’s southern courtesy and loyalty to House norms made him popular throughout the House, further insulating him from fear of being overturned on the floor. A Natcher decision could be expected to stick, so without his approval, the District could not spend a dime.

He would play a critical role in the District’s freeway battles, but even opponents conceded he “was no stooge of the highway lobby.” He had initially opposed the Interstate System because he feared it “would give the Federal Government dictatorial control over roads in the States for all time to come,” and had voted against the House bill on its final day of consideration in 1955 on July 27. However, he had voted for the House version of the 1956 Act on April 27, 1956, when the bill passed 388-19. (The final version of the bill after conference with the Senate passed the House by voice vote).

He had a good reason beyond public policy for supporting highway construction in the District and elsewhere:

His popularity at home depended on his delivering tens of millions of dollars’ worth of river projects for Kentucky each year. He had gained that power by cultivating an alliance with the House Public Works Committee, the same committee that had ordered the freeways built. Any threat to that committee’s sovereignty challenged his own ability to provide for his constituents. [Schrag, pages 122-124]

On June 26, Chairman Natcher brought the District Appropriation Act, 1963, to the House floor. In discussing the Inner Loop plans, his introductory remarks went further than the committee report:

The rivalry between the partisans of rapid transit and the proponents of the highway program is dangerous to the future development of the city. The proposed freeway

system for the District is not a political issue and those who believe this to be the situation are in for a rude awakening. The confusion and disorder attempted by the pressure groups during the last few weeks will not accomplish the desired results.

The committee was concerned about the displaced families, an issue that must be addressed before the Commissioners can move forward with the highway system:

Again we most emphatically state that those who are opposed to highways and hope the temporary delay in the inner loop program will destroy the freeway system should be disappointed.

Representative Gross pointed out that the Jones Point Bridge was supposed to be a bypass for through traffic, but it had opened "and yet we find Independence Avenue still carrying the same truck traffic from New York and other points along the eastern seaboard on south, and no relief from the heavy traffic in Washington." (The Jones Point Bridge, renamed the Woodrow Wilson Memorial Bridge, opened on December 28, 1961) "What is wrong?"

Chairman Natcher had to concede that Independence Avenue had "two traffic jams" the past week. "As soon as this freeway system is resolved, I can say to the gentleman that that heavy traffic will come off Independence Avenue."

Perhaps, Representative Gross suggested, "somebody is fumbling the ball somewhere," and he wondered if the problem was that "they do not have the roads in Maryland in anticipation of which the bridge was built." Chairman Natcher replied, "I would certainly agree with my friend."

Regarding the Inner Loop system, Representative Rhodes told his colleagues that NCTA's study would be released in November, but that was not the only reason for withholding funds for the East Leg, Northeast Freeway, and interchange "C." The committee also was concerned about the displaced families. "We feel the interim period can be utilized by the legislative committee and by the District Commissioners in an attempt to provide legislation to take care of the burdens which will fall on those people whose lives will be dislocated as a result of the construction."

Representative William L. Springer (R-Il.) asked if the two legs of the Inner Loop were indefinitely put off. Representative Rhodes explained that the appropriations committee was not a policymaking committee. However, when two of the three commissioners who approved the budget request for the Inner Loop segments changed their mind, it "caused the red light to go on as far as we were concerned." The committee concluded that the best idea was to give "those who are engaged in the business of studying plans like this a chance to restudy the whole situation." He pointed out that routing the East Leg along the Anacostia River might save money and reduce dislocations "if the National Park Service will go along with it."

Representative Rhodes had one other topic he wanted to discuss even though the bill did not address it. Another problem that "has been rather conveniently swept under the table for the last few years" was the link between the Inner Loop and Montgomery County, Maryland:

The Wisconsin Ave. corridor has been well closed and locked by action of Congress. As far as I can tell, there have been no plans brought forth, and none contemplated, for connecting with the rather extensive system of roadways being built by the State of Maryland in Montgomery County.

He hoped that “this problem will be the subject of study, and that the District Commissioners and the Highway Department will address themselves to these problems in the very near future.”

(Representative Rhodes would have a personal interest in the issue; he lived at 5502 Pollard Road in Bethesda.)

The House approved the bill without a recorded vote. [District of Columbia Appropriation Bill, 1963, *Congressional Record-House*, June 26, 1962, pages 11721-11732]

As the District prepared to solicit for bids to begin construction of the Southeast Freeway (along Virginia Avenue from South Capitol Street to the start of the proposed interchange “C” at 7<sup>th</sup> Street, SE.), city officials were trying to find ways to accommodate the families that had received notices to move out of their homes by the end of September. A team of private real estate firms and social workers was searching for housing, especially for low-income families. The team was focused on large families because enough housing was available for small families. W. Donald Calomiris of William Calomiris Investment Corporation, chair of the committee, said, “If we put our heads together, we can find homes for those people.” The committee could postpone searching for homes for residents of the 68 units at the Ellen Wilson Housing project that were to be removed; they would not be touched for several years. [Flor, Lee, “Bids Open This Month on First Contract For \$13.3 Million Southeast Freeway,” *The Sunday Star*, July 1, 1962]

Senator Clifford P. Case (R-NJ), the ranking Republican on the Senate District Appropriations Subcommittee, was meeting with officials to examine transportation planning in preparation for the subcommittee’s hearings on the District budget. Senator Case, described by the *Star* as “a veteran of disputes over transportation issues in the New Jersey-New York City area,” wanted to ensure transportation planning was coordinated for the Washington area. Over the course of a week, he talked with General Clarke and Aitken. Separately, he met with Stolzenbach of NCTA and William Finley of NCPC.

After reviewing a draft of the NCTA report, he revealed that it called for elimination of two thirds of the Inner Loop. The segments were the East Leg, interchange “C,” the Northeast Freeway, and the Potomac River Freeway. It also indicated that the Three Sisters Bridge “may be unnecessary.” Stolzenbach, the previous November, had asked the District to postpone these projects until NCTA released its report.

General Clarke was surprised by the report of Stolzenbach’s continued opposition to Inner Loop segments:

Mr. Stolzenbach has about 10 different transportation plans, some with and some without the Inner Loop, General Clarke said. “The only thing I know is that he has said that he knew ‘intuitively’ that highways would not be required.”

Five agencies, including the District, Maryland, and Virginia highway agencies and BPR, had been feeding information to NCTA's computers. "This is the basis," the *Star* summarized, for statement by highway planners that they know about the preliminary transportation agency report, and that preliminary traffic forecasts bear out the need for the Inner Loop."

Senator Case thought the area needed an "umpire" to cut through contradictory claims to protect property and prevent highway alignments that might serve traffic but harm the community. He pointed to urban renewal projects where communities had to develop a "workable plan" showing impacts not only on the affected neighborhood, but the whole community. Road builders and their powerful backers, in effect, dictated community planning by their selection of roads and alignments. He planned to introduce a bill that would give an agency, possibly the Housing and Home Financing Agency, the authority to withhold Federal funds until conflicts among highway, transit, sewer projects, and other projects are resolved. ["Study to Curb Road Projects," *The Sunday Star*, July 8, 1962; Lindsay, John J., "Sen. Case Sees Need for Planning 'Umpire,'" *The Washington Post and Times Herald*, July 8, 1962]

### **A Blistering Report**

On August 3, 1962, the House Committee on the District of Columbia released a report titled "Accelerated D.C. Highway Program and One-Way Street Plan." The *Star* and *Post* used the word "blistering" to describe the report in which the committee demanded that the District halt several Interstate projects immediately and accused the District commissioners of "circumventing" congressional policy "by not, in the interim, deferring action, as requested by the NCTA on certain projects," and failing to give Members of Congress the information they need.

The report did not name the freeways, but appeared to be demanding a halt to the Potomac River Freeway, the Three Sisters Bridge, the East Leg of the Inner Loop, the Northeast Freeway, and interchange "C." In response to the District commissioners' change of position, the House had already voted to cut 1963 spending for three of the freeways, but funding remained in the appropriations bill for the Three Sisters Bridge and Potomac Freeway.

Chairman Whitener wrote that by accelerating highway building, the District commissioners were in direct contradiction of congressional intent for a balanced highway and transit system as called for in the National Capital Transportation Act of 1960. The committee demanded that the commissioners delay freeway construction not already begun until NCTA releases its report. For Congress "to permit the District to act precipitously on its accelerated program" would be sheer folly since the NCTA report will be available for review when the second session begins in January. The goal was to avoid freeway construction that might preclude subway construction or be unnecessary if a subway were built. With the freeze, the only freeway construction that would be underway would be along the southern rim of the city from the Theodore Roosevelt Bridge to 6<sup>th</sup> Street, SE.

The report also criticized District officials for not providing accurate estimates of highway spending. The estimates provided left out the cost of operation, tax losses from land

acquisitions, and the cost of relocating approximately 28,000 people. Evaluations of impacts had been “vague and incomplete,” with only “rough calculations” of properties that would be needed.

Traffic forecasts came in for particular criticism:

One of the most appalling revelations at the hearing [June 5 and 6] was the fact that no recent all-inclusive surveys have been made on which reliable forecasts of future requirements of the National capital region can be hinged.

Projections were made without estimating total trips or dividing those trips among bus, rapid rail transit, and automobiles. Estimates also did not calculate the number of occupants in each car. The District Highway Department’s explanation was “totally unbelievable.”

The report maintained that District traffic forecasters had not coordinated with NCTA despite the agency’s role in developing a balanced transportation system. The report pointed out that the Senate and House reports on the 1960 Act had said, “any attempt to meet the area’s transportation needs by highways and private automobiles alone will wreck the city.”

The subcommittee asked NCPC to stop acting on disputed freeway projects until NCTA released its report and the projects could be put in context. “The subcommittee wants to make it clear that it is neither anti-highway nor anti-rapid transit, not pro-highway nor pro-transit. It stands for a balanced transportation system.” At the same time, the report stated:

Unfortunately and sadly, it must be admitted that little or no heed has been paid to the adverse esthetic effect of this whole highway program, going as it does into the beauty of our lovely Capital, nor to the attendant loss of parks and recreational areas in the Nation’s Capital.

The report commented that General Clarke had “candidly admitted that highway planning has far outdistanced . . . relocation.” With 40,000 people waiting for public housing, the freeway program would add 28,000 more. The District was playing a form of musical chairs with relocatees by moving them into buildings scheduled to be demolished. This plan had “an Alice in Wonderland quality.” The idea “would be amusing were it not for the fact that it is to be inflicted on people who are least capable of caring for themselves.”

The subcommittee estimated that the city would lose between 300 and 400 acres of the 2,000 acres of taxable land remaining in the old Federal city. The District would lose \$1 million in tax revenue each year just from land that had been appraised for acquisition; the entire acquisition program would result in even more losses. These figures alone suggest that the highway acceleration program was a “decision made hastily, prompted by the unexpected availability of Federal highway funds.”

Further, the report strongly criticized a proposal to convert 16 miles of downtown streets to one-way pairs. The goal was to increase the current 21 miles of one-way streets by 80 percent, according to Aitken. “This is startling,” the report said of the proposal.

The *Star* summarized:

Washington is not Pompeii, House subcommittee men said. In old Pompeii, before A.D. 79, narrow streets demanded one-way restrictions. But subcommittee members said Washington, abundantly blessed with wide avenues, does not need the same plan.

General Clarke told reporters he was “most concerned that a subcommittee of Congress believed the District Commissioners were circumventing the will of Congress. This never was intended. As I conceive our job, it is to carry out the intent of Congress.” He promised to “study in great detail” the findings of the report.

In view of the House’s actions, General Clarke said the Senate would have to be the arbiter.

Reporter Grace Bassett reached Chairman Whitener by telephone at his home in North Carolina. He emphasized that the report was a deferral, not an end to the freeway projects. “It is not my intention to stop progress. But we want to progress in an orderly way.” He said the other members of the subcommittee agreed with him that highway-transit coordination was lacking here. They also shared his concern about dislocation of people.

Bassett pointed out that the “stinging criticism of highway builders” was the latest in a series of developments that appeared to doom, at least temporarily, the Inner Loop:

The House lifted \$1.1 million out of the city budget for Interchange C, the east leg and the northeast freeway, after Commissioners, 2 to 1, reversed themselves and urged deferral.

Then, Senator Case, Republican of New Jersey, announced he would make sure at Senate budget hearings, probably next week, that highways will not overbalance proposed rapid rail lines for the area . . . .

This view supports the National Capital Transportation Agency concern that accelerated highway building will jeopardize rail transit before its [sic] off the agency drawing boards.

All things considered, a delay or sharp cutback “seemed certain today.” [Bassett, Grace, “House Unit Demands Area Road Work Halt,” *The Evening Star*, August 3, 1962; Bassett, Grace, “Delay or Cutback Seen In D.C. Loop System,” *The Evening Star*, August 4, 1962; Carper, Elsie, “Hill Scores City’s Road Program,” *The Washington Post and Times Herald*, August 4, 1962]

### **A Matter of Jurisdiction**

The District commissioners and highway officials were convinced that the National Capital Transportation Act of 1960 left highway responsibilities with “the governmental agencies having jurisdiction thereof.” However, the subcommittee’s report appeared to take the side of NCTA and the anti-highway forces who claimed NCTA had veto power over the highway program.

NCTA’s attorneys cited a provision they claimed conveyed veto power to the agency:

The Agency's studies include a continuation of the work begun in the mass transportation survey conducted by the National Capital Planning Commission and the National Capital Regional Planning Council . . . and shall include further studies as may be necessitated by changed conditions, the availability of new techniques, and the response of Government agencies and the public to the transportation plan adopted by the Commission and the Council. The Agency's studies shall also include evaluations of the transportation recommended in the transportation plan, and of alternative facilities and kinds of services.

The dispute left the "expressed intent" of Congress uncertain, as was the question of which projects the subcommittee wanted the District to halt immediately. Although lobbyists and citizens' groups were attacking five projects, NCTA had called for a halt only to the Three Sisters Bridge and interchange "C." Congress had authorized funds for the interchange in 1962, and had not opposed the project in 1963 – it withheld funds only at the request of the Board of Commissioners following its reversal of position.

The fate of the \$38 million Potomac River Freeway was uncertain. The freeway began at about the intersection of 25<sup>th</sup> and G Streets, NW., was to go through a tunnel at New Hampshire and Virginia Avenues, northwesterly through the interchange at 27<sup>th</sup> and K Streets, and along the Potomac River on an elevated structure parallel to the Whitehurst Freeway to just west of Wisconsin Avenue. From there it would cross under the Whitehurst Freeway and Key Bridge onto the bluff in front of Georgetown University. The western half was linked to the Three Sisters Bridge, but the freeway would have to be built, with or without the bridge, to connect to the Potomac Palisades Parkway, which NPS was planning between Georgetown University and Chain Bridge.

The District had received and opened bids for construction of the eastern half of the Potomac River Freeway (27<sup>th</sup> to 31 Street, NW.). The design for the western half was dependent on the fate of the Three Sisters bridge. General Clarke said, "I don't think the subcommittee is against the Potomac River Freeway."

The issue of which projects would be funded would have to be considered by the Senate Appropriations Committee [Flor, Lee, "Freeway Fate Uncertain," *The Sunday Star*, August 5, 1962]

On July 10, the Subcommittee on the District of Columbia, Senate Committee on Appropriations began hearings on the District's 1963 appropriations act, with Chairman Byrd and Senators Beall and Case present. The District's Board of Commissioners, along with other city officials, presented the budget proposal to the subcommittee. It covered all District activities, but their presentation did not prompt a discussion of the freeway impasses the city was experiencing. However, as the first day ended, Senator Case made a suggestion that reflected his recent discussions with parties to the dispute. Addressing Chairman Byrd, he said:

At an appropriate time I would like to ask your permission to ask Mr. Stolzenbach of the National Capital Transportation Agency to make any comments that might be helpful to us in regard to the whole highway and transportation program. I understand that his

Agency is not within the jurisdiction of our committee directly, but I think his testimony on the developments within the jurisdiction might be helpful to us.

Senator Byrd agreed. "I am sure we can arrange to do that." [District of Columbia Appropriations for 1963, Hearings on H.R. 12276 before the Subcommittee of the Committee on Appropriations, United States Senate, 87<sup>th</sup> Congress, 2d Session, part 1, page 116]

The *Star* said of Senator Case's request:

Mr. Stolzenbach, as a presidential appointee, and his agency as a congressionally created unit, do not fall under the jurisdiction of the District Appropriations Subcommittees. But Senator Case is determined to co-ordinate city highway programs with master development plans due to be given President Kennedy in November by Mr. Stolzenbach. ["Sharp Queries by Byrd Hit District Budget," *The Evening Star*, July 10, 1962]

Two days later, Stolzenbach met with President Kennedy at the White House for a half hour to provide a progress report on NCTA's work. Stolzenbach said that his report will recommend highways and rapid transit facilities. He and the President also discussed the idea of a subway from Union Station to downtown employment centers, a concept that was included in the National Capital Transportation Act of 1960. "Stolzenbach told reporters, "it was a very delightful meeting."

President Kennedy said, "I am much encouraged by the progress being made by the agency in finding solutions to the region's critical transportation problems." He also indicated that NCTA's balanced transportation approach might provide ideas for other urban areas with similar transportation problems. [Flor, Lee, "President Pleased by Transit Progress," *The Evening Star*, July 12, 1962]

The *Star*'s editors were pleased that President Kennedy was "much encouraged," but regretted he did not disclose what he was encouraged about. "It should be encouraging to everyone, however, that the President apparently has dealt himself a personal hand in the confused and controversial Washington area transportation game." The real curiosity about the pending report was not the rapid transit element but the expectation, "most recently expressed by Senator Case of New Jersey, that the report will state that a number of Washington area highways, including portions of the inner loop, 'may not be necessary.'"

If Stolzenbach "has discovered new data" that justifies trimming back the planned freeways, the case "will be relatively simple." What would happen, the editors asked, "if his recommendations, rather than being persuasive, [would] merely add fuel to the ridiculous feud between the proponents of highways and the proponents of mass transit, which already has severely damaged both of these essential programs?"

The editors agreed with Senator Case about the "crying need for someone to co-ordinate these two programs after the NCTA report is issued." The White House might be a good place for that coordination. "A good place to begin is to insure that the November report will not simply

precipitate a divisive and harmful donnybrook.” [“Timely Intervention,” *The Sunday Star*, July 15, 1962]

On July 19, the Senate’s District appropriations subcommittee held a single day of testimony from outside witnesses, many of whom wanted to discuss the District’s Interstate freeway plans. The *Star* summarized:

Bitter denunciation of the District’s highway program broke loose again today as a Senate subcommittee continued its study of the District budget. Most witnesses applauded the House for postponing action on three key projects in the Inner Loop system. Others went so far as to request a moratorium on any new highway construction, even street widening.

In most cases, the witnesses presented their statements with limited or no questioning by the Senators Byrd, Case, or Norris H. Cotton (R-NH).

The first few witnesses urged the subcommittee to keep the freeway program moving forward. Charles E. Phillips of the Washington Board of Trade emphasized that, “Careful and competent engineering studies indicate the need for the inner loop plus radial highways, even with the full utilization of the contemplated mass transportation facilities.” The board supported the Inner Loop, which “would improve business conditions in this section of the city” and make downtown “more attractively accessible for doing business,” as Downtown Progress had said. Lionel Kaplan of the Automotive Trade Association, National Capital Area, and AAA’s Miller also spoke in support of the freeway network. [pages 495-501]

The first anti-highway witness was Hilliard H. Goodman of the Citizens Transit Improvement Association. His organization had been promoting rapid transit for the area for the past 7½ years. “By rapid transit, we mean rail rapid transit, which in our view is real rapid transit.” His group was concerned about freeways that would interfere with rapid transit development. The nearly complete Southwest Freeway, for example, would not, but the following would: Anacostia Freeway between South Capitol Street and the proposed new 11<sup>th</sup> Street Bridge; Southeast Freeway from South Capitol Street to 7<sup>th</sup> Avenue, NE.; interchange “C”; Potomac River Freeway; Three Sisters Bridge; Northeast Freeway; and East Leg of the Inner Loop. [pages 501-504]

Polly Shackleton, the Democratic National Committeewoman, said the committee was “gratified” that the House had deleted funds from the 1963 budget for interchange “C,” the Northeast Freeway, and the East Leg. “We opposed those projects primarily because of the tremendous unresolved housing and relocation problems that would have been created for more than 10,000 District of Columbia residents.”

She urged the subcommittee to delete funds as well for the Three Sisters Bridge and the Potomac River Freeway. Her organization’s opposition to these projects “stems not from philosophical opposition to highways.” In general, the highways were needed to help people move across the city. However, Congress had created NCTA in 1960 to coordinate a balanced transportation system and submit its recommendations to the President by November 1, 1962.

She was particularly concerned about the District's accelerated schedule for the Three Sisters Bridge. As recently as September 1960, the District scheduled the bridge for construction in 1966. Suddenly, in 1961, the bridge "was accelerated to top-priority status." Last November, NCTA had informed NCPC that the bridge should not be constructed in 1963 because, as NCTA put it, its construction "will inevitably create pressure for construction of the north and west legs of the inner loop, of Route 66, and a parkway through Glover-Archbold Park."

Delaying the Three Sisters Bridge and interchange "C" was "absolutely essential if any serious reevaluation is to be made of the 1959 transportation plan." She added that after the District submitted its budget including freeway matching funds, Senate Majority Leader Mike Mansfield (D-Mt.) had introduced S. 2436 to transfer the District's road right-of-way through the park to the Department of the Interior, which she implied would not approve the necessary extension of the freeway from the bridge.

She said that alternative ways to link I-66 to the Interstate System in the District "may prove more feasible and less disruptive than the projected Three Sisters Bridge, Potomac Freeway, north leg route." Spending millions of dollars to begin building a bridge "on an undeniably accelerated basis," would force the expenditure of many millions of dollars on other freeway links to the bridge "just 3 months before Congress received the report which it directed NCTA to prepare, especially in view of the fact that NCTA has already clearly opposed the construction of Three Sisters during fiscal 1963":

We see no reason for Congress to tie its hands by making a judgment before all the facts are in. And the cart which the Highway Department is asking Congress to put before the horse is enormously expensive – \$3 million for Three Sisters Bridge and \$18,768,000 for the Potomac River Freeway.

The District's money could better be spent "where the need is both clear and acute—on this city's children, who need and deserve more and better schools, teachers, and textbooks." [pages 518-521]

Throughout the day, witnesses opposed specific freeways, favored transit, expressed concern about displaced families, and urged the subcommittee to delay the District's plans until NCTA released its report in November. Supporters of the freeway system, such as Harold E. Wirth of the Firestone Tire and Rubber Company in Washington and Eugene I. Kane representing the District Trucking Association, appeared to have a vested interest in automobile transportation. [The complete day's testimony from outside witnesses can be found in the hearing report, pages 489-600; also see "McKelway, John, "Speakers Disagree On Highway Plans," *The Evening Star*, July 19, 1962, for a summary of testimony]

On July 19, Acting Secretary of the Interior John A. Carver, Jr., withdrew NPS approval for use of park lands for the Three Sisters Bridge or its approaches. He was replying to a letter from Majority Leader Mansfield, regarding the bridge's impact on park values associated with Spout Run Park, the George Washington Memorial Parkway, and Glover-Archbold Park. NPS, Carver wrote, had agreed to allow District highway officials to use the Spout Run access to the George Washington Memorial Parkway for the approaches to the Three Sisters Bridge, but on the

District side, the bridge abutment at the foot of Glover-Archbold Park would lead to construction of a parkway through the park. “The Three Sisters Bridge proposal is unique [because] this single highway proposal would wipe out the scenic treasure of the Potomac Palisades on one side of the river and point like a loaded pistol through the center of a critically needed park on the other.”

The Interior Department’s responsibility was “to preserve the park areas under its jurisdiction within the National Capital region.” In the absence of direction by Congress to the contrary, “there is no disposition on my part to consider that the standards to be applied here should be any different or any lower than those set forth for national parks and parkways generally”:

For this reason, the Department is opposed to the construction of the Three Sisters Bridge which so vitally involves important units in the park system of the National Capital and the palisades of the Potomac River.

He did not want the Department’s opposition to be “misunderstood as callous disregard for the very serious and vexatious traffic problems confronting this metropolitan area.” Virginia commuters were exposed to delays and safety hazards:

But the Three Sisters proposal represents only a makeshift attempt to secure relief with no apparent relationship to a coordinated master plan. Congress has provided for such long-range planning through creation of the National Capital Transportation Agency. Until that Agency presents its program, we cannot be certain that the Three Sisters Bridge is the compelling necessity that its advocates claim. Conceivably, premature commitment to that structure might be an impediment to a more comprehensive solution. It would seem inconceivable that, on such expedient grounds, we should consent to the destruction of the irreplaceable community assets represented by these park areas.

In closing, he acknowledged that a bridge at virtually any location along the Potomac River in the Washington area would involve park lands. “We believe, however, that the Three Sisters Bridge crossing involves the greatest potential destruction of park property of any site along the Potomac River in this area, and that alternatives can be selected with a minimal effect upon the park lands.”

On July 25, NPS Director Wirth informed Virginia Highway Commissioner H. H. Harris of Assistant Secretary Carver’s decision. Based on Carver’s letter, “I find it necessary to rescind the tentative approval I had heretofore given you for the use of park lands for the approaches to the proposed Three Sisters Bridge.”

The *Star* reported on the denials on July 27, indicating that Wirth had read Assistant Secretary Carver’s letter into the record during a hearing on July 23 before Chairman Whitener’s subcommittee. [“Interior Bars Three Sisters Span, Road,” *The Evening Star*, July 27, 1962; the letters will be found at: District of Columbia Appropriations for 1963, Hearings on H.R. 12276 before the Subcommittee of the Committee on Appropriations, United States Senate, 87<sup>th</sup> Congress, 2d Session, part 2, pages 1675-1677]

On July 31, as mentioned earlier, the District opened three segments of the Inner Loop Freeway system: The 12<sup>th</sup> Street expressway, the Washington Channel Bridge, and part of the Southwest Freeway.

Representative Gerald R. Ford, Jr. (R-Mi.) was one Member of Congress who did not agree with waiting for the NCTA report was. On August 6, the House was considering a resolution consenting to amendments to the Washington area's metropolitan transit regulation compact agreed to by Maryland, Virginia, and the District of Columbia. As debate on the resolution began, Representative Ford rose to discuss a related but different issue:

I think it is about time someone said that all the transportation problems of the metropolitan area of the District of Columbia are not going to be solved by this transit report that we are all waiting for with bated breath.

Mr. Speaker, I happen to think that there are at least some people in that organization who are not the ultimate and final authority on how some of us are to get from our home to our office and back again. I happen to believe that there are some people who have worked long and faithfully on highway and traffic problems in the District of Columbia who, in my opinion, have done a pretty good job under difficult circumstances.

Mr. Speaker, I am getting a little sick and tired of everything being held in abeyance in this area, waiting with bated breath for this great report which is about to be forthcoming . . . I just want to be on record right here and now to the effect that as soon as this report is made we are not all going to roll over and play dead waiting for Mr. Stolzenbach—I guess that is his name—to tell us what we are supposed to do . . . .

I do not like a lot of Johnny-come-lately's stepping in the picture and deciding that everything which has been done in the past is wrong and everything they propose is going to be right. I have said my piece, but if I am here next year I am going to look with a very, very skeptical eye at some of these long-haired ideas which I understand may be contained in the report. [Washington Metropolitan Transit Compact Amendments, *Congressional Record-House*, August 6, 1962, page 15600]

None of his colleagues reacted to his comments during the debate, which resulted in approval of the resolution in support of the amendments.

(Representative Ford and his family lived in Alexandria, Virginia, at 514 Crown View Drive. His daily commute when Congress was in session benefited from improvements to Shirl in southwest and southeast Washington. He still lived at 514 Crown View Drive when he became Vice President on December 6, 1973, and drove from there with a Secret Service escort to the White House to take his oath of office as President on August 9, 1974.)

Although Representative Ford's comment did not provoke his colleagues, Donald Gingery shared the contempt of Stolzenbach. During a meeting of the Maryland-National Capital Park and Planning Commission, he accused NCTA of not cooperating with the area's planning bodies. He

said that Stolzenbach had “preconceived notions” about the area’s transit needs and had “absolute disregard” for the views of the jurisdictions involved.

NCTA, Gingery said, was “run with no intent to co-operate with the States.” When planners asked NCTA about area transit plans, they receive “nothing but the most miserable gobbledygook” in reply.

He introduced a resolution calling for a meeting with the Governors of Maryland and Virginia to request they file suit in Federal court to require NCTA to spell out its plans; seek congressional action to amend the 1960 Act to add two administrators to NCTA who would be appointed by the Governors; and ask Congress to deny funds to NCTA until it cooperated with the surrounding jurisdictions.

As Vice Chairman Brewer pointed out, “We have complete control where it affects the State of Maryland.” He added that Stolzenbach “has tried to keep us informed the best he could” and hoped to give the commission a look at the transit plans before September 25. The Gingery resolution failed for lack of a second. [“Transportation Agency Hit as Unco-operative,” *The Evening Star*, August 9, 1962]

On August 10, the Senate subcommittee on District appropriations held an afternoon session on the Department of Highways and Traffic. Among those representing the District were: Aitken and his deputy director, Thomas F. Airis, along with Commissioners Tobriner and Clarke. As requested by Senators Case and Byrd, Stolzenbach joined the panel along with Seeger, NCTA’s general counsel, and E. Sherman Perlman, special assistant to the Administrator.

Stolzenbach was the first to address the panel. “Transportation facilities, whether one is talking about highways or subway systems, have a profound impact on the growth and health of our urban areas.” He discussed the history of transportation studies in recent years, leading to the Mass Transportation Survey. Instead of adopting the survey’s plan, Congress passed the National Capital Transportation Act of 1960, which directed NCTA to evaluate the survey’s plan and consider alternative facilities and services. As stated in Section 102, the key requirement was for planning, on a regional basis, “a unified system of freeway, parkways, express transit service on exclusive rights-of-way and other major transportation facilities.”

Stolzenbach said that if that language “were not clear enough,” the House and Senate reports on the legislation spelled out the congressional intent. For example, the Senate report stated:

It is becoming increasingly evident that any attempt to meet the area’s transportation needs by highways and private automobiles alone will wreck the city—it will demolish residential neighborhoods, violate parks and playgrounds, desecrate the monumental portions of the Nation’s capital, and remove much valuable property from the tax rolls.

NCTA had not scrapped the Mass Transportation Survey, but had embarked on analysis of alternative rapid transit and highway systems “in an effort to develop a combined system which will best meet the future needs of the region at the least cost.”

As for freeways, NCTA had to consider the elements that were committed and those still open to review. “A year ago it appeared that much of the system, including the proposed inner loop and radials in north Washington, was uncommitted.” That changed when the District commissioners proposed “a sharply accelerated highway program” for FY 1963 that moved interchange “C” up by 1 year and the Three Sisters Bridge by 4 years. “Construction of these key projects would have the effect of forcing construction of much of the highway system proposed in the mass transportation survey.” As a result, allowing these accelerated projects to proceed in 1963 “would contradict the directive given the Agency by Congress.” It also would “prejudge the issue of what shall be the future transportation system in the National Capital region—the very issue which Congress reserved for its decision by the passage of the National Capital Transportation Act of 1960.”

In response to questions from Senator Gale W. McGee (D-Wy.), Stolzenbach said NCTA had been working with highway agencies in the District, Maryland, and Virginia to estimate future traffic. This work had been underway for 2 years, but just recently a member of his staff had said the highway planners they were working with “were in complete agreement on all of the factors that were going into these traffic forecasts.” These factors would affect the balance of highway and transit proposed in the November report. “Quite obviously now, with the inferior transit service we have here, for many rides it takes twice as long to take the bus as it does to ride your car.” With a rail rapid transit system, that would not be the case. “We will relate it to the cost, the relative costs of riding public transportation versus driving an automobile, paying parking fees downtown.”

One of Senator McGee’s questions grew out of a study by Wilbur Smith and Associates that projected only a small percentage of traffic in outlying areas was downtown-oriented, thus reducing the value of rail rapid transit. Stolzenbach did not consider that a valid conclusion:

I cannot believe that if we have a rapid transit system it will not reduce the requirements for freeways because if you are going to get between 60 and 80 percent of the people who ride from suburbs to downtown peak hours [to] ride transit, you are . . . going to need the number of freeways that have been predicted.

The type of freeways under consideration “are not the kind of freeways required for the vast number of daily movements that are involved in a total daily county,” even though they were the type that BPR endorses for peak hour needs:

We certainly need more freeways, more highways. No question about it . . . I have been saying this ever since I have been in office. The question here is of the balance, and the balance has to be struck in relation to a large number of considerations: Costs, the disruption of the city, and meeting the peak hour requirements.

Senator McGee wondered about the role of buses if “we would have a rather well integrated freeway system and a minimal, maybe a minimal subway system downtown.” Would not buses on freeways make sense? Stolzenbach replied that NCTA would recommend many arteries to include bus transport, but buses entering the center “cannot do the job of distributing people in the downtown area rapidly and efficiently and if you require them to make too many transfers in

order to do this, they [commuters] are simply not going to ride transit and . . . solve the basic problem, which is to relieve congestion and to provide a more effective transit system.”

He was not prepared to unveil all the details that would be in the November report, but he said:

Buses have a role. Rapid transit has a role and the automobile has a role and the highways have a role. And I assure you that there is going to be a very substantial highway program recommended in our overall plan . . . .

We are zeroing in on it. We have some ideas as to the direction in which it is going . . . . Many of the major things are clear. We are trying to present a system that will stand up under a rigorous examination in terms of its economics, in terms of the things that it will do for this city.

When Senator Case’s question time came, he asked about the Three Sisters Bridge, “one of the things that have been concerning you as possibly prejudicing the results of your study if they are allowed to proceed.” He asked Stolzenbach if the bridge was the only project he wants the subcommittee to de-fund for 1963. Stolzenbach replied, “That would be my recommendation, yes, sir.”

Senator Case asked why NCTA objected to the bridge. Stolzenbach replied that as best he had been able to determine, “the principal justification for it is to provide a route for trucks to get into the District of Columbia from Route 66,” because they would not be able to use the Theodore Roosevelt Bridge. The question, therefore, was how trucks would get into the District:

If the traffic figures don’t show the need for another bridge, it seems to me that we ought to examine very seriously whether we are just building this bridge for the sole reason of bringing trucks into the District of Columbia.

He assumed alternatives existed, such as directing trucks from I-66 via Jefferson Davis Highway to the 14<sup>th</sup> Street Bridge on Shirley Highway, a distance of about 2 miles. “This highway exists; with a very minimum of modification [Jefferson Davis Highway] could be brought up to interstate standard and provide a perfectly adequate interstate truck route connecting with 66.”

(In this area, the Jefferson Davis Highway parallels the Potomac River from Crystal City to Rosslyn. It was built in the 1940s as part of the Pentagon Road Network. On December 17, 1964, the State took over ownership and maintenance responsibility from BPR for the Pentagon Road Network. The highway was then designated State Route 110.)

Another factor was the Mansfield bill regarding the Glover-Archbold Park. If that bill becomes law, “I think that that rather effectively closes out that as one of the major circumferential highways in the region.

What about the Potomac River Freeway, which the House had funded. Stolzenbach replied, “I think whatever funds were in there for the Potomac River freeway we could not comment.” It was essentially an extension of the George Washington Memorial Parkway “and we have had no question with this as a major freeway artery along the river there.” It was probably needed,

especially since Congress allowed funding for bus stations and parking lots along the memorial parkway. The Three Sisters Bridge was another matter. “We see nothing in the traffic estimates as far as we have gone that indicate the need for it and we feel again that there is no reason to make the decision now that you have to have Three Sisters Bridge.” [District of Columbia Appropriations for 1963, Hearings on H.R. 12276 before the Subcommittee of the Committee on Appropriations, United States Senate, 87<sup>th</sup> Congress, 2d Session, part 2, pages 1651-1667]

Senator Case invited Aitken to respond. Aitken said the Three Sisters Bridge was not exclusively for trucks. It “has formed a vital link in [the] proposed regional highway system ever since the publication of the 1959 mass transportation plan.” The need was solid since traffic across the river had increased from 100,000 in 1942 to 300,000 in the early 1960s. The river was a limitation on capacity directly affecting Virginia. Without additional bridge capacity, development of northern Virginia would be held back, but with it, would continue to attract Federal offices: “More Pentagons, more CIA’s, and so forth.” He continued:

The District might consider taking a completely indifferent attitude with reference to the needs and requirements of nearby Virginia, but there seems to be little doubt that a proper appraisal warrants action on a total metropolitan basis.

Insofar as practical, such action should be based on logic and practicality. The overall plan: It is ironic that some of the agencies contesting the Three Sisters Bridge are at the same time planning and advancing projects which require the Three Sisters Bridge, specifically, the National Park Service desires to close the East Drive between Lincoln Memorial and Reflecting Pool.

NPS wanted to get as much traffic as possible from the Lincoln Memorial. “With this reduction in traffic, it becomes all the more apparent that the construction of the Three Sisters Bridge must be accelerated.”

The Cabin John Bridge and the Woodrow Wilson Memorial Bridge were part of the Capital Beltway and would carry through traffic, but “only 3 percent of the passenger cars approaching this metropolitan area were interested in going past Washington.” The rest of the traffic remained within the metropolitan area. With those two bypass bridges on the fringes of the metropolitan area . . . we have a doubt at the moment as to whether these bridges will have a full capacity or will serve a full volume during peak hours, at any early date.” More information would be gathered when they both were in full service, “but the Three Sisters Bridge is a key element in the provision of this additional capacity.”

Senator Case asked Aitken what harm would occur if construction of the bridge were delayed until 1964. After all, by then, the District would have a better idea of how much traffic would use the Cabin John Bridge and the Woodrow Wilson Bridge.

Aitken replied that traffic would increase regardless. “I could not honestly say that if we didn’t build a bridge this year or next year that the area or the traffic situation would be totally impossible.” For example, the Washington Channel Bridge, which had opened on July 31, was already carrying 25,000 vehicles a day. Aitken could not predict “an absolute disaster” if the

Three Sisters Bridge were delayed for 6 months or a year, but “I think it would be unfortunate because I think that the built-up demands for highways in this area, as elsewhere in the Nation, are tremendous, and even if you work at it constantly it is difficult to catch up.” [pages 1667-1673]

General Clarke said he was concerned that those who were advocating delay of the bridge until after the NCTA report was released “would regard a deferral action on the part of Congress as tantamount to a disapproval of the particular bridge.” He observed that Senator Mansfield had already said he would oppose the Three Sisters Bridge and that the House District Committee also had recommended deferral, “so I am a little reluctant to fly in the face of both of those.” However, “I feel I should tell you my feelings on it.”

In addition to what Aitken had said, General Clarke pointed out:

Ever since I came here I was concerned that we build usable segments of our highway system, that we not build pieces here and there, but we start in the center and build out. If you will look at the pattern of our highway development program we are tackling the most difficult areas in which to build in the heart of the city and then are trying to take it out so that it will be usable as it is completed.

As noted earlier, NPS was building the parkway to the District line. The next link was the Potomac River Freeway, which would require a bridge in the vicinity of Three Sisters Islands. Therefore, “we should begin the Potomac Freeway to make allowance for that bridge to be built, and should actually build some of the structures of that bridge. This is what these appropriations would do this year; they would allow us to get started on that.” The situation, he acknowledged, was complicated by the fact that NPS had withdrawn its concurrence in the use of park lands for the bridge on July 19 in response to a question from Senator Mansfield.

Senator Byrd asked about the views of Arlington County, Virginia. General Clarke said he had not received any direct contacts from the county but understood from news reports that the county wanted to defer action on the Three Sisters Bridge until after NCTA released its report.

When Senator Case pointed out that the use of Glover-Archbold Park for a parkway was in doubt in view of the Mansfield bill and NPS opposition, General Clarke replied, “We have had three separate agreements with the Park Service on how this land might be used, and they have withdrawn on each one of them, sir.”

Aitken added:

The 1959 MTS plan included Three Sisters and Glover-Archbold as part of what they called the intermediate loop [Fort Drive]. We subsequently dropped that . . .

The current plan, he said, did not “contemplate anything in regard to the Glover-Archbold Parkway. He explained the current plan, known as M-7, that avoided Glover-Archbold Park:

Mr. Chairman, and gentlemen, for background this plan is identified in our records as "M-7." We started out with plan A, and this is indicative of how many plans we have

drawn to get to this point. [Referring to a map] This indicates the present Whitehurst Freeway. It crosses under Key Bridge, ties into Canal Road and Key Bridge and into M Street. This lower red line shows the location of the second proposed freeway. At this point, that is at about 31st Street, it would be about at the same level as the present Whitehurst, continuing westerly it loses elevation and curves under Whitehurst at approximately 33d Street. By the time the new freeway gets to Key Bridge it is under the present Whitehurst Freeway. Continuing to the west, the present connections to Key Bridge would be removed. Outbound, that is Whitehurst Freeway, would be extended on to the northwesterly – above the canal, above Canal Road, up on the bluff in front of Georgetown University . . .

Inbound traffic would come off Three Sisters Bridge. This is up in the air above Canal Road, curving to the right, and continue in an easterly direction on the bluff, below the outbound roadway, and extend easterly to this point just about south of Georgetown University. Canal Road would have only inbound traffic on it at this point, and such traffic would have an opportunity to get on the freeway, or stay on M. Street.

Old Canal Road likely will be an extension of one roadway to serve the George Washington Memorial Parkway, and it ties in directly with this freeway, and with M Street in Georgetown, so the traffic has a choice. Prospect Street would be extended to the west, and tie into a parking area at Georgetown University. This has been worked out with the university, and they support this plan. In the vicinity of the lower end of Glover-Archbold Parkway – I should back up and pick up M Street about a block west of Key Bridge. At this point traffic westbound on M Street would curve to the right and go up on the bluff to the right of the freeway, that is, between the freeway and the Georgetown University road, continuing westerly on the bluff and above the freeway, tying in at a point out just southwest of the intersection of MacArthur Boulevard and Foxhall Road. At that point, traffic again would have a choice. It could either continue up the parkway or curving to the right it could go to MacArthur Boulevard or Foxhall Road.

Senator CASE. Even if you do not run a parkway or freeway up through the park, you do plan to take quite a piece of the park . . . for use in this traffic pattern, do you not?

Mr. AITKEN. Well, sir, that is a one-lane loop, and I think the impact would be very minor.

Senator CASE. Is it elevated or is it ground level or what?

Mr. AITKEN. Well, no, sir; it is on fill and at ground level. These contours indicate the nature of the ground. That is 100 feet. This is 125 just west of the gym at Georgetown. It drops to 50, that is a total drop of 75 feet in a very short distance. While this would use some of the park, Senator, it also would get rid of somethings they would like to get rid of. The old transit bridge, and certain other undesirable things and the resultant facility would be landscaped and attractively improved. [pages 1673-1679]

Aitken said he wanted to make an important point, namely that “unless we can build, somehow, an integrated freeway system in the city, and in the metropolitan area, we cannot meet, we cannot adequately serve, our transportation needs in the future”:

There is no city in the land today which has a completed freeway system. Some cities are quite well along, but none of them have a completed system, and I think it is quite obvious if the Interstate System, for example, is built elsewhere, and it is not built here, I think we face some nice problems and nice predicaments.

He described the issues concerning the link between I-70S, which was built to Pooks Hill, and the District; the connection between the Baltimore-Washington Parkway and downtown Washington; how to get I-95 traffic from the District line to downtown, and I-66 moving from Virginia to the city:

Now, here we have an Interstate Highway System coming along . . . . I think there is a great deal of pressure for the reconstruction and modernization of that part of the Interstate Highway System . . . . We have these things coming toward the city. Are we going to say we will stop them out here, the beltway, or here some place at the river, at the District line? [pages 1685-1686]

Senator Byrd asked Stolzenbach about his coordination with District highway officials as they prepared the 1963 budget. Stolzenbach acknowledged that “it is evident that there is disagreement between the Agency and the District of Columbia Highway Department on what should be done next year.” However, they had established what he regarded “as probably the most important example of joint highway transit planning, in other words, total urban transportation planning,” that had ever occurred in the Washington area:

I was talking to the Federal Highway Administrator yesterday and he said he was terribly excited about it. That is one of the reasons why they have assigned five of their people, their technicians, to help us and observed it because they want to apply this joint technique to other cities where they have comparable problems.

He did not think any substantive or even procedural issue existed on planning:

It is sort of a question of whether you want to take a plan, essentially that was based on an all-highway solution that is 5 years old, and say that we are going to go ahead with this because money is available, or whether you want to wait just a little bit because we are not for a 5-year study or even a 1-year study. This is all in the mill, and next January Congress is going to have the most up to date and, I think, the best plan from the point of view of application, using the best professional planning techniques that we have available in a plan for this region. It will not be just an integrated highway plan, but an integrated transportation plan. [page 1687]

Officials continued sparring over the planned freeway network, then returned on August 10 to continue the discussion. General Clarke, after discussing his background and role, summarized what he saw as the transportation goal:

I think our major objective in all of these discussions is to provide a transportation system for the city that will be effective, that will meet the needs of the people, and will to some extent meet the desires of the people. And this is what all of our discussions are trying to

resolve, to come down to an effective, reasonable, desirable transportation system. And I think we are all agreed on this as our objective.

The Mass Transportation Survey recommended creation of a coordinating agency to get a mass transit program underway while area jurisdictions worked out a compact for a replacement organization to complete the job. The result, General Clarke said, was NCTA. He referred to views that NCTA was to take over transportation planning, including highway planning, and Chairman Whitener's report accusing the District commissioners of circumventing the will of Congress by not holding off on certain projects until NCTA released its report.

The intent of Congress in creating NCTA had become unclear. "There is language in there which has been cited by people who feel that there is a mandate, that there is a requirement that NCTA evaluate this study, and then presumably decide whether it is good or bad and then go on and do something." At the same time, Congress had expressed its will in other ways:

As I see it, the intent of Congress is expressed in the legislative history, the act itself, and in the actions of Congress subsequent to the passage of the act, and by certain things that were not said in the act that created the Agency.

For example, Congress had continued appropriating funds for highway development after passing the National Capital Transportation Act of 1960. In that legislation, Congress had included a prohibition on freeway construction in a part of the city as an outgrowth of the U.S. 240-I-70 controversy:

And it has always been my feeling that since Congress specifically forbade this particular item, and was silent on the other items, that the intent of Congress was that the remainder of the program continue. And this seems to be supported by the continuing actions of Congress in appropriating money as we went along.

He also referred to the language in the 1960 Act referring to highway development by the agencies with jurisdiction. In his view, NCPC was the overall transportation planning organization for the area and particularly the city – "all the aspects of life in the District of Columbia, the planning of that falls to their organization." He continued:

So that I think the intent of Congress was that the highway program as developed continue and that there be developed an accompanying transit plan. In the act Congress included what I would consider boilerplate language, which said that the Agency was to evaluate the transportation plan.

This does not mean to tear it apart or hold it up, but to evaluate it and work along with it. And it talks about cooperation and coordination of all these programs as we move along. [pages 1692-1694]

Senator Case said he understood the difficulties involved in transportation planning, particularly in a city where Members of Congress were involved in details that were handled without congressional involvement in other cities. "I express my own sympathy to you," he told General Clarke, adding:

The fact that you have disagreement as to what these things mean doesn't disturb me in the least. This is a contribution to us who have some responsibility on this subcommittee and to the Congress, and I am sure to the President, with whom I suppose the ultimate decisions for recommendations at least must lie, in the absence of any other machinery that is set up to make final decisions here.

Meaning, he said, no disrespect to the District commissioners, highway officials, or General Clarke, Senator Case said he was convinced that some form of mass transit was essential for the Washington area:

This to me suggests the desirability of attempting before we do much more—in fact, I think anything more—in the way of major projects, that we do know a little bit better what the answer to that problem may be.

He thought, for example, that some freeway projects might incorporate rapid rail transit and, therefore, should be wider than currently planned:

And perhaps it would be wise to wait until we get this particular plan before us before we go ahead with other projects, which I think it is true may by their own momentum or the logic of their existence require further things—for example, the building of Three Sisters bridge it seem to me would logically suggest—you have got this great project here, which could, if extended through a northwest loop, be much more valuable than it is sitting here.

And perhaps it is desirable at this point to wait for the 2 or 3 months that we would wait until we have the whole picture, not only among you, because I think you all probably know what each other's thinking is pretty much according to law, but we can't know more than that, and the public can't know.

General Clarke said that as far as the projects NCTA wanted to defer (Three Sisters Bridge and interchange "C"), none of the agencies "had contemplated that they would try there to make dual use of those particular structures for transit. By contrast, for a radial facility such as the Northeast Freeway, "every consideration should be given there to the use of the median strip."

Senator Case replied by referring to the report Chairman Bible's committee had issued on June 21, 1960, regarding the legislation that established NCTA. The language discussed the Mass Transportation Survey, saying it was "a valuable starting point," but accepting it without further study "would be a mistake." The report stated:

In particular it appears that the highway agencies will not be able to build new freeways nearly as fast as called for in the plan. Since it is a balanced plan and the elimination of any one facility calls for an elimination of the other or a change in the location of major traffic arteries, the failure to build all the highways will call for a reassessment of all the parts of the plan . . . .

Senator Case admitted that trying to figure out the intent of Congress "is more than I know." He believed the 1960 Act was not intended simply to develop a transit plan, but rather to take "an overall relook at the transit problem in the District and in the metropolitan area." He understood

the desire of the District commissioners and highway officials to proceed as fast as they can to overcome “the layers and layers of approvals that they have to obtain in all the agencies,” but Senator Case still believed that this language reflected “what Congress really meant when they set up this agency, and it would be well for the subcommittee, as I see it, now to take that as a general guide.” [pages 1699-1701]

Later that day, the headline in *The Evening Star* read: “Case Would Delay Three Sisters Span.”

The hearings continued on the morning of Saturday, August 11, this time with only city officials on the panel. The day’s hearing covered many of the topics discussed the previous 2 days, but two items made news.

General Clarke, referring to Chairman Whitener’s highly critical report, asked for help from the Senators in understanding the congressional intent in creating NCTA:

I do not enjoy the position of advancing a position which seems to be counter to the position which a subcommittee of the House has adopted . . . . I would be hopeful that there would be some way of clarifying once and for all what is the intent of Congress. I had thought that the intent had been portrayed and shown by Congress over the past years in making continual appropriations to carry on our program. I thought this was a clear indication—but perhaps I was wrong.

But I suppose that, in a way, we are here asking your subcommittee to help determine for us what is the true intent of Congress in carrying out this program. I do not wish to pass the buck to your subcommittee, but I think it is clear that my position is not the position that the subcommittee of the House District Committee adopted.

Aitken pointed out that the House appropriated funds for the Three Sisters Bridge; “in the event the Senate should do likewise, these two actions might be indicative of the will of the whole Congress.”

Senator Byrd asked how the District would react if the Senate were to delete the \$300,000 in view of the House District subcommittee’s report. “Would you proceed, do you think?” he asked.

General Clarke replied, “No, sir; I do not think we would. I think we would regard this, then as a clear indication that Congress at the moment does not want a bridge there.”

Senator McGee suggested that such an action might mean simply that the Congress wants the District to wait for the NCTA report, not that Congress opposed the bridge. [pages 1757-1758]

The second point was that Senator McGee was upset about a front page story in the *Post* that morning. According to the article, a spokesman said BPR was “deeply concerned” about the disputes between District highway officials and other officials who want to hold off on construction until a mass transit system is developed:

“By law, we make the 90 per cent funds available for certain specific purposes—namely an interstate road system, a spokesman for the Federal agency said yesterday.

“If we find that the projects we are supporting are not going to be part of the interstate system, then we will have no alternative other than to request the return of the funds. The consequences for the District could be rather serious.”

Even if the District were required to return Interstate construction funds, the city would still be obligated to pay for its long-term highway construction contracts:

To do so, the District presumably would have to divert many millions of dollars away from schools, health facilities and other services which the city is already hard-pressed to provide.

A cutback could even affect completed projects that had been built with 90-percent Interstate funds, such as the 14<sup>th</sup> Street Bridge, the Washington Channel Bridge, portions of the Southwest Freeway, and even the District’s short section of the Capital Beltway on the Woodrow Wilson Memorial Bridge:

“They are all part of the overall plan for the region,” the Bureau official said. “If we are now going to start pulling pieces out of the plan, then we may have to abandon the plan and start all over again.”

If this were to happen, the roads now completed would be considered local roads and a new interstate system would have to be planned, he said.

BPR had been considering the issue for some time and had discussed it with District officials:

He said the Bureau will make its decision soon, possibly in the next few weeks. “We are at a crossroads and we have to act pretty quickly,” he said. [Clopton, Willard, “D.C. Facing Cutoff of Road Cash,” *The Washington Post and Times Herald*, August 11, 1962]

An angry Senator McGee said:

I think it would be of interest to the committee, Mr. Chairman, to know if this was released at this point in order to threaten the committee in trying to make an honest deliberation on this question.

If that is the case, who cocked the gun, I think we ought to know that.

I personally resented the appearance of the story at this time, when we are making our attempt to get the facts on this question.

And if this is an attempt to do that, then I think the committee ought to know how far they really can go in the cutting off of the funds while the Congress is trying honestly to consider all the information that is involved in reaching a decision that is in the interest of the Nation’s Capital and the surrounding areas.

And I would hope that we might have a little light shed on that, because I assume that it is the hesitancy over Three Sisters and over the circles [Inner Loop] in the east part of town, the suspension of those for the time being, that is really what has provoked this and brought it to the surface.

General Clarke quickly replied:

May I comment first on the point of a release timed with the hearings, and state in all honesty and sincerely that I had nothing to do with the timing of the release or the substance of the matter which was in the release.

I would like the record to show that clearly.

Senator McGee wanted to know the name of the BPR spokesman who released the statement to the *Post*. General Clarke said he did not know the name. "I was called out of bed this morning by other newspapers trying to find out the same information." He promised to try to find out in time for the afternoon session.

General Clarke added that the article was fairly accurate but not entirely so. He had met with the NPS Director within the past week along with BPR officials. Participants discussed the possibility that funds might be withheld. "But I assure the committee that this is not in the form of a threat--."

When the hearing resumed on Saturday afternoon, Federal Highway Administrator Whitton had joined the District panel. By then, the *Star* had published a similar article about the threat to withhold funds. The article quoted Whitton:

"We discussed this with the District," Mr. Whitton said, "but there was no ultimatum. We set no date for them. We also cannot roll up the highways that are already there.

"We just said to them: Here are some things you ought to think about. Some day you just have to finish your planning and start to work. If we can't get a highway through the District, I don't know if we should build roads into the District."

Referring to the work on the South Leg of the Inner Loop, he continued:

"The Inner Loop was agreed to as part of the interstate highway system," Mr. Whitton said. "If we build the South Leg and can't complete the other ones, then the South Leg is not properly designed. We have to have a balanced road system."

General Clarke told the reporter that he could not imagine BPR filing suit for a refund, which would require the District to go to Congress to appropriate the money "to pay up." The District, in short, would be hard put to refund Interstate funds. General Clarke made clear, however, that no one was discussing reducing funds for schools or other city services to repay BPR.

Regardless, Whitton said, "We have had no falling out with the District. We'll continue to work together":

But he made it clear that the Federal funds are available for use only in interstate systems, not local spurs, and if a road network turns out to be not a part of an interstate system, the bureau has to request the return of its funds.

Because the local roads would be eligible for BPR's usual 50-percent reimbursement under the non-Interstate program, BPR would not require a full refund. I would seek repayment only for the difference between 50 and 90 percent reimbursements. ["Road Bureau Prods D.C. on Slow Pace," *The Evening Star*, August 11, 1962]

Senator McGee asked Whitton to "shed any light on" why the two articles appeared while the subcommittee was debating whether to delay appropriations for several freeway projects.

Whitton replied:

The story, the timing of the story is absolutely coincidental. We make no release of it. A reporter called us and asked the questions, and we answered them. We had no ulterior motive whatever, other than to answer questions . . . . We did not initiate the story, nor did we plant any questions anywhere to cause the story to be brought up.

Senator McGee expressed the "sensitivity" of the timing because the subcommittee had been deliberating for 2 days "on this question of trying to resolve, if possible, this at least quasi-impasse that has arisen with the District on this question." He asked Whitton to comment on whether delaying the projects until NCTA releases its report in November would affect Federal funds for the District.

Whitton explained that the Federal-aid highway program was funded through highway user taxes that could be used for no other purpose. If a State or District does not use the funds made available to it, "the people are not getting the benefit" they paid for. The District of Columbia was in "a peculiar position" regarding the use of Interstate construction funds because it was entirely urban:

Now, any other State highway department has rural interstate routes. And if they get tied up in a city, and it is not uncommon to be tied up on construction work in a city, they can spend their money outside, in rural areas, and keep the money at work, or keep it going, and get the highways built.

But the District is in this peculiar position where they have no rural area to spend the money. And that is the reason we hate to see it tied up.

I think they probably have \$40 million or so interstate funds now available to be spent on construction projects.

He also explained the circumstances that might prompt BPR to cut off Interstate funds for the District:

We would cut off no funds to the District until we had been told, or had found out definitely that some of the interstate routes within the District had been removed from the Interstate System.

And then, when we made the next estimate of cost to the Interstate System, which I think is in 1966, our estimate would then be based on the Interstate System as in effect at that time.

Just to clarify, Senator McGee asked whether delaying interchange “C” or the Three Sisters Bridge would provoke BPR to cut off funds. Whitton replied, “It would not.”

Whitton said that a number of routes had been designated in the District, including the Inner Loop, a connection to Baltimore, and so on:

Well, if some of that inner loop is taken out, then it is not a part of the Interstate System. Or if so much of it is taken out, that we do not have a connected highway through the District, then much of the now interstate routes in the District might not qualify to be in the Interstate System, because the Interstate System has to be a connected system, as we see it.

Senator McGee wanted to confirm that simply delaying action would not result in a funding penalty for the District. Whitton replied:

That is right.

But let me be honest—we do regret delays, because we are anxious to get the money working.

Senator McGee summarized:

Well, I think that is what the real meat of this particular element in the controversy is. I do not think anybody on the subcommittee would have in mind using delay as a trick to defeat or destroy. Because the only question that has been raised here in this hearing, I believe, in all fairness to all sides, was the wisdom of trying to delay until the report was submitted which the President has requested for the 1<sup>st</sup> of November.

And if it became clear that, subsequently, this would be used only as a tactic to delay further, I think that would require a very sober assessment by the subcommittee.

Senator Case wanted to know if BPR could pay for a wider median to accommodate transit. Whitton replied, “I do not think there is any legal objection to that” if the expenditures were limited to restoring a disrupted rail line. He cited Congress Street in Chicago where the Interstate followed the alignment of a railroad that had to be restored.

Senate Case asked if BPR also could pay for construction of a new rail line. Whitton said that BPR could not pay for the rail line or the right-of-way to accommodate it. “I think the rail system ought to pay that cost.”

When the Senator asked if the distinction Whitton was making was stated in law, Whitton replied that he could not repeat the language of the law. "But I think that the money that comes into the trust fund is reserved solely for the building a highway, or for the engineering of a highway, or for the right-of-way for a highway."

Next, Senator Case asked about the use of Federal-aid funds for bus lanes. He quoted a report by the Housing and Home Finance Agency to the President enunciating a policy that would allow the use of Federal-aid highway funds for exclusive bus lanes "when comprehensive transportation plans indicate this to be desirable." Whitton explained:

We are anticipating that it will be legally possible for us to provide lanes for the exclusive use of buses if the volume of bus traffic justifies it. We might even provide lanes for buses that can use it from 7 until 9 o'clock in the morning, and from 4 until 6 o'clock in the afternoon. We would have to have policing of such an arrangement.

What was clear was that Federal-aid highway funds might be spent to provide lanes for buses, if Federal law were changed to permit it, but not for rail transit.

Senator Case returned to the *Post* article, asking how it came out. Whitton repeated the explanation that a reporter "called 2 or 3 days [ago] and talked to our public relations people." BPR had nothing to do with the timing of the article. "It is not premeditated whatever. I hate to tell you, but I did not even know you were in session."

Senator Case asked if the timing had anything to do with the NPS decision to withhold approval of the Three Sisters Bridge. Whitton acknowledged that BPR was "disturbed" by the NPS action. "But our release had nothing to do with it":

Senator Case. You can understand, of course, our concern, that an agency of the Federal Government should be attempting to make propaganda.

Mr. Whitton. No, sir. We definitely did not intend it as such.

Senator Case. It always backfires, and it especially backfires on Members of Congress.

Mr. Whitton: We would be the last one to do that.

Although Senators Case and McGee appeared satisfied, Whitton wanted to clarify one point:

The south leg that is now being built, and is designed, it is designed with the thought that it would comprise part of an inner loop. If all of that inner loop is not built, it could well be that the south leg . . . will not be designed correctly.

Senator Case wanted to discuss another issue, namely whether Interstate routes entering the city had to go all the way through. "Cannot interstate roads end in a metropolitan city?"

Whitton did not think so:

I just do not think that the Shirley Highway could come into, say, the downtown part of Washington and stop there, without going on and making a connection to the road going

to Baltimore, and still be part of the Interstate System. It could be an urban expressway. But not interstate.

The key was that the routes must be part of a connected system. A route “could flow around [a metropolitan area]. But if it started in, I think it has to flow on through.”

Senator Case asked about tunnels, and Whitton replied:

We can pay for a tunnel where that turns out to be the cheapest and most effective and efficient way of handling the traffic.

Whitton cited examples such as the tunnel west of Denver, adding that if “people still want a tunnel, then I think it is our duty and responsibility, unless Congress decides otherwise, to pay only the cost of the open cut type of highways . . . .

Senator Case asked about building tunnels under the Washington monument. Whitton replied, “Along with the District people, we are dedicated to doing the best job with the least disturbance to the established homes and businesses possible.” That included monuments.

With that, Whitton’s testimony ended, and the subcommittee returned to other subjects related to the District’s transportation needs. [pages 1805-1818]

The committee report on the hearings included many letters from others who did not testify, including a September 13 letter from Senator Randolph, then writing as a member of the Subcommittee on Roads of the Committee on Public Works. Attacks, he wrote, on the District’s capital outlay budget for highways had “created much confusion.” Referring to NCTA’s request to delay the East Leg, interchange “C,” and the Three Sisters Bridge, he said that those seeking delays “apparently are obscuring a number of facts which should be brought into focus.” The 1963 budget represents “the minimum highway needs” if the District “is to keep pace with regional and national highway development.” The budget, he wrote, was based on the Mass Transportation Survey of 1959 and approved by NCPC.

Moreover, the freeway network was designed to include rapid transit, whether by rail or nonrail. “Actually, if there should not be brought into being a rapid transit program, the proposed freeway planning will of necessity have to be much enlarged.”

Those seeking delays apparently did so “on the premise that there is a question of highway versus nonhighway facilities” for the area. This was “an unfortunate mistake” that threatened the highway program now and may threaten the transit program later.

Further, the charge that the District had accelerated its program to get ahead of NCTA was mistaken. Following the 1959 Mass Transportation Survey, Congress in 1961 had increased funds for the Interstate program, which “made it possible to proceed with the original program at a more rapid pace.” Congress created NCTA to study the rapid transit aspect of the 1959 transportation plan, including the possibility of a subway. “This meant that the second part of the overall transport plan was underway; the highway phase already had begun.”

Senator Randolph also addressed NCTA's role, which he said was subject to "additional misunderstanding." In studying mass transit, NCTA was concerned primarily with "home-to-work movement while the highway program is being designed to handle the everyday demands of modern motor vehicle traffic," which he pointed out was "only partly involved in the home-to-work movement." The truth was that "there is an ever-growing volume of motor vehicle traffic of all types that must be served," including trucks serving the area's commercial needs. "Unless these demands are met, this area will be faced with a staggering problem of traffic congestion." Delay in the freeway program will "only multiply the many serious problems that ultimately must be solved."

If the freeway system was delayed until a decision is made on a subway system, the city will be unable to do anything to address growing traffic demand, including visitors:

More than 90 percent of visitors travel in their own automobiles. It would be tragic if Washington's highway condition became such that the city would be classed as a place to avoid.

The date of NCTA report, November 1, 1962, was going to be only a starting point, to be followed by intensive hearings in 1963 to determine if its recommendations are physically possible and financially reasonable. Congressional review could take a year or more, while "highway traffic volume increases almost daily, endangering the commerce of the city and posing a serious problem of public safety." He agreed that if the area embarked on a rail rapid transit system, including a subway, some freeway plans might have to be changed, but "if the highway program is stopped until the subway plan is fully evaluated, the time lost can never be regained."

Senator Randolph also pointed out the District's freeway network, including its controversial parts, were part of a metropolitan area network within the Interstate System. The freeways must be coordinated with their links in Maryland and Virginia. "Changes in the vital parts of the plan could result in these roads being considered ineligible for inclusion in the interstate program."

In closing, he urged the committee to appropriate funds to keep the District's freeway program on schedule. Not doing so would mean costs would increase, downtown commerce would continue to deteriorate with a resultant loss in revenues, and Interstate funds might be lost. [pages 2476-2477]

That same day, August 11, Thomas W. Richards, vice-chairman of the Arlington County Board, accused the District of Columbia of plotting to spoil the county's residential areas so it can get more Federal-aid highway funds. He was referring to the Three Sisters Bridge:

To get 90 per cent Federal financing for the Potomac Freeway it wants to build, the District has got to connect it to an Interstate System which accommodates trucks. So it proposes to link it to a new bridge and then spoil our residential areas by ramming heavy truck traffic through. This is expediency rather than planning. It is a thinly veiled attempt to bail the District out of paying for the Potomac Freeway.

He indicated that the District's request for \$300,000 for the bridge in its 1963 budget was just a ruse to begin minimal construction before NCTA releases its report:

We feel that this fine park on the Virginia shore should not be destroyed simply to accommodate the District of Columbia's freeway schemes. ["Arlington Charges 'Plot' In District Road Plans," *The Sunday Star*, August 12, 1962; "Member of Board Opposes Bridge Link," *The Washington Post and Times Herald*, August 12, 1962]

The District, fighting to save its highway program, released a half-hour color film called "Freeway" pointing out how an up-to-date freeway system could eliminate congestion. At the end of the film, General Clarke said:

The alternates are clear: completion of the freeway system, with people and goods moving and community life flourishing—or construction stopped, goods and people slowed down, with the accompanying blight and decay . . . ."

WMAL-TV was to debut the \$2,000 film on Wednesday, August 15, at 9 p.m. It would then be made available to community organizations for showings with speakers available to discuss the District's Interstate program. ["D.C. Movie On Freeways Is Released," *The Washington Post and Times Herald*, August 12, 1962]

As part of the public relations effort to gain support for the freeways, Aitken, appearing on WWDC's "Report to the People" on September 1, said he wished the public would express the same support for highways that it expressed for automobiles. The District, he said, had the highest per capita income in the country, with automobile sales rising steadily. At the same time, the public expressed "no particular interest" in the freeway network those cars needed. "It makes me wonder philosophically, why."

After all, the purchase of cars was "an implied endorsement of automobility." He wondered if the lack of public support resulted from "a feeling of people that the debate about freeways is academic, something that they feel they personally can't do anything about." Even the harshest critics, he suggested, preferred their automobile to rapid transit, despite their desire to delay freeway construction until the mass transit system was worked out. ["Aitkin [sic] Seeks Public Help on Freeways," *The Washington Post and Times Herald*, September 2, 1962]

On September 25, Robert Moses was in Washington for a presentation to the 11<sup>th</sup> Annual Commissioners' and Governors' Conference on Metropolitan Washington Traffic Problems. (The Governors' Conference was the forerunner of the National Governors Association.) In his remarks, he discussed the congressional delays in the freeway program:

It is not in the public interest to delay this program on the theory that an as yet undisclosed and undetermined rapid transit system will make such highway arterials unnecessary, or materially alter the proposed network.

Washington was, he said, "a car and bus town," resulting in a need to improve transportation for these vehicles. He did not completely discount the need for mass transit:

There are locations where rapid transit can be combined with vehicular lanes with the same right-of-way, but not many. No doubt commuter subsidies of some kind are inevitable, but they should depend on superior rail service after the relative roles of the train, bus, car, and aircraft have been determined by experts concerned only with the truth. ["Moses Fears Transit May Delay Highways," *The Evening Star*, September 26, 1962]

On September 27, 1962, the Committee on Appropriations completed work on the District of Columbia Appropriation Bill, 1963. Regarding freeways, the committee's reported stated:

Funds for the interchange C project, together with the Northeast Freeway and the east leg, were disapproved by the House, and this committee concurs in this action.

The committee also deleted \$760,000 for the Southeast Freeway (13<sup>th</sup> Street, SE, to Barney Circle) because Director Aitken had testified on August 9 that although the House had appropriated funds for the project, "I am going to suggest to you, sir, that there is no need for this appropriation in 1962 with interchange C out because I cannot use it." [page 1688]

Without mentioning the proposal to shift the East Leg to cross park lands along the Anacostia River, the committee addressed the idea by citing a provision of the law, signed on June 2, 1950 (Public Law 81-534), authorizing construction of the East Capitol Street Bridge across the Anacostia River:

That neither the bridge, approaches, nor connecting roads provided for herein shall be planned or constructed through the National Arboretum on the west bank of the Anacostia River.

The report continued:

District officials are reminded that over 12 years ago Congress thus expressly precluded any plans for the construction of highways or parkways through the National Arboretum, which has since been improved at a cost of over \$8 million. In view of the longstanding legislative history on this matter, the committee expects that District officials will make no further use of planning or other funds available to them for developing future proposals which contemplate the use of the National Arboretum for highway or parkway purposes.

In short, the District was free to consider shifting the East Leg to a river alignment as long as it did not encroach on the National Arboretum.

(Like so many other projects in Washington, the East Capitol Street Bridge was the subject of extensive controversy in the late 1940s. District officials wanted to construct the new bridge at East Capitol Street. The National Capital Park and Planning Commission favored a bridge at Massachusetts Avenue. For example, General Grant, testifying as an official of the American Planning and Civic Association, said the District's preferred location would do "irreparable damage" to the area and result in such "intolerable" traffic congestion around the Capitol that Congress might have to appropriate funds for tunnels to carry the overflow on Independence

Avenue and Constitution Avenue. During the debate, Acting Secretary of Agriculture K. T. Hutchinson submitted an amendment to a bridge bill that resulted in the provision protecting the National Arboretum from intrusion by a highway or parkway. The *Star* called the fight between the city and critics the “battle of the bridges.” [Rogers, Harold B., “Grant Criticizes City Heads’ Effort On Bridge Site,” *The Evening Star*, March 14, 1950]

(President Truman approved Public Law 81-534 on June 2, 1950. The bridge opened on November 10, 1955, following dedication ceremonies presided over by District Commissioner Spencer. On a rainy day, he told the crowd of about 300 that opening the \$16 million bridge was a “pleasant task.” It was, he said, “a monument to the skill, energy and vision of the city’s engineers and planners.” Miss Tippy Stringer, the “Weather Girl” on WRC-TV who also hosted cooking and homemaking shows on the station, cut the ribbon:

Miss Tippy Stringer, television star, came bareheaded to cut the red satin ribbon . . . . As her scissors parted the satin, Miss Stringer said, “I dedicate this new bridge to the motorists of the Nation.”

Samuel Spencer, president of the Board of Commissioners, handed the blonde television personality a bouquet of chrysanthemums. Nine-year-old Don Sennott, of 1712 D st. ne., clamored for her autograph, which he got on a wet matchbook.

(Eventually, the bridge was expected to carry 90,000 vehicles a day. [Bassett, Grace, “E. Capitol St. Span Opened In the Rain,” *The Washington Post and Times-Herald*, November 11, 1955]

(In a ceremony on June 13, 1974, the bridge was renamed the Whitney M. Young Jr. Memorial Bridge in honor of the former leader of the National Urban League who had died in 1971. [“Bridge Honors Whitney Young,” *The Washington Star-News*, June 13, 1974] In 1992, the *Post*’s Alan Bisbort described the “steel-plate girder bridge” as “lean and streamlined.” [Bisbort, page 9])

Regarding one of the most controversial projects on the District’s agenda, the committee approved \$300,000 to begin construction of the Three Sisters Bridge. However, it did so “with the understanding that the District of Columbia Highway Department will not proceed with the project until the report of the National Capital Transportation Agency has been submitted in November 1962.” Further, “if that report is against the Three Sisters Bridge, the Commissioners shall proceed with the construction of the bridge unless before March 1, 1963, action to negate such construction shall have been taken by either the Senate Committee on Appropriations or the House Committee on Appropriations.”

Finally, the committee stated:

Furthermore, it is the view of the committee that no funds allocated to the District of Columbia’s highway program shall be used for the construction of the Glover-Archbold Parkway. The committee further recommends that the District of Columbia cooperate in the preservation of this natural park. [District of Columbia Appropriation Bill, 1963,

The Senate considered the bill on September 28. After the Senate had considered many other provisions, Senator Byrd discussed the highway provisions. He said that the District appropriations subcommittee had provided in its report that if NCTA's report was against the Three Sisters Bridge, the District "shall not proceed" to construction. The Senator explained why the committee changed the subcommittee wording:

It was the feeling of those of us who wished to strike out such language that if it were to remain, it would, practically speaking, give the National Capital Transportation Agency a veto over the location and construction of the Three Sisters Bridge and, indirectly, over the design and construction of the Potomac River Freeway . . . .

We believe that the action taken by the full committee yesterday in striking out the earlier language removes a straitjacket which had been applied to the freeway program in the District of Columbia . . . .

In one of the few discussions of the freeway plans during consideration of the bill, Senator Randolph asked Senator Byrd to confirm that the NCTA report was due on November 1, 1962. With that in mind, he hoped that neither the Senate nor the House Committee on Appropriations would delay construction of the Three Sisters Bridge. Having been a member of the House District Committee for 14 years, and chairman for 7 years, he understood the difficulty of resolving the contentious issues Senator Byrd faced. He said nothing had happened since he wrote his September 13 letter to the Committee on Appropriations to change his mind:

I continue to believe it would be a mistake to create roadblocks against a consistent moving forward with the freeway program for the District of Columbia and adjoining areas of the Metropolitan Washington complex. I feel that, to a degree, some recognized errors have been made—not by the subcommittee, not by the Appropriations Committee, but I feel there has been a slowing down of the highway and bridge and freeway program—at least by some persons.

He understood that the critics' positions "were well taken but, I repeat, they have argued it almost to a complete standstill." He was concerned that delays and postponements of possible solutions, both commercial and passenger, were becoming "snarled in the web of confusion here."

He cited the statement by Robert Moses that delay was "against the public interest," a comment coming from "an expert, a knowledgeable person in this transit field." Senator Randolph also cited recent *Star* and *Post* editorials. The *Star*'s September 23 editorial, "Highway Disruption," quoted Senator Randolph's letter. "These are meaningful words," the editorial stated, because "no evidence has been produced by anyone to contradict the assertion of District officials that, regardless of transit proposals, more bridge capacity across the Potomac is essential for motor vehicular traffic."

Similarly, no one had produced evidence that any location other than Three Sisters Island “would be as suitable from the viewpoints of topography, traffic service, residential dislocation, or cost.”

Relatively few freeway projects were underway, but motorists were well aware of “the frustrating and time-consuming traffic jams they create.” Delays meant that the District would have to build the freeways in a shorter period, resulting in an “intolerable mess.” The editorial expressed the hope that the Senate committee would “expedite the unduly delayed freeway construction program.”

The *Post*'s September 22 editorial, “Roads and the Budget,” stated that any basic highway system for the Washington area required the Three Sisters Bridge and the Potomac River Freeway, as well as interchange “C” and the East Leg. The growth of the suburbs was one reason why another bridge was needed to supplement the Key Bridge. “Neither the District nor, for that matter, Congress, can control the pattern of population in the suburbs.” Transit might “reduce the pressure on the roads,” but traffic that could not adapt to rail travel would increase in any event. The “economic viability” of the city depended on addressing the transportation problem.

The Senate Appropriations Committee should have restored the funds the House committee had withheld for interchange “C,” the East Leg, and the Northeast Freeway in the face of a divided Board of Commissioners. In that case, the House-Senate conference committee could retain them in the final bill. The editorial concluded with a reference to NCTA’s report, still 6 weeks off:

To hold up all decisions on highway construction for another year, particularly on such insubstantial grounds, would do the city genuine damage. If Congress wishes to insure coordination between transit and highway builders, the committees certainly have the authority to require it.

After securing approval from his colleagues to reprint the Moses article and the two editorials in the record, Senator Jennings concluded:

We must all realize this is a growing city. The number of visitors to this city will increase by the millions in the years ahead. I have spoken because I felt there could not be a disregard of the needs of the city, particularly highway construction.

Without further discussion of the freeway controversy, the Senate approved the bill, which would have to be reconciled with the House version. [District of Columbia Appropriations, 1963, *Congressional Record-Senate*, September 28, 1962, pages 21188, 21238-21241]

The *Star*, in an editorial about the “needless” restriction on the Three Sisters Bridge, commended Senator Byrd for securing the compromise language that would allow construction to begin unless either Committee on Appropriations takes affirmative action by March 1, 1963, to halt the project. Because General Clarke indicated the city would not be ready to begin construction before then, the restriction was “confusing as well as unnecessary”:

No Commissioner in his right mind would proceed to spend money if an Appropriations Committee, even on an informal basis, told him to stop . . . . In the unlikely event that

some persuasive argument against the bridge should turn up within the next few months, Congress would have ample time to step in—with only a modest amount of money having been spent in the meantime on the bridge design.

The confusion over the language, the editorial said, “can best be cleared up by eliminating its source.” [“Needless ‘Restriction,’” *The Evening Star*, September 29, 1962]

When conferees met, they soon found themselves deadlocked on one issue: the Three Sisters Bridge. By October 4, the *Star* was reporting that conferees were “stuck fast over the city’s controversial highway program.” According to reports, House conferees were “holding out for removal of the restriction and will take nothing else.” Referring to the more restrictive language in the Senate subcommittee’s report, the article said that Senator Byrd has “succeeded in modifying the language and removing the virtual veto power the NCTA held over highway plans.”

Senator Case, the newspaper reported, was leading Senate conferees who wanted to retain the language from the Senate report. The Senators were split, 4-4, on the issue. One House conferee said his delegation would remove the Senate restriction if “we have to stay until the snow falls.” [McKelway, John, “Highway Controversy Stalls District Budget,” *The Evening Star*, October 4, 1962]

The stalemate over the issue continued until October 10 when Senator Hayden, chairman of the Committee on Appropriations, took an unusual step, initiated by Senator Byrd, to complete the conference. On the Senate floor, Senator Hayden said:

Mr. President, I ask unanimous consent that the Presiding Officer appoint an additional conferee on the part of the Senate in regard to the District of Columbia appropriation bill for 1963, H.R. 12276.

Without objection, it was so ordered. [District of Columbia Appropriation Bill – Additional Conferee, *Congressional Record-Senate*, October 10, 1962, page 22933]

With this authority, Senator Byrd added Senator Absalom W. Robertson (D-Va.) to the conference, with assurance that he would break the tie among Senate conferees in support of the bridge project and allow the conference to conclude its work. [McKelway, John, “Congress Ends Deadlock Over District Budget,” *The Evening Star*, October 10, 1962]

The *Star* praised Senator Robertson for coming to the rescue to overcome “the dogged determination of four Senate conferees to impose some kind of condition” on the District’s plans for the Three Sisters Bridge:

Their feeling, as nearly as we can make it out, is that contrary to all traffic estimates and the best judgment of the District Highway Department, the National Capital Planning Commission, the Federal Bureau of Public Roads and most of the experts in Virginia, maybe the bridge is not needed.

The “whole silly business” was ironic since the restrictive language “had very little meaning anyway.” [“Robertson to the Rescue,” *The Evening Star*, October 11, 1962]

With Senator Robertson’s tie-breaking vote, the conference committee completed its work on October 10. Regarding capital outlays, the conference report stated:

The committee of conference is agreed that construction of the Three Sisters Bridge should proceed according to the plan set forth in the budget in the amount of \$300,000 as provided in the bill. Furthermore, it is the view of the committee of conference that no funds allocated to the District of Columbia’s highway program shall be used for the construction of the Glover-Archbold Parkway. The committee of conference further recommends that the District of Columbia cooperate in the preservation of this natural park. [District of Columbia Appropriation Bill, 1963, Conference Report to accompany H.R. 12276, U.S. House of Representatives, 87<sup>th</sup> Congress, 2d Session, October 10, 1962, Report no. 2548, pages 4-5]

When the House took up the conference report on October 11, Chairman Natcher discussed the conferees’ decisions on freeways. During the House hearings, he said, pro-transit and pro-highway advocates “used every political issue and every possible source of opposition to bring about confusion and disorder.” This rivalry was “dangerous and certainly not [in] the best interests of the future development of our Capital City.” He explained how the two District commissioners had asked his committee to withhold funds for the East Leg, interchange “C,” and the Northeast Freeway:

Our committee believes that, where thousands of people will be displaced, every precaution should be taken prior to construction to protect these people before they are forced out of their homes. We have been assured by the Commissioners that, before funds are requested for the deleted items, some solution will be reached solving this major problem.

He described the stalemate during the conference. “Under no circumstances would we agree to such language and so informed the conferees on the other side. They refused to yield and a stalemate resulted.” With Senator Byrd’s maneuver to add a pro-bridge Senator to the conference, Chairman Natcher said, his compromise language was added to the report and the conferees were able to complete their work. “The action insisted upon by the House assures the city of Washington that the freeway program will proceed and there is a place in our Capital City for both freeways and rapid transit.”

Representative William H. Avery (R-Ks.) told his colleagues that he had no “particular interest” in the Three Sisters Bridge, “but I think it is about time that the House took a firm position in support of continued progress on a highway program for the District.” He continued:

It appears that anyone who has an objection to one particular connection or one particular interchange can object and immediately a “hold” is put on that increment. The result is to destroy the usefulness of the whole circumferential system or the inner and the outer loop as well.

He praised the House District appropriations committee for holding firm.

Representative Rhodes agreed that the bridge would “go a long way toward helping solve the dilemma of the District of Columbia highway system.” The committee’s action went “a long way” toward a solution, but “believe me, this problem is not solved and it will not be solved for quite some time.”

Representative Broyhill recalled the Senate’s attempt to include language giving the Appropriations Committee’s veto power over the Three Sisters Bridge. He had fought hard for the bridge:

However, we must recognize that in recent months objections have developed, some of which are from people in my congressional district, to the construction of the bridge, since there is a possibility that a pending rapid transit program may eliminate the necessity for this construction . . . .

There is speculation that this [NCTA] report, which is due on November 1, may well show that the Three Sisters Island Bridge is not needed. Furthermore, a subcommittee of the House District of Columbia Committee has expressed the desirability of holding up any further highway construction of this type which might be proven unnecessary in the report I just referred to.

Under the circumstances, he thought the District Commissioners should “proceed very slowly with developing their plans for this facility during the next 5-months period, until Congress has had an opportunity to consider and act on the National Capital Transportation Agency report.”

The House agreed to the conference report without further discussion of highway issues. [District of Columbia Appropriations, 1963, *Congressional Record-House*, October 11, 1962, pages 23212-23215]

The Senate also considered the conference report on October 11. After the formalities of introducing the bill were over, Senator Leverett Saltonstall (R-Ma.) rose to discuss the Three Sisters Bridge. After recounting how conferees broke the stalemate, he said:

My purpose in rising today is to point out that that vote represents the views of only five members of the Senate committee. The remainder of the committee, so far as I know, are still in favor of the language in the Senate report.

He introduced an October 10 letter from Commissioner Tobriner informing Chairman Hayden that “before the Commissioners proceed with the construction of the Three Sisters bridge, they will give more careful consideration to any recommendations pertaining thereto that may appear in the report of the National Capital Transportation Agency . . . .”

Senator Saltonstall expressed the hope that the commissioners “will bear carefully in mind” the NCTA report before proceeding.

Senator Robertson pointed out that “it would have been utterly absurd to have held the Congress here until Thanksgiving or later to pass only on language in a report, the only purpose of which was to prevent the building of a necessary bridge.” The highway agencies in the District and Virginia favored the Three Sisters Bridge:

But we have a Commission [NCTA] indulging in a pipedream of a proposed subway to cost \$300 to \$600 million, that will go under the river and into a highway to relieve traffic congestion. We are to wait and spend millions of dollars in building U.S. Highway [Interstate] 66, and when it gets to the river, people will either have to swim across or stay on the Virginia side.

He dismissed the objections of “a few citizens who did not want any more traffic,” as well as the allegation that the project would interfere with the Lincoln Memorial or connect with the George Washington Memorial Parkway. NCTA, he said, had neither plans nor money for a subway system “and it will be many years before they have either.” Nothing was involved “but an effort to stop the building of a necessary bridge.”

Senator Mansfield referred to the language in the conference report regarding Glover-Archbold Park. “I hope this admonition will be considered.”

Senator Morse wanted a more definite statement on the issue. He said, “I serve notice on the District of Columbia Commissioners” that he would be in the Senate in January 1963 after the November election and “I strongly recommend that they take note of this colloquy”:

I strongly advise the District of Columbia Commissioners to see to it that this park remains untouched, either from the standpoint of building a highway through it or sacrificing it to selfish commercial interests in the District of Columbia. I suggest to the District of Columbia Commissioners that they not attempt any end run play, because if they do, they will be breaking faith with our committee, in my judgment, and with the Senate, and they will be breaking faith with a majority of the House of Representatives, if we can ever get an issue such as this to the floor of the House of Representatives for a vote.

Senator Mansfield thanked Senator Morse. “I am sure the Commissioners will read every word that has been said on the floor of the Senate about this matter.”

(Senator Morse was reelected.)

Senator Humphrey, in a statement that may have been inserted into the record rather than delivered on the floor, said he supported the reservations the Senate had initially approved regarding the Three Sisters Bridge. He acknowledged “honest differences of opinion,” but felt that Congress should have the benefit of NCTA’s report on mass transit “before giving a final decision as to construction of the Three Sisters Bridge.” Given the importance of the issue, “we can afford a delay of no longer than 5 months,” as the Senate had initially approved. Because the bridge committed the District to the Inner Loop system, Congress needed “an objective assessment of the transportation needs of the area until the entire highway system is evaluated in

light of the forthcoming mass transit proposals.” He regretted that the conferees decided not to approve the Senate language.

The Senate approved the conference report. [District of Columbia Appropriation Bill, 1963-  
Conference Report, *Congressional Record-Senate*, October 11, 1962, pages 23162-23165]

President Kennedy, then in the middle of the Cuban Missile Crisis, approved the legislation on October 23, 1962 (P.L. 87-867), without comment.

That same day, General Clarke delivered a speech to the American Society of Civil Engineers in an attempt to resolve clashes between highway and transit supporters. He said, “the curse of Washington is the endless controversy about the solutions to the problems of the future which involve continuing delay with restudy after restudy of problems on which agreement may have long since been reached.”

The modes served different needs:

The mass transportation problem is concerned primarily with the movement of people into and out of the downtown section of the region. The highway problem is concerned primarily with moving those people who are not going downtown but who are moving diffused patterns throughout the region.

To break through the competitive spirit among the partisans, he said:

My proposal is quite simple. Let us attempt to arrive at agreed total volumes or percentages of the total travel . . . for which we will plan each mode of transportation.

Let us allow each agency to determine and plan an adequate system to provide for the agreed-upon loads. In this way we could at least get progress without the planners’ competing for traffic loads to justify individual broad plans.

If this first step could be agreed upon, the remaining steps are relatively simple. They consist of co-ordinating the detailed planning and construction of the various facilities to be built so that each new system provides for the other without undue waste and for mutual support.

He said that following his suggestion “would allow the shoemaker to stick to his last and the tailor to the cutting of the cloth so that the whole person will be clothed.” He favored acceleration of the highway program as well as mass transportation to create a balanced transportation system:

We must avoid action on the part of any of the official agencies which attempts to restrict unduly the programs of others to insure that a pre-determined solution will be justified. It would be possible by design to restrict a program on either side to a point that it would fail.

He believed that “we can secure among all the agencies a remarkable degree of unanimity of the numbers of people for whom adequate mass transportation should be provided and the numbers who should be provided with adequate facilities for travel by car.”

As for groups such as the American Institute of Architects, General Clarke thought they “could render a much more constructive public service by using their many talents to advise and consult on the ways by which highways may be skillfully threaded into the fabric of the Nation’s Capital.”

The area’s population, he said, would double over the next 18 years, which meant more highways were needed. He expected that sufficient housing would be available for those relocated by the program, and the board of architects would assist highway officials on matters of “esthetics and general livability.” He was “willing and anxious” to work with NPS on replacing any park land taken for the city’s public works program:

If we can avoid negativism, timidity and sheer obstruction along with cross-accusations of competing agencies, I believe we can move the city along. [Pierce, Charles D., “Clarke Proposes to End Highways-Transit Feud,” *The Evening Star*, October 23, 1962; “Clarke Tells Bickering Transit Foes to Get Back to Work,” *The Washington Post and Times Herald*, October 24, 1962]

Although the President signed the District appropriation act, 1963, without ceremony or comment – typical for such a bill – he did send a letter to Commissioner Tobriner regarding the Three Sisters Bridge. Administrator Stolzenbach, in his first appearance after a law was passed designating him an ex-officio member of NCPC, read the letter when Engineer Commissioner Clarke asked to have an item on the bridge removed from the agenda. The letter was in reference to Commissioner Tobriner’s October 10 letter to Senator Hayden:

Dear Mr. Tobriner:

I am advised that on October 10<sup>th</sup> you informed the chairman of the Senate Committee on Appropriations, in connection with the conference on the appropriations bill for the District of Columbia, that the Commissioners will give careful consideration to the forthcoming report of the National Capital Transportation Agency on the transportation needs of the region before proceeding with the construction of the Three Sisters Bridge.

I believe that this was a wise decision and that the agency’s recommendations should be studied and evaluated before a decision to proceed with construction of the bridge is reached.

I should appreciate it if you would keep me advised through Mr. Horsky of future developments with respect to this matter.

Sincerely,

John F. Kennedy.

[Flor, Lee, “Kennedy Note Upholds Wait on Sisters Bridge,” *The Evening Star*, October 26, 1962; “JFK Backs Delay On Bridge Project For Transit Report,” *The Washington Post and Times Herald*, October 25, 1962]

With action on the FY 1963 budget completed, the District Highway Department submitted its 1964 budget request to the District commissioners. The department asked for \$88.8 million, a \$30 million increase, for a budget that included several controversial freeway proposals. The budget sought funds for the projects Congress had delayed, namely interchange “C,” East Leg, Northeast Freeway, and the Southeast Freeway between 11<sup>th</sup> Street and Barney Circle, SE., as well as two projects NCTA had opposed unsuccessfully (Three Sisters Bridge and Potomac River Freeway).

New items referred to construction of:

- North Leg of the Inner Loop along Florida Avenue between 3<sup>rd</sup> Avenue, NW., and 11<sup>th</sup> Street, SE.;
- Center Leg between the Southwest Freeway, along 2<sup>nd</sup> Street to the North Leg along Florida Avenue;
- Intermediate Loop between East Capitol and 41<sup>st</sup> Street, SE., and Missouri and Georgia Avenues, NW.;
- Ninth Street Expressway between Constitution Avenue and the Southwest Freeway.

The budget, Engineer Commissioner Clarke said, presented a clear choice for the agencies considering the budget. As for one of the chief objections to freeway construction, he was “confident the relocation problem caused by the projects can be solved.” [Flor, Lee, “Roads Budget Request Rises by \$30 Million,” *The Evening Star*, October 25, 1962; Clopton, Willard, “Funds Allowed To Build Most of Intermediate Loop,” *The Washington Post and Times Herald*, October 25, 1962]

### **National Capital Transportation Agency Submits Its Report**

As directed by the 1960 Act, NCTA submitted its report, *Transportation in the National Capital Region: Finance and Organization*, to President Kennedy on November 1, 1962. In a transmittal letter, Stolzenbach told the President:

The programs recommended in this report strike a sound balance between highways and mass transportation for this region. The Agency proposes a continuing program for the construction of a regional highway system and a ten-year program for the construction of a modern high-speed rapid transit system. These facilities are essential to solving the region’s severe transportation problem and to preserving and enhancing the vitality and appearance of the Nation’s Capital.

The plan focused on the express transit system, which called for two subway routes within downtown. The routes totaled 19 miles and crossed twice for distribution and collection. “This will provide fast service throughout downtown, speeding rush hour trips and improving circulation of downtown traffic in off-peak hours.” The downtown lines would be extended

through the District and suburban areas along seven rapid rail transit routes and one commuter railroad route. Stations and parking areas would serve as local distribution and collection centers linking automobiles with the transit lines.

The plan included express and local bus service in the District and throughout the suburbs with convenient connections to the high-speed trains. The report summarized:

The rail rapid transit system will be 83 miles long and will be served by 65 stations. Nearly 19 miles will be underground. Some 26 miles of freeway median strips and 24 miles of existing railroad rights-of-way will be used for the rail rapid transit system. The Pennsylvania Railroad line [from Bowie to Cheverly in Prince George's County, Maryland] will be 15 miles long and will have seven suburban stations. Express bus operations will be provided on 52 miles of freeway and parkway. [*Transportation in the National Capital Region: Finance and Organization*, National Capital Transportation Agency, 1962, pages 31-32]

The report identified the location of each route and station as well as the time a trip between them would take.

NCTA estimated that a capital outlay of \$793 million would be needed for the rapid transit system. Of the projected cost of \$793 million, the report estimated that \$681 million would be needed for construction (including engineering, acquisition of right-of-way, and contingencies), with the balance of \$112 million to acquire rail rolling stock. [page 48]

The plan called for a basic fare of 25 cents for all trips within the 10-mile square of the original District of Columbia. The suburban areas were divided into zones, with fares increasing 10 cents per zone. Concessions, advertising, and other sources of non-operating income were projected to generate about \$5 million annually by 1980.

Funding for the transit plan would be a problem since the Federal Government did not have a transit-aid program. The recommended plan called for the issuance and sale of \$530 million in federally guaranteed loans on the private money market during 1971-1974. Proceeds would be used for capital outlays and to refinance \$415.6 million of interim Treasury borrowing. The Federal guarantee would encourage more private borrowing than would otherwise be possible and keep the interest at a possible level of 4.5 percent. In addition, the plan proposed \$180 million in government equity from the local governments, \$20 million of capital outlays from system revenue, and new Treasury loans of \$63 million to be repaid from surplus revenue after the system is on a revenue-producing basis.

The plan included \$180 million in government equity, with the Federal Government providing \$120 million of this amount. Government equity would be repaid after retirement of debt within 30 years of system completion. The recommended breakdown of the local contribution among jurisdictions was:

- District of Columbia: \$21,720,000
- Maryland counties: \$18,690,000

- Virginia suburban districts: \$19,590,000

Construction debt would be retired within 30 years mainly from farebox revenue, after which the government debt would be repaid:

Whether or not repaid, the equity paid in by local jurisdictions represents an average annual per capita burden during this period of less than 50 cents for each resident of the National Capital region. [pages 80-81]

Construction would begin in 1964, with downtown service to begin in 1968.

As for highways, the report explained that auto ownership was steadily increasing, with many people moving through downtown in the future either unable or unwilling to use public transportation.” The movement of trucks was another consideration. Still, the region had a substantial network of freeways and parkways, totaling 140 miles, but “more roads will be needed if the residents of the region are to have a substantial degree of mobility.” Current plans included another 65 miles of freeways or parkways. NCTA recommended another 50 miles of freeways by 1980.

In the Washington area, as elsewhere, “the public has also shown that it is troubled by overextensive highway construction and regards rapid transit facilities as a less disruptive means of transporting people to and from downtown.” This preference was shown in the Washington area where virtually every citizens association was “in favor of more emphasis on new rapid transit facilities and relatively less emphasis on new highways.” [pages 10-11, 42-43]

The recommended highway plan retained the key features of the Mass Transportation Survey plan:

The Capital Beltway is the framework for future regional industrial and commercial as well as residential development, and the major heavy-duty route bypassing central Washington and connecting its outer suburbs. From a dozen points along the Beltway, radial expressways lead inward to serve the suburbs and the District.

The new transit system would reduce traffic in certain corridors, necessitating changes. [page 43]

The key problem was downtown where no practicable highway system could accommodate the traffic to and through downtown as forecast for 1980. Coupled with the downtown subway, NCTA recommended a downtown freeway system in the form of an inverted “T” connecting the central bridges (15<sup>th</sup> Street, Arlington Memorial, Theodore Roosevelt, and Key) with freeways to Montgomery and Prince George’s Counties:

The “T” includes major elements of the inner loop proposed in the 1959 plan. However, the North Leg of the previously proposed loop is replaced by an express street system that would provide adequately for traffic requirements and at the same time preserve desirable neighborhood characteristics and fit in with any future plans for neighborhood

improvements. The Agency's studies show that such improved street facilities would be adequate for traffic movements in the area which the North Leg would serve . . . .

The Agency's studies similarly show that the East Leg of the previously proposed loop is not required since it can be satisfactorily replaced by a high-speed route through Fort Drive.

Instead of the East Leg, NCTA favored a route that crossed the Anacostia River on the 11st Street Bridge, then ran north on the Anacostia Freeway and Kenilworth Avenue, both of which would be widened and swing northwest onto Fort Drive. The rationale was that much of the traffic originates or ends in Washington and Montgomery County or in southern Prince George's County. Under NCTA's plan, much of this traffic would remain on the east bank freeways, unlike the District plan which encouraged motorists to cross the river, crowding the bridges and the area between the river and downtown.

With those elements out, the "T" consisted of:

- (a) Extending the Southeast Leg to 11<sup>th</sup> Street and across the Anacostia River to Route 295; and
- (b) Constructing an underground freeway below the Mall from Third and C Street, S.W., to the vicinity of Third and C Streets, N.W., and a depressed freeway from there to New York and Florida Avenues. This Third Street leg will not require use of any part of the Capitol grounds. In the vicinity of New Jersey Avenue it will be integrated with proposed urban renewal projects. [pages 43-44]

NCTA also proposed to combine I-95 and I-70S in the District and Maryland:

The Third Street Leg will be extended along New York Avenue to 9<sup>th</sup> Street, N.E. From there the route will turn and follow the Baltimore & Ohio Railroad tracks toward Silver Spring. This will be the means of bringing Interstate Routes 70-S and 95 into the city from Maryland and of serving the central and eastern portions of Montgomery County and the western portions of Prince George's County.

I-95 diverted from I-70S in the vicinity of Michigan Avenue/Queen's Chapel Road and continued to a link with I-95 at the Capital Beltway.

For western Montgomery County, traffic service to downtown "will be provided by the George Washington Memorial Parkway and the Potomac Freeway."

The use of the railroad corridor was "the key to meeting" highway needs by providing additional capacity while "avoiding the substantial relocation of persons, loss of taxable property and disruption of neighborhoods that would result from construction of the Northeast, North Central and Northwest Freeway proposed in the 1959 plan." A rapid transit line between Silver Spring and Queen's Chapel, Maryland, would be located in the I-70S corridor. [page 44]

The new plan also called for changes in I-66 in Virginia. The State was building I-66 outside the Capital Beltway and acquiring right-of-way within the circumferential. Under the plan:

Route 66 will have six lanes except between the Airport Access Road junction and Four Mile Run. Between these two points the capacity will be increased to eight lanes. From Route 66 to Arlington Boulevard a short spur through Four Mile Run will be needed as will improvements of the Boulevard.

The reason for the reduction was that trucks could not cross the Theodore Roosevelt Bridge; they would be diverted to the Shirley Highway's 14<sup>th</sup> Street bridges. [pages 44-45]

NCTA also rejected the Three Sisters Bridge. The report explained that the only reason for the Three Sisters Bridge was "to bring trucks and additional auto traffic from Fairfax and Arlington Counties into downtown." That service is not required. With 22 bridge lanes open in 1957, 19 more lanes recently opened or under construction, and mass transit reducing automobile traffic, "central area bridge capacity will be adequate for the needs of motorists in 1980 without Three Sisters Bridge.

Further, building the Three Sisters Bridge would "create traffic pressure that would tend to force construction of highways that would otherwise be unnecessary." The report cited the Northwest Freeway, the Glover-Archbold Parkway, the North Leg of the Inner Loop Freeway, and portions of the Intermediate Loop in Arlington. [pages 25-28]

The report also called for two projects that were essential to the operation of the downtown freeway plan. One was construction of a highway on Fort Drive between the combined I-70S/95 and the Kenilworth Avenue Expressway, a project that would require little new right-of-way because the city had acquired most that would be needed. The widening of Kenilworth Avenue and the Anacostia Freeway would be needed in later years. [page 45]

Finally, NCTA considered advanced vehicle concepts, such as monorail, but concluded that "the standard-gauge, dual-rail system has distinct advantages over the monorail vehicle system." The report considered D.C. Transit System's monorail proposal in an appendix, limiting its review to a line from Georgetown to Dulles International Airport. A transit line was needed in the densely populated Wisconsin Avenue-Chevy Chase-Bethesda corridor, but the line to the airport "would depend almost entirely on airport and tourist patronage; it would carry virtually no commuter traffic and therefore make no contribution to the solution of the peak hour congestion problem."

Rapid transit service to the airport "may well be desirable," but the most logical route would be an extension of the proposed rapid transit line serving, and deriving revenue from, Arlington and Fairfax. Moreover, if rail service were provided to the airport, travelers should be linked to downtown and "not force him to transfer to a bus or taxi several miles short of downtown as would the Superrail proposal."

Further, the monorail would be "too costly to become part of a rapid transit system whose heart is a downtown subway." Tunnels, for example, "would have to be about one and half feet higher" to accommodate the elevated line. [pages 66, 91]

Professor Schrag summarized the NCTA plan:

Gone, in the NCTA plan, was Bartholomew's intermediate loop. Gone was the northern half of the Inner Loop, the so-called North Leg and East Leg, except for enhancement of existing streets. Gone was Bartholomew's pet Northwest Freeway. Gone too was the Three Sisters Bridge. The NCTA acknowledged the need for some new highways, but only where they could be built with the minimum impact on established neighborhoods. Thus, it combined the North Central and Northeast Freeways of the 1959 plan with a version of the East Leg to create a Y-shaped freeway whose stem would run alongside the B&O railroad tracks leading north from Union Station. Because these tracks had been in place since the beginning of the century, a highway alongside them would not divide neighborhoods any more than they already were divided, "avoiding the substantial relocation of persons, loss of taxable property, and disruption of neighborhoods" that would result from the 1959 plan. [Schrag, page 54]

The new plan, with its reduced highway component, would cost less than the 1959 proposal:

It confidently asserted that its program offered a plan in which "each type of transportation is assigned to do the work for which it is best suited and in the sense that people will have a reasonable choice of how to travel." [Schrag, page 54, quote is from the NCTA report, page xi]

### **Trying to Sort Out the Freeway Battles**

Upon receipt of the NCTA report, President Kennedy released a statement in which he "expressed his hope that the report and recommendations of the transportation agency would be a significant contribution to the solution of the transportation problems of the National Capital." The plan was to be reviewed by District, Federal, and other officials before the President submitted recommendations to Congress.

Representative Broyhill, after scanning the report, said it "looks like a real step forward." He said he would contact Chairman McMillan of the House District Committee to urge hearings by the Joint Committee in early January 1963. "I am sure the chairman will agree with me." In addition, Representative Broyhill said, "I hope it will be shown that the Three Sisters bridge will not be needed."

The District's Aitken was skeptical of the funding aspects of the mass transit plan. He would not be able to comment in detail until NCTA released appendices on planning, engineering, finance, and organization. "If Mr. Stolzenbach can build a transit system for 60 per cent of the persons going down town in rush hour, let him." He added, "But why can't he let highways alone?"

Virtually every other agency or jurisdiction that was asked to review NCTA's report made the same observation regarding the absence of the appendices. Without them, officials could not understand the basis for NCTA's assertions.

Donald Gingery was critical, as he had been of Stolzenbach and NCTA all along:

It's perfectly obvious there was no control or checks and balances over the agency's procedures. I think the agency should not get any more funds until Virginia and

Maryland get some representation on the agency. I recommended some time ago that Congress give the State Governors the right to appoint a chairman who would rank with Mr. Stolzenbach.

This was an undercover study without checks and balances and it throws planning in both States into chaos.

Chairman Wells of the Maryland-National Capital Park and Planning Commission said he thought NCTA, with its focus on the District, had not considered the 800,000 residents of Montgomery and Prince George's Counties.

Arthur K. Stellhorn, planning director of the Maryland-National Capital Park and Planning Commissioner, was concerned that NCTA had proposed rail service along most of the routes where Maryland planners favored highways. He said that Stolzenbach was "taking the same routes that we are but he is taking off the highways." Gingery agreed, saying NCTA's plan would stop the commission "dead in its tracks." NCTA's report had "cast a real legal shadow on all regional planning for years to come."

State Senator Fenwick of Virginia thought NCTA had performed a service. "I feel, however, that there may be overemphasis on mass transit at the expense of the highway program." He was concerned that if the plan were used to delay highway construction "in hopes that within the next 10 years we will have a rapid transit system, we might never recover from the delay of these programs."

John E. Harwood, the Virginia Highway Department's location and design engineer, disagreed with NCTA's conclusion about the Three Sisters Bridge. "Adding more trucks to the 14<sup>th</sup> Street Bridge would only add to the congestion there. There is going to be a need for many more bridges, no matter how much rapid transit you have."

Ernest D. Wilt, who chaired the Arlington County Board, said the area needed "something like" NCTA's rail transit plan. "We may find we don't need the Three Sisters Bridge," which the board had long opposed. [Flor, Lee, "Broyhill Vows Early Transit Plan Action," *The Evening Star*, November 2, 1962; Clopton, Willard, "Area Politicians Favor Transit Plan Plus Roads," *The Washington Post and Times Herald*, November 3, 1962]

The Bureau of the Budget sent the report to the Departments of the Treasury, the Interior, and Commerce, home of BPR, and the Housing and Home Finance Agency for review. Comments were expected by the end of the year, although full review might not be possible until NCTA released the appendices. Horsky said that given the amount of information yet to be released, "It could be that the budget and legislation will be in a supplemental request to Congress."

BPR's Barnett was concerned about the NCTA's proposal on freeways, which was "certainly not the program" BPR had approved for the region. While all officials should give "a new look" at the program, he said "the Bureau expects an integrated system." ["Transit Reviews Seen Awaiting Added Data," *The Sunday Star*, November 4, 1962; Clopton, Willard, "Transit Scheme Still Must Clear Many Hurdles," *The Washington Post and Times Herald*, November 4, 1962]

The *Star*, meanwhile, was skeptical. An editorial stated that NCTA's report "does not suffer from any lack of confidence." A subway was needed, but NCTA's assertion that it would carry enough riders "to pay its entire capital and operating costs over the next 40 years is an astounding claim." Quite simply, "There is no precedent in experience elsewhere to support it."

As for the highway element of NCTA's report, it did more "than simply curtail certain parts of the regional freeway system which has been carefully developed and generally approved for years." Instead, it had "cut the heart out of this system—to such a degree, in fact, that the question arises as to whether the true intent might not be to make automobile congestion so clearly intolerable, through inadequate highways, that commuters would have no alternative but to seek other forms of transportation that exist only on paper." What would be left was a "skeleton highway system" that officials might be able to finance "under existing policies underlying Federal aid in highway construction."

The editorial cited the report's position on the Three Sisters Bridge as an example:

[It was] unnecessary because a rail-transit line would extend into the Arlington-Fairfax region and that, in its considered judgment, existing Potomac bridges alone would have sufficient capacity in 1980 to accommodate vehicular traffic. Here we go again! What is the source of traffic estimates which allegedly support this assumption?

Until NCTA released appendices explaining the basis for such assumptions, "the public would be wise to reserve judgment on much of the report." ["Transportation Plan," *The Sunday Star*, November 4, 1962]

How trucks would cross the Potomac River if the Three Sisters Bridge were not built was another question. On November 13, the District Commissioners committed to building the Three Sisters Bridge by approving an extension of the Potomac River Freeway from 31<sup>st</sup> and K Streets to Georgetown University. Director Aitken said the city had little choice but to build the Three Sisters Bridge. Key Bridge, which carried U.S. 29 between Rosslyn in Virginia and Georgetown in the District, could not handle truck traffic. Only the middle of the structure, built originally to accommodate streetcars, was structurally able to accommodate truck loadings. If Key Bridge had to carry trucks, it would have to be reconstructed:

Reconstruction would require closing Key Bridge to traffic while this work was done. This bridge now carries 66,000 vehicles a day and I am not about to propose that it be closed.

Moreover, when the District Commissioners approved the Potomac River Freeway plan earlier in the day, they had deleted two ramps connecting Key Bridge with the Whitehurst Freeway. Aitken said the ramps were "not compatible" with the planned freeway system and were not economically feasible.

As a result of these decisions, Key Bridge was no longer a possible link in the freeway network for traffic crossing the Potomac River. In addition, the Eisenhower Administration had requested that the Theodore Roosevelt Bridge, still under construction, not carry trucks. Aitken said the

plan was for Interstate traffic to cross the river on the Three Sisters Bridge as part of the Potomac River Freeway. The four-lane Whitehurst Freeway would carry westbound traffic while the four-lane Potomac River Freeway would carry eastbound traffic. [“Pierce, Charles D., “Key Bridge is Ruled Out as Truck Link,” *The Evening Star*, November 14, 1962]

The District commissioners held a public hearing on the 1964 budget for road construction. The hearing was sparsely attended, with only about 50 people in attendance. The *Star*’s opening paragraph summarized the result:

Charges of “blackmail” and “unadulterated arrogance” and warnings of “irreparable harm” and “disaster” were sounded today as highway supporters and opponents collided at a public hearing.

Polly Shackleton said that by including the East Leg, Northeast Freeway, and interchange “C” in the budget, District officials displayed “unbelievable gall.” These freeways could result in the “ruthless destruction of countless homes and communities . . . .” This action on these projects represented “pure unadulterated arrogance.” She also criticized District highway officials for their plan to remove the ramps connecting Key Bridge and the Whitehurst Freeway, which she thought was a form of “blackmail” to force construction of the Three Sisters Bridge.

Chairman Neil Phillips of the Committee of 100 on the Federal City called the District highway budget “ideal” for the truck and highway lobby, but “a blueprint for disaster for the District of Columbia”:

Washington has drifted to an ever-increasing auto-dominant transportation system in which the interest of motor vehicles reigned dominant and the interests of the people—concerned with their neighborhoods, institutions, and fiscal soundness of their government—stood neglected.

Clifford C. Ham of Neighbors, Inc., called the highway proposals “opportunistic, costly and . . . destructive of human values.” His group favored NCTA’s transit proposals:

For the first time some emphasis is placed on solutions involving more than automobile transportation. For the first time we recognize considerations of such factors as home, communities, the potential displacement of families and businesses, and the elimination of needed public and private community facilities.”

Some witnesses favored the highway plans. J. C. Turner, president of the Greater Washington Central Labor Council, reminded the commissioners that thousands of construction workers depended on the highway program for their jobs. He said that, “unless the highway program goes forward month by month, there will be severe unemployment this winter as well as in the winters to follow.” He was convinced the relocation problem would be solved so that “no one in this community will suffer and the highway program will go forward.”

AAA’s Miller said the board endorsed the highway program:

Even if the most modern and advanced rapid transit facilities which have yet been devised were to be provided the Washington Metropolitan Area tomorrow, it would not and in the foreseeable future take care of only a fraction of the area's transportation requirements and at an appalling deficit.

He disputed NCTA's estimate that its proposed rapid rail system would pay for itself. It would, he said, run deficits "vastly greater" than the annual deficits of \$16 million predicted for the more modest rail system proposed by the Mass Transportation Survey:

One can only imagine what the deficit would be for the proposed eight-lane rail rapid transit system proposed by the National Capital Transportation Agency.

Overall, according to the *Post*, "the proposed highway program drew more cheers than jeers at the lightly-attended hearing." [Pierce, Charles D., "D.C. Highway Plan Termed 'Blackmail,'" *The Evening Star*, November 16, 1962; Schuette, Paul A., "Freeway Plans Stir Debate at Public Hearing," *The Washington Post and Times Herald*, November 17, 1962]

Given the interest in shifting the East Leg Freeway from the 11st Street corridor to the west bank of the Anacostia River, District officials opened discussions with NPS officials in hopes of a compromise regarding the use of park lands. Wirth told reporters that he had not seen details of a proposal. "I don't want to take a stand one way or the other without looking at it." He indicated, however, he had "an open mind" on the question. One concern he cited was that the freeway would cut off a portion of a public golf course. District officials responded that the golf course could be extended north onto land created by proposed dredging and reclamation around Kingman Lake. Further, they contended, most of the park land needed for the freeway was undeveloped and, in general, not suitable for park facilities. ["Wirth Keeps 'Open Mind' on East Leg," *The Washington Post and Times Herald*, November 18, 1962]

### **Implementing the Year 2000 Plan**

On November 27, 1962, President Kennedy released a memorandum on the Year 2000 Plan for the National Capital Region. Building on the Year 2000 Plan, President Kennedy said that in view of the Federal interest in the region, he wanted "the greatest possible coordination of planning and action among the Federal agencies in developing plans or making decisions which affect the Region." To facilitate planning, he established "development policies" as guidelines. For example, all agencies were to base their decisions on the prospect that regional population would be 5 million by 2000. Further, the Federal Government would "limit the concentration of Federal employees within Metro-Center . . . over the next four decades to an increase of approximately 75,000." Federal office development should follow the corridor cities concept recommended in the Year 2000 Plan:

The success of the corridor cities concept depends on the reservation of substantial areas of open countryside from urban development. It shall be the policy of the executive branch to seek to preserve for the benefit of the National Capital Region strategic open spaces, including existing park, woodland, and scenic resources.

The memorandum advocated non-monumental government buildings in clusters within the central business district that “will have a dignity and strength to establish their public identity.”

As for transportation, President Kennedy’s memorandum said:

Planning to meet future transportation requirements for the Region shall assume the need for a coordinated system including both efficient highway and mass transit facilities, and making full use of the advantages of each mode of transportation.

With these and other guidelines, he asked all department and agency heads “to give full consideration to these policies in all activities relating to the planning and development of the National Capital Region, and to work closely with the planning bodies which have responsibilities for the sound and orderly development of the entire area.”

The *Star* welcomed President Kennedy’s call for coordination, saying it “logically complements his earlier appointment of Charles A. Horsky as special White House advisor on Washington area affairs.” Horsky was in a unique position to resolve roadblocks, especially those involving conflicts involving previous administration policy:

Action is more difficult, however, when the proper policy is not clearly defined, as is the case with the most pressing area problem—transportation.

The *Star*’s editors saw the memorandum in the context of the President’s recommendations to Congress on mass transit and highway proposals in NCTA’s report:

Here also, however, the new memorandum should prove beneficial. For its issuance at this point obviously is intended to enlist the co-operation of all agencies in carefully studying the controversial NCTA report, and in submitting recommendations which will help the White House arrive at a sensible conclusion. [“Goal: Co-ordination,” *The Evening Star*, November 28, 1962]

In part because of President Kennedy’s support, the Year 2000 Plan was more influential than the Downtown Progress action plan. Gutheim and Lee summarized the impact:

A fruitful debate began to define common interests. Large portions of the wedges and corridors plan were embraced in Maryland and, with modifications due mainly to topography, in Virginia as well. The bold and simple diagram planted itself in the popular imagination and, widely supported by civic groups, survived many challenges by the Council of Governments for as long as fifteen years.

In downtown Washington, redevelopment and the location of federal buildings received support from the plan but were less consistently responsive to it. Nevertheless, the plan influenced the design of the Metro rail system and special project planning for Pennsylvania Avenue and other development centers. Most of all, the Year 2000 Policies Plan also affected the future planning of the National Capital Planning Commission.

The impact of the Year 2000 Policies Plan was most pronounced in the metropolitan region where rural land still existed. For the first time, a structure was suggested that combined the much-desired qualities of order, open space, and mobility.

The Year 2000 Plan affected the scope of planning in the area:

To realize the vast wedges and corridors design, regional planning organizations clearly had to include all planning elements: zoning, regulation of new subdivisions of land, transportation networks, public works, and the allocation of funds. The regional growth configuration of the Year 2000 Policies Plan also required more immediate action to regulate development of heavily populated corridors, including the new town centers, highways, the completion of the mass transportation system, and the preservation of three hundred thousand acres of open space required to separate the corridors. Policies worked out jointly between the National Capital Planning Commission and the National Capital Regional Planning Council additionally involved economic analyses; development plans; and studies of legal, administrative, and fiscal arrangements. In this way, new forms of development planning were superseding the older and simpler regulations of land use that had constituted planning for the past half century. [Gutheim and Lee, pages 291-293]

### **The Darwinian Theory of Transportation**

Despite NCTA's objection to several freeway proposals, the District commissioners had committed to the Three Sisters Bridge on November 13 by approving an extension of the Potomac River Freeway from 31<sup>st</sup> and K Streets to Georgetown University. Director Aitken said the city had little choice but to build the Three Sisters Bridge. The Key Bridge, which carried U.S. 29 between Rosslyn and Georgetown, could not handle truck traffic. Only the middle of the structure, built originally to accommodate heavy streetcars, was structurally able to accommodate trucks. If Key Bridge had to carry trucks, it would have to be reconstructed. Aitken said:

Reconstruction would require closing Key Bridge to traffic while this work was done. This bridge now carries 66,000 vehicles a day and I am not about to propose that it be closed.

Moreover, when the District commissioners approved the Potomac River Freeway plan earlier in the day, they had deleted two ramps connecting Key Bridge with the Whitehurst Freeway. Aitken said the ramps were "not compatible" with the planned freeway system and were not economically feasible.

As a result of these decisions, Key Bridge was no longer a possible link in the freeway network for traffic crossing the Potomac River. In addition, the Eisenhower Administration had requested that the Theodore Roosevelt Bridge, still under construction, not carry trucks. Aitken said the plan was for Interstate traffic to cross the river on the Three Sisters Bridge as part of the Potomac River Freeway. The four-lane Whitehurst Freeway would carry westbound traffic while the four-lane Potomac River Freeway would carry eastbound traffic. [Pierce, Charles D., "Key Bridge is Ruled Out as Truck Link," *The Evening Star*, November 14, 1962]

The plan for the Potomac River Freeway seemed uncontroversial because the District and NCPC had approved it and Congress had appropriated funds for it. However, whether the new freeway would extend ramps to Key Bridge did prove controversial. As NCPC Chairman Rowe pointed out, the absence of connections with the bridge created the need for the Three Sisters Bridge, making the absence controversial. She indicated that the District's action was taking liberties with NCPC's approval. Although NCPC had approved the Three Sisters Bridge, she contended the approval was only in principle, without approval of plans for approaches in the District. She also disputed the District's plan to link the freeway to Georgetown University via Prospect Street, a plan NCPC had never approved. Further, NCPC's associate director, Charles H. Conrad, disagreed with Aitken about the feasibility of the link to Key Bridge. "There is no physical reason why it cannot be done." [Schuette, Paul A., "River Highway Runs Into New Controversies," *The Washington Post and Times Herald*, November 19, 1962]

NCPC Executive Director Finley was about to leave his post to take a position with a Baltimore mortgage and development firm. On November 21, he addressed the Washington section of the Institute of Traffic Engineers on "Reflections on Leaving the Nation's Capital."

Finley praised the Bible Committee for its 1959 recommendations for a regional development agency and other recommendations that had been gathering dust ever since. "The recommendations should be dusted off and studied—they were years ahead of their time." He told the professional engineers, "No matter what anybody says here, the future transportation system will result from decisions made in the halls of Congress on non-technical basis resulting from the emotional reactions of Congressmen."

He praised the District Highway Department, saying it had the most enlightened approach of any State highway agency for designing attractive freeways in cities. "The District has had the most creative response to the problem of urban design, a problem which more traffic engineers are going to have to consider as time goes by." He complimented the District for its cooperation with city planners and for its hiring of architectural consultants for help in designing highways that fit in the Nation's capital. "Hal Aitken, District highway director, deserves a great amount of credit for this," he said.

Finley included "a few jovial comments," as the *Star* put it, on the District's "friendly rival," NCTA. He noted that Darwin Stolzenbach was not in attendance, possibly because he feared Finley "would reveal his Darwinian theories of transportation [namely that] if you delay highways long enough, you really need transit."

Mr. Finley said people also were saying that the initials NCTA stand for "Never collate the appendices." As the *Star* explained:

This was in reference to the growing number of requests by agencies for several appendices which the NCTA said would be published soon after its November 1 report to President Kennedy on financing and organization for transportation. Agencies have been told that the NCTA had all of the material ready for the appendices by October 1, but has never been able to write the material in what it felt was acceptable form, officials said.

Finley also suggested that strengthening a regional planning agency would be like sending an ambassador to a country that doesn't exist. "We need a better metropolitan organization, and would be much better off with some centralized type of government." At present, NCPC had a say in many areas, but its function was largely advisory, which he called "an old-fashioned idea" in planning:

A competent agency ought to be established which is big enough and strong enough to prepare a development plan for the city, say for 20 years. It ought to be able to see that decisions are made according to that plan.

If the commission were under the direction of the White House, he speculated, it would be able to deal with Federal agencies across the board with authority. He hoped that appointment of Charles Horsky was an indication that "this is where we are headed."

He said of his current NCPC post, with its annual salary of \$19,000, "it has been thrilling to work in the community. I look forward to coming back with my pockets filled with money." ["D.C. Freeway Designs Lauded By Parting NCPC Chief Finley," *The Evening Star*, November 22, 1962; Whitten, Leslie H., "Finley, in Parting Short, Blasts Inaction Here," *The Washington Post and Times Herald*, November 22, 1962]

A *Star* editorial complimented Finley for saying "publicly what others are saying behind the scenes" regarding Stolzenbach's efforts to delay highway construction. Stolzenbach denied any such intention, claiming he simply thought highway development should be delayed until decisions are reached on the rail rapid transit system NCTA had proposed:

There should be no need to say that the NCTA proposals will have to stand or fall on their merits. Any thought (by Mr. Stolzenbach or by anyone else) that the prospects for an elaborate rail-transit system might be enhanced by delaying highway construction until automobile congestion becomes intolerable is childishly ridiculous. ["Darwinian Theory," *The Evening Star*, November 30, 1962]

### **In the Wake of the NCTA Report**

In response to the Bureau of the Budget's request to agencies to review NCTA's plan, NCPC unanimously approved the \$793-million rail transit system in principle on December 6, urging that "construction proceed as rapidly as possible in the interest of economics and service to the public." During debate, NCPC modified the endorsement that originally recommended "that the [transit] system be fully implemented at the earliest possible time." This phrasing seemed to broaden an endorsement of the NCTA plan. After discussing the question during a recess, the members agreed to call for construction of the transit system "as rapidly as possible" after general approval.

As for NCTA's proposed highway cutbacks, NCPC decided to withhold judgment until NCTA published the appendices of supporting data. [Lewis, Robert J., "Planners Back Rail System," *The Evening Star*, December 6, 1962]

In addition to the commissioners' approval of the Potomac River Freeway plan, the year ended with further good news for the highway builders when NPS, the District Department of Highways and Traffic, and BPR announced agreement on December 13, 1962, on the South Leg of the Inner Loop. The plan was to build the freeway through a 1,400-foot tunnel under the Lincoln Memorial grounds between the Potomac River and 14<sup>th</sup> Street, NW. Officials had been negotiating since 1960 when NPS had proposed the plan, and reached general agreement about 6 months earlier.

On December 14, 1962, all parties signed the agreement. Wirth signed for the Department of the Interior, saying:

This section of Washington—the Lincoln Memorial, the Reflecting Pool, the Washington Monument, the Tidal Basin, and the Jefferson Memorial—is the real heart of beautiful Washington. I know that you are as much interested as we are in retaining this atmosphere to the greatest extent possible.

Consultants employed by NPS had partially designed the tunnel.

The agreement included removal of the driveway between the Lincoln Memorial and the Reflecting Pool, plus removal of the temporary buildings on both sides of the Reflecting Pool, with park roads and parking areas to be built in their place.

The NPS would be in charge of the first segment, between Constitution Avenue and a midpoint between the Memorial and the Tidal Basin. BPR would be involved in approval of the consultants' work and final approval of the plans.

The second segment ended west of 15<sup>th</sup> Street and included part of the road network for the area around the Tidal Basin where the Japanese cherry trees were a popular tourist attraction each spring. BPR would be the contracting agency for this section and oversee construction.

District highway officials would be in charge of the final segment, which involved construction of an interchange between 14<sup>th</sup> and 15<sup>th</sup> Streets.

The project was estimated to cost \$18 million, with construction to begin in 1963 and completion scheduled for late 1965. Engineer Commissioner Clarke said, "We really don't expect any trouble. We all understand each other's problems."

The plan satisfied all parties. The District received the Interstate highway it wanted, while NPS was finally able to improve the memorial plaza and the area around the Reflecting Pool. [Flor, Lee, "Lincoln Memorial Inner Loop Tunnel to be Begun in '63," *The Evening Star*, December 14, 1962]

A *Star* editorial expressed surprise that there "seemingly is no end to the studies, negotiations and compacts" needed to build the Inner Loop. The fact that the agreement gave each party veto power was an arrangement that "to say the least, opens the door to future delays and disagreement." General Clarke's comments were reassuring, but the key was simple:

In the final analysis, however, the success of the new agreement will depend upon whether each of the principals who signed it . . . continues to work together with a reasonable amount of good faith and mutual trust. [“In Accord’—Again,” *The Evening Star*, December 18, 1962]

On December 23, Lee Flor reported that the District Highway Department had sent a 13-page list of questions to NCTA about its November 1 report. Engineer Commissioner Clarke, who referred to the list as a “white paper,” said the city wanted NCTA to know and check all the District Highway Department’s assumptions. “We want to be as objective as possible.” Department officials also planned to “sit down with the NCTA officials” to go over the white paper. The paper questioned each action NCTA had proposed, including its traffic forecasts for decisions by individuals about the use of an automobile or transit. The department also questioned NCTA’s modal split forecasts about corridor cities. In addition, District highway officials questioned NCTA’s assertion that the \$793 million system could be financed from passenger fares. “The highway officials,” Flor wrote, “said this is the first time such a claim has been made, since transit systems in all other American cities do not pay for themselves.”

Further, the District explored the history of the National Capital Transportation Act of 1960 to determine whether NCTA had any legislative basis for making highway planning recommendations. Stolzenbach had wanted this authority, including veto power, but it was not included in the 1960 Act. The highway staff thought that the November 1 report’s assertion of such authority was based on partial quotes from the legislation. [Flor, Lee, “13 Pages of Questions Asked on Transit Report,” *The Sunday Star*, December 23, 1962]

On December 24, the *Star* reported that construction crews had begun work on a four-lane section of the Potomac River Freeway across Rock Creek Park between 26<sup>th</sup> and 31<sup>st</sup> Street, NW.:

The freeway section will be built on piers just south of Whitehurst freeway. The piers were put up several years ago, immediately after the District Highway Department received a permit from the National Park Service.

The project included extensive landscaping to restore the park atmosphere, while the District agreed to transfer land from a former school to NPS to increase the size of Rock Creek Park slightly:

The new freeway section is to carry eastbound traffic from the Three Sisters Bridge. In the Rock Creek area, the four lanes will separate into two ramps, to connect to the northbound and southbound lanes of the West leg of the Inner Loop.

The \$2.8 million project is to be finished by July, 1965, when it will serve as a temporary detour while the Whitehurst freeway is altered and while K street is torn up for construction of the Inner Loop.

West of 31<sup>st</sup> Street, the city's plans for the freeway were held up while the fate of the Three Sisters Bridge was decided. [Flor, Lee, "Work Starts on Freeway Over Rock Creek," *The Evening Star*, December 24, 1962]

As agencies awaited the appendices to NCTA's November 1 report, they continued their reviews to comply with the Bureau of the Budget's deadline of January 31. With that deadline in mind, NCPC set up a committee to study the location of the East Leg Freeway. NCTA recommended it be built on the east side of the Anacostia River while the District favored the west side because it would reduce the number of families displaced. Officials had sought a compromise, but Stolzenbach had not been willing to change a decision he had submitted to the President.

NCPC also wanted to study the ramp connections from the Potomac River Freeway to Key Bridge and the need for the Three Sisters Bridge. Studies for the freeway omitted the connection to Key Bridge and called for removing present ramps from the Whitehurst Freeway to the bridge. Instead, the new freeway would pass under Key Bridge and connect with the Three Sisters bridge. [Flor, Lee, "East Leg Freeway Review Is Ordered," *The Evening Star*, December 25, 1962]

The year ended with an important road opening on December 31. The Maryland State Road Commission opened the Cabin John Bridge across the Potomac River. At the same time, an

8-mile stretch of the Capital Beltway spanning the bridge opened linking the River Road interchange in Montgomery County to the State Route 7 interchange in Virginia. In addition, NPS opened a short segment of the George Washington Memorial Parking linking the CIA's new headquarters (and BPR's research facility) to the Capital Beltway.

The *Star* described the opening: "The 1,400-foot, \$3 million Cabin John Bridge across the Potomac . . . was opened some time today with absolutely no fanfare." With the temperature at 13 degrees, the *Star* explained, "a ribbon-snipping ceremony would not be appealing." Maryland had scheduled the opening for 10 a.m., but cars reportedly began driving across the river as early as 8 a.m. ["Cabin John Opens on Cold, Quiet Note," *The Evening Star*, December 31, 1962]

(As mentioned earlier, the Cabin John Bridge was renamed the American Legion Memorial Bridge on May 30, 1969.)

## Debating the NCTA Data

In view of NCTA's rejection of the Three Sisters Bridge, Engineer Commissioner Clarke said in early January that the District Highway Department would study whether an improved Key Bridge could serve as a substitute. "It is under study, but it is not in the recommendation stage. We did feel obligated, though, to consider all the various alternatives." [Pierce, Charles B., "Highway Unit Weighs Key Bridge Widening," *The Evening Star*, January 3, 1963]

NCTA finally began releasing the appendices on January 10, 1963, ultimately six reports with a total of nearly 1,000 pages of text and maps. The reports released on that day predicted that 60 percent of commuters entering downtown Washington in 1980 would use mass transportation facilities (not broken down by rail or bus). This figure compared with 40 percent at present, and 56 percent in 1980 as forecast by the Mass Transportation Survey. The District Highway Department, in preparing its estimates for the ICE, had predicted steady transit use estimated at only 25 percent in 1980.

In discussing the projections, NCTA said that in 1959, no transit agency was in operation. Now, with NCTA planning a network, it projected higher mass transit use based on experience in other American cities with a rapid transit system. [Flor, Lee, "Heavy Use of Mass Transit Seen In Reports Issued by NCTA," *The Evening Star*, January 10, 1963]

The Washington Metropolitan Area Transit Commission, the bus regulatory agency that favored expanded use of buses, had complained to the White House that NCTA had not discussed its proposal with the commission. The appendix on "System Planning" included five pages explaining why NCTA had rejected the express bus alternative to the November 1 plan. To attract commuters out of their cars, a much better level of transit service would be needed than the express bus system. "Without providing a very high level of new transit service, those 50,000 potentially new riders and some of today's transit riders will be coming to downtown by auto. Then automobile congestion in downtown would continue, and more freeways would be required."

NCTA had considered laying out a downtown routing plan for buses on city streets, but the plan "was found to be inadequate." Wilbur Smith and Associates had studied a downtown bus subway system that could accommodate 120 buses an hour. However, this plan would handle only 7,500 passengers per hour in return for construction costs of \$4.5 million greater than for a rail transit system:

In sum increasing bus-subway capacity either by adding tunnel lanes or by widening stations would add substantially to the cost of a system that even without these changes would cost more than rail transit.

No one has ever operated a comprehensive express bus system, let alone a comprehensive bus subway system. It has yet to be established that a bus-subway system could be scheduled and operated in a fashion that would attract a large volume of patronage. [Flor Lee, "NCTA Explains Alternative of Express Buses," *The Evening Star*, January 12, 1963]

On January 12, the White House asked 16 local, Federal, and county organizations to complete their reviews and submit them to NCTA by January 26:

The President has asked that the views of the District of Columbia Commissioners, Federal departments and agencies, and State and local governments and other responsible organizations be considered in developing the administration's recommendations to the Congress on both the report and the Transit Development program.

NCTA was to submit all the comments and NCTA's recommendations after review of the comments to the Bureau of the Budget.

In a statement, NCTA indicated it would make the same recommendations to the bureau that were contained in its November 1 report, including completion of two-thirds of the downtown subway loop and rail rapid transit and commuter lines by 1969. The statement quoted Stolzenbach as saying, "From informal comments we have received on the back-up material already provided the co-operating agencies, I am confident we will be able to ask Congress to move ahead on this basic schedule." ["Transit Agency Seeking Views of 16 Groups," *The Sunday Star*, January 13, 1963]

On January 18, President Kennedy transmitted the annual message to Congress on the District of Columbia's budget. In the section on "Highways and Traffic," President Kennedy expressed concern about the District's highway fund, which would "face critical deficiencies after 1965." How large the deficiency was would depend on the scope of the highway program:

Those decisions will be made promptly. The National Capital Transportation Agency has prepared and transmitted to me a report recommending a system of highway and modern rail transit facilities for the National Capital region. This report is being reviewed by appropriate Federal and local agencies. When that review has been completed I will forward the report of the National Capital Transportation Agency to the Congress with my recommendations. Therefore, I am withholding from the fiscal year 1964 budget those highway projects which do not conform to the highway recommendations of that Agency - the east leg of the Inner Loop Freeway, the Intermediate Loop, the Potomac River Freeway and the Three Sisters Bridge. At the completion of the review, appropriate budget amendments will be submitted with respect to both the mass transit and highway programs of the District. The projects which are not in question in the current review, particularly the center leg of the Inner Loop and its continuation to the north, as well as the modified Interchange C, represent a major and important highway program.

Although President Kennedy withheld \$21 million requested by District highway officials pending completion of the NCTA review, Administration officials made clear that he was "very definitely" keeping the door open on the highway versus transit debate. [Flor, Lee, "Road Funds Held Up for More Data," *The Evening Star*, January 18, 1963]

The District commissioners submitted their response to NCTA. On January 29, the *Star* reported:

Administration attempts to keep the strongly worded Commissioner report confidential failed today. Into the open emerged an almost unprecedented public dispute between the considered views of the Commissioners and the Agency Director C. Darwin Stolzenbach, all appointed by the President.

The commissioners sharply criticized NCTA's procedures and statistics, particularly in contrast with the 1959 Mass Transportation Survey:

The 1959 study was based on frequent and open discussions with all agencies and groups interested in transportation in the region. The resultant plan was responsible to the clientele it would serve.

The . . . agency plan was prepared unilaterally.

In contrast with the survey, NCTA based its recommendations on assumptions, not scientific analysis of traffic:

The Board of Commissioners should not push aside lightly the thoughtful studies and investigations which have been made over the years, as well as some of the solid, established trends.

Furthermore, in the absence of conclusive evidence concerning assumptions, methods and other relevant factors, the Board of Commissioners must be reluctant to accept at face value the data presented by the . . . agency.

In rejecting NCTA's estimate of 21,500 peak-hour trips across central Washington bridges, the board pointed out that NCTA had ignored the corridor plan that was central to the Year 2000 Plan. President Kennedy had called on all agencies to support the Year 2000 Plan, but NCTA had not done so.

The commissioners also said that NCTA had minimized factors that altered the view of highways:

For example, the NCTA based estimates for transit needs on the a.m. peak hour traffic. However, experience has demonstrated that peak hour for highway traffic is in the p.m. period.

President Kennedy, the commissioners pointed out, had called for "efficient highway and mass transit facilities" to make "full use of the advantages of each mode." (The commissioners underlined this quote.) Instead, NCTA appeared to "resolve questionable areas in favor of transit, tending to create a paper need for transit at the expense of highway travelers."

The board took particular exception to NCTA's opposition to the Three Sisters Bridge. Based on the conference report on the District of Columbia Appropriation Act, 1963, the District held off work on the bridge until officials could review the NCTA report. They found that NCTA's analysis of Potomac River crossings "lacks flexibility," with the commissioners questioning the "apparent neat balance between capacity and demand from a technical standpoint." They could

not find any “solid data in the NCTA publication on which to justify further deferral of the project.” Expert consultants over the years had verified the need for additional capacity, but no other bridge would provide adequate service.

Without the bridge, the Potomac River Freeway, which NCTA did not oppose, would be killed because it would not be eligible for 90-percent Interstate funds. Trying to convert Key Bridge to serve the purposes the Three Sisters Bridge was intended to fill would require “major surgery” and would be “too costly and disruptive of values in Georgetown.” [“D.C. Hits Transit Report, Backs 3 Sisters Bridge,” *The Evening Star*, January 29, 1963; “D.C. Bars 3 Sisters Span Delay,” *The Washington Post and Times Herald*, January 29, 1963]

On January 30, Special Advisor Horsky promised that the commissioners’ report would receive “careful consideration.” He thought that within the next month, President Kennedy would send his recommendations to Congress on freeway and transit proposals. As for the Three Sisters Bridge, Horsky said the commissioners’ report was “very comprehensive and gives a lot of reasons for building the bridge.” However, White House officials had only just received it. He did not think the District would start construction until the White House decided how to resolve the conflicting views on the bridge.

General Clarke informed reporters that he could not comment on the report, which had not been released officially, but he indicated that the city was not negotiating with a consultant for a design contract. [“White House May Review Sisters Span,” *The Evening Star*, January 30, 1963; “Three Sisters Operation Is Shelved for Awhile,” *The Washington Post and Times Herald*, January 31, 1963]

A *Post* editorial said that the White House’s policy on the area’s transportation system would be tested by the city’s desire to move forward with the Three Sisters Bridge. A White House veto would provide “an unwarranted triumph for bad figures and high emotions.” The bridge was needed partly because the opening of Dulles International Airport in 1962 had stimulated a “very rapid rate of development.” The resulting traffic would use I-66 for District access, but “if there is no Three Sisters Bridge, it will unavoidably be funneled through the parks and the monumental areas downstream.”

NCTA had proposed the unattractive alternative of Interstate trucks running in front of Arlington Cemetery [on Jefferson Davis Highway] and debouching into the overloaded 14<sup>th</sup> Street Bridges.” Further, “the Key Bridge must then be connected to the Potomac River Freeway by a grotesque clover-leaf suspended out over the river, and traffic would flow directly onto the local streets of Georgetown.” If the White House relied on NCTA’s “wildly optimistic” plan to extend rail rapid transit to Falls Church in 1970 and Fairfax City in 1973, “it will risk all of the dangers that may be expected to flow from the steady constriction of the newest suburbs’ access to downtown Washington.” [“The Case for Three Sisters,” *The Washington Post and Times Herald*, January 31, 1963]

## **Responding to NCTA**

The Northern Virginia Regional Planning Commission passed a resolution that did not endorse the transit aspects of NCTA's plan. The commission wanted assurances "that the rail program proposed by the NCTA will be feasible in conjunction with a comprehensive, co-ordinated highway program." Arlington County's representative to the commission, John Lohman, objected to the resolution, saying that the county would be transformed by a "sea of concrete" until ample rail transit facilities supplemented highways. Prince William County's Francis M. Coffey countered, "Highways are the backbone of this Nation and they always have been." Although the commission approved the resolution, it modified an earlier version that accused NCTA of "drastically cutting back the proposed highway program. ["Virginia Group Balks at Mass Transit Plan," *The Evening Star*, February 1, 1963]

NCTA missed its self-imposed deadline of January 26 for submitting its final recommendations to the White House. Some agencies had not yet provided their comments, in part because of the late release of appendices. Some jurisdictions had approved the "general principle" of rapid transit but not NCTA's recommendations on freeways.

The Bureau of the Budget wanted the recommendations before drafting the Kennedy Administration's proposals to Congress. Horsky, referring to the District's comments, wanted to ensure the White House had NCTA's comments on the highly important report. "The Bureau of the Budget will want as much light on this as possible." ["NCTA Misses Deadline On Final Transit Plan," *The Sunday Star*, February 3, 1963]

Senator Mansfield reintroduced his bill, now S. 651, on February 4 transferring District right-of-way in Glover-Archbold Park, to the Department of the Interior, and made clear his opposition to the Three Sisters Bridge. It was identical to the bill he had introduced in the 87<sup>th</sup> congress. "That bill was passed by the Senate, after extensive hearings; but no action beyond public hearings was taken in the House."

He summarized the history of the park, which he said was not large but was very important to those who knew it. If the District had its way, an expressway would be built through the park, "not this year or in 3 or 4 years, but I am certain it will in the not too distant future." Further, if the District built the Three Sisters Bridge, "it is inevitable that a highway will be built through the park because the approaches from the bridge have no other place to go."

He was skeptical that "new fancy highways and expressways" were the answer to the city's congestion problems; they would "only increase it." He said:

Unless we preserve some of the natural beauty of our Nation's Capital and develop the city with these things in mind, we are going to end up with a very costly city of expressways, arterial highways, and unsightly parking lots. There must be other ways to resolve these difficulties.

He praised NCTA for identifying "more reasonable solutions." [Glover-Archbold Parkway, *Congressional Record-Senate*, February 4, 1963, pages 1685-1686]

The Joint Transportation Commission (JTC) released a report on February 8 that was skeptical of NCTA's claims. The JTC grew out of growing concern in the area about how the expanding suburbs in Maryland and Virginia affected the area's transportation mix, including bus transfers among jurisdictions. District Commissioner McLaughlin and State Senator Northrop proposed a presidential commission to help regulate the area's private transit companies. Representatives Hyde of Maryland and Broyhill of Virginia secured congressional approval, but President Eisenhower vetoed the bill after Virginia indicated it would not join. McLaughlin, Northrop, and State Senator Fenwick then convinced the two State legislatures and the District Board of Commissioners to authorize the JTC.

By March 1961, the new Washington Metropolitan Area Transit Commission had taken over regulation of transit services from the area's public utility commissions. Next on JTC's agenda was a compact for building and operation a rail transit system as called for by the Mass Transportation Survey and the National Capital Transportation Act of 1960. However, NCTA and the JTC were suspicious of each other, as Schrag explained:

On one side were the NCTA Advisory Board and staff and their allies. By early 1961 this meant the Stolzenbach crowd: a group of people who opposed freeways, favored home rule for the District of Columbia, and owed their power to President Kennedy. Members of this group were suspicious of the Joint Transportation Commission, which included the District's engineer commissioner (the NCTA's opponent in the freeway fight) as well as suburban politicians who had dubious sympathy for the disfranchised people of D.C. On the other side was the JTC, which, after 1961, was dominated by suburban voices.

The JTC, consisting of politicians, "regarded appointed experts of any stripe—Bartholomew, Stolzenbach, and Gutheim included—as impractical dilettantes" who might give a Federal transit corporation for the area "terrifying powers, such as the ability to push trunk lines through jurisdictions without consent." [Schrag, pages 96-99]

The distrust surfaced in the JTC's response to NCTA's November 1 report and recently released appendices. On February 8, JTC's report rejected NCTA's idea of a Federal corporation to build and control the rapid rail system. JTC urged regional officials to agree on an interstate compact to replace NCTA as soon as possible:

An interstate compact agency inherently would provide a greater degree of responsiveness to the plans and needs of the local areas and would insulate the Federal Government from becoming directly involved in a matter as purely local as community planning.

Although NCTA had predicted negotiations on a compact would be difficult, JTC reported "substantial progress" on the compact. It expected to have a draft ready for review by the end of the year.

The report also questioned NCTA's claim that the rapid transit system could pay for itself out of the farebox:

The financing plan makes no provision for meeting any deficits which may be experienced in the construction or operation budgets.

In such a long-term project, the estimates of construction are subject to changes due to unpredictable variations in the price of labor, material and equipment and the net revenue projections are subject even to a great variety of complex factors, none of which may be predicted with any certainty.

Further, NCTA had greatly underestimated how the rail system would affect the area's private bus companies. While expecting express bus and feeder lines to provide "substantial" service in 1980, NCTA estimated that by then, buses would carry about 88 million passengers (28 million on express bus lines and 60 million on feeder lines), compared with 209 million in 1961. The private companies would take in fares of \$4.7 million in 1980, compared with \$37.7 million at present, and require operating subsidies from local jurisdictions of only \$7.5 million, bringing total revenue to \$12 million. In view of this "substantial curtailment" in private bus operations, "full attention should be directed to the development of satisfactory arrangements to keep the private segment of the system in a state of necessary economic well-being." [Flor, Lee, "3-State Transit Agency To Replace NCTA Urged," *The Evening Star*, February 8, 1965; Clopton, Willard, "NCTA's Rail System Plans Attacked by Parent Agency," *The Washington Post and Times Herald*, February 8, 1963]

Professor Schrag summarized the result:

The rift between the NCTA and the JTC widened after the November Report and Stolzenbach's antihighway proposals. In February 1963 [JTC counsel Jerome] Alper complained that the NCTA had failed to consult the JTC "on system design or in the formation of any of its plans." Fenwick wrote to President Kennedy to condemn Stolzenbach's meddling in highway matters and to support the Three Sisters Bridge. [Schrag, page 99]

On February 20, the District commissioners sent a preliminary report on the NCTA recommendations to the Bureau of the Budget. *The Washington Post* began its description of the report by writing:

The District Commissioners ripped into the National Capital Transportation Agency's highway and rail transit proposals for the Washington region.

In a 99-page critique bristling with such uncomplimentary phrases as "paper solution," "unsupported optimism," "unexplained neglect" and "poor planning," the Commissioners charged that NCTA would "decimate" the city's presently planned freeway system and cause choked rush-hour traffic congestion for decades to come.

They ended up recommending that the planned freeway system be completed, that commuter service be started on three existing railroad lines, that express bus service be given more consideration and that a start be made on NCTA's proposed downtown subway . . . .

The Commissioners' charge that NCTA failed to cooperate with the city in preparing its plan, miscalculated future demand for highways, manipulated its figures to show the desirability of rapid transit and failed to consider factors that could derail its financial estimates.

In not seeking advice from the area's highway agencies, "NCTA has followed a procedure contrary to all modern urban transportation studies." The result of this "unilateral control of input assumptions and adjustment" was "a paper solution which shows all transportation demands and capacities nearly in balance." The commissioners pointed out that under those circumstances, NCTA could forecast any balanced solution it desired. For example, NCTA predicted that 95 percent of increased daily trips by 1980 would be via highways, but NCTA recommended \$793 million for its rapid rail transit plan, almost as much as for added highways:

Apparently the "balance" criteria used by NCTA is the proposed expenditure of estimated similar sums of money on fixed transit and on highways.

The commissioners rejected virtually all of NCTA's recommendations on the regional freeway system, including the projects President Kennedy had withheld from the District budget. They also challenged NCTA's claim that even with deletion of several Interstate projects, its plan "includes a continuous interstate highway system." This claim was "a mythical conclusion" because NCTA did not check with State or Federal roads officials to see if the network complied with Interstate standards. Had they done so, they would have learned that the network was not in compliance, jeopardizing 90-percent Federal construction funding. The loss of funds for the Potomac River Freeway, which would be of little value if the Three Sisters Bridge were not built, would be \$25 million. Further, NCTA's projected savings of \$428.4 million in reduced freeway construction should have been only \$84.3 million, and even that lower figure might be countered by the cost of improving city streets.

NCTA's conclusion that the rapid rail network could pay for itself out of the farebox was "dramatically overstated." NCTA, the commissioners explained, was caught in a two-way bind because its construction estimates are too low and its revenue estimates are too high. If those estimates were realistic, NCTA would have had to state that Congress and the local jurisdictions would need to subsidize the subway, and that prospect could undercut support. Between likely increases in construction costs and conservative revenue forecasts, the combined deficit would add up to about \$400 million in 25 years.

The commissioners agreed that the District "unequivocally" needed improved mass transit as part of a balance transportation system. They endorsed JTC's efforts to develop a tri-State compact agency that would replace NCTA as soon as possible. They also endorsed rail lines along Wisconsin Avenue (Northwest to Bethesda), Rockville-Silver Spring along the Baltimore and Ohio Railroad, along the Pennsylvania Railroad to Lanham in Prince George's County, Maryland, and one through Alexandria to Springfield, Virginia. Beyond those lines, more study was needed, especially in the absence of "data necessary to equitably and adequately compare the merits of the Mass Transportation Survey Plan of 1959 and the NCTA Plan of 1962." ["Commissioners Rip Into NCTA Transit Report," *The Washington Post*, February 20, 1963;

Flor, Lee, "Only 4 Lines of Rail Transit To Get D.C. Chiefs' Backing," *The Evening Star*, February 20, 1963]

The Department of Commerce, home of BPR, submitted its comments to the Budget Bureau on February 20. According to Schrag, Martin Wohl wrote the report. He was working in the office of Secretary Luther H. Hodges, but was a rapid rail transit skeptic and coauthor in 1965 of *The Urban Transportation Problem* (with John R. Meyer and John F. Kain, published by Harvard University Press.) [Schrag, pages 4-5, 55]. Commerce favored a downtown subway as the "only practical means in which essential volumes of traffic can be moved while maintaining the dignity and beauty of the Nation's Capital," but did not specify whether it should be a subway for buses or rail transit.

The report "particularly complimented" NCTA for trying to develop new ways of forecasting preferences for transit or highways. However, NCTA "has used a substantial number of assumptions that are highly questionable." NCTA had not cooperated with planning and highway agencies, and had "substantially over-stated" transit ridership and revenues. Because NCTA had not completed enough basic engineering and planning work, its preliminary estimates were "hardly comparable in completeness and accuracy to cost estimates which should be submitted to Congress for project authorization." The estimates for the cost of the tunnel segments "might require as much as 50 percent upward revision."

Commerce recommended prompt construction of the Three Sisters Bridge and key parts of the Inner Loop Freeway. At the same time, Commerce believed the North Leg, Center Leg, and East Leg should be restudied to determine location and number of lanes in view of the impact of the rail transit system.

Further, the 1960 Act had directed NCTA to evaluate the 1959 Mass Transportation Survey plan and consider alternatives. The NCTA report stated that the agency had done so, but according to the Commerce Department, "neither the report nor the six published appendices show any indication that a thorough analysis of these alternatives were made." ["Federal Study Favors Inner Loop Start Now," *The Sunday Star*, February 24, 1963; "Commerce Urges Sisters Span, Loop," *The Washington Post and Times Herald*, February 25, 1963]

Other agencies also had commented on the NCTA report and documentation. As the *Post's* Willard Clopton put it:

The transit plan has been accepted in principle by a majority of political leaders and planners throughout the area. But the agency's corollary proposal that freeway construction be cut back had flown into a hornet's nest of criticism.

Some of the agencies questioned NCTA's assumptions on engineering and contingencies as being too low, while its assumptions on income were off by about two-thirds. Nevertheless, according to Lee Flor in the *Star*, agencies recommended a start on the rail transit system "on the basis that forecasting is not definite enough to prove that a transit system will fail to attract travelers away from their automobiles. The only real way to find out [is] to build a subway and then see if people use it, the analyses say."

Clopton reported that the White House was preparing its recommendations to Congress, but officials “are keeping as mum as if they were hatching another Manhattan project.” His sources at the Bureau of the Budget indicated that “a dual submission to Congress is likely,” with will “contain something for everybody.” [Clopton, Willard, “JFK Drafting Transit Plan,” *The Washington Post and Times Herald*, February 17, 1963; Flor, Lee, “Rail Transit System Is Recommended Despite Doubts on Agency’s Estimates,” *The Sunday Star*, February 17, 1963]

Donald Gingery of the Maryland-National Capital Park and Planning Commission, continuing his crusade to restructure NCTA, informed his colleagues that Stolzenbach was exercising “dictatorial power” in the absence of Maryland and Virginia officials who could provide “checks and balances that are so necessary so we can’t be hurt as we are being hurt.” He added:

We have not been consulted anywhere along the line about this plan. We need protection. Time has been wasted on this transportation plan because of incompetence.

He said the District commissioners’ comments had “repudiated with finality the factual basis of the NCTA plan and cast doubt on the ability of Maryland and Virginia to get 90 per cent Federal aid in building interstate highways.” NCTA’s present veto over the States’ transit plans was “not acceptable.” He said:

What’s the use of spending two years working on a plan and then vetoing it? Maryland and Virginia should have a voice in drafting these plans on a day to day basis so that there will be support for the proposals when they are released.

To provide the needed protection, Gingery again introduced a resolution calling for establishment of a three-man leadership of NCTA, with a representative from Maryland and one from Virginia joining Stolzenbach. The resolution asked the Maryland General Assembly to work through the State’s congressional delegation to secure a change in the National Capital Transportation Act of 1960 to create the new leadership troika.

This time the commission approved the resolution unanimously, despite concerns that J. Newton Brewer, Jr., expressed that, “we’re going to sabotage completely the possibility of ever getting funds from Congress to build a rapid transit system in this area.” [Dessoff, Alan L., “NCTA Head Attacked by Plans Body,” *The Washington Post and Times Herald*, February 21, 1963; Duke, William, “Maryland Seeking a Voice In Area Transit Planning,” *The Evening Star*, February 21, 1963]

The *Star*, in an editorial, agreed with much of the District commissioners’ report. The result was “the chaos which now envelops the Washington area transportation picture,” an outcome that was “as predictable as the rising sun.” Even before finishing its studies, NCTA had “made known its intention to propose a regional rail-transit system so attractive and so economically feasible that large portions of the long-planned area freeway program could be scrapped.” It drafted the report unilaterally on the assumption that its plan would be “so universally acceptable that the outcome would be virtually unchallengeable.” Unfortunately, no such mathematical precision was available to NCTA or anyone else.

The District commissioners' "devastating" analysis charged that using NCTA's own data, "the estimates of transit costs are too low, the revenues too high, and the means of predicting future transit use subject to 'incredible' and 'ridiculous' error."

The commissioners' report, "as might be expected," challenged NCTA's assumption on highways:

It accuses the agency of assigning traffic volumes to freeways far in excess of their capacity, of undervaluing the desire of motorists to use their cars, of shattering the concept of the interstate highway system, of downgrading the potentials of express buses on freeways.

The editorial rejected the tendency "to throw up one's hands over the transit situation," but faced with the evidence, the White House might be unable to send its comprehensive transit-highway proposals to Congress in the near future as planned:

The administration possesses both the authority and the information it needs, however, to end the unwise restraints now imposed on the freeway system, and to get on with the job of resolving differences over the transit proposals. It will not be the first time that such a dispute has been settled at that level. ["Inevitable Response," *The Evening Star*, February 22, 1963]

Senator Douglas, a long-time critic of the Three Sisters Bridge, wrote to President Kennedy to advise him that its construction would lead to highway construction through Glover-Archbold Park and the conversion of Spout Run Parkway into an eight-lane expressway. Noting that Arlington County opposed the plan, Senator Douglas asked, "Are we to go ahead on the advice of the D.C. Commissioners and the D.C. Highway [sic] to build a bridge and connecting truck routes against the other jurisdiction most concerned, when it is overwhelmingly opposed to such actions?" ["Douglas Asks 3-Sisters Bridge Ban," *The Washington Post and Times Herald*, February 26, 1963]

While waiting for President Kennedy's recommendations, the Committee of 100 on the Federal City made clear its continued opposition to the Three Sisters Bridge. In late February, the committee wrote to the President, the Bureau of the Budget, and the House and Senate Appropriations Committee to express its opposition:

For good or ill, the traffic forces which would be generated and in turn, unleashed by the proposed Three Sisters Bridge would be such that no one, not even the Highway Department, dares foretell its eventual consequences.

The bridge would "force construction of the proposed northern and northwestern portions of the Inner Loop . . . no freeway yet conceived for Washington would be more destructive of cultural and tangible values."

NCTA's report offered a "soundly based, balanced transportation system." By contrast:

As if in a footrace to put down a highway network which would foreclose an economic transit system, the District Highway Department and the Engineer Commissioner have relentlessly pursued an all-highway planning objective which even the 1959 Transportation Plan had rejected.

The Committee of 100 rejected the argument that the bridge was needed to carry trucks. This justification was “without substance” because, the committee stated, the Eisenhower Administration’s restriction of truck traffic on the Theodore Roosevelt Bridge could be changed by an executive order. Moreover, the committee claimed that:

All available traffic forecasts, including the forecasts of the D.C. Highway Department itself, verify the NCTA’s conclusions that the proposed Three Sisters Bridge is not warranted if, as is planned, a rail rapid transit line is constructed to Arlington and Fairfax Counties.

This statement contradicted the District’s interpretation of its data. [Flor, Lee, “Federal City Committee Would Bar Sisters Span,” *The Evening Star*, February 27, 1963]

One member of the Committee of 100 took exception to its views. AAA’s Washington I. Cleveland had written a letter requesting contributions “to combat the efforts [of NCTA] to emasculate the highway program in the Nation’s Capital.” The District area’s Highway Users Conference was planning “an intensive public relations campaign to keep the area road program from being drastically curtailed.” The Committee of 100 “disassociated” itself from these views. [“Three Sisters Bridge Meets New Attack,” *The Evening Star*, March 30, 1963]

### **President Kennedy’s Decisions - Delayed**

Although the White House had promised prompt decisions following agency review of the NCTA report and documentation, the Administration plan was stalled. While waiting for the report, interests continued expressing their views in hopes of influencing the outcome.

The *Star* understood the problem, stating in an April 11 editorial:

It is not surprising that the White House is already far behind its original schedule for proposing specific expenditures to Congress for rapid transit and freeway construction in Washington. The elaborate technical claims of the National Capital Transportation Agency in defense of its rail transit proposals, at the expense of freeway construction, have generated controversy which the White House could neither ignore nor easily resolve.

The editorial said that in recent remarks, General Clarke had “summarized the dilemma in words which the politicians now grappling with the problem would be wise to heed.” He said:

What I get from all the studies to date and from the statistics that we have is that we should be proceeding at a great rate with both a highway system and a transit system. We should not be bickering about a few percentage points of difference in estimates about what will happen in 1977 or 1980. Our crystal ball is not that clear, nor is our rate of

progress going to be so great that we cannot keep our goals under constant scrutiny and make changes in them as we go along. If we were to miss the estimate by 10 per cent – and past experience tells us that we will probably not be that close – a difference of two or three years of natural growth will take up the capacity. If past experience is of any value, we appear more likely to underestimate our needs, so that the need for the facilities will come sooner than we plan.

The editorial agreed with this “sound advice”:

A decision to curtail highway building now would not make people stop driving automobiles; it would merely compound the traffic jams and wreck an orderly program of construction which will have to be carried out eventually in any case. At the same time, the transit portion of the total load should be handled largely by a subway transit system which, in the interests of the Nation’s Capital, should be started now. [“Cloudy Crystal Ball,” *The Evening Star*, April 1, 1963]

In early April, NCPC was working on a “compromise proposal” that had been in development for several months to resolve the I-266/Three Sisters Bridge controversy. The concept would reduce the number of lanes on the bridge from eight to six and eliminate some approach roadways. The District would give its 100-foot right-of-way through Glover-Archbold Park to NPS. In return, NPS would allow construction of I-266 through Spout Run Park to serve trucks. [“3 Sisters, Spout Run Deal Pends,” *The Washington Post and Times Herald*, March 18, 1963; Lewis, Robert J., “Simultaneous Renewal of Two Areas Is Urged,” *The Evening Star*, April 4, 1963]

D.C. Trucking Association sent a telegram to President Kennedy urging him not to put the North Leg or the Three Sisters Bridge on the shelf. Deletions of the “key segments” of the Interstate System “would ignore the importance of these segments both as a part of the interstate system and as integral elements of an effective freeway system for the movement of people and goods in the city.”

Director Aitken, in an interview, said the two projects would be needed in years to come. Failure to complete the Inner Loop would “scuttle” the District’s Interstate System and cause the loss of many millions of dollars in Interstate construction funds.

AAA’s Cleveland worried about the implications of the freeway battles in the District for the Nation. If the argument that mass transit could reduce the need for freeways prevailed in the District, similar arguments elsewhere would lead to a “general slowdown” in urban freeway construction. [“Keep Loop, Truckmen Urge JFK,” *The Washington Post and Times Herald*, April 17, 1963]

Later in the month, staff of the National Capital Regional Planning Council issued a report backing the basic rapid transit system, but suggesting a need for more highways to meet growing demand. Staff suggestions included a Potomac Freeway through Alexandria, the Northwest Freeway in the Wisconsin Avenue corridor, and the North and West Legs of the Inner Loop. The Three Sisters Bridge and Spout Run connections should be advanced because “no adequate

design has yet been presented for any other route for the connection of Interstate 66 with the Inner Loop.”

Even with those freeways, highway congestion could increase in ways that would force the imposition of tolls to discourage peak period use by private automobiles:

The most equitable mechanism for rationing the use of the highway system is through charging a fee for a trip made during the peak hours. This would assure that the use of scarce highway capacity would be made by those to whom it was of greatest value.

Staff endorsed most aspects of the NCTA transit proposal, putting the cost at what they considered a realistic estimate of “around a billion” dollars, considerably more than NCTA’s estimate. The report recommended a series of public hearings in the local jurisdictions to test the extent of support.

The staff report, a response to the Bureau of the Budget’s request for comments by the end of January, was long overdue. The council, however, put the report on hold for further review by NCPC and the Maryland-National Capital Park and Planning Commission. [Flor, Lee, “Planners OK Rapid Rail, More Area Freeways,” *The Evening Star*, April 23, 1963; “District May Have to Charge Tolls to Restrict Highway Use,” *The Washington Post and Times Herald*, April 24, 1963]

General Clarke wrote to his NCPC colleagues urging them to adopt a “basic highway system for the District and the region that can withstand the annual onslaught of dissension.” In view of the 3C planning process the Federal-Aid Highway Act of 1962 had required be in place by July 1, 1965, General Clarke wrote, “it is essential that immediate steps be taken to assure the establishment of a formal planning process for this region, including the District, Maryland and Virginia.”

Charles H. Conrad, NCPC’s acting staff director following Finley’s departure, told the panel that work had been underway for 6 months on a comprehensive highway plan, but that it required agreement on a thoroughfare plan for the District and its neighboring jurisdictions. He expected the plan would be completed in 1964. Chairman Rowe said that many decisions would depend on that report. [“Clarke Seeks Speedup On Area Highway Plans,” *The Evening Star*, May 3, 1963]

Meanwhile, District highway officials, in response to a request from BPR, were considering a new route for the Three Sisters Bridge. The new location, about an eighth of a mile to the east of the original location, would be about halfway between Key Bridge and the planned Three Sisters Islands location, linking to the exit of Spout Run Parkway. Another option was to change the angle of the Three Sisters Bridge so it would not point directly toward Glover-Archbold Park, the issue that was at the heart of much of the opposition. [“D.C. Studies New Site For 3 Sisters Bridge,” *The Evening Star*, May 3, 1963; “Shift in Bridge Site Asked by U.S. Bureau,” *The Washington Post and Times Herald*, May 4, 1963]

The White House delay could be attributed, at least in part, to disagreements among NCTA’s advisors. Neil J. Curry, a Los Angeles trucking executive and a member of President Kennedy’s

Committee for Traffic Safety, had served on NCTA's advisory committee on finance. The committee had endorsed NCTA's financing plan, including its freeway cutbacks. When members of the California congressional delegation informed Curry of the implications of the endorsement, he wrote to Stolzenbach in protest. Curry, the trucking official, referred to the critiques submitted by the District and the Commerce Department:

I am concerned that there be a complete understanding on the part of all concerned of the limited role played by the Advisory Committee on Finance, particularly from the standpoint of any recommendations relative to cutting back or delaying the District highway program . . . .

I wish to express unequivocally my opposition to the philosophy and proposals in the NCTA report which would cut back the highway program. I would appreciate your making every effort to see that there is no misunderstanding regarding my position on this matter. ["Transport Advisor Balks At Plan Sent to Kennedy," *The Evening Star*, May 3, 1953]

Lee Flor discussed the reason for the White House delay on May 5:

Washington area transportation recommendations are stalled in the White House because administration officials fear their effect on pending national transit legislation, officials said yesterday.

Legislation to establish a \$375 million transit grant program for the 214 metropolitan areas throughout the Nation has been passed by the Senate. Similar legislation, reported out by the House Banking and Currency Committee, is awaiting clearance by the Rules Committee before coming before the House.

The Washington area rail transit program calls for a \$120 million grant program and \$731 million in guarantees for bonds. Administration officials are reportedly afraid the local measure will overshadow the House action on the national legislation.

When the 87<sup>th</sup> Congress had come to an end on January 3, 1963, the legislation had passed the Senate, but not the House. In the 88<sup>th</sup> Congress, the legislation had been revived. On April 4, the Senate approved the Urban Mass Transportation Act of 1963 by a vote of 52 to 41. House action was pending.

(Congress would not complete action on the urban mass transportation bill in 1963. As noted earlier, President Johnson approved the landmark Urban Mass Transportation Act of 1964 on July 9, 1964, during a signing ceremony in the Cabinet Room of the White House.)

Downtown Progress, saying "there is no record of a city having an overabundance of good transportation," voiced its support for the freeway network as well as the rail transit system:

The freeway plan of the District of Columbia Highway Department . . . is a reasonable program . . . and it should be carried out as rapidly as possible. Deferral or deletion of major segments of the freeway plan will result in a highway system that will be

inadequate to meet the needs of the area, even with a comprehensive rail rapid transit system.

To sacrifice a portion of this freeway network on the vague claim that it might not be needed could well result in economic losses and sociological damage which would far outweigh the present costs of these new roads.

Completing the network was essential “for the dynamic growth which lies ahead.” A “satisfactory solution” for part of the Inner Loop had “not yet been designed, particularly the north leg,” but must be found. Regarding the Three Sisters Bridge, the organization wrote:

No reasonable solution has been presented which would enable Key Bridge, and its approaches, to properly serve the traffic needs of this area.

The statement continued, “The time for study, though well spent, is behind us. The time has now come for action.”

As for NCTA’s transit proposals, the statement said:

There is no dispute over the need for a modern, efficient high capacity rail rapid transit system. This is essential, and every effort should be taken to expedite its construction.

. . . . The transportation system which will serve the rapidly growing metropolitan region must provide a high degree of accessibility between the central business area and the communities which depend on downtown and upon which downtown is dependent.

Only a balanced transportation system, comprised of adequate highways and rapid transit facilities, both rail and bus, can meet the needs of the Nation’s Capital. [“Downtown Group Backs Rail Transit,” *The Evening Star*, May 11, 1963; “Business Unit Backs Road, Rail Systems,” *The Washington Post and Times Herald*, May 12, 1963]

With the President’s report on hold, the Federal City Council released a report on May 4 calling for an immediate start on the 98-mile rail transit system as well as the freeway network. The report indicated that projections of a regional population of 5 million by 2000 “warrant an assumption that the National Capital region will require both the amount of mass transit proposed in the NCTA’s 1962 report, and a system of freeways largely in accord with that proposed by the District Commissioners.” NCTA’s assumption of financial independence should not be the sole basis for advancing the transit option; the area “must have an efficient, modern, rapid rail transit system, including the best equipment available, whether or not complete financial self-sufficiency is attainable.”

The council urged Congress to authorize NCTA to proceed with construction rather than waiting for an interstate compact or a Federal corporation. Further, “in face of the uniqueness of a jurisdiction where the legislative and taxing power rest solely in the Congress, both the Congress and the Executive must accept a special obligation either to provide or to guarantee the financing of the enterprise.” Specifically, the council recommended that construction on the downtown subway and some radials begin in FY 1964.

The council recommended construction the Three Sisters Bridge near its island site, construction of the East Leg on the west side of the Anacostia River, and a modified freeway along the northwest downtown boundary. Saying the city “should be integrally related to the Federal interstate highway system,” the council nevertheless suggested that BPR consider easing its standards for segments such as the North Leg and the Potomac River Freeway through built-up areas.

The report cited the Theodore Roosevelt Bridge, with its restriction on truck traffic, as an example of an Interstate freeway that did not meet full standards. Council president Gordon Gray told reporters, “I’m not sure who has the ultimate power in this thing, but I think the President of the United States could influence the standards if he wants to.” [Flor, Lee, “Area’s Rail Transit Plan Stalled in White House,” *The Sunday Star*, May 5, 1963; Clopton, Willard, “Put Downtown Subway First, Council Urges,” *The Washington Post and Times Herald*, May 5, 1963]

### **The President’s Recommendations**

Finally, on May 27, 1963, President Kennedy sent a letter to congressional leaders on the transportation needs of the Washington area. He explained that NCTA’s report of November 1, 1962, recommended a 10-year Transit Development Program, which would “provide the National Capital region an extensive rail rapid transit, commuter rail and express bus system,” including commuter rail and express bus service within the right-of-way of several freeways and express parkways. This plan was, “in my judgment, both sound and necessary.”

He submitted a bill to authorize NCTA to proceed with construction of the system. “I hope that this proposed legislation will receive both prompt and favorable Congressional action.” There was, he said, no questioning the need for improving the Washington area’s transportation network. “Nor can it be doubted that improved transportation must include a major rapid transit system.” He explained:

The alternatives would be steadily worsening congestion with all that congestion means in losses of time and money, or an enlarged highway and freeway program entailing additional expense, major disruption of persons and businesses, and substantial impairment of the appearance and attractiveness of the city.

As for NCTA’s estimate that the rapid transit system would cost \$793 million over 10-years, “any estimate is subject to modification upon the completion of more detailed engineering.” Nevertheless, he thought NCTA’s estimate provided “a reasonable basis for authorization of the program.” He continued:

In accordance with the directives given it in the 1960 Act, the Agency has provided as far as possible for payment of system costs by users, with the remaining costs to be distributed among the Federal and local governments of the region. The bulk of the capital costs, which would be ultimately payable from system revenues, would be financed by borrowing from the capital market. The remainder of those costs would be financed by Federal and local grants in the same proportion as that proposed in the

national mass transportation program which I have recommended. The Agency has concluded that necessary borrowing can be repaid from fare box revenues within 36 years. Even under adverse circumstances, it seems reasonable to conclude that the borrowing could be repaid within a period of 50 years.

He supported the intention of Congress in passing the 1960 Act that a regional compact agency take over construction. "I am hopeful that the compact negotiations which are now in progress will reach a successful conclusion."

President Kennedy recognized that rapid transit was not the sole answer. "Rapid transit must be related to, and coordinated with, the movement of people and goods by freeways and parkways, roads and streets." He did not know a "single touchstone" for balancing the roles of transit and highways in meeting the area's "total regional transportation needs."

He acknowledged the "wide differences of opinion" on the specific highway and bridge proposals. He was convinced, however, that the differences could be resolved by "a careful re-examination of the highway program of the District of Columbia in light of the Transit Development Program, and the social, economic and esthetic impact of highways in the Nation's Capital." He asked the District's Board of Commissioners to work with appropriate Federal Agencies on this reexamination.

As for the projects he withheld in his FY 1964 budget proposal for the District, he now recommended proceeding with the East Leg of the Inner Loop and Fort Drive Parkway. Funds were available for these projects. Horsky clarified for reporters that the President advocated the west bank alignment for the Anacostia River segment of the East Leg.

President Kennedy continued:

Decisions on the appropriate highway facility for the North Leg of the Inner Loop, particularly whether it should be built to Interstate standards, should await the outcome of the re-examination which I have outlined above. Since the construction of the Three Sisters Bridge as an interstate facility appears to depend upon the decisions which must be made with respect to the North Leg, its construction should likewise be deferred until all the alternatives have been fully re-examined. For similar reasons, no further commitments at this time should be made with respect to the Potomac River Freeway.

In the end, he said, "an intelligent decision" on the area's transportation should encompass highways and mass transit. Until now, transit plans were tentative and lacked sure knowledge they would be carried out:

The time has now come to answer that question. The Transit Development Program of the National Capital Transportation Agency presents a carefully conceived and attractive plan. It has commended itself to me, and I hope it will commend itself to the Congress.

President Kennedy's letter was accompanied by a five-paragraph of legislation authorizing NCTA to begin construction of the rail transit system "subject to the availability of

appropriations and other funds.” He also enclosed a 42-page Summary Report on the Transit Development Program.

The *Star* and *Post* provided readers with a sampling of reaction to the President’s letter. The delays in the Three Sisters Bridge, Potomac River Freeway, and North Leg for more study prompted Chairman Natcher to say that “any effort to bring to a complete halt important highway projects is a serious mistake.” He added that “the approved freeways which have been considered by our committee from time to time, with funds appropriated, are a vital part of the future development of the District.”

Chairman McMillan of the House District Committee said:

In my judgment it is going to take both modern highways and a modern rapid transit system to haul the traffic coming into the District daily. I hope the program can be worked out and we can get it started.

Chairman Bible of the Senate District Committee pointed out that the District’s downtown had the fourth highest daytime population in the country. “I hope that Congress may make its decision this year or no later than next.”

Stolzenbach was, as might expected, delighted with the letter. As for the subway system, “If we get the breaks, we can start digging in 1964.”

By contrast, the letter “brought gloom” to the District Building, according to the *Post*. General Clarke said, “I think the best thing I can say is nothing.” The commissioners had sent their views to the President for consideration. “The Commissioners will begin the studies that the President has requested that we make.”

H. E. Humphreys, Jr., chairman of the National Highway Users Conference, was “stunned that the President has urged further delay to the interstate and defense highway system.” The only bright spot for highway supporters was President Kennedy’s recommendation on the East Leg, a position that Stolzenbach opposed. [Flor, Lee, “Kennedy Calls on Congress to Vote Area Rail System,” *The Evening Star*, May 27, 1963; Clopton, Willard, “Rail Transit Plan Sent To Congress,” *The Washington Post and Times Herald*, May 28, 1963]

On June 1, President Kennedy sent a special letter to Commissioner Tobriner, president of the Board of Commissioners, outlining how to conduct the reexamination of the freeways. It “should be started immediately and concluded as promptly as possible.” He continued:

A re-examination should focus on the sections of the highway plan which have from the beginning been the most uncertain and the most controversial—the north leg of the inner loop and the Three Sisters Bridge, both of which involve the manner in which traffic is to be moved across the near Northwest of the District.

This will necessarily involve a restudy of those additional portions of the plan which are directly affected by the conclusions reached in the re-examination.

The reexamination of the highway program “should assume a full mass transit system approximating that proposed in the transportation development program, and should make full use of all data which have been accumulated by the National Capital Transportation Agency.”

President Kennedy also advised Tobriner “to insure that economic, social and aesthetic considerations are fully taken into account and related to broader community development plans.” To do that, the commissioners should work with the Departments of Commerce and the Interior, the Housing and Home Financing Agency, the Commission of Fine Arts, NCPC, and NCTA:

Regional and local authorities in Maryland and Virginia should, of course, be consulted to the extent necessary to insure co-ordination of transportation plans and policies within the entire National Capital area.

He asked Tobriner to let Horsky know the “appropriate timetable” for the reexamination and to provide “periodic reports” to Horsky on the review.

Despite the “wide differences of opinion” on the controversial freeway segments, “a major objective of the re-examination should be a consensus which can command general support.”

District officials had mixed reactions to the letter. The implication was that if the reexamination confirmed the need for the North Leg and the Three Sisters Bridge, the White House would approve them and allow the Potomac River Freeway to go forward. However, NCTA, NCPC, and the agencies that President Kennedy wanted the city to work with had expressed wide differences on the freeways. The *Post* observed that, “One top city official considers it patently impossible, and believes the re-examination will end in the same old conflicts.” Albert A. Grant, the chief highway planner, thought the city might be able to convince technical staff based on data, but convincing policymakers was uncertain.

Director Aitken said the city did not have the “substantial amount of money” that would be needed for the reexamination, but was working with the House and Senate on the matter. He expected the review to include a re-check of traffic estimates, preparation of alternate plans, preparation of models, and exploration of the use of airspace above the freeways for office or apartment buildings. [Pierce, Charles D., “Kennedy Asks New Study of D.C. Highways,” *The Evening Star*, June 5, 1963; Schuette, Paul, “Community Accord On Freeway Plans Sought by Kennedy,” *The Washington Post and Times Herald*, June 6, 1963]

### **Congress Considers the President’s Report**

Within days, Congress began examining the President’s recommendations. The chairmen of the House and Senate District Committees wanted to hold joint hearings. Chairman Bible thought the President’s recommendations “provide a working base for Congressional consideration and, hopefully, action on the growing problems of metropolitan Washington.” Chairman McMillan said he would be pleased to co-chair joint hearings. In addition, Chairman Natcher had hearings on the District appropriations bill coming up in June.

As it happened, though, the Subcommittee on Roads, House of Representatives, had begun holding hearings on May 27 to consider several bills amending Federal-aid law. On May 29, General Prentiss, the former District Engineer, appeared before the subcommittee to testify on behalf of the American Road Builders Association (ARBA). After discussing ARBA's views on each of the pending bills, he brought up President Kennedy's call for "a delay and re-study of certain segments of the planned Interstate System within the District of Columbia on the premise that the provision of a suitable rail transit system might make the construction of these freeway links unnecessary":

The great weakness in this premise is that it overlooks the fact that the rail transit system will effectively serve only certain portions of the commuter traffic load, while the planned freeway system is needed to serve not only commuters but also the 24-hour needs of freight transportation and passenger automobile traffic of all kinds, including tourist traffic, the diffuse patterns of local traffic, substantial amounts of through traffic, and the requirements of the national defense.

He was certain that the restudy would confirm the need for the freeways, but the "tragedy of the situation" was that people would be deprived of the freeway service for several years, "much to the detriment of the national capital region."

Because the District transportation system was not the subject of the hearing, Representative William C. Cramer (R-Fl.) began the questioning on the pending bills. After doing so, he expressed interest in General Prentiss's discussion of the District issues. Representative Cramer, who lived at 6714 Joallen Drive in Falls Church, Virginia, while Congress was in session, explained his interest:

I still can't get to Congress over decent highways coming to work in the morning over 14<sup>th</sup> Street Bridge, for one example. There is still a missing link in the expressway to the South here connecting with even the Capitol. How long do you think such a delay and such a restudy would take, do you have any idea?

Prentiss did not know, but said all the data necessary for the restudy "has already been collected" by the highway department, NCPC, and the other planning agencies in the area.

Representative Cramer thought General Prentiss's reasons for not delaying the freeways were "very sound," adding:

I don't think there are many cities in the United States that have a worse traffic problem than the District of Columbia . . . . [It] appears to be that the highway situation in the District of Columbia is about as botched up, hodgepodge and slipshod as any in the United States of America. As a matter of fact, I had a study made with regard to delays on present projects and out of 31 projects underway now 21 of them have been delayed for periods ranging from 16 days to 9 months beyond the termination date of construction. As I say, there is no way to get to the U.S. Capitol over 14<sup>th</sup> Street Bridge and Shirley Highway on the expressways system even though the system is now constructed. It is not connected up.

With another “indefinite delay” on tap, “when are we going to get any relief for the District of Columbia highway traffic?” Highway traffic, he said, was going to increase “regardless of what type of a rail transit system may be devised.” He agreed with General Prentiss about the variety of traffic in the city. The high number of trucks passing through the city was inevitable because “there is no other way for them to get to the Northeastern United States except through the District of Columbia on U.S. 1, and so forth.”

General Prentiss pointed out that tourists did not want to ride into the city on a rapid transit system. “Most of them will come in here in their own automobiles or by buses.”

Representative Cramer agreed that tourists did not “want to leave their automobiles some distant place when they want to visit the District of Columbia.” He also wondered how “the Defense Establishment [is] going to move over rapid transit system.”

General Prentiss pointed out that 10 years ago, when he represented the District as Engineer Commissioner on NCPC, staff conducted “a very comprehensive origin-destination survey,” with the finding that 50 percent of people who drove into the area inside the proposed Inner Belt Freeway “did not have a destination inside the inner belt.” The 50 percent of vehicles that were causing the congestion within in the downtown area inside the Inner Belt “were not there because they wanted to be there, they were there because it was the only way to get to where they wanted to go.” The point of the Inner Belt Freeway and its connecting radials was to let people “get to their destination without going into the central city.”

Referring to the Potomac River Freeway and the Three Sisters Bridge, Representative Cramer asked if the Inner Belt Freeway would connect without these missing links. General Prentiss said that “no section of this belt can carry out its function until the belt is closed.” True, the rapid rail system would reduce traffic within downtown, “but the great majority of people are very probably like you and me, we want to see other people using that rapid transit so we can drive downtown in comfort because it happens to be more convenient for us to drive our automobile.”

Representative Cramer thought the question related to “the basic psychology of American independence, even in getting to town.” He was not opposed to rapid transit for commuters who want to use it “but I don’t think you can substitute it entirely for the highway system.”

General Prentiss said ARBA was not opposed to rapid transit, either, but “rapid transit has to stand on its own legs and not stand on legs that are supported by taking away what careful studies by experts have indicated is absolutely essential to the solution of the transportation problems of this city.”

Chairman Fallon, who chaired the subcommittee, also was concerned by the President’s message, pointing out that one editorial he had seen from another city suggested that its officials also take a “stop and look” attitude about its planned expressways:

This could spread all over the country in a very short while and change the thinking of a lot of people, and it might impede and certainly will hinder the construction of a much needed Interstate System in those cities.

Representative Cramer suggested “it appears to me that might be the objective of making Washington the guinea pig or test case and thus the focal point of this whole mass rapid transit program which is to some extent faltering in other areas, as justification for the rapid transit, mass transportation bill now pending . . . to try to give great emphasis and push behind that program.” His personal opinion was that doing so “to the detriment of the Interstate System is not the proper approach.”

Chairman Fallon, who told one interviewer that he disliked driving, especially freeway driving and commuted daily by rail between his Baltimore home and Washington, said that was his personal opinion, too:

Certainly if the press is in some instances going to recommend that nothing be done in other cities until they see what happens to the Washington study or action, this will obstruct the building of these highways in most of the large cities of the United States.

General Prentiss reminded the subcommittee that Congress had accelerated the Interstate System in 1956 to complete the network, including the routes into Washington, within about 13 years, “and we are certainly not going to be able to do that if we stop the construction of our interstate highways out on the border some place and look at rapid transit.”

Representative Cramer acknowledged that some changes in Interstate routes around the country were justified, “but a lot of changes have been made which couldn’t be justified, in my opinion, and uncertainty of it is very unfair to people who own property in these areas.”

After some additional discussion of the pending bills, Chairman Fallon thanked General Prentiss for his testimony. The chairman assured General Prentiss that the subcommittee was “interested in seeing the program initiated by Congress in 1956 go forward to completion by 1972.” From the testimony “it certainly seems this is going to be one of the greatest obstacles to the completion of the system if these delays are carried out, not only in Washington but throughout the Nation.” [Federal-Aid Highway Act Amendments of 1963, Hearings before the Subcommittee on Roads, Committee on Public Works, U.S. House of Representatives, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, Report 88-6, pages 65-76; reference to Chairman Fallon’s dislike of driving based on interview reported in: Schwartz, Gary T., “Urban Interstates and the Interstate System,” *Southern California Law Review*, March 1976, pages 433-434, footnote 195]

Representative Cramer wrote to Chairman Fallon on June 7 to call for hearings “at the earliest possible date” on the President’s proposal to delay the Three Sisters Bridge, the North Leg, and the Potomac River Freeway. After summarizing recent developments, he wrote:

I do not believe that the construction of critically important parts of the National System of Interstate and Defense Highways should be further delayed on the basis of recommendations which do not take into account the purpose and objectives of the Interstate System.

The District was already 30 percent behind schedule, ranking below 32 States. The studies ordered by the President would only put the city further behind. Further, if they resulted in a

decision not to complete the Potomac River Freeway, the segment under construction “will not serve the purpose for which it was designed” and it “will almost certainly be taken off the Interstate System so that the Federal Government would bear only 50 percent of the construction cost.”

He called for hearings, but emphasized that “I don’t think such hearings could or should be construed as opposing a justified and properly financed mass rapid transit program that may be needed but would serve notice that any such planning should not be permitted to destroy the effectiveness or unduly delay completion of the Interstate and Defense Highway System—be it in Washington, D.C., or elsewhere.” [“House Asked to Air Road Delay Plan,” *The Washington Post and Times Herald*, June 8, 1963]

(The Subcommittee on Roads hearings were part of the review leading to the Federal-Aid Highway Amendments Act of 1963 (P.L. 88-157), which President Kennedy approved on October 23, 1963. Among its provisions was a revision of the timing of ICEs and a change in the 1956 statutory requirement that Interstate standards “shall be adequate to accommodate the types and volumes of traffic forecast for the year 1975.” The new requirement was that standards “shall be adequate to enable such project to accommodate the types and volumes of traffic anticipated for such project for the twenty-year period commencing on the date of approval by the Secretary . . . of the plans, specifications, and estimates for actual construction of such project.” As Lee Flor pointed out in the *Star*, this change could affect the Three Sisters Bridge because meeting traffic demand in 1975 might require only a six-lane bridge while meeting demand in, say, 1984, might require eight lanes. [Flor, Lee, “Forecast of More Traffic To Alter Design of Bridges,” *The Sunday Star*, October 13, 1963])

### **The Commissioners’ Views**

Chairman Natcher, preparing for hearings on the District of Columbia Appropriations Act, 1964, also wanted to explore President Kennedy’s transportation letter. The Congressman was, according to Lee Flor, “indignant” that the Bureau of the Budget had not made public the views of the District commissioners as expressed in an analysis dated April 8, 1963, and sent to the White House. Chairman Natcher was upset because he had not realized until late May that the Budget Bureau had not released the commissioners’ final analysis. Had he known, he would have released it in April. Now, he gave copies to the press, which saw it for the first time.

The commissioners endorsed a downtown subway, half the proposed rail-transit lines, and study of express bus routes, but they also wanted to build the Three Sisters Bridge and the Potomac River Freeway. The commissioners were still “concerned that certain studies . . . used by the transportation agency . . . have not been made available.”

Although the analysis was similar to their earlier views, the commissioners added a section on the decline in the use of subways and rail transit in New York City. In 1940, the subway carried 1.8 million trips; in 1960, the total was 1.3 million even though the city’s population had increased by 2 million people. Transit riding per person since 1940 had declined by 40.6 percent in New York City, 33.1 percent in Chicago, and 41.2 percent in Philadelphia. Flor summarized:

The transit system, proposed for 1980, will carry only 117,000 more passenger trips than the bus and streetcar system in 1955, while the number of trips on highways will increase by 2.5 million, the report states.

Service to present bus riders may be severely hurt because the number of bus stops may change, the report indicates. The proposed 98-mile rail transit system would have only 30 stations in the District, while D.C. Transit now has more than 3,000 stops in the District, the report says.

The commissioners also informed President Kennedy that the District's highway plans would displace 25,200 fewer people than originally estimated. NCTA had estimated displacement of 33,000 people under the highway and transit plan the Mass Transportation Survey had recommended in 1959. This figure, NCTA calculated, could be reduced by 5,400 people because fewer highways would be needed under the transit proposal. NCTA said its plan "would save the homes and relocation costs of 27,000 persons in the District."

The District commissioners disagreed, as Flor summarized:

The District Commissioners, however, in their official evaluation of the transit proposals said that around 7,800 persons would be displaced, provided two freeways are built along the Baltimore and Ohio Railroad tracks through the north part of the District, it was disclosed yesterday.

The NCTA transit plan would have little effect on relocations because they would be about the same under the 1959 or 1962 plans:

But a more realistic appraisal shows the agency's transit system would "save the homes" of only around 144 persons, or around 35 families. This is based on the District's official report, a presidential decision on the East Leg freeway, and the pending decision on the combined freeway [along the Baltimore and Ohio Railroad tracks in the northern part of the District].

The wide difference in figures is because the transportation agency used the relocation estimates for the Wisconsin Avenue corridor and the Intermediate Loop.

The District Commissioners use relocation figures for the projects financed by interstate funds because they already have junked several controversial projects.

Critics had used relocation issues as a "key weapon" in their attacks on the highway plan, saying displaced families were "social dynamite." They were, Flor concluded, likely to dispute the District commissioners' new displacement figures.

Chairman Natcher also released the Department of Commerce's 39-page February report on the NCTA plan. It had called the Three Sisters Bridge and the Potomac River Freeway a "necessary part of the highway network and detailed engineering and construction of it should be pursued vigorously." The report accused NCTA of failing to "cooperate with agencies responsible" for

transit development, adding that the agency did not “fully analyze the cost or service potentials” of the transportation alternative.” In addition:

The NCTA study failed to complete a sufficient amount of basic engineering work for all sections, including subsurface exploration, evaluation of construction methods, the preparation of preliminary plans and profiles, etc., in order to realistically develop sound cost estimates for the rapid transit system recommended.

The White House and Bureau of the Budget were concerned that Chairman Natcher’s release of the Commerce Department’s report would give ammunition to opponents of President Kennedy’s decision. He had neglected to release a letter from Under Secretary of Commerce for Transportation Clarence D. Martin, Jr., transmitting the report to Members of Congress, including Chairman Natcher. On orders from the Budget Bureau, Martin had written:

This report was one of several submitted to the President from various agencies on this matter. Understandably, conflicting opinions were represented in the various reports he received.

The President has now made his decision after considering all relevant advice and I would like to emphasize that the Department of Commerce fully supports the recommendations of the President . . . .

As Flor pointed out:

But the department has not changed one word in its transit analysis made last February, which is almost the exact reverse of the presidential recommendations. [Flor, Lee, “D.C. Transport Plan Balked by Kennedy,” *The Evening Star*, June 1, 1963; Flor, Lee, “Roads’ Displacement Toll Seen Reduced by 25,200,” *The Sunday Star*, June 9, 1963; Flor, Lee, “Commerce Says It Favors Rail Plan Though Formal Report Is Critical,” *The Evening Star*, June 11, 1963; “Foes of Kennedy Rail Transit Proposal Cite Critical Commerce Department Note,” *The Washington Post and Times Herald*, June 12, 1963]

### **Chairman Natcher Takes a Stand**

Chairman Natcher began hearings on June 3 to consider the District’s appropriations for FY 1964. Serious discussion of the District’s highway construction plans did not begin until June 11 when the three District commissioners joined Director Aitken and Deputy Director Airis on the witness panel. The chairman decided to reverse the usual order by offering his own statement before the city officials spoke because, he said, “This committee is deeply concerned with the highway and freeway problem.” Any effort to halt the highway projects was “a serious mistake.” Given the nearly daily growth of traffic, “we must carry our highway program along with any and all proposals concerning a rapid transit system.”

Congress, after years of deliberation, had initiated the Interstate System in 1956, and required it to extend through important metropolitan areas. In 1961, Congress had increased taxes to pay for the increased cost of the program. Despite all that, “a new party” (NCTA) had been introduced

into the Washington area's highway planning process. "Because of intercessions by various interests, the advancement of the freeway system has been dramatically curtailed."

By FY 1964, half of the time Congress allotted for construction of the Interstate System will have elapsed. He asked Aitken, in his opening statement, to discuss the percentage of the city's Interstate System that was open or under construction to help the committee understand the relationship between elapsed time and completed work.

He wanted to identify "what constructive steps the Congress can or should take to either get this program underway," as mandated by Congress, "or whether it should be stopped entirely until basic policy decisions are made":

The Congress does not intend to sit idly by and permit this important public works program to be placed in jeopardy by irresponsible intruders . . . .

The freeway system is critically needed to ease our transportation requirements. It will stabilize confidence in the construction of office buildings, both private and Government. It will create taxes. It will save thousands of dollars by the elimination of costly traffic delay, and it will save lives. [District of Columbia Appropriations, 1964, Hearings before a Subcommittee of the Committee on Appropriations, U.S. House of Representatives, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, on H.R. 7431, pages 619-620]

When the hearing resumed on June 12, General Clarke explained that after much controversy, the Kennedy Administration had "supported certain projects and requested other projects be delayed for further study." He said that, "This is the position that we have adopted in formulating our budget" for FY 1964. As a part of the Kennedy Administration, District officials naturally followed the President's direction. [page 622]

Aitken summarized Interstate projects underway and their status before Chairman Natcher interrupted to recall the events leading to the Appropriations Act for FY 1963, including the stalemate during the House-Senate conference. The result, largely because of the chairman's efforts, was that the law included funds for the Three Sisters Bridge and the Potomac River Freeway. The House Committee on Appropriations believed these projects were important and "under no circumstances would we agree to bring to a halt the highway system."

Then President Kennedy halted those two projects and the Northwest Leg, which was not even under consideration during deliberation of the FY 1963 appropriations. Nevertheless, on June 1, the President had asked the District to study those freeways based on the concerns raised by NCTA. The District's request for FY 1964 reflected these actions.

Chairman Natcher just wanted to confirm that up to June 1, the District thought the projects should proceed. General Clarke replied, "That is correct, sir." [pages 628-629]

Aitken said that to complete the Interstate System on schedule, the District would have to obligate \$51 million a year. In FY 1964, the District expected to have between \$65 and

\$75 million of unobligated funds. “Optimistically, as things now stand, we doubt that we can obligate more than about \$30 million in fiscal year 1964.” That was because the District could not “advance a project to design or construction until we get past the planning hurdle.” They were able to proceed only on projects “on which there is agreement between some of the planning factions, shall we say.”

He cited a problem with the Center Leg, which “has been on the freeway plan since 1955.” The problem was that the Center Leg would pass under two pieces of property under the jurisdiction of the Architect of the Capitol, J. George Stewart. The District did not need title to the land, only permission, but it had not secured clearance from the Architect. Aitken was confident that the Center Leg would “have a terrific effect in clearing up traffic confusion around the Capitol Hill area” because no motorist would “use the city streets if he can get on a freeway system for a part of his trip.”

Chairman Natcher said the committee would not support any project that would damage the Capitol or any section of the National Mall.” He added, “I do not believe you gentlemen would recommend any proposal that would fall in that category.”

Aitken assured him, “That is absolutely right.” He explained:

The center leg, then, is the next logical place to get a heavy movement of traffic off the surface of the Mall, so that when you are standing on the westerly terrace of the Capitol and looking toward the monument, you will not see this traffic. It will be landscaped and have more of a park type appearance and it can be reserved for local traffic movements. [pages 630-634]

Chairman Natcher wanted to discuss the Three Sisters Bridge and the Potomac River Freeway. In view of the President’s call for a study, the city had not requested additional funds for these projects. Aitken told him that the Three Sisters Bridge was “a good one to pick out as an example of what goes on in our planning process.” He went through the history of the bridge as far back as 1953 and its inclusion in the Mass Transportation Survey. Overall, he said, NCPC had “acted on the item, directly, or indirectly, at least five times. But as of today, the Commission has not signed off on some elements of the Three Sisters Bridge.” The problem was not planning, but “the business of replanning over and over.” [pages 633-634]

General Clarke said that based on discussions with District highway staff and BPR, “this type of restudy would take about 9 months to do. It will be a most thorough and comprehensive study.” The city needed to shift money around for the study, but did not need additional money for it. [page 636]

Chairman Natcher wanted to confirm what the city had requested for the North Leg. The budget, Aitken replied, asked for \$900,000 for study and right-of-way acquisition on the section that was not in controversy. The White House, the chairman wanted to confirm, did not object. Aitken and General Clarke confirmed that the White House did not object to the request. [page 643]

As Chairman Natcher directed the discussion to the planning process, he asked about NCTA's role in planning highways. Aitken replied that the National Capital Transportation Act of 1960 "says that the responsibility for planning shall continue in those agencies that already had it." As "the best way" to indicate NCTA's work, he cited its "proposal with reference to the north leg of the inner loop where they would build in a serious deficiency in a part of the inner loop freeway."

In response to Chairman Natcher's inquiry about the concept of a 3C planning process for the Washington area, General Clarke replied that the planning process, involving NCPC and the National Capital Regional Planning Council, from 1955 to 1959 was "an excellent example then of a cooperative planning process." Since then, "the cooperative planning process seems to have fallen apart to some extent." Since the Mass Transportation Survey had been completed, the major actions "seem to have been a downgrading of the plan that was arrived at in 1959."

What was needed was for the area's two official planning bodies, NCPC and the Regional Planning Council, to get everybody involved from the start of the plan. "You talk out everything in a long time-consuming process. But you would have to keep that—you have to go through this so that at the end, the plan will be supported by the people who have to carry out the plan." That type of cooperative planning process "has been missing the past 3 or 4 years." [pages 645-646]

Chairman Natcher asked about funds in the budget for the South Leg Freeway. The city's budget for 1963 indicated that the freeway would cost about \$18 million. Aitken said, "During the past year, we have reached, I think, what might be termed a gentlemen's agreement with the National Park Service and the U.S. Bureau of Public Roads as to a method for proceeding." Details were still being worked out with NPS and BPR, "but it looks like the estimated cost now might be in the order of \$30 to \$40 million." The main reason for the increase was the desire on the part of NPS for a tunnel "so that this freeway will not disrupt the park features in this part of the city." [page 649]

Regarding NCTA's report and the commissioners' formal response to it, Chairman Natcher wanted to know if they still supported completion of the District's proposed Interstate System. Tobriner replied:

Sir, that is the recorded position of the Board of Commissioners. But our effectiveness is controlled by the President's request that some of these items—namely, the Potomac Freeway and the Three Sisters Bridge—be deferred for further study.

Chairman Natcher asked if the commissioners had any comments on organization, finance, or phasing of the mass transit portions of NCTA's report. General Clarke said he was part of a 10-member group of District, Maryland, Virginia, and Federal representatives negotiating an interstate compact as Congress had called for in the National Capital Transportation Act. With details to be worked out, the members were unanimous in recommending that "the ultimate organization for the . . . rapid transit in this area should be a compact type of organization in which each of the States and the Federal Government would have some voice."

Maryland and Virginia, he said, were concerned about “whether or not the same financial terms would be available to a compact agency as would be available to a Federal corporation.” The understanding was that the risks to the States “would be no greater under a compact agency than they would be under a Federal corporation.” [pages 650-651]

The panel discussed the relocation issue. General Clarke said the city had asked Congress to approve the use of Federal-aid highway funds for relocation costs on the same basis as under the urban renewal program. “This amounts to \$200 per family and up to \$3,000 for commercial establishments.” The city also had requested legislation allowing it to coordinate with the Redevelopment Land Agency on a Centralized Relocation Service to handle all relocations in the District. “This, I think, would go a long way toward satisfying some of the critics of relocation.”

He estimated that the highway program would displace about 7,000 people over 10 years, or 700 people or 200 families a year:

While it is a problem, it does not seem to be an impossible load. I think it has to be put in a reasonable context, because if you say 7,000 people that is a lot, but it is 7,000 people over a period of 10 years. [pages 669-670]

Chairman Natcher asked how the commissioners were going to comply with President Kennedy’s request to reexamine the Three Sisters Bridge and the North Leg. General Clarke said the best way to reply was to submit, for the record, a memorandum, dated June 11, he had received from Director Aitken. The city proposed to hire “a firm with outstanding and nationally recognized ability in the field of traffic forecasting, and, if possible, with some knowledge of transportation problems in the National Capital region.” The firm would develop traffic estimates for highway facilities to serve “the study corridor extending from the Three Sisters Bridge site on the west to a connection of the north leg extended to the Baltimore-Washington Parkway on the east, with emphasis on a continuous route for the entire length of the study area.”

At the same time, the District planned to continue developing geometric studies and architectural sketches of alternate locations for a crossing above Key Bridge, including the Three Sisters Bridge. As for the Potomac River Freeway, the city would continue developing geometric studies and architectural sketches from the Three Sisters Bridge and alternative river crossings.

The District also planned to retain “a nationally recognized firm to consider aesthetic treatments and develop appropriate sketches and models” for the North Leg from the Potomac River Freeway to the Center Leg. A study of the social and economic impacts of the North Leg would include impacts on tax base, relocation, use of air rights, and other factors.

General Clarke estimated that the studies would take about 9 months and cost approximately \$500,000. [pages 672-673]

Closing out this portion of the hearing, Chairman Natcher said he had “often wondered just how those people feel who believe that this program should be brought to an abrupt halt, and how the people feel who believe we do not need any highways.” He believed the city should proceed

with rapid transit and the highway system. “I see no reason to penalize the District of Columbia by stopping the highway program, and in my opinion that is what is being done.”

He had talked with those who wanted to halt the program and now he wanted to go through their arguments. They argued that the freeways would affect the appearance of the city; would affect the city’s ability to pay its share of the highway program; reduce District revenues by taking taxable property; and, of course, displace many people. He asked the panel to comment on those objections to the highway program.

General Clarke had heard aesthetic arguments from the American Institute of Architects, the Commission of Fine Arts, and others. “All I can say in answer to that is that we have attempted to employ the finest architects we can find.” The city had added local architects to the staff. As he had told the institute, “if they desire to help us they could tell us how to get a highway through a city esthetically instead of just saying it cannot be done.” For example, “Miss Smith” had examined the E Street Expressway “and I think she came up with a very fine treatment.” (This is a reference to Chloethiel Woodard Smith, the influential District-based architect who had been involved in the new Southwest among many other projects.)

Aitken pointed out that architects also criticized buildings in Washington and elsewhere, but he referred to an article in *Architectural Record* of May 6, 1961, in which architect Edmond Bacon said, in regard to Philadelphia, “That the decision was made not to try to fight the automobile, a losing battle at best, but to treat it as an honored guest and cater to its needs.” The article included a map of an inner loop for Philadelphia. The article reinforced what General Clarke had said. “In other words, here is a problem. Help us make it as attractive as we can.”

General Clarke admitted that the city had reduced, overall, the amount of parkland in the city. Based on a study of how much had been taken and how much given back, he said “they balanced out to about 250 acres each way.” In the case of the East Leg Freeway on the west side of the Anacostia River, for example, “The city will end up with more parkland” than before.

The effect on tax rolls, General Clarke said, was debatable. “You have to evaluate the question of taking land off the tax rolls and perhaps if you can reduce the volume of traffic on the street you can add a little to the tax rolls.”

He was aware of the complaint that traffic reduces the value of adjacent property. “I don’t have any total picture on it . . . . If we could remove the traffic all of us would agree that a piece of residential property without traffic running by it all day long, is more valuable without that.” However, he questioned “whether the economic aspects of the freeways are, as these people phrase it, a simple removal of land from the tax rolls.” He thought the freeways brought more business into the city.

Aitken also considered the argument to be based on a fallacy. The “economic equation” is more complicated than simply adding up the property take from tax rolls for freeway right-of-way. For example, such an equation does not take air rights into consideration. He said, “we have proposals, sincere proposals by men that want to build office buildings that will cost \$30 to

40 million over the center leg of the freeway system.” Other freeways had similar, valuable air space that would add to the tax rolls.

Aitken agreed that the city was going to have a problem providing the 10-percent match for the accelerated Interstate program, but the commissioners had not, as some asserted, decided to divert general funds from other needs, such as schools or welfare, to the highway program. “Well, to my knowledge, the general funds haven’t contributed in the past to the financing of the highway program.” In fact, the reverse had been true recently, with the city shifting District highway funds to general needs, namely policing. [pages 673-679]

On June 14, the subcommittee welcomed Federal Highway Administrator Whitton and other BPR officials along with General Clarke. “Mr. Whitton,” Chairman Natcher told subcommittee members, “appears before our committee at my request.”

Whitton began by saying that he appeared in support of the District commissioners’ request for budget revisions for 1964 to conduct the studies of certain highway projects as recommended by President Kennedy in his letter of June 1, 1963. The recommended studies of the Three Sisters Bridge and the North Leg of the Inner Loop also involved “a look at those portions of the Interstate System plan within the District of Columbia and the connections thereto in the immediately adjacent areas of Maryland and Virginia.”

Prompt action on the studies was essential because the region’s Interstate System was “interrelated and must be completely integrated into an overall transportation plan.” Given the time limit on completion of the Interstate System, the time was fast approaching when final decisions would have to be made to confirm the network in the District and its links to routes in Maryland and Virginia. In view of this urgency, he was appearing before the subcommittee in support of the District’s budget needs for the studies.

Chairman Natcher asked Whitton a few questions about the history of the Interstate System, including its urban segments. Whitton explained that the Federal-Aid Highway Act of 1944 had directed PRA to work with the State highway agencies to designate a 40,000-mile Interstate System, including Interstate routes “into and within urban areas.” The chairman asked about designation in the District of Columbia. Whitton presented a copy of the Yellow Book map of the District saying it depicted “the Interstate System you speak of.”

The chairman asked what changes had occurred in the District’s network since the original designation in 1955. Whitton cited the addition of:

- The Three Sisters Bridge in 1957,
- The connection between Theodore Roosevelt Bridge and the 14<sup>th</sup> Street Bridge about 2 years earlier,
- The Lincoln Memorial connection,
- Shift of the East Leg from the 11<sup>th</sup> Street corridor to a route along the west side of the Anacostia River,
- The Center Leg, which was not yet formally approved, although Whitton said BPR would approve it, and

- The North Central route, still under study.

Responding to questions from Representative Edward R. Finnegan (D-Il.), Whitton explained that under the Federal-Aid Highway Act of 1956, the “last dollar has to be out of the trust fund by October 1, 1972.”

Representative Finnegan, whose district was based in Chicago, asked if he correctly understood that under the President’s June 1 letter, the North Leg of the Inner Loop and the Three Sisters Bridge were being “held up until such time as he formulates some plan that has to do with mass transit.” Whitton clarified the status:

I do not believe you are quite right in saying it is being held up. I think we must make these studies of the Three Sisters Bridge and the north leg of the inner loop to obtain the necessary information to make a proper presentation for the public hearing which is required by the [1956] statute . . . .

I am in favor of proceeding as fast as possible in accordance with the request by the President to the Commissioners.

He said some preliminary studies had been made, but not final studies. That was true, for example, of the North Leg. Studies thus far had not been “made in sufficient detail properly to acquire information that would enable the District to have the public hearing which is required by the statute.”

Whitton added that after the studies were completed, BPR would have to decide whether to approve the segments. He and General Clarke also clarified that part of the Potomac River Freeway was under construction, but the portion near the Three Sisters Bridge was subject to the study of that structure.

Representative Finnegan wanted to explore Whitton’s earlier comment about connections in the adjacent States, citing I-66 as an example. Whitton confirmed that I-66 was needed. “There is no question in our minds about Route 66, which crosses the Potomac on the Theodore Roosevelt Bridge and then swings west into Virginia.” He continued:

In a relatively short time, by which I mean probably this calendar year the State of Virginia will be awarding a contract for Route 66 from the west end of the Theodore Roosevelt Bridge up and past the point where the Three Sisters Bridge connection would join to it. If we do not know between now and then whether or not there is to be a Three Sisters Bridge, then we will not know whether to provide for an interchange between Route 66 and Three Sisters Bridge [the I-266 link]. So, therefore we need to know as quickly as possible so we can tell Virginia, “Yes, there is going to be a Three Sisters Bridge and, yes, you must provide for an interchange and buy the necessary right-of-way and design the highway in accordance with that.”

With Representative Finnegan departing for another commitment, Chairman Natcher took over the questioning. He wanted to know if the 1961 ICE covered the entire Interstate System in the District as currently designated. Whitton confirmed that it covered “the designation as we have

approved it at this time.” If BPR designated additional routes, such as the Center Leg, “it then would not agree.” However, Congress was considering legislation calling for another estimate for 1965 that would update the costs based on all designated routes at that time. (The Federal-Aid Highway Amendments Act of 1963, as noted earlier, required the new ICE.)

Chairman Natcher wanted to know if BPR could approve the use of Interstate funds “where the system was not properly worked out and agreed upon.” Perhaps not understanding the question, Whitton said BPR could approve projects only on routes that were part of the approved Interstate System.

The chairman asked about the standards for the North Leg Freeway. “Specifically, would one-way streets with intersections at grade meet the requirements with reference to standards?” Whitton replied, “No, sir.” (He did not explain his answer, but Interstate standards called for full control of access; one-way pair streets with at-grade intersections would not qualify.) How, then, would the number of lanes be determined? Whitton said the number would be based on predicted traffic volumes as of 1975, adding that he was hoping Congress would change the year of traffic design, as it would do in the 1963 Amendments Act.

Asked to comment on the reexamination of the North Leg Freeway, Whitton said that it would focus on how much traffic would use the freeway “with the premise that a transit system would be built as has been proposed in the President’s recent message to the Congress.” The amount of traffic that could be expected on the freeway would determine the standards for its construction, adding, “not only the standard that will be used, but whether it should be a depressed or an elevated section or a section at grade.” Further, the study would consider the social effects of the North Leg Freeway on the area, the aesthetic effects, and the economic effects:

We shall make as complete a study, if the Bureau of Roads has anything to do with encouraging the District, as ever was made on an urban expressway, because this is the Capital of our country, and we are all good citizens and are proud of our Capital, and we want it to continue to be a place where people can enjoy it.

The chairman asked if the rest of the Inner Loop would be eligible for Interstate funds if the North Leg were not built to Interstate standards. That, Whitton said, would depend on the results of the study, but I believe as of now if the north leg is not built, then the south leg as now built or under construction will be overloaded.”

What, Chairman Natcher wanted to know, was the purpose of the Three Sisters Bridge and the Potomac River Freeway. Whitton explained:

We think that more bridge capacity is needed across the Potomac, and the Three Sisters Bridge will provide that capacity. The Potomac Freeway would connect the Three Sisters Bridge to both the south leg, and the north leg. In brief these two projects are key components of Interstate Route 266 which serves to connect Route 66 in Virginia with Route 95 leading to Baltimore.

He added:

There is another thing the Three Sisters Bridge does, Mr. Chairman, if I may say so. The Three Sisters Bridge provides a way for the truck traffic to get into Washington and still comply with an agreement somebody made not to run any truck traffic through the Lincoln Memorial area.

Was it reasonable for Virginia to design I-66 in Arlington County without knowing where it will connect to the Three Sisters Bridge? Yes, it was reasonable, but the design could not be completed until State officials know whether the Three Sisters Bridge would be built as part of the I-266 connection:

That is the reason we are in a hurry now, because we do not want to hold up Route 66. If we get that Theodore Roosevelt Bridge completed without a way to go off the west end, somebody up here will ask us, "How come?"

Because the reexamination could delay the Three Sisters Bridge for 2 or possibly 5 years, will Virginia have to delay I-66 for the same time. No, Whitton said, Virginia could proceed with construction. The question would be whether to include design of the I-266 interchange or build it without the link.

How long would it take to design and build I-66 in Arlington County and the Three Sisters Bridge and the Potomac River Freeway in the District? Whitton and General Clarke estimated 4 or 5 years. Chairman Natcher said of those timelines, "I would like to say, on the record, too long." Whitton responded that I-66 might be faster since Virginia had conducted the survey for the route through Arlington County, but that would present a problem:

Truck traffic cannot go through the Lincoln Memorial tunnel, and truck traffic would have to get off at the present Key Bridge and just across the Key Bridge and on to M Street, and downtown the best way they could.

(The record attributed this statement to Whitton, but General Clarke may have provided the clarification.)

When Chairman Natcher asked about the Federal-aid Interstate funds apportioned to the District (\$113 million obligated for projects and \$60 million apportioned but not obligated), Whitton wanted to make a point:

The District situation is peculiar. There is no other condition like it in the United States. Every other State has a rural area on which they can spend their interstate money if they get tied up in an urban area. Here the District has no similar place to go.

The chairman wanted to know if Whitton had any information showing that construction of freeways in metropolitan areas "has been detrimental from an economic standpoint in the area into which they extend?" Whitton told him, "No, sir. I think it is just the opposite." The chairman agreed. "I say as a matter of record, I think you are correct."

With the session nearing an end, Chairman Natcher asked what would happen if the District, "because of delays of one kind or another, cannot complete its Interstate Highway System on

schedule.” Would BPR be justified in approving construction of Interstate freeways in Maryland and Virginia leading to the District boundary?

Whitton said BPR’s commitment “is to build a connected system of interstate highways, and I think we are dutybound [sic] to be very careful in seeing that that mandate is carried out.” If the situation the chairman described were to occur, “then it will be up to us to cut those stub ends back to where they do form an interconnected system, cut back the work in the District and the adjoining States or any other section.”

Chairman Natcher thanked Whitton for his testimony, closing the session by repeating what he had often said “during the past 7 months,” that he did not oppose a rapid transit system for the District, “but under no circumstances do we believe that the highway program in the District of Columbia should be killed off to advance or bring about the construction of the rapid transit system.” There was room for both. Anything that delayed or set aside “the fine system” BPR and the District had designated would be “a serious mistake.” He did not believe “there should be any interruption here in the District of Columbia of the approved overall plan.” [pages 723-737]

When the House Committee on Appropriations completed its bill on July 8, for the District of Columbia Appropriation Bill, 1964, the report included a long section on the District’s highway program reflecting Chairman Natcher’s views. Any attempt to bring Interstate highway projects to “a complete halt is a serious mistake.” To meet day-to-day growth in traffic, “we must carry the highway program along with any and all proposals concerning a rapid transit system.” Citing the history of the Interstate System through legislation in 1944 and 1956, the report stated that “Congress has insisted on its original policy that this nation including the District of Columbia shall have an interstate system.” It must be “continuous and . . . properly designated.”

Beginning with FY 1959, Congress had appropriated funds for the Potomac River Freeway and the Three Sisters Bridge, both of which were “consistent with and a part of the national program and have been reviewed repeatedly by the Congress.” The District had sufficient appropriations for those projects. The Committee on Appropriations approved the District’s request for \$900,000 for the North Leg Freeway in FY 1964. “The Three Sisters Bridge, Potomac River Freeway and North leg of the Inner Loop should proceed without further delay.” [District of Columbia Appropriation Bill, 1964, Committee on Appropriations, U.S. House of Representatives, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, Report No. 499, July 8, 1963, pages 2-3]

### **Chairman Fallon – To The Rescue?**

On June 25, Chairman Fallon began Subcommittee on Roads hearings under the title “Transportation Planning in Certain Urban Areas.” He said that “satisfactory progress” was being made on construction of the Interstate System, but “it is evident that most of the progress to date has been accomplished in rural areas.” The urban segments constituted “the most difficult phase of interstate highway construction,” in part prompting Congress to approve the 3C planning process for projects in metropolitan areas effective July 1, 1965.

Given the importance of completing the Interstate System on schedule, he called the hearings to determine “as definitely as possible” whether compliance with the 3C requirement would prevent the States from meeting that goal and whether amendments might be needed. [Transportation Planning in Certain Urban Areas, Hearing Before Subcommittee on Roads, Committee on Public Works, U.S. House of Representatives, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, Committee Serial 88-9, 1963, pages 1-2]

Representative Cramer, in his opening statement, explained that in approving the 3C planning process, “it was not the intention of the Congress, and the section was specifically worded to make certain it was evidence of that intention that this section should not result in undue delay in the completion of the Interstate System of which urban extensions are a vital and integral part.” The urban sections, like the rural segments, must be completed by 1972.

“As a matter of fact, it is my opinion that this section was put in partially, so far as Congress is concerned, to expedite these constructions, to avoid conflicts, to permit planning that would avoid those conflicts, with the result that urban extensions and construction would be expedited rather than delayed, and that any construction of this section to the contrary is subverting rather than carrying out the intent and purpose of the Congress.” In that regard, he introduced his letter to Chairman Fallon calling for a hearing on the freeway program in the District of Columbia. [pages 2-3]

The testimony overall was aimed at the impact of the 3C planning process around the country, not the District of Columbia, but the District came up at times. Administrator Whitton, the first witness, discussed the evolution of urban transportation planning and how the highway community had addressed objections to the urban segments of the Interstate System. His statement did not address the District of Columbia’s freeway network, but when questioning began, Chairman Fallon brought up the subject almost immediately. He asked if highway officials were receiving “full cooperation of all of those that are charged with the study of mass transportation in the cities.”

When Whitton replied noncommittally that most areas were experiencing full cooperation, Chairman Fallon asked if there were any areas where such cooperation was not forthcoming. Whitton agreed that difficulties were occurring in some areas, but did not specify where. Chairman Fallon got to the point: “I am, of course, referring to the report of the National Capital Transportation Agency”:

Mr. Whitton. Yes, sir.

Mr. Fallon. Do you know by whom this report was prepared?

Mr. Whitton. By that agency, so far as I know.

Mr. Fallon. In your knowledge, do you consider these people qualified to evaluate the transportation planning studies in the District of Columbia?

Mr. Whitton. With due respect, Mr. Chairman, I do not believe I am qualified to pass on their qualifications. I have made no study of their qualifications.

Whitton added that he was aware of NCTA’s report, but had not studied it. Chairman Fallon pointed out that the Department of Commerce had reviewed the report and “concluded that their

plan does violence to the efficient flow of motor vehicle traffic within and through the District.” Further, as far as the chairman knew, “there was no cooperation on the part of the mass transit people to find out just exactly the thoughts of the people who are charged with the building of the Interstate System in and about Washington.” They wanted, he said, some Interstate segments held up until their study was completed. He asked Whitton, “Do you have any knowledge of how long it will be before their study is completed?”

The administrator did not. “They were established some time ago, but, in view of the recent developments, we feel that a more detailed study should be made of particularly some sections of the inner loop.” He hoped the study could be completed in 6 months. He did not want to speculate on the result, but said he wanted the subcommittee to know “I am completely in accord with the study being made, because it had to be made” before officials determined the location and design of the legs.

When the chairman asked about the Three Sisters Bridge and the Potomac River Freeway, Whitton replied only that they were part of the study. The chairman asked whether Whitton agreed that every time someone objected to a segment and called for yet another study, “it is a delay in the possibility of completing this Interstate System at our target date?”

Whitton replied, “Mr. Chairman, I think this study needs to be made. That is my firm opinion.”

Representative Cramer interrupted to point out that the study President Kennedy called for was different from a project study of location and design. He wanted a study of the proposals “in relationship to all other types of transportation” not only now but in the future.

Whitton replied, “Mr. Cramer, I think any urban highway study should take into account the other types of transportation that are imminent.” When Representative Cramer asked if all this planning justified delaying the Three Sisters Bridge and the North Leg for 5 or 6 years, Whitton replied that the studies were justified, especially since the shape of the planned transit system could affect the outlines of the highway network needed to meet future traffic demands.

Representative Cramer, seemingly exasperated, asked if Whitton had been involved in preparing the report, dated February 20, 1963, from Under Secretary of Commerce Martin on the NCTA proposal that stated:

Interstate Route 266, which includes . . . Three Sisters Bridge and Potomac Freeway, is a necessary part of the highway network and detailed engineering and construction of it should be pursued vigorously.

Whitton told the Congressman, “We are pursuing it vigorously.” They were beginning the study and would complete it “as quickly as possible.”

Whitton’s position, Representative Cramer pointed out, was “quite different” from the position in the February 20 report about pursuing the bridge vigorously. Whitton disagrees. “Mr. Cramer,

I think we are. I think this study had to be made.”

Representative Cramer pointed out that Congress was divided on the type of transit system the Washington area needed, and resolving the differences could take some time. Should the Three Sisters Bridge and North Leg be delayed while Congress debated transit issues? Whitton did not think so; officials should proceed with whatever the study President Kennedy had requested determined.

Representative Cramer agreed, but said the President wanted to delay the segments “indefinitely until the basic decision as to all types of mass transportation in Washington in the future be determined.”

Whitton questioned the word “indefinitely,” but Chairman Fallon intervened to ask how BPR cooperated with NCTA on its report. Whitton said BPR furnished technical personnel to NCTA but added that in doing so, “we did not necessarily agree to their findings.” In other words, BPR did not furnish opinions; “it was just work.”

Chairman Fallon tried to clarify whether any cooperation had occurred in NCTA’s planning with BPR or the District Highway Department. Whitton was hesitant to “call it cooperation.” BPR simply furnished help.

Apparently still exasperated, Representative Cramer pointed out the statement in the Commerce Department’s report that NCTA “failed to cooperate with the agencies responsible for freeway, parkway, and arterial highway development” and the statement on page 1 of the report that agencies of the Commerce Department had cooperated in previous studies, including the Mass Transportation Survey and would have cooperated in the same way with NCTA “if the services had been requested.” The Congressman said bluntly that the Commerce Department had clearly stated that NCTA “did fail to cooperate.”

Whitton, presumably not wanting to imply criticism of President Kennedy, replied:

They did not ask us where to put the rails or where to leave out the highways. The only help we gave them was a couple of people.

He stated that BPR’s three or four transportation engineers “were furnishing their technical knowledge, and not of a nature that would call for recommendation.”

In other words, Representative Cramer summarized, NCTA did not consult BPR about its area of jurisdiction, the District’s freeways. Whitton replied, “I was not asked to make a recommendation.” In response, Representative Cramer read from the 1960 legislation calling for NCTA to cooperate with agencies involved in highway development. NCTA, he suggested “did not conform to the basic law that authorized this study.”

Whitton told the Congressman that, “I attended two conferences with the NCTA in which they outlined the program of their own that they were considering.” He added, “I would like the record to show that.” [pages 23-27]

On June 26, General Prentiss was the next witness, again representing ARBA. Speaking generally, he said that highway construction in urban areas was “the most urgently needed part of

our national highway program and the most difficult.” The problem wasn’t the lack of “technical competence” to plan the freeways:

The real bottleneck in urban planning lies in gaining concurrence and approval of plans . . . . This condition is especially true in urban areas encompassing multiple jurisdictions . . . . These governmental approvals are either extremely difficult or impossible to obtain without the support of public-spirited citizens. Many citizens’ organizations are for the highway program until a specific highway proposal appears to adversely affect their own immediate interests.

After commenting on aspects of the 3C planning process, he summarized:

Efficiency in planning, engineering, and construction requires that there be a continuous and orderly flow of work from the planning stage through all of the preliminary steps and the actual construction of the highway facilities.

The proper implementation of section 134 [the planning provision of the 1962 Act] will encourage this orderly and efficient process.

He pointed out that a 3C process does not “guarantee that the plans which are developed will ever be implemented.” He hoped no one thought the 3C process would lead inevitably to construction of the urban Interstate freeways.

The District of Columbia, General Prentiss said, was “an excellent illustration of the fallacy in this thinking.” For years, the District had a planning process similar to the new 3C requirements, “but the difficulties of implementation have been enormous.” The District, as a result, may have little difficulty complying with section 134, but would still face “tremendous difficulties in getting actual construction started, and these difficulties in implementation are related to the planning process.”

He summarized the history of the District’s freeway network, a subject he was fully familiar with as a result of his tenure as the District’s engineer commissioner. He said that NCTA was entitled to its opinion, but the Commerce Department and the District commissioners had pointed out the deficiencies in NCTA’s conclusions and how the agency reached them. NCTA made unrealistic assumptions, bent figures several times to get desired results, and manipulated “questionable assumptions by a method of analysis of unproven reliability.”

General Prentiss wanted a restudy of the transit needs NCTA had recommended while the District proceeded promptly with the Interstate network. Funds had been appropriated to complete design of the Three Sisters Bridge and the remaining segments of the Potomac River Freeway. As for the North Leg, he was fully familiar with “the sociological and esthetic condition of the area,” since he had been born “a few hundred yards” from the proposed alignment. Deferring this key link would only “defer the economic dividends which the District and the metropolitan area will reap from the linking up of the inner loop.” It will help keep people out of the central area who do not want to go there. [pages 63-72]

Chairman Fallon asked General Prentiss if he thought the NCTA report contained “any new information” that justified restudying the District freeway network. No, General Prentiss said, he had not seen anything that would indicate that such a study “would do anything more than waste time and money.”

The chairman asked why the North Leg was so important. “Cannot the traffic east and west be accommodated on the south leg?” General Prentiss explained that the Inner Loop would never serve its full purpose until it was a complete circle that permitted traffic from all directions to bypass the central business area. “I feel that the key, the absolute key, to solving the traffic problems of Washington depends upon the earliest possible completion of the entire inner belt.”

Would not the proposed subway loop advocated by NCTA serve the same purpose as the Inner Loop? General Prentiss said the subway loop would serve “exactly the opposite purpose.” The subway loop was intended to get people close to their destination in the central area so they could conclude the trip on foot. By contrast, the Inner Loop was intended for people who wanted to get somewhere other than the central area.

Representative John A. Blatnik (D-Mn.) asked about the many examples around the county “that cooperation is more of a continuing process rather than a stop-and-go proposition.” He asked why coordination among all the District agencies was so difficult. Did other large metropolitan areas have the same problem? General Prentiss agreed that around the country, “the planning agencies are going to have to work closely together, they are going to have to not only cooperate but coordinate their planning so that they do not come up at the end of a long session of developing a planning process with diametrically opposed ideas.”

NCTA’s report illustrated the problem because of the agency’s “unilateral planning” in developing recommendations for mass transit and freeways:

In other words, instead of being sure that they were going forward, utilizing the same accepted data as has been used in the preparation of all of these plans, they used other data and came up with a different answer.

Representative Blatnik wondered if another agency, above BPR, was needed as a coordinating agency to resolve disputes. General Prentiss thought BPR was the right agency to give the go ahead when the planning process resulted in a decision to proceed with a highway project. However, in a democracy, nothing “is going to replace selling the public on what is good for the public.” Faced with 10 years to get the planning process implemented, “My idea is that we have got to start right now” in selling the community on the need for freeways so “the newspapers and all of the other citizens organizations are educated and understand why these engineers say this, that, and the other ought to be done.” In the District, for example, most people had no idea why the Inner Loop was needed:

What we ought to be thinking about is how much it is going to help the whole metropolitan area and the big section downtown, instead of worrying about a small strip across Northwest Washington, which, as I said before, is where I was born.

Representative Blatnik admitted he was puzzled. How do you get groups with divergent points of view to “finally come to a workable, reasonable compromise arrangement, and then come out and proceed with implementing the agreed upon program.”

General Prentiss indicated that usually when people or groups object to a segment of a comprehensive program, “they seldom, if ever, have an alternative”:

What we have got to do is have officials who have enough intestinal fortitude, after having evaluated all of the benefits as well as all of the objections, and they find, as they will, that the benefits are much on the plus side, to go ahead and say, “Well, we are sorry, ladies and gentlemen, but the few must be inconvenienced so that the many may benefit; and this is going to benefit the many, and we are going to go ahead with it.”

Representative Blatnik, who lived at 2900 North Kensington Street in Arlington, Virginia, provided an example of the stop-and-go method of road construction:

I am thinking, for instance, of the Washington 14<sup>th</sup> Street Bridge, with a complex of mazes, overpasses, underpasses, and loops. I am just waiting until that is fully operational. I want to see four lanes on one side merge with four lanes on the other side at relatively high speed, approximately 40 miles an hour, and suddenly merging in four lanes. It is going to be a honey. You will have a real pileup on this side.

On the other side of the river, coming from Dulles Airport, you come down to the [George] Washington Parkway, and again you have suddenly and abruptly four lanes merging into two lanes at speeds of 40 miles an hour and more, and six blocks down the hill the two lanes become one, and on one side you have a whole chain of cars at a dead stop waiting one by one to get onto a six-lane bridge, and when you come to the other end you stop, you cannot get off. I do not know who in the world is responsible for that.

General Prentiss agreed that these examples were the result of how projects in the area were planned. On the District side, the Potomac River Freeway was part of the solution, but it was partly on hold. Representative

Mr. Blatnik. Who can break this deadlock, or how should it be broken in this area?  
General Prentiss. I do not have the answer to that. I am sorry.

Representative Blatnik wondered if BPR could do so, or perhaps Commerce Department officials. General Prentiss replied:

I am of the opinion that the only way we are going to get this deadlock broken is by the public rising up and saying, “We want this to go forward now.” And then those in authority will pay attention. I do not know any other way. I do not know of any organization that has the authority right this minute to say go ahead.

If the solution was waiting for the public to rise up, Representative Blatnik said, “We are going to wait a long time.” General Prentiss said, “That is right.” [pages 72-78]

Other witnesses on June 26 were from highway-oriented associations and were supportive of highway development (Automobile Manufacturers Association and American Trucking Associations).

General Clarke and Director Aitken were the lead witnesses on June 27. Pointing out that he would be leaving office in 2 weeks, General Clarke said he hoped his 3 years in the post would allow him to offer constructive evaluations and suggestions.

First, though, he said he hoped that Section 134 of the 1962 Act would stir the “fire under the pot” that would “consume the embers of inaction and indecision.” The time had come for planning agencies to “halt costly piecemeal consideration of transportation segments whether it be for highways or rapid transit.” The “slow progress” on the Inner Loop in the District was an example of piecemeal planning and implementation:

In contrast, the concept of the National Capital Beltway which soon will completely encircle the metropolitan area has been adhered to and typified the benefits of farsighted system planning and implementation.

He told the subcommittee that based on his 3 years of service, he had sent identical letters to NCPC and the National Capital Regional Planning Council that read in part:

. . . that the future growth and economic stability of the region depends in a large measure upon the development of an effective and efficient urban transportation system in harmony with the overall comprehensive plan.

The two groups “have the basic responsibility for the establishment of a comprehensive planning process.” Their “acceptance of that responsibility can only be measured by the firmness and resolve exhibited by the Planning Commission and the Regional Planning Council in adopting thoroughfare plans without undue reservations to the labyrinth of detail.”

The period of the Mass Transportation Survey from 1955 to 1959 reflected a cooperative and comprehensive planning process. Since then, “new factors have entered the situation.” NCTA’s plans “raised serious questions about the need for several elements in the currently programed highway plan.” Acknowledging that responsible elements existed on both sides of the resulting controversy, “the very fact that there are responsible elements on both sides of this controversy has required further study of those elements in controversy.”

NCPC was responsible for planning and orderly development of the Nation’s capital, but planning must not only be long-range but take on a regional scope. The National Capital Transportation Act of 1960 had reiterated the congressional requirement “for planning on a regional basis of a unified system of freeways, parkways, express transit service on exclusive rights-of-way and other major transportation facilities.” Section 134 of the 1962 Act had reiterated this concept for the District and elsewhere:

Factors of esthetics, sociological, and economic considerations must receive great attention and must be related to the broader community development plan. Public improvements are rarely sought by those whose privacy may be invaded. We must seek

to minimize this invasion keeping in mind, however, the common good and overall benefits to the region at large.

If the area's planning agencies "cannot do the job, we will have to devise some other method."

He emphasized, however, that the planning of transportation systems "cannot wait until the ink is dry on the final detailed comprehensive plan for the area." General Clarke concluded:

Nevertheless, we must be assured that the transportation plan itself takes into account all significant factors. Transportation systems are the arteries of the region and will shape or be adjusted to shape the land use pattern. The life flow in these arteries must be kept current if we are to have healthy growth in the area. [pages 135-138]

Chairman Fallon began the questioning by referring to General Clarke's reference to the difference between planning through 1959 and since then. "To what extent did the National Capital Transportation Agency cooperate with you in the preparation of the NCTA report?"

General Clarke answered that "this is somewhat a difficult question to answer." The city had shared the expertise of its metropolitan planning study group with NCTA, the group that "runs computers to see what the various programs . . . would produce in the way of traffic loadings under certain assumptions." However, the programs fed into NCTA's computers were entirely NCTA's, as well as the decisions on which systems to study." He compared it with "loaning someone a typing pool." The group members loaned to NCTA "exercised very little in the way of policy coordination."

As for policy coordination, Aitken explained that he had a meeting with NCTA's Stolzenbach on October 10, 1962, but it "was simply a briefing, and there was no question of exchange of ideas, or thoughts, or principles, or policy."

Chairman Fallon observed that this did not sound like a cooperative planning process. Aitken began, "This is true." Normally, when a freeway idea was raised, the District worked with BPR, Maryland, or Virginia in "a free exchange of ideas and discussions during all stages of development of a project from the concept to the final finished plan."

Asked if he agreed with the NCTA report, Aitken said he was "in accord with the philosophy that we need improved mass transit," but had a "considerable difference of opinion" on the highway system. He cited the example of design standards for the Interstate System, which Congress specified should be adequate for a design year. BPR and highway departments across the country had devised a means of forecasting that traffic.

"Contrarywise, the NCTA limited traffic requirements by one device or another." On the North Leg, NCTA "made a predetermination as to the amount of traffic that would be permitted on the facility." Aitken based his claim of predetermination on a statement "in the back of the front page of their consultant's report on this particular item, [where] the consultant was careful to say that NCTA told them to design it for a certain volume of traffic." In short, instead of following the direction of Congress in authorizing the Interstate System and using the method employed by every State highway agency in forecasting traffic volumes, NCTA "went at it in a different way."

In response to followup questions from Representative Cramer, Aitken said:

And the facility which was recommended by the Agency, which consisted of one-way streets between sections of freeway, is like building a country road in the middle of the New Jersey Turnpike.

And, as Representative Cramer pointed out, such a feature would not qualify for Interstate funds.

Aitken explained another consequence of recent developments. The District had asked BPR to approve preliminary design of interchange "C" and the Center Leg, but just that morning, BPR told him it would not act on the requests until reexamination of the North Leg, Three Sisters Bridge, and Potomac River Freeway was completed. BPR wanted to be satisfied that the District would have a properly integrated Interstate System:

So when you talk about the north leg of the inner loop system, this is like a block that holds up the house: with[out] this one everything is in doubt. [pages 138-141]

Representative Cramer, who had been absent for General Prentiss's testimony on these subjects, picked up on Aitken's comment. "That concept would destroy the fundamental purpose of the interstate highways, would it not?" Aitken agreed and said the District Highway Department "does not propose such a plan."

Representative Cramer wanted to be sure he understood the testimony. BPR was holding up approvals on segments not under study per President Kennedy's instructions. Aitken confirmed that this was his understanding based on his conversation with BPR that morning.

They discussed what would happen if BPR would not approve 90-percent Interstate funds for the Center Leg. The estimated cost was \$60 million, with BPR providing \$54 million in Interstate funds. If the Center Leg were dropped from the Interstate System because of a failure of connectivity, the Federal share would drop to \$30 million on a 50-50 basis. With the Interstate System, the city would receive all the Federal dollars needed to complete the route to full standards by 1972, but would have to draw the 50-50 funds from annual apportionments of \$5 million for the ABC program. The District's annual allocation of Interstate funds for 1963 was \$34.5 million.

Representative Cramer asked if Virginia officials are designing I-266 in view of the uncertainty about the Three Sisters Bridge connection to the District. Aitken said Virginia highway officials had asked him what they could do to resolve the issue. "Virginia cannot settle the question of design in this area west of Key Bridge any more than we can settle the design of the Potomac River Freeway until we know where that river crossing is going to be."

Representative Blatnik asked who would make that determination. Aitken replied that "we have had a lot of help," with the transcript noting: "[laughter]." Aitken added that the city "had determinations several times in the past but they get changed." The city had developed a plan based on the Mass Transportation Survey, but "all at once it appears we do not have a plan to follow."

Chairman Fallon wanted to know if “any new factors” have come to light on the North Leg, Three Sisters Bridge, or the Potomac River Freeway that would alter decisions. Aitken said that some homes would be taken for the bridge approaches, but right-of-way needs had been taken into account in planning the bridge. He thought the real issue was that if the bridge and freeway were built, the District would have to provide a connection via the North Leg. When Representative Cramer asked what the objection was to the North Leg, Aitken replied:

Well, sir, I do not know. I know that housing will be involved, but I also know that we can recreate housing over the freeway to replace a substantial part of that which would be affected.

Representative Cramer said that on April 8, 1963, the District commissioners had approved a transportation plan that included the facilities. He asked if anything had happened since then that would change this support. When Aitken replied that the District’s views had not changed, Representative Cramer immediately pointed out that “the one salient difference is the President’s message.” Aitken replied, “Yes, sir.”

Representative Cramer began reading from the President’s June 1 letter. The President called for “careful reexamination” of the highway program in light of the transit plans. The Congressman asked if the city had considered transit in developing the highway program. Aitken and General Clarke assured him the city had done so.

President Kennedy called for consideration of the social, economic, and esthetic impacts of the highways. He allowed some projects to go forward, such as the East Leg and Fort Drive Parkway, but put others on hold pending the studies he outlined. What, the Congressman asked, were the social, economic, and esthetic impacts the President was referring to.

General Clarke was fairly certain the President was referring to the homes that would be taken for the North Leg and the resulting disruption to families. As for esthetics, the North Leg would go through some sensitive areas, such as Embassy Row; it was “a very important area of the city and must be treated very carefully.” If the Three Sisters Bridge were not built, traffic volumes on the North Leg would be reduced somewhat, and that would have a bearing on the design.

Representative Cramer wondered if these factors had been considered before release of the Mass Transportation Survey in 1959. The survey considered only the need for the facilities, General Clarke said. “Now the problem of how it was to be built, precisely where it was to be built, and just how it was to be treated, was a matter that was deferred for later consideration.” The city had not planned to build the North Leg until 1969, so time remained to consider these factors.

Representative Cramer asked if President Kennedy wanted the city to study how to build the facilities. No, General Clarke told him, the study was to determine whether the facilities would be built to “interstate or some lesser standard.”

Representative Cramer pointed out that everyone expected a freeway, with limited control of access, to be built in the North Leg corridor and had been planning accordingly. “And now that

whole thing may be changed and it may not be.” He added, “And that is not the decision of you people.” General Clarke confirmed that it was President Kennedy’s decision.

In response to a question from Chairman Fallon about whether the facilities in question were needed, Aitken said, “Absolutely, yes, sir; there is no question about it.” [pages 144-150]

Representative Blatnik said he was experiencing “very severe, if not extreme, puzzlement.” He referred to the comment that, “If the planning agencies cannot do the job, we will have to devise some other method.” After the 1959 survey and the 1962 NCTA report, this was “a very peculiar statement, or admission,” but it reflected the “befuddled mess” that transportation planning in the area had become. The District began with the enlightened planning of Pierre L’Enfant, but “I think today it is perhaps one of the worst in the country.” He did not think the District’s problems were any different from the issues facing any major city:

By contrast, we have this bounding [sic] around to conferences, consulting with agencies, and Good Lord, not knowing quite sure who makes the final decision or determination, no one charged with the responsibility of executing this huge program.

The planning function seems to have “become an end in itself, and you are running around and around and not getting anywhere.”

General Clarke said, “you have described the situation very well as to the confusion that exists.” Unlike all those other cities, part of the District’s problem arose from “the somewhat exclusive jurisdiction of various Federal agencies over pieces of property in the District of Columbia and in the region.” He cited NPS, the planning agencies, the Architect of the Capitol, the Smithsonian Institution, and all the other bodies that must agree to plans for “any type of facilities, be it highway, sewer, or anything else.” In other cities, officials can develop a plan and proceed. “But this is not always possible in Washington.”

The District began work on the freeway plan outlined in the 1959 Mass Transportation Survey, but the intervention of planning bodies and NCTA was “very disruptive to the orderly operation of the Highway Department.” As a result, the department did not have any plans on the shelf to build anything. “They are just devoid of plans” that would allow the city to meet the 1972 deadline for completing the Interstate System.

Referring to his comment about devising some other method of planning, General Clarke told Representative Blatnik:

What I had in mind is that it seems to me that over the past year or so the planning agencies were not able to agree really on anything in the highway program; and, if the District of Columbia and the State of Maryland and the State of Virginia are to meet this 1972 deadline, if the planning agencies cannot bring this all back into a package so we can make orderly progress, I think we are going to have to come back to the President or to the Congress and say we have got to find another way to do it outside of the planning agencies.

Maybe an ad hoc group that would have enough authority to agree on a concept, and we would feel sufficiently confident of the concept that we could go ahead and do our programing and getting this program underway again.

Mr. Fallon. In the meantime, we are doing nothing.

Mr. Blatnik. That is exactly it. [pages 150-152]

General Clarke said the city was advancing the Interstate projects in its current budget, such as the Center Leg and East Leg, and would complete the reexamination under the President's instruction as quickly as possible. When Representative Cramer recalled the earlier statement that BPR would not approve planning funds for the Center Leg, General Clarke clarified that the city would do what it could:

Mr. Cramer. You cannot do much if they do not give clearance for Federal money.

General Clarke. You are absolutely correct on that.

Mr. Cramer. So for all practical purposes, that is stymied, and that is a necessary link no matter what happens to the north leg, is it not?

General Clarke. I believe so.

Representative Cramer summarized his view that Washington was "becoming a national example of the hodge-podge that results from lack of long-range planning and programing and actual construction, when you apparently get involved in a fight for prestige position between mass transit proposals and highway proposals." The Interstate System in the District was "now being bogged down and is likely to be more so in the future," with other cities experiencing similar problems "as the result of this overriding consideration now of municipal planning in general, and mass [transit] planning in specific."

He added that he became concerned about this issue during the hearings on the miscellaneous bills because if these problems spread around the country, the Interstate System "conceivably would not, and probably would not, be completed by 1972 in the most critical areas, meaning the urban areas."

General Clarke agreed that in the District, "an effort far beyond that we have been able to put forth" would be required to meet the deadline:

Mr. Cramer. I would hate for any other city in the country to use what is happening in Washington as an example of what they should do on extensions in their communities.

General Clarke. I would agree with that. [page 152]

Representative Blatnik was "amazed by this type of thing . . . completely perplexed." Here was the very important engineering program with decisions to be made. "The whole thing is suspended—suspended animation." He asked if General Clarke agreed that, "The Congress or the executive branch are the ones that can move and break the deadlock." General Clarke agreed.

The Congressman said:

I do not think we should be a party to sitting here and standing by and hoping someone sometime in the future is going to break the deadlock. These men know what has to be done, and they know how to cooperate with the agencies . . . .

You have a continuous flow of operation and not just a jerky, stop-and-go, “don’t go through the tulip bed operation.” But here it is the north leg, the east leg, the inner loop, the Three Sisters Bridge—and you go on the bridge and cannot get off. It is not your fault, but this type of operation is serious enough and inexcusable enough to warrant going right into it and seeing if we cannot get the logjam broken and get the show on the road.

Chairman Fallon agreed that city officials had been undermined. They were planning in accordance with congressional direction and the 1959 plan. “And then another agency is added to the Government . . . and they say that the engineers and the people with the responsibility of location and design did not know what they were talking about.” The NCTA report implied the incompetence of the very people whose experience “shows you have one of the best records for this type of work in the country.”

As far as he was concerned, NCTA officials might know something about mass transit, but “I do not consider them experts on the Interstate System or the design of an interstate system.” The District’s highway officials were the experts in that area:

And to have a garden club or somebody else come in and say that you are wrong because you are going through a tulip bed . . . .

Representative Blatnik pointed out he had referred to “tulip bed” only as “shadowboxing and sparring around,” but did not mind “this tiptoeing around the edge of it.”

Chairman Fallon told the Congressman, “I did not tiptoe . . . . I think we should find the answer and find it soon.” [pages 153-154]

Representative Cramer asked about the people being displaced. General Clarke replied:

In the past 2 years I have not felt any particular objections from the property owners in any area.

I recognize that part of the north leg goes through an area of a lot of people of low income and low-cost housing, and they are not the type of people--

Representative Cramer interrupted to say, “If some is slums, you will be just as well out of there.” General Clarke continued:

Some is slums, and some of it above that category, and with a little more attention to the housing code and all it could be usable housing. These are not the type of people you hear from individually. Collectively on this problem we have heard many objections.

Under current plans, relocations per week were about three to five. “To me this is not an insurmountable problem.” The city was seeking congressional approval to use Federal funds authorized for urban renewal for relocating those displaced by highway projects.

Chairman Fallon pointed out that the Committee on Public Works also approved dams that could flood out farmers and towns upstream for the greater good. “That is going on every day, and you find that in almost every public works project.” General Clarke agreed but clarified:

I think perhaps the difference involved in relocation in the city as compared to many of the flood-control projects, Mr. Chairman, is, of course, the low-income status of the people and the difficulties they have in relocating. [pages 153-155]

Representative John F. Baldwin, Jr. (R-Ca.) commented that NCTA clearly had violated its authorizing legislation and the will of Congress:

Certainly it is not the intention of Congress to authorize a program of this magnitude and have some individual independent agency have the right to veto and block the intention of Congress.

NCTA, he said, had “acted in a completely arbitrary manner” and had not cooperated, as Congress directed it to do, with other planning agencies that “had a far greater history in planning.” Section 134 of the Federal-Aid Highway Act of 1962 called for a 3C planning process in metropolitan areas around the country. That NCTA violated this concept by acting arbitrarily and ignoring the reliable planning agencies “is even more reason for us not to allow this to continue.” He told Chairman Fallon that “this committee should make it [sic] views known in the strongest manner possible.”

Chairman Fallon closed out the testimony by saying he hoped to have NCTA officials appear before the subcommittee to explain why they did not feel they had to comply with “the wishes of the Congress and our legislative process.” [pages 156-159]

Testimony continued on July 9 with the appearance of Vice Chairman Brewer and Donald Gingery of the Maryland-National Capital Park and Planning Commission. In a brief opening statement, Brewer made clear that the commission was “unanimous” in support of the District’s freeway plans, including the Three Sisters Bridge, the North Leg, and the Potomac River Freeway. It may seem odd, he said, that Maryland supported the Three Sisters Bridge, which was to be built between the District and Virginia, but “our people will use the facilities, and we feel they are vitally needed, and the sooner the better.”

The commission also supported rapid transit “and, if the Congress, in their wisdom and judgment decides that they wish to provide a billion dollars for rapid transit in this area, we welcome it.” He continued:

But we do feel very strongly about the need for the highways, and we do not think that the highways should be sabotaged in order to provide future rapid transit at a date which we feel is sometime in the future, and we feel that the highways are needed now.

Gingery supported construction of NCTA's rail transit system by 1969, but could not agree with the omissions of the freeways NCTA opposed. "Without them, the hundreds of thousands of vehicles going to and from and through Washington daily will aggravate existing traffic congestion by jamming local streets, increasing bottlenecks and deteriorating property values."

He said the moratorium or freeze on freeway construction in northwest Washington west of 12<sup>th</sup> Street had "far-reaching effects" and had "made a bad situation worse in the most heavily congested section of Washington." It blocked extension of freeways to serve workers and professionals who lived in Montgomery County but worked in the District. "It has, in effect, placed a Chinese wall around the Northwest section of the Nation's Capital by denying easy, convenient access to thousands of Marylanders who must work in downtown Washington."

Trying to solve the area's transportation problems without the three freeways NCTA had rejected would be "foolhardy." On a map, he showed the vast area of Montgomery County that had "no radial road plan programed or approved by any agency in the State or in the District of Columbia" to serve "this vast human mass of people to get in or out of the District of Columbia." And yet, under the freeze, "there cannot be any planning or building of highways in the whole Northwest section of Washington."

Gingery said that when Maryland and Virginia agreed to the National Capital Transportation Act of 1960, officials believed they would have veto power over NCTA's plans. "There was written into the act that we would have complete cooperation of the NCTA. This cooperation has never occurred." As a result, the veto the two States thought would work has not worked. "It has not worked, and it will not work as long as this one Administrator, who really appoints his own administrative body, runs the Transportation Agency." He thought NCTA would run better with three Administrators, one from each of the main jurisdictions in the area.

Without such a change, "we are in real trouble, real trouble." Because of the way NCTA has operated, Maryland and Virginia lost 2 full years in highway planning. "And mind you, gentleman, the Transportation Agency has little or nothing to do with highways, yet has succeeded in blocking the consideration of the inner loop where all Maryland roads must connect in the District of Columbia."

Every agency, except NCTA, thought the 1959 plan was sound. "And who came along and changed it? The very Agency we set up under that 1959 plan."

Chairman Fallon observed that the National Capital Transportation Act was under the jurisdiction of another committee. He asked if NCTA had cooperated with the Maryland commission. Gingery replied that NCTA had, but "the cooperation was almost silly; it was childish." He explained:

We would go down to the meetings, and we would be shown a plan—no backup statement. And that is what the Department says. We have never yet been able, on a reasonable basis, to get in and meet with the Transportation Agency and work out our various problems.

Cooperation, Gingery said, had been “failing from the word go.”

Brewer agreed. “I have had innumerable meetings with Mr. Stolzenbach, and I think the difficulty is the fact that we are not a party to the development of those plans.” His impression was that NCTA officials wanted to defer freeway construction “in order that they might make feasible the statistics they furnished for rail rapid transit.” [pages 167-173]

Chairman Fallon asked how the freeze on the Three Sisters Bridge and North Leg affected planning in Maryland. Brewer reply that with the 5-year freeze on the northwest quadrant and the NCTA-inspired reexamination, “we cannot really plan.” Trying to plan “might be just throwing the taxpayers’ money down the drain.” Unless the District can plan its network with certainty, “we certainly cannot do any planning.”

Brewer added that the commission supported mass transit, but was opposed “if it means our highways are going to be sabotaged and we are not going to be able to move our people.” [pages 173-174]

Representative Cramer asked about progress on the 1959 plan. Gingery pointed out that highways and transit were interrelated, but NCTA came along and “left the 1959 plan and embarked on this idea that they would do away with highways, they would freeze them, and they would fool around with transit to supplement highways, stop all the highway building.” And they were successful in “stopping every bit of highway planning and construction from the Baltimore Expressway to the Potomac River.” Maryland could not acquire property or program a road from the Outer Belt Freeway until the District settled issues related to the Inner Loop “with finality.” Things were moving along nicely:

And the Transportation Agency comes in and says, “We are not going to have an inner loop. We are not going to let you connect this road, or connect that road, or connect this road to the inner loop. We are knocking the whole top off it. It is going away. It is going to be served by a subway.

So here was “poor old Maryland” unable to provide links in accordance with the 1959 plan. And here was Virginia “bringing this tremendous Route 66 in, and they suddenly find this six-lane road has to be dissipated into the existing bridge crossing [Key Bridge], which cannot even comply with interstate roads.” Unless Congress did something drastic about NCTA, the two States and the District were going to lose millions of dollars in Interstate funds—and probably had spent \$20 to \$30 million “illegally because they cannot comply with the interstate regulations.”

Representative Cramer said that as far as he was concerned, highways were being “put into second place in order to try to accommodate mass transit facilities, and so you wind up with the tail wagging the dog.” [pages 176-177]

Representative Fred Schwengel (R-Ia.) wanted to know if NCTA imposed the freeze on freeways in the northwest quadrant. No, Brewer told him, it was “put on, unfortunately, by the Congress of the United States on the recommendations of certain people who favored the idea of a freeze.”

Asked to be specific about the people involved, Brewer replied:

I think there were certain people then associated with the staff of Senator Bible. I think Mr. Fritz Gutheim was the leader in it. I think Mr. Stolzenbach . . . was probably a party to some of this freeze . . . .

The Congress was convinced to put this freeze on because they were afraid of the so-called Wisconsin Avenue corridor . . . . Somebody told me there had been a map prepared, a map held by an official agency of Government . . . which shows the homes of every Congressman, every Senator, every administrative assistant, every legislative assistant, who lives in Northwest Washington, and that they were hoping to freeze and prevent any roads from going through this area which would disturb these homes, and they encouraged people to oppose the construction of any corridor in that area to put a freeze on.

He could not verify his statement about the map, but that was what he had heard. Representative Schwengel, who lived at 4005 Nellie Custis Drive in Arlington, asked to see the map, but Brewer did not know where it was or even if it existed. [page 205]

Representative Schwengel asked who in NCTA was “most responsible for this problem, do you think?” Gingery replied, “There is one Administrator who is virtually a dictator,” namely Stolzenbach. He had advisers “who come from all over the country, some of them.” The Congressman asked if any of them lived in the District, but Gingery did not know.

(Of the eight NCTA officials listed in the 1963 *Congressional Directory*, Stolzenbach lived at 10515 Meredith Avenue in Kensington, Maryland, while J. Neal Tomey, Director of the Office of Administration, lived at 6004 Osceola Road in Bethesda. All but one of the other officials lived in Arlington or Alexandria. The exception was Richard R. Haratine, Director of the Office of Public Information and Community Services, who lived 1634 I Street, NW. [*Congressional Directory*, 1963, Government Printing Office, 88th Congress 1st Session, page 591])

Discussing the Department of Commerce’s report on NCTA’s recommendations, Representative Cramer said he had asked Administrator Whitton several questions regarding “why he should now change his position.” The Congressman was “not satisfied with those reasons” because “the facts are the same today as they were before [in 1959].” The only thing he could think of that had changed was the new President.

Gingery said, “Well, there has been a lot of pressure put on these Government agencies by somebody.” The pressure, Representative Cramer agreed, “is obviously going to have a deleterious effect on highways throughout the District of Columbia.”

Brewer pointed out that Governor Tawes had designated the Maryland-National Capital Park and Planning Commission to be the coordinating agency with NCTA. Even so, Stolzenbach insisted on seeing the Governor. Brewer recalled the discussion:

Governor Tawes: Have John Funk and Mr. Brewer seen this?

Stolzenbach: They have looked at the maps.

Governor Tawes: It is a problem which I am sure they are capable of dealing with, and they are the approving authorities.

It was a short meeting, but that was what NCTA considered cooperation. All the commission wanted was to be represented when planning is underway so they know what was being considered for their community. "We do not feel this is true today."

Representative Cramer read the language in the law calling on NCTA to cooperate with other agencies and the States:

I am very disturbed by the fact that apparently the provisions written into the National Capital Transportation Agency Act of 1960, with the specific intention that all other planning groups and the States of Maryland and Virginia should be specifically consulted, and, as a matter of fact, the Governors of the States – I am reading from section 204, subsection (d), which begins:

In order to facilitate the transition from a Federal agency to an interstate proprietary agency and to further coordination within the National Capital Region (the NCTA) shall submit the transit development program and any revision thereof . . . (5) to the Governors of Maryland and Virginia or such government agencies as they may designate for approval of the location and extent of proposed agency facilities and the time table for the provision of such facilities within Maryland and Virginia, respectively –

We have been advised in these hearings before that the NCTA did not bother to consult hardly with any other agency, even though so instructed by the Congress.

I am reading now from subsection (f) of the same section 204 –

that the NCTA shall conduct research, surveys[,] experimentation, evaluation, design, and development, in cooperation with other Government agencies and private organizations when appropriate, on the needs of the region for transportation.

And time after time in the act are references to cooperation, consultation.

Again in section 205, subsection (a), paragraph 7, the NCTA –

shall cooperate with Government agencies to facilitate cooperation with coordination of location, design, and construction of freeways, parkways, and other arterial highway facilities with the transit development program. [for clarity, ellipsis not used]

Representative Cramer continued:

So, Congress wrote into this transit authority, in section after section, the requirement that they consult with the Governors . . . . I understand now that that was not done, in direct

violation of the instruction of the Congress of the United States, a complete usurpation of authority by the NCTA.

Brewer assured him that if Congress would amend the law to provide equal representation from Maryland and Virginia, “that kind of cooperation is going to occur.”

Representative Cramer, referring again to language in the National Capital Transportation Act of 1960 imposing the northwest freeze, asked why the communities couldn’t plan for a freeway through the area since planning was not prohibited. Brewer answered that “we do not want to be planning unless we know we are going to be able to build it.” The District could not plan; therefore, neither could Maryland. He added that the freeze was put on “to serve the selfish interests of people who were concerned about the construction of a road which might disturb their home or some other building . . . or other thing that they own. This is not the way to do business.”

The Congressman then read the language in “freeze” provision stating that “the Agency shall not later than January 10, 1965, submit to the President, for transmittal to Congress its recommendation as to whether any such freeway or parkway should thereafter be built.” Brewer responded that he could not understand why NCTA “should be the ones to make this determination,” instead of organizations such as his that had been in cooperation with the District since 1928. Asked if he thought NCTA had the sole authority to determine whether freeways or parkways should be built through the northwest quadrant, Brewer responded: “That is the way it appears, sir, and that is what has been happening, and that is the effect of it.” [pages 207-210]

Representative Baldwin explained his view that under the Federal-Aid Highway Act of 1956, every motorist in the country was paying the gas tax to build the Interstate System. Anyone who deliberately blocked construction of that system in the District of Columbia was “barring 2 million people, directly and indirectly, from getting their proper returns on the Federal gasoline tax and barring all the rest of the tourists in the United States from getting their proper return . . . .” Brewer said of the Congressman’s entire statement, “this is the finest statement I have ever heard.” [pages 210-211]

Representative Schwengel asked about Presidential adviser Charles Horsky. “He is presumably interested in the development of this whole area, including the District of Columbia.” Had he been in touch with the planning commission or involved in any way? Brewer pointed out that Horsky lived in Maryland. Brewer knew him, but not well. “As far as I know, he has not injected himself into the picture too strongly.” He added:

He may have been working with Mr. Stolzenbach. I do not know. But they are good friends, and I guess they might be working together. I do not know. I think he did have some meetings with General Clarke before he departed as Engineer Commissioner.

I cannot figure it out exactly. There seems to be something, a veil some place, that we just do not seem to get through. And somebody—I really must say I cannot understand how this information gets to certain places.

Representative Schwengel concluded that Horsky had “shown no great interest in this very, very serious problem.” [page 211]

(According to Professor Schrag:

The most important defender [of NCTA’s plan] was President Kennedy, whose enthusiasm . . . Stolzenbach later attributed to Kennedy’s being the only president to grow up in a city with a subway.

(In late March 1963, after the Commerce Department and the District released their denunciations of the NCTA recommendations:

Horsky – the president’s gatekeeper on all matters affecting the capital – reluctantly realized that the White House and the Bureau of the Budget would have to referee this dispute. Though he “recoil[ed] at the idea of another study,” he suggested that some pressure from the top was needed.

(The result was President Kennedy’s June 1 letter to Tobriner calling for studies of the Three Sisters Bridge and the North Leg based on the assumption that the NCTA transit system would be built. [Schrag, page 57])

Representative Cramer read from NCPC’s conclusion that despite the extensive rapid transit system NCTA had proposed, “most of the travel in the National Capital region in the year 2000 will take place in automobiles.” NCPC called for completion of the Center Leg, Northeast Freeway, and continuation of the Southwest Expressway. “It seems to me that the highways in the District of Columbia are . . . suffering from strangulation of overplanning [sic].” He wondered how often transit systems for the District of Columbia was going to be planned, recalling the 1959 plan, the 1962 plan, the Year 2000 Plan, and now the District needed funds to conduct studies on sociological, economic, and aesthetic aspects. Gingery said:

I can tell you that if this idea of bringing in another study and another study continues—and this is an age-old device to stop a project. You fellows have been around too long not to realize, if you want to stop something—let’s get another study going and spend a million more. This is precisely what is taking place.

He urged Congress to “get the thing back on the even keel” or “we will all be old men before we have the highways built or the transit, either one.”

Asked to provide an example of NCTA’s invalid estimates, Brewer described his concerns about NCTA’s ridership estimates for the subway. NCTA expected it to be at full capacity during the morning and afternoon weekday peak periods. Possibly, Brewer said, the subway might be at full capacity downtown, but in the suburbs, he had serious doubts about ridership of the rail transit lines. He did not want to wait until the transit facilities were built to see if NCTA’s estimates of ridership and income were accurate before freeways could be built. With cooperation and the lifting of the freeze, local officials were ready to build those highways now:

The Congress can do it if they want to. We know that, if the Congress stand up [sic] and says, “We want it, we have got to have it, and the people are entitled to it,” we will get it, and not have a lot of little people rubbing around town here stopping it.

Representative Cramer said Brewer had “put your finger on what the philosophy is.” The mass transit planners thought, “We will force people to ride mass transit by simply not building highways.” That, he said, is what the NCTA proposal “amounts to.”

The Congressman was concerned that transit advocates were urging “that all other cities should do as Washington is doing—delay the highways in order to give consideration to mass transit.” If that was the case, “the completion of the Interstate System in the urban areas by 1973 . . . will be impossible.” He pointed out that he did not usually agree with editorials in *The Washington Post*, but an editorial about the Three Sisters Bridge made a “pretty sound observation”:

The eventual builders of the bridge will be able to make their cofferdams with the baled volumes of the consultants’ reports . . . . As long as our system of government pushes all political issues off onto the technicians in the weak hope that eventually someone will devise a computer to solve them, precisely that long will the city remain trapped in its circle of expensive, redundant, and vulnerable engineering studies. [pages 212-216]

(The title of the July 9 editorial was “In Lieu of a Decision.”)

Other witnesses concluded the hearing, also in support of building the freeways. However, the Subcommittee on Roads did not hear from Stolzenbach or other NCTA officials.

### **The New Engineer Commissioner**

General Clarke left office on July 8 to become chief of military construction for the Chief Engineer, U.S. Army Corps of Engineers. He was, as he admitted, leaving many unsolved problems, and not just on the freeway disputes. Given the number of agencies involved in decisionmaking, disarray was a normal condition, he told WWDC’s “Report to the People” on May 25.

The transportation controversy, he said, was the most challenging problem he had faced as engineer commissioner. He hoped Congress would break the deadlock later in the year by authorizing funds for rapid transit while giving the go-ahead for freeway construction.

His successor was Colonel Charles M. Duke, a Texas native. Among the posts he held before President Kennedy chose him to be the new engineer commissioner, Colonel Duke had been district engineer for the New York district of the U.S. Army Corps of Engineers. His most recent assignment was as chief of supply and logistics for the Army’s 1<sup>st</sup> Corps Group in Korea.

On July 8, with about 100 city officials and guests in attendance at the District Building, Commissioner Tobriner gave the departing General Clarke a key to the city. “With this key go the thanks of the District for a job done with extraordinary fairness, honesty and effectiveness. You have brought to us your wisdom, strength and example. And you take from all of us our respect, our love and our unqualified admiration.”

Colonel Duke took his oath of office during the ceremony. Tobriner said, “he comes at a time in the city’s history when a technical skill, balanced judgment, seasoned experience and, most importantly, human goodness and compassion and understanding are critically needed.” [“Clarke Leaves His Office In Usual Confused State,” *The Washington Post and Times Herald*, May 27, 1963; “Col. Duke Sworn In As D.C. Commissioner,” *The Evening Star*, July 8, 1963; “Duke Is Welcomed To District Board As Clarks Gets Key,” *The Washington Post and Times Herald*, July 9, 1963]

Colonel Duke moved with his family to 5712 26<sup>th</sup> Street, NW., in the District’s Chevy Chase neighborhood, a short distance from Rock Creek Park.

A few weeks later, on “Report to the People,” Colonel Duke explained that as a former “straphanger” on the New York City subway, he understood the value of rail rapid transit. “It is no secret that I and the Board of Commissioners support the principle of rapid transit.” The question was how to balance highways and transit. The proper blend, he explained, was the key to reexamining the North Leg Freeway and the Three Sisters Bridge, as President Kennedy had ordered. He hoped the report on the reexamination would be completed in December, in time for its recommendations to be reflected in the President’s message to Congress on the District’s budget. [“\$19,000 Family Income Seen For D.C. Area in 40 Years,” *The Sunday Star*, August 18, 1963; “Road Restudy Finish Slated In December,” *The Washington Post and Times Herald*, August 18, 1963]

### **Searching for a Solution**

Area officials continued struggling with what to do. The Montgomery County Council, for example, decided not to vote on a request by NCTA that it support the agency’s transit plan. The problem was that officials could not be sure what transit facilities would be provided to the county. As County Manager Mason A. Butcher explained, “Whatever is built to Tenley Circle and on to the District line is sure to come into Montgomery County, but we don’t know what it will be.” Council members also were upset that the NCTA plan opposed construction of the North Leg, the Three Sisters Bridge, and the related Potomac River Freeway, all vital arteries as far as county officials were concerned. [“Rapid Transit and Dam Fail in County Council,” *The Evening Star*, June 19, 1963]

On June 18, Chairman Natcher held a public hearing on the District’s Appropriations Act, 1964, for non-government groups and individuals. Witnesses discussed a range of topics, including highways. Peter Glickert of the Capitol Hill-Southeast Citizens Association was pleased that unlike in previous years, he did not have to urge the committee to shift the location of the East Leg. “Logic has finally prevailed in this matter and even the Highway Department has decided to be sensible in locating this road along the Anacostia River.”

Still, the association was concerned that highway officials “failed to grasp all the opportunities given them for easing the harm which this road can do to the city.” He hoped the committee would remind the District Highway Department that if it is more careful “with its right-of-way and its programming, the closer the District can be to having some sort of freeway system when the District’s freeway money runs out.”

Glickert pointed out that many witnesses talked about the shortage of funds for building schools:

We wish to remind this committee that it is, to a great extent, responsible for this situation.

The committee had reduced the Federal payment to the city in lieu of Federal taxes and used general funds for police services. In addition, “in the last 3 or 4 years, \$8 million to \$12 million of school money has been put into freeways.” In view of the furor erupting at the time about school funding, he asked, “will this immoral diversion of funds be reinstated or will the money be used to promote the welfare of the District’s people?” In short, the city had a “shabby school system . . . partly because District road plan [sic] are so enormous.” [District of Columbia Appropriations, 1964, Hearings on H.R. 7431 Before a Subcommittee of the Committee on Appropriations, U.S. House of Representatives, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, 1963, pages 1089-1090]

(In the rapid turnover of witnesses, the subcommittee did not comment on Glickert’s assertion regarding diversion of funds from schools to freeways.)

Polly Shackleton, District Democratic Committeewoman, said her group firmly supported President Kennedy’s decisions on the transit and freeway debate. The committee was committed to balanced transportation, and recognized the importance of the Interstate System, but “we seriously question the necessity of providing a blockwide, high-speed truck route through the very heart of the city”:

The ruthless destruction of countless homes, schools, churches, playgrounds, the tearing asunder of entire neighborhoods, and the cruel uprooting [sic] of thousands of people unfortunately are included in the price that must be paid to let the trucks roar through in safety at speeds of at least 50 miles an hour.

In view of the “extensive human suffering” that was inevitable, she urged the committee “to stand firm and not be swayed by the self-interested, well-heeled and highly organized lobby which had chosen to make Washington its battleground and openly fight the President.”

Representative Robert N. Giaimo (D-Ct.) of the committee asked if she was saying that highway projects should be halted only because of the disruption to homes, churches, and schools and other facilities. When she said that was “a very good reason” for reviewing the program as the President suggested, Representative Giaimo pointed out that highway and urban renewal programs throughout the country involved the taking home, businesses, and other structures. “There are many Federal programs we have to do just that in order to obtain a good result.”

Shackleton was not persuaded. She cited one unspecified route that would involve 13,000 people being uprooted. “It would involve whole neighborhoods and communities.” She definitely thought that officials should “stop and look this over and see whether it is trucks or people in this city.”

Representative Giaimo pointed out that Congress had approved funds for the program. “And you are now saying Congress is wrong?” When she replied that she was supporting President

Kennedy, he wondered what would happen if the President changed his mind. Shackleton replied, "I am very glad President Kennedy and I happen to be on the same on this issue, as we are on most other issues."

In view of the Democratic Committee's overriding concern about housing displacement, Representative Finnegan pointed out General Clarke's testimony that never more than 7,000 families would be dislocated and that relocation arrangements could be made week by week. Shackleton said, "That is very doubtful. I think some of us are still to be convinced by the allegations of General Clarke."

She reminded Chairman Natcher that she had testified the year before on basically the same points. Her committee was very concerned about the people of the District:

They have not proved to us, General Clarke, or anyone else, that they are going to be able to relocate these 13,000 or 15,000 individuals. I think you are aware of what is a very explosive situation . . . . I do not think it would help it by throwing people out of their homes and disrupting neighborhoods.

Representative Giaimo again made the point that people were being dislocated around the country for the Interstate System. "This is a problem in all our urban areas."

Mrs. Shackleton pointed out that she was for the highway program, "but I do not know why they should go right through the heart of residential sections of cities." In San Francisco the previous fall, she said, there was a bond issue "which they passed for a subway because they were sick and tired of these freeways destroying the city."

Representative Giaimo said:

I do not find much merit in the argument about the fact that you have to build a highway through an area where there are homes. You have to build a highway through places where there are people. That is nothing new to us.

Chairman Natcher thanked her for "your splendid statement," and moved on to the next witness. [District of Columbia Appropriations, 1964, pages 1104-1107]

The following day, June 19, one of the witnesses was Moe Lerner of Air Transport, Inc., testifying on behalf of the Citizens' Traffic Board of the District of Columbia. (Air Transportation, Inc., was involving in providing ground transportation to and from airports in the area.) After introducing himself as chairman of the subcommittee on mass transit, he began:

Progress in the development of the Washington highway program, including portions of the National System of Interstate and Defense Highways, has virtually ground to a halt and the Nation's Capital is threatened with strangulation unless planned highway improvements are permitted to go ahead on schedule.

The Mass Transportation Survey proposed "an effective system of freeway and highway improvements," but NCTA recommended "a severe \$600 million cutback" in those plans.

The Citizens' Traffic Board agreed with the District commissioners' analysis of NCTA's report. In particular, "highways are of prime importance to the efficient conduct of our major industry—the Federal Government." The Washington area's second largest industry, tourism, required "good highway facilities to bring him and his dollars to our city," given America's preference for traveling by cars for vacation travel. Further, the business community could not transport goods without good roads:

In short, we need freeways and improved streets and I recommend that this committee give its wholehearted support to the District of Columbia highway program. If there is a need for a rail transit program, let it be considered on its merits, but not at the expense of badly needed highways.

In 1950, the National Capital Park and Planning Commission agreed on a plan for freeway development "that had the wholehearted approval of the engineers and officials." The Mass Transportation Survey "again emphasized its freeway plans as essential no matter what other types of transportation [sic] would be needed:

Now, new faces are attempting to turn back the highway clock and have succeeded in freezing many of the projects—even some that have already been started.

Officials should encourage and support development of a good transit system. "It should be attractive and handle our rush-hour traffic efficiently in air-conditioned comfort." It should be "a show window for the rest of the world." But, Lerner wondered, why hold up the Three Sisters Bridge, the North Leg, and the Inner Loop concept? He concluded:

For a balanced transportation program we need both the freeways planned to meet the highway needs of the District of Columbia and a mass transit system; therefore, we should not allow the traffic problem to be ground to death in an argument between highway and transit.

During public hearings, with many witnesses to speak, Chairman Natcher and his colleagues often had little to say after each presentation. Lerner's presentation was an exception. Chairman Natcher said, "I want you to know that as just one member of this subcommittee I could not agree with you more." He was convinced the area needed rapid transit and a highway system. The idea of killing off the highway system to promote rapid transit "is a serious mistake."

He had been in the House, he told Lerner, for 9 years. During that time he voted for a bill that resulted in construction of District of Columbia Stadium that "is a beautiful stadium, probably the most modern stadium in the United States." At the time, he was told it would cost between \$6 million and \$7 million. Instead, it cost \$19,800,000, with the District having to borrow about \$800,000 a year to pay the interest. "It was a white elephant when it was completed. It is a white elephant today."

As this example of unreliable cost estimates demonstrated, taxpayers should be "informed carefully and thoroughly about any mass transit system":

If it is going to cost \$1,150 million, to be paid for over a period of 30 to 40 years, with bonds to be guaranteed by the Federal Government or a great portion of them, we want to know what the share of the District is going to be. The burden is to be placed upon the taxpayers here in the city of Washington . . . . I am not in favor of killing off the highway program here in the District in order to obtain a rapid transit system. That is my feeling about this matter and I believe I am right.

Before we have any rapid transit system or any other program in the District, I think the people ought to have all of the facts because it is people like you who are going to have to pay for it.

He added:

I am not against rapid transit. I never have been, but I say to you that I am not in favor of a rapid transit system here in the District of Columbia that is brought about as a result of killing off and destroying the highway program here in the city of Washington.  
[pages 1152-1154]

On the evening of June 20, the committee heard from additional witnesses, including David Sanders Clark of the Committee of 100 on the Federal City. He said the committee strongly supported President Kennedy's position on the District's highway plans, particularly his call for a careful reexamination of the highway program and a delay in funding for the North Leg, Three Sisters Bridge, and the related Potomac River Freeway until the outcome of the review was known:

We firmly believe that any new freeways and bridges planned for Washington should be so located, designed, and constructed as to uproot as few people as possible from their homes and places of business, and do the absolute minimum of damage to the appearance of this city. These three ill-considered projects clearly do not meet the criteria.

Instead of appreciating the President's support for the rest of the highway program, highway advocates had "taken to lambasting the President for daring to suggest that certain parts of the program warrant further study." Clark added, "the most vociferous and intemperate criticism seems to come from individuals who are definitely not residents and taxpayers of the District of Columbia." Members of Congress were receiving letters from all over the country in support of the projects, with truckers particularly solid in support for the Three Sisters Bridges.  
[pages 1221-1222]

When Chairman Natcher asked about the cost of the NCTA transit proposal that the Committee of 100 supported, Clark could only restate NCTA's estimate. The chairman asked if he was including interest on the bonds over a 30- or 40-year period. Clark hoped the system would make money, as NCTA believed:

We do not think that is the really important thing. We feel that a transit system is a public service, just like a fire department or the post office, or the highway department. It is

something that people in a major metropolitan area have to have and people in the area are going to have to pay for in one way or another.

Chairman Natcher restated his view that killing off the highway program to bring about a rapid transit system was “a serious mistake.” He asked Clark if he believed Congress would appropriate \$20.5 million in the first year, \$50 million in the second year, and underwrite and guarantee \$600 million worth of bonds in the third year. Clark replied that he hoped so because every major city had similar problems.

The chairman said, “That would set a precedent from the standpoint of guaranteeing the bonds.” Clark said if so, it would be “desirable to set a precedent for the Federal Government supporting mass transit for cities just the way that the Federal Highway Act . . . set the precedent for the Federal Government helping out with highways.” [pages 1222-1224]

The subcommittee also heard from Peter Craig of the Northwest Committee for Transportation. Discussing the history of transportation planning, he explained that in the 1950s, planners acted on the assumption that highways would have to carry the primary transportation load. In 1955, automobiles carried 57 of peak-hour travel; planners assumed this trend would continue for decades. In 1980, 66 percent of all peak-hour trips would be in an automobile, with only 34 percent by transit, namely buses. NCTA wanted to reverse those percentages. “Numerically, the difference is about 50,000 peak-hour auto trips – enough to fill five eight-lane freeways to capacity.”

Unfortunately, debate over transportation “at times has been highly emotional, complicated by false issues and by erroneous or irrelevant factual claims.” In short, the debate should not be about subways or no subways. The issue was not highways or no highways. Both were needed. “The issue is one of degree: how much more highway capacity, where, for what purpose, and with what capacity.” He commended the Whitener committee hearings in 1962 and its unanimous report that was highly critical of the highway plan.

NCTA had proposed “a workable transportation system” that had been endorsed by NCPC, NPS, the Commission of Fine Arts, and President Kennedy. Craig’s committee also endorsed the plan, as well as President Kennedy’s call for reexamination of several freeways in view of the NCTA plan. “It is important to emphasize, however, that this pending reexamination of the District’s highway program need not, and will not, stop highway construction activity.” If the Committee on Appropriations approved the District’s proposed budget for FY 1964 of over \$60 million, it would be “by far the largest highway appropriation in the history of the Nation’s Capital.”

Craig offered several reasons why the reexamination was needed. First, he cited planning realities. The assumption behind the original freeway network was that the city would not have rapid rail transit. “It makes no sense to build a subway system to handle over half of Washington’s commuter needs to the central city, and also superimpose a highway system designed to carry 100 percent of such traffic.” Such needless overbuilding could hurt everybody, “placing both the subway and highway systems in financial jeopardy.”

Second, Craig cited fiscal concerns. It was, he said, a “demonstrable fact” that the District could not expect to receive enough funds to complete more than a fraction of its freeway program. President Kennedy, in his budget message, had made the same point about the District’s highway fund: “The highway fund . . . will face critical deficiencies after 1965.” Craig estimated that in the District, the deficiency would be about \$88 million. “There will not be funds available to pay for any of the eight freeway projects still under study – even those upon which the NCTA and the Highway Department are in complete agreement, such as the center leg and the Northeast freeway.” NCTA had provided “full justification” for its financing plan, but District officials had not provided any such justification for their plans.

Finally, Craig said the District’s highway program should be appraised to determine the degree of highway construction the city could physically tolerate. The full network would make the city even more dependent on the automobile than it already was, while requiring a 45-percent increase in parking spaces:

A freeway once built is permanent. Before any new commitments are made, the planners, the public, and the Congress must be certain that the irrevocable step is required. That proof does not exist today.

During the question period, Craig said he had some reason for hope that the District’s highway planners were rethinking their ideas:

For example, on two of these projects, the Northeast Freeway and the North-Central Freeway, we have seen a change in the attitude of the District Highway Department since a year ago and it now seems to be seriously considering the NCTA’s recommendation that those two freeways be combined as a single freeway facility, utilizing the right-of-way of the B. & O. Railroad. Such a combination of interstate routes, NCTA believes, would meet the truck and auto needs in conjunction with rapid transit and if so, the District is the gainer.

That was encouraging, but for “some reason,” the District highway department “adamantly stuck by its original plan” for the Three Sisters Bridge, “even though the assumptions which underlay those plans have now been shelved.” There was, he said “no conceivable need for that bridge, for autos, for trucks, even for bicycles, and it is only if you want to assume that rapid transit won’t carry anybody or that sometime beyond 1980 there may be some horrendous traffic increase, that there could conceivably be a traffic justification for the bridge.”

In 1960, Congress had faced a similar situation where freeway construction was planned in the northwest quadrant that would parallel and compete with a likely location for rail rapid transit. Congress concluded “that if there is any doubt, let’s build the subway first and see if it works and defer a parallel and competitive freeway for consideration at a later time.” The result was the 5-year moratorium included in the National Capital Transportation Act of 1960.

Craig was not opposed to all freeways, citing his support for the Southeast Freeway, the combined freeways in northeast, and the Theodore Roosevelt Bridge. The Three Sisters Bridge was “one of the most frivolous highway proposals.” He asked, “There are such essential freeway

requirements—why can't we proceed on those in which there is full agreement, particularly given the critical fund shortage in the District highway funds?"

When Representative Giaimo pointed out that given the problem of suburbanization, highways were needed to get people into and out of the cities, Craig explained that he was not arguing that highways, automobiles, and trucks were not needed:

The problem is how do you alleviate the congestion. One subway line can carry as much traffic as four eight-lane freeways. In other words, in terms of traffic congestion alleviation, one subway line can do as much as four eight-lane freeways . . . . Yet if you build the freeways, you have only compounded the problem in terms of a central city because you must park those cars at the other end and each of those cars takes 300 square feet. [pages 1244-1248]

Not all witnesses who discussed transportation opposed the District's freeway plan. *The Evening Star* report on the hearing pointed out:

Indorsement of the District's highway program was voiced by spokesmen for five business groups—the area's Automotive Trade Association, a new car group; Eastern Greyhound Lines; the Oil Heat Institute of Greater Washington; the area's Tire Dealers and Retreaders Association, and the area's Laundry-Dry Cleaning Association. ["Hearing Brings Clash On Highway Cutback," *The Evening Star*, June 21, 1963]

With District officials concerned that the reexamination President Kennedy had ordered would affect the schedule for the Center Leg, Administrator Whitton told reporters on June 28 that he saw "some possibility" that engineering studies for the project could start during the year. Clearly, the White House-ordered study "will affect what we do on the Center Leg," and that might result in delay. "A restudy of the North Leg is a good idea and is needed regardless of any controversy," but whether it was built would affect the location of the Center Leg.

The other problem was a dispute with Maryland over how the Center Leg would be linked to Maryland's segment of I-95 at the District line. While the dispute was unresolved, he thought the District could work on the southern half of the Center Leg, which would be unaffected by the later decisions on where the "troublesome northern section" would link with I-95 in Maryland.

As for the East Leg, BPR was "willing to consider" its relocation along the west bank of the Anacostia River, as favored by President Kennedy. ["Studies on D.C. Center Leg Freeway May Start This Year, Official Reports," *The Washington Post and Times Herald*, June 29, 1963]

As June 1963 ended, *Star* editors took a look at the situation:

It was inevitable from the beginning that the bitter dispute over Washington area transportation would end in the lap of Congress. And the need now is for cool heads to resolve the feud—not perpetuate it.

The only way they could do so was if committee leaders accepted a simple premise:

That the controversy over highways and the controversy over rapid transit are separate issues, not competing solutions to the problem of moving people in and out of Washington.

Rapid transit was absolutely necessary. “The most extensive system of freeways alone would not suffice.” Congress should approve legislation to begin work on the transit system.

At the same time, the editors blamed NCTA for the current crisis. The agency’s “unjustified attacks on the freeway program” invited retaliation by highway advocates. However, NCTA’s “major blunder” should not jeopardize the needed transit system.

Chairman Fallon had been correct in calling NCTA “the bottleneck” blocking decisions on freeways, but the White House “took the NCTA off the hook” when President Kennedy called for reexamination of the Three Sisters Bridge/Potomac River Freeway and the North Leg. Further, BPR was the agency threatening to withhold funds for the Center Leg until the controversy is resolved.

The editors offered a “clear” course of action. The Center Leg should proceed because it was “needed regardless of other decisions on the road system.” Similarly, if Congress can convince the Kennedy Administration to relax its order, the Three Sisters Bridge and the Potomac River Freeway “should move ahead immediately.” These actions would leave questions only about the North Leg:

The engineering, esthetic and relocation problems involved in this project all are difficult. But we are confident that they can be solved. The studies to provide the necessary answers should be undertaken immediately. [“Transportation Crisis,” *The Sunday Star*, June 30, 1963]

### **Appropriations 1964**

On July 8, the House Committee on Appropriations completed work on the District of Columbia Appropriation Bill, 1964. The committee’s report on the bill included a section on the city’s highway program. The committee had “very thoroughly” examined the District’s highway program with officials of the District and BPR. Bringing important highway projects to “a complete halt is a serious mistake.” Highways and rapid transit were both needed to meet the city’s transportation needs. The report traced the history of the Interstate System to the Federal-Aid Highway Act of 1944, which authorized designation of the System, and the Federal-Aid Highway Act of 1956 which authorized funds to build the network around the country, including in the District.

For FY 1959 through FY 1963, Congress had appropriated funds for the Potomac River Freeway totaling over \$17 million. “Additional obligations in the sum of \$11 million are imminent.” In FYs 1962 and 1963, Congress appropriated funds for the design and partial construction of the Three Sisters Bridge. “These two projects are not in the embryonic stage.” Further, they were consistent with the national program “and have been reviewed repeatedly by the Congress. “The District now has \$330,000 available for the Three Sisters Bridge and \$1,248,000 is remaining available from prior year appropriations for the Potomac River Freeway.”

In addition, the committee's bill appropriated \$900,000 for the North Leg in FY 1964. The section concluded:

The Three Sisters Bridge, Potomac River Freeway and North Leg of the Inner Loop should proceed without further delay.

The committee recommended appropriations for the North Leg (Center Leg to Northeast Freeway, \$900,000), the East Leg (\$450,000), 11<sup>th</sup> Street Bridge and approaches (\$400,000), the Center Leg (\$1,294,000), and the Northeast Freeway (\$903,000). It did not appropriate funds for interchange "C," with the city's consent, because it had funds from previous appropriations that were sufficient for needs in 1964. [District of Columbia Appropriation Bill, 1964, Report to Accompany H.R. 7431, Committee on Appropriations, U.S. House of Representatives, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, Report No. 499, July 8, 1963, pages 2-3, 11]

The House considered the bill on July 11. In introducing the measure, Chairman Natcher discussed the many aspects of District activities the bill covered. When he came to the freeway controversy, he expanded on the report language. With many other controversial issues to be debated on funding for schools, welfare, and other aspects of the District, the freeway portion of the appropriation bill did not generate debate.

Nevertheless, several members of the subcommittee commented on the freeways. Representative Giaimo, saying that he was new to the committee, told his colleagues that he was not opposed to a rapid transit system for the District. "I am, however, opposed to a philosophy that says that rapid transit should and could exist without highways." He had cosponsored legislation in support of rapid transit, including a bill that would establish a rapid transit system linking the eight States in the northeastern megalopolis. "But never did I anticipate that such a system would preclude the use of highways."

Of the projects that President Kennedy had asked the city to reexamine, he said, "it would be extremely damaging and wasteful to abandon these projects." These projects could be completed in 4 years while the rapid transit system was, according to some estimates he had heard, as much as 10 years off. The transit system would undoubtedly have an effect on the highway planning that would be conducted after it was built. "But this does not mean that the construction of a rapid transit system precludes any highway program whatsoever." He added:

In the event that Congress authorizes a rapid transit system for the District of Columbia, I have little doubt that it will receive sympathetic attention from our committee. Until such time, however, I would like to echo the feeling that the projects presently underway should be completed. [District of Columbia Appropriation Bill, *Congressional Record-House*, July 11, 1963, pages 12453-12454]

Representative Finnegan told his colleagues that President Kennedy, "on advice that we members of the Committee considered to be in error," had delayed several projects for reexamination until the NCTA plan "could be further implemented." The District commissioners, Administrator Whitton, and the subcommittee supported continuing these projects, "not, of course, to the exclusion of any transit plans." Both highways and transit were the answer to the District's

transportation problems, but rapid transit would not be completed for 10 years. Therefore, he “unequivocally” recommended construction of the Three Sisters Bridge, Potomac River Freeway, and North Leg. The first two projects did not need funds at this time, but he supported the \$900,000 in the bill for the North Leg. He hoped “all proceed with such speed as is proper.” [pages 12454-12455]

Representative Baldwin also expressed his views. He referenced the Subcommittee on Roads hearings that had been completed the day before. His colleagues, he thought, would like to think that Washington was leading the Nation in the construction of Interstate highways through metropolitan areas. “Unfortunately, this is not the case.” On the contrary, the Roads Subcommittee’s hearings demonstrated that:

. . . the Washington situation was a sea of confusion and when we got into the meat of it, to find out why this sea of confusion existed, we found despite the recommendations in 1959 of every responsible planning agency in Washington, D.C. . . . that the recommendation of one agency which has come into the picture in the last few months, for all practical purposes had brought the Federal interstate highway program in the Washington area to a standstill.

All other responsible agencies and officials who testified, he said, “were united that this program must go forward.”

Representative Baldwin explained his concern that the taxpayers of the District and the surrounding area were not getting the highways their highway user taxes were intended to provide. “The reason they are not getting them is primarily because of the obstructiveness of the National Capital Transportation Agency.” This blockage must be broken. Everyone in the country was receiving the benefits of the Interstate System they were paying for, except for District residents who were “being penalized by a theory that apparently the National Capital Transportation Agency has that if they can bar any improvement in the highway system in the Washington, D.C., area, they can force sufficient support for a mass transit program.”

If NCTA thought that obstructing a program Congress overwhelmingly supported was how to gain support for rapid transit, its officials were going to “find that some of us who would otherwise support it will probably oppose it until the NCTA withdraws its opposition to completion of the program for Federal interstate highway construction in the Washington area as contemplated when we enacted the Highway Act of 1956.” [pages 12455-12456]

The House approved the bill on a voice vote, forwarding it to the Senate for consideration.

## **Senate Considers the Appropriation Act, 1964**

On September 23, the District Subcommittee of the Senate Committee on Appropriations began hearings on the District's FY 1964 budget. City agencies testified about the usual wide range of city business, including the Department of Highways and Traffic. The department's tables showed that the House bill had approved all requested funds for freeway projects except the \$330,000 requested for interchange "C." Neither the Senators nor the District officials discussed the freeway issues beyond a brief reference by city officials. [District of Columbia Appropriations for 1964, Hearings on H.R. 7431 before the Subcommittee of the Committee on Appropriations, United States Senate, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, pages 20, 31]

On September 25, Senator Byrd opened the subcommittee's public hearing on the District's appropriations bill for FY 1964. Over 150 witnesses and spectators filled the hearing room. Of course, they were interested in a variety of subjects, but several wanted to talk about the freeway controversy. For example, Polly Shackleton expressed her concern about the relocation of District residents. She favored a central relocation service. "Urgent efforts by public agencies and private groups already are underway to increase the supply of much needed low- and middle-income housing." She was "particularly gratified" by President Kennedy's decision to order a restudy of the social, economic, and esthetic impacts of the North Leg, Three Sisters Bridge, and Potomac River Freeway.

She was hopeful that officials could find a way to "largely eliminate or at least minimize the loss of homes and destruction of neighborhoods and community facilities." Along those lines, she favored the Center Leg in general, but was not satisfied with the proposed route that resulted in the "entirely unnecessary destruction of homes and church and neighborhood facilities." [pages 793-794]

Similarly, Grosvenor Chapman, chairman of the Transportation Committee of the Washington Planning and Housing Association, testified that his group did not question parts of the Inner Loop, but had serious questions about the need for the North Leg, Potomac River Freeway, and Three Sisters Bridge. "We believe that construction of these facilities to interstate standards would result not only in a waste of public funds but also in the destruction of properties, neighborhoods, and scenic and traditional values of uncountable value." [page 798]

Several witnesses spoke in favor of the freeways. Harold Wirth of Firestone Tire and Rubber Company appeared on behalf of the Washington Representatives of Rubber and Tire Manufacturers:

Gentlemen, we should honestly face up to the urgent requirements of this situation from the viewpoint of the harassed motorists in the northwest quadrant of our metropolitan area. My own humble experience is merely one [that is] similar to thousands upon thousands of motorists who must traverse this quadrant daily on their way to and from their homes and offices.

In response to a question, Wirth said he lived in Rock Creek Hills, Montgomery County, and worked at 1001 Connecticut Avenue, NW. Since moving to the Washington area in 1938, he

found that traffic had grown, but “not one thing has been done to ease traffic congestion and its accompanying driving hazards during these past 24 years, with the exception of allowing Wisconsin and Connecticut Avenues to carry four lanes in place of three going north in the afternoon.” They both were, he said, “death highways.”

In his view, the Three Sisters Bridge and Potomac River Parkway were “the most important part of the entire freeway system”:

It should be built first before any other portions of the inner loop in view of the tremendous congestion existing in this northwest area caused by constant postponement of relief freeway construction . . . .

The early approval of the appropriation for the Three Sisters Bridge would assist in easing some of our congestion by permitting motorists from the western, middle, and northern areas of Montgomery County now crowding the only remaining streets [that] they can use to come into town, to approach the District through the George Washington Memorial Parkway now under construction on the east side of the Potomac River.

The east-side parkway, to be located entirely in Maryland, could not link with downtown Washington until the Potomac River Freeway was completed, “and this freeway cannot be completed until our highway engineers know where they may cross the river.” This relief was urgently needed. “Senator, it is all well and good to talk about esthetics and beauty, but when we have human lives at stake we should forget the beauty and get down to basic facts.” [pages 789-792]

AAA’s Miller testified about the “urgent need” for the Three Sisters Bridge. He described Virginia’s plans for I-66 and I-266, with eight-lane I-66 crossing into the District on the six-lane Theodore Roosevelt Bridge, which is restricted to passenger vehicles. He said, “Unless the Three Sisters Bridge is built to accommodate trucks, and the additional two lanes of vehicular traffic, there will be a traffic jam of colossal [sic] dimensions at the approaches to the Roosevelt Memorial bridge.” Trucks would have to cross at the 14<sup>th</sup> Street Bridge. “So far as the Key Bridge is concerned it is presently loaded to capacity and is not capable of handling the additional traffic which will be approaching on Route 66.”

Miller supported the entire proposed Interstate System. “The freeway system in the National Capital region is one entity and you cannot remove sections of it, as the NCTA is recommending, and still have an integrated system.” Without the Three Sisters Bridge and with the North Leg reduced to a “junior freeway,” as NCTA recommended, BPR might not be able to provide the full 90-percent Interstate funding promised for the full network.

He emphasized that AAA did not oppose the rapid transit system; if Congress decided to appropriate funds for its construction, “we will raise no objection.” However, AAA favored the full system the Mass Transportation Survey identified in 1959, including its transit component. AAA had “tried desperately” to avoid the conflict between highway and rail transit proponents. The association had urged NCTA to limit its recommendations to transit. “We even took our

recommendation to Charles A. Horsky, Advisor to the President on National Capital Affairs, but all to no avail.”

Instead, NCTA recommended cutting the highway program “by \$600 million, including a reduction of 70 miles of freeways,” bringing the highway and rapid transit plans “to a grinding halt in the form of a stalemate.” On behalf of the “overwhelming majority of the motoring public,” he said:

It is now quite obvious, as a result of what has transpired during the past 3 months, the quickest way to move ahead with all our transportation plans is to get the freeway program back on schedule at once . . . .

We believe that the people have been deliberately misled into believing that the rail rapid transit system would do away with the need for any further highway building in the District. Gentlemen, this is totally inaccurate. [pages 795-798]

Director Aitken, Deputy Director Airis, and their colleagues appeared before Senator Byrd’s subcommittee on September 28. Aitken summarized projects completed in the past year:

We have completed Anacostia Freeway from East Capitol Street to Pennsylvania Avenue [and] opened to traffic the 12<sup>th</sup> Street Expressway, from the Southwest Freeway to Constitution Avenue. We have opened to traffic the Washington Channel Bridge [and] the Southwest Freeway from Washington Channel Bridge to the center leg. This latter section of freeway was opened to traffic on August 26, and within 2 days it was carrying approximately 32,000 vehicles per day. We expect to complete the freeway between the center leg and South Capitol Street about May 1964.

Several projects were underway. The Southeast Freeway from South Capitol Street to Sixth Street, SW., was to be completed by June 1965. The city expected to complete the Potomac River Freeway from E Street to the K Street interchange in late 1965. The Theodore Roosevelt Bridge was to be opened to traffic in early 1964, the 11<sup>th</sup> Street Bridge (east structure) early in 1965, the E Street Expressway from 23<sup>rd</sup> Street to 19<sup>th</sup> Street in late 1965.

He told Senator Byrd that the location for the Three Sisters Bridge might be shifted to an alternate location. Senator Byrd said that in the previous year, “we marched up this hill in the face of considerable fire. Why was it you permitted your troops to go up the hill and get shot at?” He was referring to the original location and wondered why talk had emerged of moving the bridge. Aitken, saying he did not want to argue with the Senator, explained that if the bridge could be built somewhere else, the city had to consider it. Perhaps a bridge at another location would provide better service for the area.

The city had requested funds for engineering and right-of-way for the East Leg along the western bank of the Anacostia River. Aitken said the Center Leg was the “next major project,” extending from the interchange near 2<sup>nd</sup> and D Streets, SW., northerly to a connection with the North Leg. The city also wanted funds for engineering and right-of-way for the Northeast Freeway.

Engineer Commissioner Duke, who had been promoted to Brigadier General, joined the panel to discuss the newly formed Policy Advisory Committee. President Kennedy's advisor, Charles Horsky, had recommended formation of the committee to coordinate the reexamination of the Three Sisters Bridge and North Leg. The committee held its first working session on July 19. It included:

- C. Darwin Stolzenbach, NCTA Administrator;
- David E. Finley, chairman, Commission of Fine Arts;
- Mrs. James H. Rowe, chairman, NCPC;
- Conrad L. Wirth, Director, NPS;
- Colonel Charles Duke, District Engineer Commissioner;
- Rex Whitton, Federal Highway Administrator; and
- John Kohl, Assistant Administrator for Transportation, Housing and Home Finance Agency.

The committee designated Duke to be coordinator.

The committee, after a 2-hour organizational meeting, issued a statement saying the members "agreed to adopt objective re-examination procedures to insure results which would command general support." The statement added that the members agreed to "accept the responsibility to support the subsequent task of designing transportation facilities which would evolve from the re-examination." As the *Star* pointed out, four of the seven members "previously have opposed building the two projects." The committee had not decided whether to hire an outside consultant to conduct the study, as the District had planned to do. ["Policy Advisers Named On Highway Restudy," *The Evening Star*, July 20, 1963; "Group Set Up to Advise City on Freeway Plans," *The Washington Post and Times Herald*, July 20, 1963]

General Duke told the subcommittee:

We have held several meetings to date and at the moment we are involved in two simultaneous studies, one having to do with the possibility of relocating the Three Sisters Bridge. This is postponing, in effect, the discussion or consideration of the requirement for the bridge because we feel that, to a certain degree, the requirement would be tied in to the decision on the north leg itself. But we recognize full well that considerations other than strictly engineering considerations play a vital role in the decision on this project and . . . two alternate sites are being considered in an endeavor to try to resolve what one might call the other-than-engineering considerations.

As for the North Leg, the committee was considering proposals that fell into three categories:

At one end of the spectrum, having to do with the class of project that would carry the most traffic, we are considering eight-lane freeways—two different proposals, in fact. One has a minimum of right-of-way taking, and the other what the planners consider to be an "optimum" taking of right-of-way. This would be an eight-lane freeway and would have a sizable capacity for handling traffic.

At the other end of the spectrum we are considering a couple of proposals having to do with advancement of one-way streets only, with grade separations at various streets to enhance the carrying capacity as much as possible . . . .

Then in the middle, which amounts to somewhat of a compromise between these two solutions, the Committee is reviewing a proposal which has to do with the separation of the two types of traffic involved. The through traffic would be passed underneath the streets in a tunnel-type arrangement and the local traffic would be carried above the tunnel in a one-way street with controlled lighting. This would separate the local traffic, in other words, from the route traffic [sic].

Based on the Policy Advisory Committee review, the Board of Commissioners intended to send its report to President Kennedy by the end of December 1963.

Senator Byrd recalled that in 1962, the District was lagging behind the rest of the country in completion of its Interstate network. He asked about progress since then. Aitken replied:

I will comment on it but I do not like to, because I have to admit that whether it is my fault or someone else's, we are further behind now than we were a year ago.

Based on the latest ICE, "we have roughly 6 years to carry out roughly two-thirds of our program." He added, "It is going to be a very difficult picture and a difficult program because there are practical limitations on how much work you can do." [part 3, pages 2462-2496]

On November 6, the Committee on Appropriations completed work on its District of Columbia Appropriation Bill, 1964. The committee's report did not discuss the freeway issues, but did include a chart indicating that appropriations for the freeways were the same as in the approved House bill. [District of Columbia Appropriation Bill, 1964, Committee on Appropriations, United States Senate, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, Report No. 632 to accompany H.R. 7431, November 6, 1963, page 20]

The Senate approved the bill on November 19, 42 to 35. During the debate on the bill, Senators were primarily concerned about schools and Federal public welfare aid, not freeways or transit.

These other issues would delay the conference committee's agreement on a unified bill. The conferees continued to meet through mid-December even as the country adjusted to the November 22 assassination of President Kennedy and the transition to President Lyndon B. Johnson. Finally, on December 17, conferees resolved differences on the hiring of additional teachers and welfare workers.

On December 18, the House considered the conference committee report. Chairman Natcher, in summarizing the final bill discussed the rivalry between advocates of highways and rapid transit ("Rivalry between these two groups is dangerous and certainly not in the best interest of our Capital City."), but the House approved the bill without debate. The Senate also approved the bill on December 18 without discussion of the freeway controversies. [District of Columbia Appropriation Bill, *Congressional Record-House*, December 18, 1963, pages 24905-24910;

District of Columbia Appropriation Bill, 1964—Conference Report, *Congressional Record-Senate*, December 18, 1963, pages 24999-25003]

President Johnson approved the legislation on December 30, 1963 (Public Law 88-252).

### **Waiting For Hearings on NCTA's Transit Plan**

While officials debated the freeway network for the Washington area, NCTA and transit advocates were trying to secure congressional support for the plan. On January 11, 1963, NCTA released a 124-page appendix on *System Planning*.

NCTA estimated that during peak periods Monday through Friday in 1980, 19,600 vehicles an hour, at most, would want to cross the four Potomac River bridges (14<sup>th</sup> Street, Arlington Memorial, Theodore Roosevelt, and Key), which collectively would have a capacity of 21,500 vehicles. "This means that central area bridge capacity will exceed demand by nearly 10 percent, even without the Three Sisters Bridge." If the forecast was wrong, additional capacity could be provided by building ramps connecting the Key Bridge with the George Washington Memorial Parkway in Virginia and the Palisades Parkway and Canal Road in the District. These changes would increase the bridge's capacity by 40 percent. The Three Sisters Bridge would be redundant.

As pressure had grown around the country for increased rapid transit, Washington officials tried to divert metropolitan areas from considering expensive fixed-rail or subway systems to developing less expensive express bus systems. The White House had made the suggestion for the Washington area in the fall of 1962, but NCTA's November 1962 report had rejected the idea in only one paragraph.

Now, in an appendix, NCTA explained why an express bus system would be impractical. Buses operating on city streets would be caught in the same congestion as the automobiles, possibly even making it worse because of stops. A subway for express buses would cost \$4.5 million more than a rail subway because of additional ventilation that would be needed. Finally, NCTA argued that an express bus system would be subject to weather. "During a recent blizzard in Cleveland, rail operations had a single two-hour delay; bus operations of the same transit company remained chaotic for a week." The report stated:

In sum increasing bus-subway capacity either by adding tunnel lanes or by widening stations would add substantially to the cost of a system that even without these changes would cost more than rail transit.

No one has ever operated a comprehensive express bus system, let alone a comprehensive bus subway system. It has to be established that a bus-subway system could be scheduled and operated in a fashion that would attract a large volume of patronage.

Skeptics had questioned NCTA's expectation that a rapid rail system would operate at a profit. The new report predicted that the rail system would lose money for 5 years, but would be net profitable due to increased patronage. By 1980, fares would bring in \$79.2 million, while another \$4.8 million would be raised from advertisements, vendors, and other sources. With

deductions for subsidies to feeder bus operators (\$7.5 million), and depreciation (\$5.2), the system would have a net income of \$43.4 million.

The report also summarized NCTA's views on the District's remaining freeway network. The East Leg, the report explained, was not needed and would be disruptive of homes and families, especially in the 11<sup>th</sup> Street corridor where District officials planned to build it. NCTA recommended a route that crossed the Anacostia River on the 11<sup>th</sup> Street Bridge and continued north on the east side of the river via the Anacostia Freeway and Kenilworth Avenue, both of which would be widened.

As for the District's consideration of running the East Leg on the west side of the river, NCTA pointed out that "much of the traffic that would use an eastern bypass originates or terminates in Washington and Montgomery County, on one hand, and southern Prince Georges on the other." Under NCTA's proposal, this bypass traffic would not have to cross the river on the crowded bridges in the 11<sup>th</sup> Street area. Putting the East Leg on the west bank would "encourage portions of such traffic to cross to the west, thereby further crowding these bridges."

The District initially had proposed extending I-70S in the Wisconsin Avenue corridor, but in 1959 had changed preferences to the North Central corridor for I-70S along Florida Avenue between Pennsylvania Avenue and 1<sup>st</sup> Street, NW. The Montgomery County traffic that would have used I-70S in the Wisconsin Avenue corridor would instead use a parkway/freeway combination along the Potomac River. NCTA proposed to replace the city's planned eight-lane North Leg Freeway with a four-lane "express street system" in the Wisconsin Avenue corridor. The system would include grade separations at major intersections on Wisconsin Avenue or a parallel street. "The route would be designed for higher capacity at the points where it joins the freeway system and where traffic will be heavier."

The express street system could carry 3,000 vehicles an hour, but NCTA projected actual traffic in 1980 as between 2,500 and 3,000 vehicles an hour. The expanded western end, moreover, could carry 3,600 vehicles an hour

With construction of the express street system, NCTA concluded that a freeway in the North Central corridor as proposed by the District was not needed. Much of the traffic expected to use the North-Central Freeway would instead use the express street system in the Wisconsin Avenue corridor or the routes along the Potomac River. Eventually, a depressed four-lane facility would be needed in the North Leg corridor. However, this facility was not planned for construction for several years; planners did not have decide on it now.

NCTA had compared its projected highway system with a mathematical model to predict transit use:

The recommended highway system, together with the refined rapid transit system, will permit motorists to travel even in the peak hours at speeds substantially greater than is possible on today's congested highways . . . .

What the results showed was that—given the agency’s recommended transportation system—1977 peak-hour speeds would be 30 per cent faster than 1959 speeds. [Clopton, “NCTA Plan Is Defended In Report,” *The Washington Post and Times Herald*, January 12, 1963; Flor, Lee, “NCTA Explains Alternative of Express Buses,” *The Evening Star*, January 12, 1963; “Transport Agency Would Separate Traffic at Wisconsin Crossings,” *The Evening Star*, January 12, 1963]

On January 25, the Prince George’s County Commissioners sent a telegram to Stolzenbach letting him know they approved NCTA’s \$793-million rail rapid transit system “in principle.” The commissioners joined Fairfax and Arlington Counties in Virginia in support of the plan. The District, Montgomery County in Maryland, and Alexandria in Virginia had not taken a formal position. [Clopton, William, “Prince Georges Backs Plan for Rapid Transit,” *The Washington Post and Times Herald*, January 26, 1963]

As explained earlier, the District and Montgomery County would express many reservations about NCTA’s plan. On March 28, the District Commissioners’ Planning Advisory Council called for progress to complete the Inner Loop and the proposed subway. The council, which the commissioners had reactivated in 1957 to advise them on planning matters, said construction of the downtown subway should begin immediately. “Feeder lines using existing rail lines, should be fed into this inner loop as early as possible. Further study can then be made of the controversial sections of the subway system.” The council’s head, Frank Wolfsheim, said:

Considerable doubt has been thrown on the accuracy of some of the cost and revenue figures of the NCTA report. These doubts should be cleared up before final authorization of construction funds is made by Congress.

In addition, the council recommended construction of the Three Sisters Bridge and Potomac River Freeway “at the earliest possible date.” [“Early Start On Transit Plan Urged,” *The Washington Post and Times Herald*, March 29, 1963; “Speed in Building Urged for Road and Rail Transit,” *The Evening Star*, March 28, 1963]

A month before President Kennedy released his recommendations, the Department of the Treasury sent an advisory letter to the Bureau of the Budget on April 16 indicating that it should not make direct loans to NCTA. Treasury might be willing to make loans to the District government or guarantee bonds sold to the public to pay for the rail network, but direct loans to NCTA would set a dangerous precedent for the Federal role in transit systems in other cities.

Even a loan to the District was problematic because such loans ordinarily go to the agency with sufficient taxing power to “stand in front of the Federal guarantee.” The special situation in the District “may warrant waiver of this requirement,” but only if it did not set a precedent:

Some extraordinary handling of the National Capital area mass transportation system is warranted by the peculiar status of the area relative to the Federal government. Such special treatment, however, should be provided in a form that will not place the Federal government in an untenable position in regard to the overall mass transportation program.

The other issue was whether the District, if it borrowed the funds from the Treasury at interest, would be willing to pass the funds on to NCTA. General Clarke told reporters the commissioners “do not know enough about the import of this to be able to comment.”

The Treasury Department’s decision would increase the cost of the rail rapid transit plan by as much as \$135 million. NCTA had expected to receive loans at 4-percent interest, along with guaranteed loans from private investors at 4.5 percent. If the entire amount had to come from private investors at 4.5 percent interest, the total cost would be \$911 million instead of \$776 million. [Clopton, Willard, “Treasury Dashes Hopes For Transit Loans Here,” *The Washington Post and Times Herald*, April 17, 1963; Doolittle, Jerry, “Estimated Cost Of Subway Up By \$135 Million,” *The Washington Post and Times Herald*, April 22, 1963]

As discussed earlier, President Kennedy announced his decisions regarding the Washington area transportation network on May 27, 1963, and sent a bill to Capitol Hill for “prompt and favorable” action. The President’s letter was consistent with the Treasury Department’s decision in relying on private investors. The three-page bill, which Representative Broyhill introduced as H.R. 6633, did not address financing issues.

Except for the financing issue, President Kennedy had given NCTA and Stolzenbach virtually everything requested. As noted earlier, Stolzenbach was optimistic that construction could begin in 1964.

While waiting for the hearings, officials and organizations announced their views. On June 3, the National Capital Regional Planning Council, after an intense 3-hour discussion, reversed its support of the 1959 plan to endorse rapid transit and a downtown subway. The council’s resolution was carefully worded in view of the divided views of the representatives of area jurisdictions. It did not endorse “rail,” which meant its resolution could refer to express buses rather than a rail network. The resolution had been drafted in part by Mrs. Rowe who, according to Lee Flor, was “an ardent rail transit supporter who has become known for her opposition to freeways.” The resolution did not mention highways. [Flor, Lee, “Planning Council Backs Downtown Subway Plan,” *The Evening Star*, June 4, 1963]

The Fine Arts Commission praised President Kennedy on June 18 for his “leadership . . . in requesting the Congress for authorization to proceed with plans for the rapid transit program formulated by the National Capital Transportation Agency.” The system was “urgently needed to prevent further seizure of parklands for highways.” The resolution, approved unanimously, also said the rail transit system would “curb the proliferation of car parking lots in important areas to the detriment of the appearance of the city.” [Lewis, Robert J., “President Wins Praise For Supporting Subway,” *The Evening Star*, June 18, 1963]

On July 3, Senator Byrd took a 2-hour tour of the sites of the new and proposed highways and bridges in the District, including the Three Sisters Bridge, the Potomac River Freeway, the Theodore Roosevelt Bridge, the Washington Channel Bridge, and the interchange, under construction, between the Southwest Freeway and the proposed Center Leg of the Inner Loop. At the Roosevelt Bridge construction site, he put on a hard hat and climbed up a 30-foot ladder to the bridge floor. The *Post* reported:

Byrd, a onetime welder . . . showed that he still knew how to work with his hands. After a one-minute lesson, he fastened some reinforcing rods together with wire. Could he be made into a competent rodman? “Oh, we could do it eventually,” said rodman foreman John Casteel.

After the tour, Senator Byrd met with reporters in his office. He said the “consensus in the Congress” was that the area needed a rapid transit system as well as the freeway system sought by the area’s highway departments. He was concerned about the delay in completing the Interstate System in the city. “I don’t see why [the Interstate System] should stop here in the District of Columbia.” He thought the Three Sisters Bridge was the best approach to improved trans-Potomac travel while the Potomac River Freeway and North Leg were essential. (Aitken had told him that not building the North Leg would be “like having half a wheel on a vehicle.”)

He also was concerned that J. George Stewart, the Architect of the Capitol, had not issued a permit for construction of the Center Leg under the Capitol grounds. Aiken had told the Senator that after 6 years of negotiations, Stewart had still not issued the permit. Senator Byrd said he might summon Stewart to the hearing “so that we can go into the matter with him.”

Senator Byrd also was concerned that the study requested by the President had not yet begun. “I certainly hope this reexamination and decisions are reached with reasonable dispatch.” It should be started as soon as possible so that “we can find out where we are going with our freeways.” [Mintz, Morton, “Both Freeways, Transit Needed Here, Byrd Says,” *The Washington Post and Times Herald*, July 4, 1963; Flor, Lee, “Road, Rail Backing Seen in Congress,” *The Evening Star*, July 4, 1963]

### **Transit Program for the Capital Region**

On July 9, 1963, Chairman Whitener of the District Subcommittee opened hearings titled “Transit Program for the National Capital Region.” Stolzenbach was the first witness, but before his presentation, Representative Broyhill wanted to introduce a prepared statement and raise some questions he wanted the NCTA Administrator to address. The brief statement indicated, “I recognize a definite need for a rapid transit system for this area,” but also was convinced “that no such system will eliminate the need for an expanded highway system to service the region, particularly for through traffic.”

Representative Broyhill recalled the history behind the National Capital Transportation Act of 1960. The Mass Transportation Survey had indicated a need for a transit system to complement the highway system. That was why Congress created NCTA. The purpose was to create an agency “to develop a program, study the financial feasibility of a mass transit system, and then to come back to Congress and get the authority to go ahead with it.” Not much was said during the Joint Committee’s hearings and deliberations about the new agency conducting a new study of the needed highway facilities. The survey had already projected the highway and bridge system needed:

So it comes as somewhat of a surprise, and to a degree a disappointment to some, that one of the major points in your recommendations is the holdup or postponement or delay or

abandonment of some of the highway projects. Many of the people in the area feel that we are going to need all of the highway freeway projects that are in the pipeline right now before we come to any real solution to our problems here. What we are doing here now is just delaying something that is inevitable.

The District was not taking advantage of the 90-10 Federal program for constructing the Interstate System, and the city's delay was affecting the ability of Maryland and Virginia to use their funds to the best effect. Given the need for the "up-to-date highway and freeway program," he would "like to have that point developed quite extensively during your statement, Mr. Stolzenbach, as to why we need to hold up on these highway programs which have been approved and are in the pipeline." He also hoped that nothing in the committee's proceedings would indicate support for the delay resulting from NCTA's report.

He complimented NCTA for calling for a \$60 million contribution from the local jurisdictions. "I do not believe we have much chance of getting this program approved by the Congress unless there is some willingness on the part of the local community to pay a portion of the cost." He wanted Stolzenbach to address whether the local communities have indicated support for their participation in the cost. In view of the questions about ridership, Representative Broyhill thought that local contributions would result in more participation by the riding public.

His third point was "the most serious one." He wanted to know if NCTA had "taken full cognizance in their study and in their recommendations of all of the existing transportation facilities, such as the existing rail lines, but more important, the existing transportation system." During deliberations on the 1960 Act, he said:

The committee expressed deep and grave concern as to whether the creation of any mass transit system would destroy or injure private enterprise, and the committee did express its intention, its desire, its determination to see that these privately owned and operated transportation companies were not injured and certainly not destroyed, but, on the contrary, took the view that these privately owned transportation companies should be exploited, expanded, and improved as a part of an overall improvement of transportation services here in the metropolitan area.

Chairman Whitener, in something of a rebuke, pointed out to Representative Broyhill that NCTA's report of November 1, 1962, had addressed the issue of existing mass transportation facilities in chapter 2 and also went into the highway situation:

I would hope that in the hearings that we can approach this matter as a serious study of the need for a rapid transit facility in the District of Columbia and in the metropolitan area, and not as a battle between advocates of one form of transportation and advocates of another.

Some, he said, thought the Whitener subcommittee "was opposed to the highway program. Of course, there is no basis for that allegation." He made his view "as one member of the committee" clear:

I am not in favor of a highway program or any other program which would uproot thousands of people from their residences without some plan to relocate those people. I think it is one of the bigger problems here in the District of Columbia. It is nice to be able to bring folks in from outside of Washington on highways, but I think it is even nicer to have places for people who are living in the District of Columbia to go to bed at night.

He added that someone from Washington had been calling people in his North Carolina district and providing “completely erroneous information as to the purpose of these hearings.” As far as he was concerned, “anyone who has any views on this matter can set them forth here in the record and give their testimony.” [Transit Program for the National Capital Region, Hearings before Subcommittee No. 6 of the Committee on the District of Columbia, U.S. House of Representatives, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, 1963, pages 9-13]

The chairman did not speculate on who was calling his constituents, but the *Post* and *Star* speculated that he was referring to pro-highway lobbies.

Stolzenbach said he wanted to explain how NCTA had carried out its mission under the 1960 Act and to seek favorable congressional action on the President’s bill seeking authority for NCTA to begin construction of the proposed rapid transit system. “The Agency’s recommendations with respect to highways have been taken under advisement by the President and the other agencies concerned and the bills presently before this committee do not concern these recommendations.”

He summarized the first stage of NCTA’s review, namely “forecasts of future travel within the region.” He told the subcommittee:

The key conclusion of the Agency’s traffic analysis is that without a rapid transit system, and even assuming a highway system larger than that proposed by the District Commissioners, congestion will increase. But with a rapid transit system, and vigorous freeway program, not only can we accommodate the additional traffic that will develop, we can substantially improve today’s conditions and give the city a real measure of relief.

The NCTA proposal embodied in the White House bill, would create “a truly regional mass transportation system consisting of more than 80 miles of rapid transit service, an additional 15 miles of commuter railroad service, and over 50 miles of express bus service on freeways.”

He emphasized that in developing the proposal, he, Deputy Administrator Quenstedt, and their staff had held “countless meetings” with the public, private organizations, and “a wide variety of other agencies and governmental bodies,” as directed by Section 204(g) of the 1960 Act.

The legislation also had directed NCTA to study a subway from Union Station capable of dispersing passengers “to the principal employment centers of the District of Columbia and its immediate environs.” NCTA “literally examined dozens” of plans and settled on “the one that we decided was the best one.” He displayed a map showing the expected concentration of employment centers in 1980. On a second map he highlighted the downtown subway system, with its 15 stations that he said were “so located as to bring 80 percent of the prospective downtown employees to within a 5-minute walking distance of their offices, and that some 92

percent will be within an 8-minute walk of their office . . . .” The system also would be “an efficient economical means of bringing shoppers into town during the middle of the day,” as well as “a means of internal circulation within the downtown area that will greatly relieve the congestion we now find on downtown streets all during the day.”

The 1960 Act also called on NCTA to design a downtown subway that could be extended to serve other parts of the region. Using space already dedicated to transportation service would minimize disruption to the community as would avoiding residential areas:

The program before you involves no defacing of the city, little interference with the life and homes of our people, and, at the same time, provides the city and the region with a system capable of handling the traffic volumes expected in 1980 and beyond.

In planning the system’s eight transit radials, “the Agency closely adhered to the congressional requirement that railroad and highway rights-of-way be used wherever possible.” Six used railroad or highway rights-of-way. As a result, the proposed transit system would provide areawide coverage “while at the same time minimizing construction costs.” He identified the radials in clockwise order:

- The line from Rockville to downtown “utilizing the right-of-way of the Baltimore & Ohio Railroad.” The trains “would, without interruption, stopping at Union Station, go right on through into the downtown distribution system.”
- To serve the northeast, NCTA proposed a rapid transit line in the median strip of proposed I-95. “This line would merge with the B. & O. line” before going into the downtown distributor.
- Continuing to the east, NCTA proposed to establish a commuter railroad along the Pennsylvania Railroad’s main line from as far as Bowie, Maryland. “Trains on this line would come into Union Station where the people could get off and by an over-the-platform transfer board the subway system and thereby get anywhere in the downtown area.”
- In the southeast, NCTA would place a rapid transit line in the median strip of the proposed expressway going to the Henson Creek area of Prince George’s County.
- For the southwest, NCTA would place a line in the right-of-way of the Richmond-Fredericksburg & Potomac Railroad “from Springfield into Alexandria, serving the city of Alexandria, serving Pentagon City, a large office building and apartment development complex now going up there, serving the Pentagon, going under the river and into the downtown subway distribution system.”
- A rapid transit line to the west would run in the median of I-66 serving Arlington and Fairfax Counties. It, too, would connect with the subway distribution system by crossing the Potomac River in a tunnel.
- NCTA could not find an existing right-of-way in northwest, but proposed a subway line “going out Connecticut Avenue, eventually over to Wisconsin and out through the Bethesda business district past NIH [National Institutes of Health] to Pooks Hill.” The subway would be carried at least to Tenley Circle.

- Finally, NCTA proposed another subway line that “originates in the vicinity of Quincy Street and Georgia Avenue, and joins this Northwest route near Florida Avenue and 19<sup>th</sup> Street, bringing people here into the downtown distribution system.”

He added:

In addition, the dotted lines on the map show the various locations of the 50 miles of express bus service . . . . We propose express bus service running on the George Washington Memorial Parkway from Cabin John in Montgomery County, Md., direct to downtown Washington.

The rapid transit line on Route 95, would be served by express buses operating on the highway between the transit terminal and points further out.

In the southeast, express bus service on the existing Suitland Parkway, and on the Anacostia Freeway, would bring passengers into the rail rapid transit line serving that sector.

Similarly in the southwest, express bus service on the proposed expanded Shirley Highway would bring people to the Pentagon where they could transfer to the downtown subway.

Eventually the program contemplates express bus service on the access road to Dulles International Airport. The FAA, incidentally, is interested in the ultimate possibility of having a spur of the train line serve the airport, but I think that is some time in the future.

He summarized:

Here then is an express rapid transit system that truly covers all quadrants of the region, and provides far better service for bringing our people into downtown than can be accomplished by any other means.

NCTA’s rapid transit system “represents the most modern, up-to-date system that American technology can devise.” The system, in short, “represents as much of an advancement over the older subway systems in this country as the Thunderbird does over the model ‘T’ Ford.” The system would operate twice as fast as the New York City and Philadelphia systems:

In addition to their high speed, the rapid transit trains will have modern styling, they will be air conditioned, seating will be comfortable, and the cars will be attractively appointed and well lighted.

Stolzenbach summarized some the advantages of the system within the District. A trip from the State Department to Capitol Hill now took 25 minutes; it would take 5½ minutes by subway. When the subway was completed, 77 percent of all downtown jobs would be within 5 minutes of a station and 90 percent would be within an 8-minute walk. “As a result, the rapid transit system will provide excellent service during the off-peak, as well as the peak, hours and it will serve throughout the day as a fast means of traveling around the city.”

Suburban stations had been designed “to provide some 50,000 parking spaces so that a very large percentage of the passengers will be able to use their cars to get to the rapid transit lines.” Special bays would be made for passengers arriving at the station on feeder buses:

In short, this is an auto-age rapid transit system designed to provide an attractive alternative to driving all the way to town.

In considering cost, Stolzenbach pointed out that the committee creating the 1960 Act “refused to accept the proposition that a regional rail rapid transit system here in Washington must be a deficit operation. Neither do we.” Nothing was to be gained, he said, by looking at operations in other areas, except to use the experience elsewhere to make the Washington system more efficient. “We have a new slate to write on,” and NCTA had applied “a hardheaded, businesslike manner” to finances:

We have done this, Mr. Chairman, and it is abundantly clear that given the conditions now existing in the National Capital region and the dramatic growth expected in the years ahead, the transit development program before you today will be largely self-supporting, and over a period of some 35 years, will repay all borrowing for capital requirements. And notwithstanding the comment this conclusion has excited in some quarters, it is not concocted of legerdemain and wishful thinking. It is based on the facts.

The key ingredient for success exists here in Washington, but not in any other rapid transit city; namely, a history of realistic, economical transit fares. Unlike these other cities, where transit fares have been kept artificially low, with the municipality making up the deficits out of general public funds, fares in the Washington area have kept pace with the cost of providing transportation service.

The idea that the transit development program would be “largely self-supporting is the cornerstone of the financial plan” NCTA had proposed. The capital outlay of \$793 million was to be raised “through a combination of private borrowing and Government grants.” NCTA had assembled an advisory committee on finance consisting of businessmen from around the country. “The recommended plan satisfies all the tests.” It would have “a minimal impact on Federal budget expenditures, and calls for equitable participation by the local governments.”

Stolzenbach agreed with President Kennedy’s observation that establishing an interstate compact agency, with its own financing powers, was the appropriate form of organization. Establishing the compact was going to be a difficult task “beset with complex constitutional, legal, and political considerations.” While negotiations are underway, the President believed, “work on the transit development program should go forward vigorously.” If the compact had not been approved at the point where private borrowing was necessary, Congress should establish a corporation with borrowing authority to carry the program forward.

During this testimony, Stolzenbach did not address Representative Broyhill’s three questions. Committee questioning was postponed to allow out-of-town officials associated with NCTA to testify before leaving the area. [pages 13-24]

Testimony resumed on July 10, with Deputy Administrator Quenstedt and Chief Counsel Seeger presenting statements. Quenstedt discussed the schedule for construction of the rapid transit segments, while Seeger addressed several issues, including how the proposed network would be able to pay for itself out of the farebox. He cited examples from other parts of the country. Chicago, Cleveland, and Philadelphia “meet operating expenses plus a share but not all of the capital costs.” New York met its operating costs, but made only a “a minor insignificant contribution to capital cost.” Boston “doesn’t even meet operating expenses.” Some commuter railroads, such as the Long Island Railroad, were profitable, while others lost money.

The reason the District system could rely on the farebox was that it would charge a zone fare. “So the man who is traveling a longer distance, and who costs you more to carry him, pays a proportionately larger fare.” By using zone fares, “not only will this system meet its operating expenses but it can meet its capital charges as well.”

Representative William H. Harsha (R-Oh.), a longtime highway supporter who also served on the Committee on Public Works, interrupted Seeger’s testimony. With the House considering national urban mass transportation legislation, already approved by the Senate, at the same time as the NCTA bill, he wanted to know if Seeger was saying that the national financing problem requiring Federal funds could be “solved by a realistic rate.”

When Seeger would not go that far, Representative Harsha asked, “if your theory is accurate, it would apply in any situation, wouldn’t it, as long as you raised the rate to meet the demand of operating costs and capital reduction?”

Seeger replied, “Yes, I would say yes.”

Representative Harsha concluded, “In other words, we don’t need this [national] mass transit bill they are trying to shove down our---“

Seeger tried to divert Representative Harsha by explaining that the mass transportation bill included a provision for loan guarantees to help cities that wanted to charge higher fares to finance their systems out of the fare box. “But I think the administration’s position . . . is that what you charge is properly a matter of city policy, and is not to be a matter of Federal policy.”

Representative Harsha was not convinced. Under Seeger’s theory, “you could finance the bonds anywhere in the country,” without Federal assistance.

Allowed to continue his statement, Seeger concluded with a discussion of a survey to measure potential ridership. “The final conclusion of the survey was that a potential market as high as 85 to 90 percent of the downtown employment in Washington exists for rapid transit.” [pages 57-70]

Stolzenbach returned to the stand for the question period. Chairman Whitener began by saying that based on questions he had received from other Members of Congress, the biggest concern about the plan was the cost; “some of them are a little leery about supporting such a system here in Washington.” They also thought the two States and local jurisdictions should contribute more than presently planned.

Stolzenbach said the estimated cost was the minimum necessary for a regional rapid transit system. The overall cost should be “weighed against the value to the community that is going to result.” However, NCTA was not asking for a cash gift from the Federal Government to pay for the system. “What we are asking for is underwriting of a project which we are convinced will be self-liquidating in the long run.” He added that in deciding on an appropriate State and local share, NCTA was using the formula in the Senate-passed national mass transit legislation.

NCTA, Stolzenbach said, had consulted with the governing bodies of regional governments about the financing plan. “The invariable response was, ‘Well, that seems reasonable.’” Representative Broyhill wanted to know who made these commitments. Stolzenbach was vague, referring to elected officials. “It varied.” Since the plans were not yet approved by Congress, the officials could not put it before their local bodies for a formal vote.

Representative Broyhill thought the issue would come up on the floor of the House. He wanted a more formal commitment from the suburban communities stating they were ready to participate in the cost. Stolzenbach said, “I don’t think these people are in a position to make anything that could possibly be considered as a legal commitment at this point.” The NCTA bill had been written so that construction would not proceed without the required contribution. “In Virginia, for example, we don’t go beyond Pentagon City until they do make a commitment.”

Chairman Whitener wondered if those communities would be willing to contribute more if the feeling in Congress was that they were not doing enough. Stolzenbach thought that when communities saw the system in operation, they would be willing to contribute to ensure it reached their territory.

The chairman asked for NCTA’s answer to the many concerns raised about the agency’s impact on the area’s Interstate network and on networks elsewhere in the country. (As described earlier, Chairman Fallon was conducting hearings that were considering this point at the same time as the NCTA hearings.) Stolzenbach said NCTA proposed “a tremendous freeway system” for the area, with the differences between NCTA and area highway agencies “actually quite small.” The studies directed by President Kennedy were intended “to resolve some very practical problems of seeing just how you can meet the highway requirements in certain sectors of the city, where . . . the proposal is to build an interstate freeway of eight lanes, which is going to be very disruptive.”

Stolzenbach agreed that cities around the country were objecting to freeways:

The desire to have those needs met by alternative means, such as rapid transit is a phenomenon that has occurred in many other cities before it ever happened in Washington. I am thinking of San Francisco, New York, Boston, and Chicago.

And I think actually the refusal to go along with certain freeways in the heart of some of these other cities is of greater magnitude than anything that we have proposed.

The highway people in Maryland and Virginia wanted the Interstate network as planned, but NCTA felt “under a mandate to evaluate the plan put forth in 1959,” a view that Chairman Whitener’s report in 1962 confirmed. NCTA consulted with many highway officials, he said.

The fact that they may not agree with the recommendations “doesn’t imply any lack of cooperation.”

Chairman Whitener asked about a concern by highway officials around the country that highway user revenue would be used to build rapid transit. Stolzenbach replied, “We have never entertained such a thought nor in any of our studies, reports or recommendations will you find the slightest hint of that idea.

Perhaps mindful of Chairman Natcher’s off-stated concern about cost increases, Chairman Whitener asked if “you are confident that this transit system will do better in paying off its bonds than the D.C. Stadium has done.” Stolzenbach replied, “Yes.”

Chairman Whitener asked how NCTA could be so certain that construction of the rapid transit system would cause “a minimum of difficulties in the everyday life of the community.” Based on soil conditions, NCTA and its consultants had determined that most of the subway construction could be accomplished by tunneling “which involves no disruption at the city street level except at stations.” Some disruption might occur in a few sections where, due to soil conditions, cut-and-cover construction might be best. The disruption, even in those cases, would be “minimal.”

Representative Broyhill’s question period was next. He asked about consultation with area highway departments. Stolzenbach told him, “we consulted with them to the greatest degree that was possible.” Did the District or State highway officials, the Congressman asked, agree with NCTA’s recommendations. Stolzenbach replied, “No.”

Representative Broyhill saw this issue as a problem because those highway agencies had experts who had made the technical decisions on which projects to advance, but given the conflict between those officials and NCTA, Congress was being asked to do something it was usually reluctant to do, namely “sit in judgment between experts on various technical proposals.” He was “most reluctant” to hold up freeway projects already approved by engineers, and yet NCTA was proposing to delay freeway construction “for quite a number of years,” and that was based on the assumption that Congress would complete legislation and that subway construction could begin in 1964. “I do regret that you haven’t been able to work out that particular problem and have come to this committee with that unresolved.”

Before Stolzenbach could reply, Representative Harsha had a question about cooperation with highway officials. He pointed out the highway officials, including Administrator Whitton, who had testified recently before the Subcommittee on Roads, Committee on Public Works, that consultation was absent or “silly.” Moreover, the Commerce Department’s formal comments to the White House on NCTA’s report said “NCTA failed to cooperate.”

Stolzenbach summarized the consultation efforts, stating that BPR and the three highway agencies were fully aware of what NCTA was doing. They all wanted the Interstate System to proceed as planned, claiming NCTA did not have authority to review the highway plans. They implied, “Just go along with our highway plans and maybe we will go along with your rapid

transit.” He said that he did not think the 1960 Act “contemplated the requirements that this Agency get the agreement of all these highway departments.”

Chairman Whitener pointed out that President Kennedy, the highest authority of all, had reviewed NCTA’s report and gone along with it. Representative Harsha said the President did not have the opportunity to review the report as thoroughly as BPR, but the chairman replied, “I believe the buck stops right down at the White House, doesn’t it?”

When Stolzenbach referred to the NCTA study as a “truly joint project” and that the personnel borrowed from BPR had contributed to the technical review, Representative Harsha countered that, “If it was such a joint project and so well coordinated and cooperation was the utmost, why would they [the Commerce Department] come out with a stinging report like this?” Stolzenbach answered:

I can only presume they didn’t agree with our conclusions. It was understood in this joint project that this Agency has a responsibility for making recommendations.

Representative Broyhill, whose district included several privately owned commuter bus companies, returned to one of the questions he had raised the day before:

Mr. Broyhill. Did you consult with the operators of privately owned transportation companies in coming up with this report?

Mr. Stolzenbach. We made every effort to, Mr. Broyhill.

Mr. Broyhill. You made every effort. You mean, they refused to consult with you?

Mr. Stolzenbach. Yes.

Mr. Broyhill. The private companies refused to consult with you?

Mr. Stolzenbach. Yes.

He clarified that he initiated cordial consultation with D.C. Transit’s Mr. Chalk. In 1961, Chalk asked if NCTA would support his concept for a super-rail-transit system from the car barns in Georgetown to Dulles International Airport. Stolzenbach said he could not; NCTA had not completed its evaluation of the type of system the area needed. Moreover, Chalk did not have engineering specifications NCTA could consider. “I am sorry to report that his immediate response was, and I quote, ‘This is the end of all cooperation between us. Period.’”

The area’s other bus companies rejected overtures from NCTA. However, NCTA’s plan was based on providing facilities for bus service, such as stations and parking lots, but the bus companies would own the buses.

Representative Broyhill was concerned that the rapid rail lines would “take the cream” of traffic and leave the privately owned companies with “the feeder service, that in many instances . . . might not be profitable.”

Seeger responded that NCTA included \$7 million a year in its plan “to pay for feeder bus service that, in our judgment, would not be profitable, but would be important to the rapid transit system.” In addition, the plan included private bus service on trunklines such as the Shirley Highway and George Washington Memorial Parkway.

Representative Broyhill was not completely satisfied that the private companies in northern Virginia were being treated fairly, but his question period ended. [pages 72-88]

Representative Harsha was next. He was not, he said, opposed to NCTA's rapid rail system, which he thought was "certainly needed." He was less concerned than Representative Broyhill about the private commuter bus companies:

I am sure no one needs to hold their hand. They will look after themselves. I don't think you have to get down on your hands and knees and beg them to meet with you.

He was, however, vitally concerned about the "curtailment of the highway program." He said that apparently Chairman Whitener and Stolzenbach "think that the last word on what is to be done here does rest with the White House." He asked for Stolzenbach's reaction to the fact that the Appropriations Committee of the House has said, "We must carry the highway program along with any and all proposals concerning a rapid transit system," and have, for 5 consecutive years beginning in 1959, appropriated funds for the Potomac River Freeway and the Three Sisters Bridge. For FY 1964, the committee included \$900,000 for the North leg. "What is your reaction to that? Do you care to comment?"

Stolzenbach began, "May we start backward?" The \$900,000 was for the portion of the North Leg that was not in dispute. It was what the District wanted, NCTA "went along with" it, and the President included it in his budget. "It has never been in dispute at all." The rest of the North Leg, the part in dispute, "hasn't even been planned."

NCTA also did not oppose the Potomac River Freeway:

The only reason that is being held up is because until you know whether there is going to be a Three Sisters Bridge, it affects the design, and they were actually ready to start constructing parts of the Potomac River Freeway. That is not in dispute.

The only thing that is in dispute is one bridge, and the design of a highway corridor through the north leg, which was not contemplated to be built for another 6 years.

Representative Harsha wanted to confirm that NCTA did not object to the Potomac River Freeway. "That is right," Stolzenbach told him. What about the Three Sisters Bridge? Stolzenbach replied:

Our findings show that for a long time to come, even without a rapid transit system, you don't need the Three Sisters Bridge to handle the river traffic, and these are using the D.C. Highway Department's own figures.

NCTA, he said, was "not fighting this problem." It was simply one agency of the executive branch that had made a recommendation to the White House.

Representative Harsha turned to a NCTA brochure that referred to Washington as "a model area." Therefore, its mass transportation must be a model system. "The 212 metropolitan areas of the country will look upon the National Capital Transportation Agency and its work as a

model from which they can draw knowledge to help them in their growing problems of mass transportation.” The Congressman wanted to know if the advance of NCTA’s plans would be “the cue for the cities all over the United States to curtail their interstate highway development program within their community area?”

Stolzenbach replied that NCTA hoped to “build a model transit system here.” At this point, the mechanics of an integrated transportation system left “something to be desired,” but “this is just one of the facts of life in a complicated jurisdictional area in which there is great disagreement as between localities as to what the highway system should be.” Maryland and the District of Columbia, he said, were “further apart as to what highways should be running between the District and Maryland than any of the differences that lie between us and the D.C. Highway Department, for example.” All NCTA could do is “consult and cooperate” as well as making recommendations.

Representative Harsha commented that if NCTA wanted to be a model system, it would in his view not encourage other cities to change or curtail their highway programs.” Stolzenbach disagreed, saying, “Long before this Agency was created, highways . . . were being curtailed by action of city governing bodies in innumerable cities throughout the country. This is nothing new. It didn’t start here.”

What, Representative Harsha wanted to know, would happen to the Interstate System if cities decided to curtail freeways and use rapid transit instead? Stolzenbach replied that NCTA had proposed “a continuous interstate system” for the District:

I think it is reasonable to expect that if you are going to have a regional rapid transit system that is going to move twice as many people by public transportation than you would otherwise have, that this might call for some modifications in a highway system that was planned before 1955. This is literally what we are faced with here. The inner loop was designed in 1955.

Representative Harsha understood that NCTA was primarily concerned with moving people. Had NCTA given any consideration to national defense? Seeger, using a map, explained that “there isn’t any question about having a complete interstate system in the District of Columbia.” The map included I-66 from the west, I-95 from the south, and I-70S from the northwest to the Center Leg “of the loop and providing a continuous interstate system with trucks from Route 66 coming across the Jefferson Davis Highway over onto Route 95.”

The Congressman asked how NCTA’s map differed from the Mass Transportation Survey’s map of Interstate freeways. Seeger said the District proposed separate lines for the North-Central Freeway (I-70S) and the Northeast Freeway (I-95). NCTA recommended combining the two “and the great advantage of this was that you could, instead of going through the heart of north central Washington with tremendous displacements, you could follow the railroad right-of-way and get the highway in easily and smoothly without a big public fuss.” The District has said it could not see any “insuperable obstacles to this proposal.” In addition, NCTA recommended building the East Leg of the Inner Belt on the east side of the Anacostia River, but that idea was not adopted; the plan for construction on the west side was going ahead.

The only real issues, Seeger continued, were the Three Sisters Bridge and a portion of the North Leg:

My only point at this moment is that whatever may be said about the desirability of having Three Sisters bridge or the north leg of the loop, given this tremendous interstate system that is really agreed upon for all practical purposes, there need be no delay whatever in the District's highway program.

There are projects to keep them going for a good number of years to come.

The District, he said, had "a great deal of highway" ahead of it without worrying about the Three Sisters Bridge, "and no one was even proposing to build the north leg of the loop until 1969, anyway." The District's real problem was not whether to build a bridge or a portion of the Inner Loop, but how to pay its share of the cost for the Interstate highways that everyone approved. "It will take every cent the District has to do them, and there is no reason at all why the Three Sisters Bridge question should delay the completion of an interstate system."

Representative Harsha, recalling Stolzenbach's testimony before the Joint Committee that, "Highways and mass transit are and will always be competing facilities for mass transportation," asked what that meant. Stolzenbach said the modes competed for public choice, "but if the public has no alternative but highways, there can't be any competition." If government agencies want to establish a balanced system, they were not competing but were complementary.

When Representative Harsha again said the highway program was being held up, Stolzenbach told him that the Three Sisters Bridge was not even in the District's highway program when NCTA was created. The bridge, despite appropriations for it, was being held up by President Kennedy's call for a reexamination. At this point, agencies were trying to put together a balanced system that would give the individual traveler the choice of whether to use public transportation or the highways.

Representative Harsha changed directions by asking about Stolzenbach's activities, before becoming NCTA Administrator, as chair of a civic committee that promoted rapid transit and curtailment of the automobile. Stolzenbach said he was reflecting the views of the Interfederation Council of the Greater Washington area, which believed that the 1959 Mass Transportation Survey put too much emphasis on highways. "That was the simple view and this is what we expressed to the Congress at the time."

Representative Harsha asked if the council recommended "that certain police restrictions should be employed restricting the use of private automobiles in the area." Stolzenbach did not recall everything he may have said, but "one way of being sure that our highways are adequate to handle peak-hour traffic is to provide some means of controlling it":

When I talked to the traffic director of the city of Los Angeles last year, I asked him what is the solution to Los Angeles freeway problem [sic]. He said, "I am hopeful that we can eventually get some means of keeping the number of people who get onto these highways down to the limit that the highways can handle at a reasonable speed."

The Federal Highway Administrator told me, not long ago, that they are working on and doing research on means of controlling traffic so that the freeway systems in cities will work, instead of having freeway traffic come to a grinding halt as it does in Los Angeles twice a day.

Did the council advocate, Representative Harsha wanted to know, that the highway departments of Maryland and Virginia come under a regional agency's control. Stolzenbach said he was speaking for a group, but "I haven't taken any position on this question." But had he not advocated, the Congressman asked, that the regional transportation agency have the power to establish and operate a regional highway system "whether or not the local authorities agree." Stolzenbach did not recall saying that, but he pointed out that if each jurisdiction has a veto, "this may cause some problems."

Representative Harsha summarized that if Federal agencies were going to usurp State and local authority and control people, "where are going to go? Everything is going to be dictated from here in Washington as to what these people are going to do with their roads and how they are going to . . . ." Stolzenbach interrupted to say he did not think a central bureaucracy in downtown Washington should dictate decisions. "The real tough problem here is how do you organize this region to not only do regional planning but to get regional decisions."

What would happen, Representative Harsha asked, if local jurisdictions decided not to go along with NCTA's transit plan. Stolzenbach said NCTA planned to build, first, an economically viable system in the District. It would be self-sustaining, but would not provide regional service if other jurisdictions rejected the plan.

Representative Harsha asked about the difference between NCTA's November 1962 report and the transit development program released in the summary report of May 1963 and cited in the White House bill. Seeger said they were identical except in dropping interim-Federal loans that the Treasury Department had opposed earlier in the year.

The Congressman was concerned that if Congress approved the bill adopting the May 1963 report, Congress would "block ourselves by curtailing the Three Sisters Bridge, accepting your recommendations and these others."

Seeger said the bill did no such thing; it did not even mention the highway program. "It simply sets forth the engineering details with respect to the transit program, and the bills that have been introduced would do no more than that." The summary report did not mention NCTA's highway recommendations or the Three Sisters Bridge.

Representative Harsha said he had additional questions, but the House was in session, and the committee adjourned. [pages 88-96]

On July 9, O. Roy Chalk was in the Mediterranean on vacation. However, his office sent his letter to President Kennedy transmitting a "preliminary report on transportation" in the Washington area. The area should take advantage of "the maximum efficient application of the

most advanced technological developments in mass transit” to create the best transit system in the world.

The enclosed report explained that D.C. Transit System’s “exhaustive, critical analysis” of NCTA’s report revealed weaknesses that undermined the “very foundation” of its recommendations. A “vast wealth” of information and resources “was ignored, wholly or substantially,” while transit innovations, some in the experimental stage, were never mentioned or “glossed over briefly and dismissed summarily.” By ignoring “rudimentary principles of sound transportation planning,” NCTA made “many theoretical and dubious basic presumptions,” the result being “an inadequate definition of the present and future transportation problems of the area, thus preliminarily casting considerable doubt upon the proposed solutions.”

The problem with subways was that they were “a permanent fixture” that could not be “moved from place to place as the demands upon it may require.” Building such a network “could have drastic consequences,” especially if based only on “a mere 2-year study.”

The Washington area, the letter said, was familiar with the streetcar, motorbus, and surface railway. Now, however, Congress had appropriated \$25 million for the Housing and Home Finance Agency to study alternate methods of transit. Research included:

1. Pneumatic tube systems.
2. Ground effect machines.
3. Superrail.
4. Monorail.
5. Monobeam (an elevated beam that can carry transit vehicles in both directions).
6. Hydrofoil.
7. Carveyor (a “people mover”).

D.C. Transit suggested that a combination monorail-subway was another option worth studying, as was an underground automobile highway.

The company was not simply opposing construction of a rail rapid transit system; it was simply suggesting that the area wait until the recently financed research was completed before committing more than \$1 billion for “a permanent, inflexible subway system.” In the absence of “a panacea for the mass transportation ills,” officials should employ patience and careful planning, “as opposed to panic,” in deciding what to do.

The company, under its franchise approved by Congress, had the right to operate any mass transit system in the area. D.C. Transit was “ready, willing, and able” to incorporate the rapid transit system into current operations. The company was continuing its research “into the transportation needs of tomorrow” and was “redoubling our efforts to develop media to meet those needs.” The report concluded:

We respectfully submit that our efforts should not be thwarted even before we have had an opportunity to experiment with and to develop the fresh, embryonic concepts which have emerged as a result of these efforts.

The 16-page report contained drawings of futuristic modes of transit such as monorail and “ground effect machines” riding on air cushions.

The *Post* contacted Dr. John H. Kohl, who was in charge of the housing agency’s transit experiments authorized by Congress. He did not recommend delaying the Washington area system. “The problem is too urgent,” he said. “Various approaches can be taken and the decision as to the type of approach is essentially a local one.” He thought that NCTA’s plan “was pretty well engineered.”

Charles Horsky acknowledged that the White House had received several copies of the report, but thought that Congress was “the proper forum” for considering Chalk’s views in the course of its hearings on the NCTA bill. “I imagine that Congress will invite Mr. Chalk to discuss his proposals. The transportation agency probably will have its chance to reply to the Chalk charges at that time.” [Eisen, Jack, “Chalk Raps Transit Plan As Dubious,” *The Washington Post and Times Herald*, July 12, 1963; Flor, Lee, “Chalk Urges Delay on Area Rail Transit,” *The Evening Star*, July 12, 1963; the report, minus illustrations, was included the hearing record, pages 296-299]

Stolzenbach and his NCTA aides returned to the hearing on July 16. Representative Harsha began the questioning by trying to get Stolzenbach to admit that the views about curtailing highway construction he had expressed on behalf of the Interfederation Council were his own views. He had, for example, chaired the committee that drafted the report to this subcommittee. Stolzenbach was cautious. The report reflected the views of the council; he would not “entirely disassociate myself” from the conclusions. He did not “seriously disagree” with the conclusions, but they were a result “a drafting committee.”

Representative Harsha said that if Stolzenbach was on the drafting committee that prepared the report, “then it did reflect your personal opinion and your personal views” on curtailing highways use, did it not. Stolzenbach replied, “Certainly,” but as NCTA administrator, “I have not found it necessary to take a position . . . on a lot of the questions that were involved at that time.”

Representative Harsha pointed out he was not asking about Stolzenbach’s NCTA tenure. In his previous role, had he not recommended that the highway departments of Maryland and Virginia should come under the control of the agency that became NCTA? No, Stolzenbach said, “I never recommended that.” What about curtailment of the automobile? That was the council’s position and he “certainly felt at the time and the vast majority of the people who testified felt . . . that there was overemphasis on highways in the 1959 plan.”

Upon questioning about the Interstate System in the District, Stolzenbach was hesitant even to admit that he had seen a map of the network since the D.C. Highway Department had not published one. “It is difficult to say, for example, that our recommendation that the center leg of the inner loop be an interstate facility is in conflict with the plans for the highway people because the Bureau of Public Roads and the District of Columbia Highway Department have been in agreement on that problem.”

Would construction of the Three Sisters Bridge, Potomac River Freeway, and the North Leg have any effect on NCTA's plans? Stolzenbach replied, "They would have practically no effect."

The 1960 Act called on NCTA to research facilities, equipment, and services to meet the area's transportation needs. Had NCTA studied anything besides conventional subways? A NCTA consultant, Operations Research, Inc., had studied "the whole range of possible vehicle systems, ranging from the conventional things we have today into the most esoteric type of systems, such as ground effect machines." At one point or another, he said, NCTA had considered "every conceivable combination."

Referring to D.C. Transit System's report to President Kennedy, Representative Harsha asked about the flexibility of the NCTA proposal. Stolzenbach replied, "Considering the economics of the whole problem of urban mass transportation, I think it is the most flexible system that I have ever seen." He added the NCTA proposal was "essentially a radial system and the rail portion of it does not attempt to provide crosstown suburban transportation."

Representative Harsha questioned NCTA's assumption that costs related to the automobile, including parking fees, would increase substantially by 1980, but transit fares would remain constant and possibly decrease. Stolzenbach based his assumptions on the law of supply and demand. "There will be a greater demand and the price will have to go up." Seeger added that parking costs would continue to increase "faster than other costs, including the operating costs of the transit system and the fares paid into the transit system."

The NCTA officials agreed when Representative Harsha said they had not considered the movement of goods or services or materials. He suggested that NCTA had recommended "the so-called Junior Expressway or one-way street system" for the North Leg in the vicinity of S Street, NW. Stolzenbach denied that NCTA had made such a recommendation. Instead, it had recommended studies of alternatives to an eight-lane freeway in that corridor.

He did not recall how many people would be displaced by an express street system. But he agreed that NCTA's proposal would displace 5,400 people, with 20 percent displaced by the transit plan and the remainder by the highway program. No, NCTA had not made any plans for relocating people. "That is not our job."

How many people would be displaced by the Three Sisters Bridge? Stolzenbach replied that none would be displaced by the bridge itself. What about the Potomac River Freeway? Not very many.

Representative Harsha asked about NCTA's modal-split conclusions. Stolzenbach agreed with the Congressman that the Department of Commerce considered its forecasting procedures to be still in the developmental stage. He added that, "all the techniques in this whole business" were still being developed.

Representative Harsha asked Stolzenbach to confirm that the rapid rail system would carry about 20 percent of trips during peak hours, while the rest would be on highways. Yes, Stolzenbach said, adding that the breakdown was based on a joint traffic forecasting project conducted with

personnel of NCTA, the D.C. Highway Department, and BPR. Many of the decisions leading to the forecasts “were made by the Highway people. [sic]”

Stolzenbach answered a question about the Junior Expressway in the North Leg corridor by saying it would have about half the capacity of an eight-lane freeway. He did not have an estimate of the difference in safety.

Representative Harsha asked if it was possible that NCTA’s estimate of the cost of building the subway might “be very low.” Stolzenbach replied, “It is always possible that estimates can be off.” Finding that NCTA had done few test borings, with many coming after the report on November 1, 1962, Representative Harsha suggested that NCTA “just gambled and took a chance that it would show up as it did.” Seeger did not think the three engineering firms employed for the purpose “would consider themselves as ‘gambling.’”

Was not the 10-percent contingency included in the cost estimate “way below the normal practice”? Seeger explained that other systems had used 30 percent, but the additional percentages reflected anticipated inflation. NCTA had not projected inflation in its capital cost estimates.

Representative Harsha found through questioning that the estimate did not take into account the increase if personnel costs or the cost of construction went up about 14 percent. Did the estimate of \$793 million include interest on loans? No, it covered only capital outlay. NCTA projected it would borrow about \$800 million at 4.5 percent interest. The total cost, counting interest, would be about \$1.5 billion.

Representative Harsha concluded his 1½ hours of questioning by summarizing that the cost was \$793 million “if we do not have any increased costs.” [pages 118-132]

Representative Frank J. Horton (R-NY), whose district included Rochester, wanted to understand the philosophy of NCTA’s highway studies. Stolzenbach said that the philosophy was “to develop a balanced system,” and that also was the philosophy of highway officials who had endorsed NCTA overall transit plan. “The area of disagreement is quite small.” The 1959 Mass Transportation Survey had been the starting point for the highway studies.

Was the highway program in direct competition with the rapid transit program? Was NCTA trying to eliminate competition? Stolzenbach said, “That was never the intention.” Seeger added that the NCTA plan included a highway network costing well over \$800 million, “and we would not have recommended a highway system anywhere near that figure if our intent was to eliminate competition.”

What if NCTA had been directed only to study the highway network without a rapid rail system. According to the 1959 survey, Seeger replied, even with a \$500 million rapid transit system, the area would need \$2 billion worth of highways. Without transit, the area would need even more. “Now, I am talking about a highway program that is vastly beyond anything that is contemplated by the District of Columbia Highway Department.” [pages 132-134]

Representative Broyhill was next. He wanted to clarify that NCTA contemplated operating only the subway system, not bus lines. “That is right.” Could free enterprise survive with development of NCTA’s transit plan. “Yes.” Would a subsidy be needed? “Some of the lesser feeder lines that will be necessary possibly would not be profitable, and we have provided in our financial estimates for a certain amount to be paid.” NCTA would pay about \$7 million a year in subsidies out of annual operating revenues.

NCTA had not checked these figures with the existing companies, which had refused to cooperate. The subsidy might have to be considerably larger.

Did NCTA consider restricting the subway to the District and letting bus lines bring passengers from Maryland and Virginia into the city. Yes, NCTA had considered the idea, using I-66 as an example. Seeger said, “The conclusion was that it would be cheaper in the long run, taking into account operating costs and capital costs, to provide the rail service. There was also the fact that we felt that the rail service in that corridor would attract more passengers than would buses, largely because of the transfer problem.”

Representative Broyhill wanted to confirm that the system within the city could survive if the surrounding jurisdictions did not go along with their projected contributions. Stolzenbach agreed. Without suburban extensions of the rail line, the bus lines could continue providing radial service. In that event, Stolzenbach said, NCTA had proposed short extensions to Woodside and Silver Spring in Maryland and Pentagon City in Virginia, “which we feel are appropriate terminal points.” But Representative Broyhill emphasized the point that the subway could be kept within the District and that NCTA should explore letting “other types of transportation” bring people to the subway.

Did NCTA consider an all-bus system, without a subway? The 1959 survey concluded it was impractical. NCTA took another look at the idea, but decided that “as far as flexibility is concerned, we feel you get the greatest amount of flexibility and service, bringing everything together, by having these rail lines go as far into the suburbs as there are people to ride them.”

Representative Broyhill emphasized that his questions did not necessarily reflect his opinion. They were questions he thought would be asked on the House floor.

He asked about NCTA’s conclusion that three times as many people would ride rapid rail transit as buses. “How in the Sam Hill could a person know which he would prefer and how could you rely on his answer and, the second part of question is, Is that your sole source of information as to predicting the habits of people, what people do in riding rapid rail versus buslines?”

Warren Wittreich of National Analysts, Inc., explained the survey. The idea was to ask the question in as unbiased a way as possible to convey equal options. Of those who expressed a preference, 48 percent said they preferred rail because it avoided traffic and weather problems. Others thought rail was more comfortable or safer. Of those who preferred buses, 27 percent said their reason was greater mobility, while 24 percent thought buses provided greater comfort, and 15 percent said the bus would get them closer to their destination.

Had NCTA contacted the Housing and Home Finance Agency about its \$25 million research study? Yes, NCTA had been “in frequent contact” with the agency’s John Kohl. The housing agency “endorsed our program very heartily.” [pages 135-139]

Chairman Whitener asked if NCTA had considered D.C. Transit System’s assertion that it would have the right to operate the system? Seeger replied, “We were satisfied, Mr. Chairman, that under the D.C. Transit Franchise Act there is no right to operate the system. This is wholly a matter for Congress to decide. We have made no recommendations on that point.” The chairman read language in the 1960 Act that said NCTA should encourage private transit companies to provide needed services and that NCTA should not operate competing services, but may make agreements with private transit companies to provide services.

Seeger said he understood that language to keep NCTA out of the bus business, but the language is silent “on the question of who should operate the rapid transit system.”

Would NCTA operate the rapid rail system? NCTA proposed to construct the system but had not made any proposal on operation. A Federal corporation or an interstate compact agency were two alternatives for operating the system or Congress could provide for contracting operation to a private operator.

A private operator could run the system at a profit? Yes, although the bond period might have to be extended. The profit could come out of the farebox? “There is nothing profitable about this system,” Seeger replied. “All we have ever said is that it would pay its capital cost which isn’t very exciting to an investor.” A management contract might be possible, with the operator paid out of the farebox, if the bond period were extended.

What did the language in the 1960 Act mean: “shall encourage private transit companies to provide needed services in a manner consistent with the transit development program”? Seeger said NCTA interpreted that language to encourage maximum use of private operators, particularly for buses, “but I interpret the whole act as being a hedge on the question of operation of the rapid transit system.”

Chairman Whitener said that he and Representative Broyhill were raising the question “as to whether or not it was not the intent of Congress at the outset to first preserve existing transportation facilities, and secondly, to encourage existing, taxpaying, transit operators to operate a system required to meet the public convenience and necessity here in this area.” Seeger suggested that if the committee interpreted the language in that way, “that is dispositive.”

Chairman Whitener asked about the claim in D.C. Transit System’s recent report to the President that NCTA had overlooked new developments in the transit field. For example, NCTA thought the transit company’s proposal to operate a monorail, partly in tunnel, to Dulles International Airport was not feasible. Seeger said that NCTA’s engineering studies indicated that the tube for monorail would have to be larger than for a subway. “You would be spending more money and you wouldn’t get anything back in exchange for the additional money that you are spending.”

Did NCTA consider the new modes listed in the D.C. Transit System report? Yes, and NCTA had provided the study to the committee for the record.

How does NCTA respond to D.C. Transit System's claim that the NCTA report cited other transit systems in the country in support of the proposed system, but they are "deficit operations and are publicly owned and operated?" Seeger said he had addressed that point the previous day:

Our point is that in other cities rapid transit fares are kept low as a matter of city policy, that in this city there already exists a zone fare, that the policy established by the Congress was not to keep fares low but to charge a fair price for service and that the result is that we will be different from the other cities.

The system would have a 25-cent fare within the central zone, plus a 15-cent fare outside that zone.

As for ambiguous language in laws, NCTA thought transit usage would increase, and D.C. Transit System apparently thought so, too, as reflected in its recent acquisition of one of the Virginia bus companies. "So, conceivably they agree with this idea that there will be stimulation and it will occur in the suburbs and they are placing themselves in a position to profit from it."

Representative Harsha asked if NCTA was projecting more transit patronage because of the curtailment of the highway program. Quenstedt said, "There is an unfortunate identification of this agency with regards to the highway program." NCTA did propose a smaller freeway network than the 1959 survey, but so did the D.C. Highway Department. NCTA did not think the Three Sisters Bridge was necessary, but even if the entire highway program were built, "there is a need for transit. I believe everybody is agreed on that." During peak hours, NCTA projected that 60 percent of people coming into the District's central area would do so by the proposed transit facility. District highway officials said that at present 40 percent of people came into the central area by public transportation. "They say that that same absolute number will come in." This was a disagreement among responsible groups.

Representative Harsha asked if NCTA could sit down with the area's highway agencies and planning commissions "and come up with an acceptable compromise that will meet the needs of this community and correlate this program with the highway people and the other interested groups." Quenstedt said that all the groups were subject to President Kennedy's direction, and he had called for reexamination of the Three Sisters Bridge and North Leg. BPR's Whitton had told the Subcommittee on Roads that he thought the reexamination was necessary, as did General Clarke. Quenstedt said he had read Aitken's testimony, but he had "ducked it every time they tried to him down." [pages 140-146]

On July 18, Deputy Director Staats of the Bureau of the Budget appeared before the subcommittee in support of the legislation. The Federal interest in this issue, he said, was clear. Aside from the fact that the Federal Government employs nearly half of the workforce in the area, "the entire Nation has an interest in preserving the beauty and dignity of the National Capital region." Mass transportation "has a direct relevance to the future appearance and dignity of the Nation's Capital."

NCTA's plan "should meet both present and long-range needs of the region." It was based on the legislative mandate of the 1960 Act, could get underway with a minimum of delay, and its transportation development program was "essential to the achievement of long-range regional development plans." The Federal contribution to the project was consistent with the national legislation the White House had endorsed based on a two-thirds/one-third ratio for a national mass transportation program. As a result, a Federal contribution of \$120 million for a system that would cost nearly \$800 million "is not out of line."

Chairman Whitener asked if the plan was financially sound if jurisdictions outside the District refused to contribute their share. Staats was confident that area jurisdictions would agree to participate, but if not, "the total system might be less, or the fare structure adjusted but I think, so far as the payoff period is concerned, I think that the answer would be 'Yes.'"

Would it be financially sound if the system were extended only to Woodside and Friendship Heights in Montgomery County, Bowie in Prince George's County, and Pentagon City in Virginia? Staats thought so, but emphasized he wasn't suggesting that the system be limited in that way.

Representative Harsha asked if Staats thought the farebox could support the program. Staats thought "the assumptions here are reasonable." Many assumptions had to prove valid, but he cited two reasons why this system would be self-sustaining when many other systems were not. First, the fare would be higher than in areas such as New York City where people were used to paying a lower fare that did not equal costs. Second, by building a new system from scratch, "obviously you are going to be able to take advantage of what the manufacturers have learned in research and development of the most efficient system and the most comfortable system for transportation." That would make it more attractive to the public. Admittedly, the assumptions could prove wrong, in part "because we are dealing with human psychology," but based on review of the financial plan by several agencies, "we think they are not out of line."

When Representative Harsha asked about subsidies to local jurisdictions outside the District, Staats explained that those subsidies came out of operating revenues, not the Federal contribution.

Staats realized that President Kennedy's call for reexamination of the Three Sisters Bridge and North Leg had prompted controversy. "We are willing to take our share on this one." The two projects had "generated much controversy in the community." The White House concluded that "a careful analysis and statement of the alternatives—in terms of benefits and costs to the community—is required to resolve this controversy and produce a clear community consensus":

It should be emphasized that the issues surrounding these highway projects would have required resolution regardless of the NCTA report. That report reinforces reasons already present.

He cited Administrator Whitton's statement before the Subcommittee on Roads that "this study needs to be made." Further, the District was continuing a very large highway program of projects not in dispute. However, the District did not have all the funds needed to complete these

ongoing projects. Meanwhile, the District scheduled the Three Sisters Bridge and a portion of the Potomac River Freeway for early construction, but included the North Leg in a much later program:

Therefore, we see no basis to the contention that the highway program has been damaged. On the contrary, we believe that the proposed review will enhance its soundness by insuring that the program will meet in the best possible way both the needs and the desires of the entire community. Hasty action on parts of the program which are in dispute could seriously damage the future of this program in terms of community acceptance.

The decision to reexamine the two projects was consistent with the committee's 1962 report. "That report clearly reflects the philosophy that transportation facilities are provided as a service to the entire community and should be consistent with and maximize desired community development objects." He did not see any reason why the reexamination should be "a long-drawn-out affair." Contrary to statements in the press, the reexamination did not mean "an indefinite delay. This is not true at all. It is not contemplated." With cooperation from all parties, Staats expected the reexamination to be completed "in a very few months." If Congress approved the national mass transit bill, the White House would be ready to submit recommendations on the highway program in 1964. "We think that this kind of time would enable Congress before it commits itself to the appropriations to have the results of this review."

Representative Broyhill said the controversy about the highways was jeopardizing the mass transit legislation. "One of the things that the so-called highway people object to is the fact that they feel that this thing has been pretty well studied for a number of years." Other committees of Congress were concerned that the studies were called for only to make way for mass transportation:

In fact, I was told by a member of the House Public Works Committee the day before yesterday that if this bill comes to the floor this session, he predicts every member of the House Committee on Public Works will oppose it.

Staats wanted to dispel the idea that deferral of the three highway units had anything to do with whether the region would have highways or mass transit. "We need both. And I think that these three units would have been held out even if there had not been such a program." For example, the Three Sisters Bridge had been studied for years, but area officials still didn't agree on where it should be built, if at all.

Representative Harsha, a member of both committees, said his Public Works colleagues were concerned that NCTA was "recommending the curtailment of the highway program and, as such, may be attempting to have a captive market for this rapid transit system in an effort to make it pay off." They were concerned as well by the notion that the District system would be a model for all other communities to curtail development of the Interstate System in favor of mass transit.

Staats thought that an adequate mass transportation system would reduce pressure for additional Interstate routes in cities. It also would reduce pressure for additional Interstate highways to meet purely local needs. [pages 153-169; Staats' formal statement is on pages 171-176]

Architect of the Capitol Stewart appeared before the committee on July 24. He was concerned about NCTA's transit proposals that affected the Capitol grounds. The subway tunnels would have to be constructed "far underground" to avoid interference with the existing subway connecting the House and Senate wings of the Capitol. The plans would require "costly and extensive underpinning" for the Capitol. He was concerned the transit plans would interfere with extension of the Capitol to include a large underground garage and other facilities under the east plaza where NCTA proposed to place its station.

Further, NCTA had never consulted with him, his office, or congressional leaders. The only contact by NCTA that he was aware of was a request for information, such as on soil borings taken for the proposed extension; the Speaker of the House, as chairman of the Commission for Extension of the Capitol, had granted permission to provide that information to NCTA.

Stewart had been aware of NCTA's study, but the first he knew of how it would affect the U.S. Capitol grounds was when he saw the map in the newspapers covering NCTA's report. In response to questions from Representative Harsha, Stewart said he had no specifications, no detailed drawings, and no information on the planned depth of the line, the width of the tunnels, or what they would displace. The Congressman asked:

How could they, as responsible engineers, arrive at a cost of this thing, if they haven't progressed enough in their plans to determine the depth of their tunneling and the displacements and all the additional shoring they may have to do when they go into these other buildings or highways?

Stewart replied, "I don't know how they do it. He added, "I am not here to censure what they have done or what they haven't done." He was there only "to make a plea" that Congress not approve construction of transit facilities under the U.S. Capitol Grounds until NCTA joined in a study with his office, the Commission for Extension of the U.S. Capitol, and other congressional leaders. Speaking only as one member of the extension commission, "I would like to see it a little further away, near enough to service the building, but not underneath it, practically." In reply to questions from Representative Harsha, Stewart could not estimate how long coordination would take, how much it would cost, or whether it would affect NCTA's overall cost estimate.

Representative Broyhill pointed out that Stewart's testimony provided another example where NCTA failed to carry out the intent of Congress by not coordinating with other agencies and organizations affected by the proposed rapid transit system:

I think that this is most regrettable. I just think that we are spending a lot of time here and we are just not going to get anywhere; \$793 million in itself is a really difficult appropriation to get through this Congress. Certainly, with the Speaker and the Architect of the Capitol feeling the way they do about this matter, I think these are pitfalls that the Agency could well have avoided. [pages 202-211]

Polly Shackleton was the next witness. She said that a Member of Congress told her that some people considered her “merely a lobbyist or tool for transit interests.” She denied it:

I wish to state in no uncertain terms that I am not employed for money or other consideration by any transit equipment manufacturer or supplier, commercial interest, or business or professional group which stands to profit financially from any type of transportation program or related activity. Nor am I a stooge, paid or unpaid, for either D.C. Transit, the railroads, the roadbuilders, the National Capitol Transportation Agency, or the Bureau of Public Roads.

Chairman Whitener reassured her by saying, “Mrs. Shackleton, if you stick around here, you will be accused of a lot of things.”

The Democratic Central Committee favored the bill under consideration “because we are convinced that a rail rapid transit system for this area is absolutely essential.” She and her committee were not qualified to judge costs or methods of financing. “But we do suggest that any alternative to an efficient subway, rail transit system will be far more costly in human terms, as well as in terms of the viability of the city.” She also praised Chairman Whitener’s report of the Special Subcommittee on Traffic, Streets, and Highways. [pages 211-213]

She was followed by Dr. Kohl of the Housing and Home Finance Agency. The agency’s Office of Transportation had reviewed NCTA’s report, including its appendices. “We have found no objections to the NCTA transit proposals as they relate to the national program” that Congress was considering. The national program had a dual role of stimulating local transit development and of assisting regional efforts to meet transportation demand. NCTA’s plan was consistent with these goals.

Without naming D.C. Transit System, Dr. Kohl also addressed “disappointment and criticism” that someone had expressed because NCTA had not embraced more advanced technology. Some had said, he recalled, the transit program should be delayed pending the results of the agency’s research program:

While apparently appealing claims are made for new transit media, few can be found to have real substance when analyzed in the cold light of fact. Most of the HHFA demonstration projects, even those dealing with new equipment potentials, are actually refinements of the conventional rapid transit system. Only one project is underwriting the development of a radically different system, and this may be some years in the experimental stage before its practical application can be assured.

Other systems, such as the monorail, have been thoroughly explored with due regard to the statutory obligation that any recommendation be capable of early implementation. In view of all the circumstances with which NCTA was faced in preparing its recommendations, its selection of a modern rail facility of established capabilities seems reasonable. It may be regarded as a progressive, but not a “way out” solution.

Chairman Whitener asked specifically about D.C. Transit System's view that NCTA had not adequately considered pneumatic tube systems, ground effect machines, superrail, monorail, moonbeam, hydrofoil, and carveyor. Dr. Kohl believed that NCTA had studied these alternatives:

A number of these systems have specialized application, and in the light of the requirements of an areawide rapid transit system would not be suitable. Many are still in the early promotional stages and have not been proved either as physically feasible or as acceptable to the riding public, and therefore, I think many stages of development [remain] to be accomplished before most of these systems can be regarded as practical for urban mass transportation.

With the research funds authorized by Congress, the Housing and Home Finance Agency was encouraging new looks and hoped to identify some substantially new technology. "But at this particular time the conventional system is the one of established capability."

Representative Harsha asked if by the time the conventional system proposed by NCTA was completed, it would be obsolete? "No," Dr. Kohl replied, "I don't think so." He cited the monobeam as an example. It was "nothing more than a narrow gage bus on elevated concrete roadway." It might be helpful in some specific applications, "but where you are dealing with a major urban area, with peak-hour volumes of the magnitude that are likely to occur here in Washington, where you have to have interchangeable parts of an areawide system," a conventional system was the best option. He added that nothing was likely to result from his agency's study that "would justify altering the kind of conclusion that was reached. [pages 217-224]

O. Roy Chalk testified on July 25. He began by saying that his company favored a modern rapid transit system in the range of \$300 million to \$400 million. Only the newest, most advanced modes of transportation should be employed. The company favored "a greatly expanded and integrated highway system capable of piercing the bottleneck in the heart of the city." Further, "we are in favor of private enterprise being continued indefinitely as the exclusive operator of any transit system in our Nation's Capital pursuant to the mandate of Congress" as expressed in S. 3073 in 1956. (Chalk was referring to the Senate bill that became the Washington Metropolitan Transit Authority Act granting a franchise to D.C. Transit System, Inc.) Finally, Chalk said, "we are violently opposed to the extravagance of public ownership and operation, and the illegal violation of S. 3073."

He said his testimony was intended to "fill the obvious vacuums" in Stolzenbach's testimony and correct "any erroneous impressions" he left with the committee. "The deliberate exaggerations replete throughout the NCTA testimony are only exceeded by the bald minimization of truth which appears in the Administrator's plan." Many of NCTA's recommendations were "the result of a subtle technique of fallacious inverse argument" to reach a predetermined conclusion based on "alleged imaginary facts" lined up to fit that conclusion.

He endorsed the ideas in the evaluation that Martin Wohl had prepared for the Commerce Department but that had not yet been included in the committee's record. He had identified

numerous “grossly inaccurate and incorrect estimates and calculations.” Besides inaccuracies, NCTA’s report favored an inflexible “corridor” concept that “is completely shortsighted and long ago outmoded.” Chalk pointed out that, “Today’s main ‘corridor’ becomes tomorrow’s little used branch line.” Instead of simply eliminating the bottlenecks, NCTA proposed to solve transportation woes “by unnecessary and costly substitution of the entire bottle.”

He stated that as noted in his report to President Kennedy, NCTA gave no credence to the idea that the results of the transit experiments were worth waiting for. Instead, it was trying to “panic Congress” into approving its supposedly \$793 million proposal. “To be realistic and honest, the plans of the NCTA, if brought to fruition, would undoubtedly cost in excess of \$1.5 billion and could set a pattern for similar wasteful spending in many other cities of the United States.”

Chalk also discussed his claim that D.C. Transit System had the franchise, under S. 3073, “to operate a mass transportation system of passengers for hire.” No street railway or busline that would compete with his franchise company was to be established in the District. NCTA had ignored this statutory restriction. True, NCTA referred to feeder bus systems and subsidies, but “Who in his right mind would expect private enterprise to hang on, losing money, and accept the crumbs of service which fall from the table of a publicly operated major service line?”

(Section 3 of the 1956 Washington Metropolitan Transit Authority Act read:

No competitive street railway or bus line, that is, bus or railway line for the transportation of passengers of the character which runs over a given route on a fixed schedule, shall be established to operate in the District of Columbia without the prior issuance of a certificate by the Public Utilities Commission of the District of Columbia (referred to in this part as the “Commission”) to the effect that the competitive line is necessary for the convenience of the public.)

D.C. Transit was providing excellent service, at no cost to the Federal Government, with “the largest fleet of new air-conditioned buses in the world, of which we are particularly proud.” Even so, NCTA’s plan was “to disregard and to violate the rights of private ownership and operation of transportation facilities in the metropolitan area.” NCTA paid lip service to the congressional mandate that private enterprise be used wherever possible, but its recommendations presume government-operated transit lines “and that its expenditures should be of such astronomical proportions as to forever preclude the likelihood of economic operations with profit.”

Chalk recommended that Congress reject NCTA’s proposal and reaffirm D.C. Transit System’s existing franchise under S. 3073. Costs should be limited to not exceed \$400 million, with no more than 5 miles of subsurface tunnels if needed. Selection of technology should be delayed at least 2 years to allow the results of ongoing experimental projects to be known.

Representative Harsha asked if D.C. Transit System had cooperated with NCTA. Chalk said the company had tried to work with Stolzenbach virtually from the day he was appointed. Nothing happened for a long while, but the company eventually submitted its proposal to NCTA. NCTA “refused and ignored even to consider this proposal.” At their last meeting, Stolzenbach made

clear he would support a fixed-rail subway system “and that there wasn’t much point to discuss what he, I think, described as newfangled ideas.” Since his mind was completely closed, “there wasn’t any point in our assisting him, and that was the last time that I had the privilege and pleasure of meeting with Mr. Stolzenbach.”

Chalk denied the precise wording that Stolzenbach had said ended their discussion and that it had anything to do with a line to Dulles International Airport. “The point is that he said he had already made up his mind and there was no point in discussing any other ideas. There is a big difference.”

Asked about Dr. Kohl’s testimony on new technologies, Chalk said he hadn’t heard the exact wording, but said that Dr. Kohl had “indicated to our organization that he is most enthusiastic about this type equipment, and that it offers possibilities for the solution of certain phases of the problem.” He thought officials should wait for the results before going “off the deep end in expending in excess of \$1 billion.” He suggested, for example, a tunnel might be built for a monorail suspended high enough that automobiles could use the tunnel as well. Another alternative was a tunnel for mass transit during peak hours that automobiles could use at other times.

With “a little courage,” officials could establish regulations to control traffic by keeping certain vehicles out of bottleneck areas during peak hours. In that case, “you would have no need for subways. You wouldn’t even have a problem.”

As it was, if Congress adopted the NCTA plan, D.C. Transit System would gradually go out of business by about 1970. Meanwhile, the company was in the process of unifying bus service in Maryland, Virginia, and the District. Passengers would be able to travel around the region without changing vehicles. “Now this is a very convenient matter . . . . We are living in an age of convenience, and this is a great convenience.” [pages 263-269, 299-304]

Louis Justement was one of the witnesses on July 29, this time as chairman of the Transportation Committee of the Washington Building Congress, Inc. The congress, he said, considered a rapid transit system “desirable and necessary for Washington and this is the time to try and get it.” The fact that NCTA’s calculations suggested the system would be self-liquidating was pleasing, but “we do not believe that the acceptance of the rapid transit plan should be conditioned on this fact or its irrefutable substantiation by supporting data.” He asked, “Freeways are not expected to be self-liquidating; why should we expect more from rapid transit?” Although the Federal Government paid 90 percent of the cost of Interstate construction, the District’s 10-percent share was only “a first installment [because] a freeway requires continued maintenance and results in extensive and permanent loss of taxable real estate, costs which must be borne by the District of Columbia and adjoining counties.”

Rapid transit questions could “not be resolved by computing machines which, depending upon the data which is fed into them, could favor an all-automobile or an all-rapid transit solution.” What was certain was that if the city [the metropolitan area] was going to grow to 3.5 million people, “it must have a rapid transit system, and the sooner the better.” The NCTA transit plan was better than the plan proposed by the Mass Transportation Survey, but too many concessions

had been made to reduce the total cost. “We believe an adequate downtown distribution system must be provided with a center loop with local service and frequent stations.” The downtown section was the key, because whatever it consisted of was “just about final.”

Freeway controversies could be left to the future. Once the regional transit system was in place, it would create “an ideal framework for all other planning.” Flexibility might be excellent in some cases, but not for transit. “Rail rapid transit, by its very rigidity, will serve as the framework for all other planning, the body structure around which the living city grows and develops.” As others had said during the hearings, buses were more flexible, but they had some disadvantages, particularly the need to stop at virtually every corner in a congested city. Unlike a rapid rail system, a bus that can go anywhere does not provide a basis for sound city planning.

By contrast, as a rapid rail system spreads around the area, the tendency would be “to erect a vast majority of the new, important traffic generator structures in the immediate vicinity of the stations as they were planned.” Instead of uncontrolled sprawl, the growth of population “would be largely served by these new centers.”

Speaking only for himself, not the Washington Business Congress, he reacted to earlier suggestions that instead of incurring the enormous expenditure proposed by NCTA, the area should experiment with a small expenditure by building a trial line, such as one from Rockville to Union Station along the Baltimore and Ohio Railroad tracks, expanding from there with special bus routes. He was referring to testimony earlier in the day by Delmer Ison, Executive Director of the Washington Metropolitan Area Transit Commission, who had said:

We feel, though, that before we rule out an all-bus system that perhaps a study should be made, an engineering study and passenger study, but in the meantime, rather than delay this program, we recommend that we experiment with a rail system, say running from Rockville down to Union Station. [page 322]

Justement did not consider such a proposal a “fair test in any sense whatever.” He compared such a trial with “expecting an arm to function by itself out in midair, as a trial.” He continued:

[It] violates the main function that a transportation, a rail transportation, system can use from the point of view of planning, in that it is labeled a “trial”; it is labeled something that may or may not be permanent, and it develops no stations along its way; there are no new stations developed.

Further, a trial would push off a final decision to some “indefinite future” based on experience in the absence of the “most important part” of a rail rapid transit system, namely the downtown distribution loop:

Now, if you had to do something that was just a partial system I would much rather start with the body and have the downtown distribution system to which you could always add arms, but I would never try to make an arm function without a body. [pages 361-367]

As the hearings were moving to a conclusion on July 31, the *Post* carried an analysis by reporter Jack Eisen. He had been the newspaper’s principal reporter on city and metropolitan planning

(1957-1961), but had spent the previous year as associate editor of *The Los Angeles Times*, where he got to see a “wholly automobile-oriented city,” which he described as “a monstrous example” of the type. Eisen began:

Washington’s rapid transit program is getting more and more to resemble a ghost train shuttling eternally to and fro on a shadowy side track. Is it not about time somebody got it out onto the main line?

He would like to report that “after all these years,” plus 3 weeks of hearings, the city was ready to move forward. “But the course of the hearings had been just the opposite.” The solid ground transit advocates had expected to find “had been churned into vast clouds of dust . . . obscuring the main issues.” The subcommittee members were “baffled, perhaps even a bit angry.”

The question came down to what kind of city people wanted. A transit-oriented city was closely tied to its downtown. A highway-oriented city, such as Los Angeles, “tends to explode ever farther across the landscape.” In Washington, the argument was being carried to extremes, “and being flaunted, often in scary half-truths, by the highway lobbies.”

The debate between highways and transit should not occur. Everyone agreed an adequate freeway network was needed. The question was “how wide, how well-located, how well-designed and how well-adapted they should be in the special character we want to keep for the Nation’s Capital.” Surely even the most “dedicated mover of earth, pourer of concrete,” agreed that the area needed “an adequate, fast, safe, heavy-duty means of mass transportation.”

Stolzenbach had concluded, reasonably so according to Eisen, that a conventional subway was needed at least in downtown. However, another section of the 1960 Act “provided NCTA with its unhappy status as a lightning rod” by calling on NCTA to “evaluate” the 1959 Mass Transportation Survey. NCTA’s conclusion that the Three Sisters Bridge and North Leg should be dropped and the White House’s call for their reexamination “brought the highway lobbies into the arena in a howling fury.” The highway people already were concerned about interest in mass transportation in other cities and the legislation the Senate had passed authorizing a national transit program. If the NCTA plan could be defeated, the highway people thought it would be “an omen of victory for the highway forces.”

Even without the national implications, Eisen thought “the transit bill would have a rough time,” as reflected in the testimony before the concurrent hearings of the Whitener subcommittee and the Subcommittee on Roads. The primary purpose of some of the testimony before both subcommittees was “to clobber NCTA and all its works.” Stolzenbach had been accused of having an anti-freeway bias, of rigging statistics, of ignoring agencies that disagreed with him, and being unrealistic in thinking his system could pay for itself. “And so the charges go, all emphatically denied but each leaving a residue of doubt in the minds of the District committeemen.”

Chairman Whitener had been “the most neutral member” during the hearings. He appeared to be most concerned about the displacement of families by construction projects. “Clearly, if he had

his druthers on this issue, Whitener would choose the subway. It displaces fewer people than freeways.”

Representative Harsha was on the opposite side, having been the most vocal member of the subcommittee “in his insistence against any highway curtailment.” He favored mass transit, “but his interest is focused on buses.” He had “bored the hardest on Stolzenbach’s anti-freeway statements.”

Representative Broyhill, the only member of the subcommittee from the area, “followed a familiar tactic by suggesting a retreat before the outer ramparts of the transit defenses had been breached.” He suggested limiting the subway to the District,” a view that “squares with his lamentations over the harm that might befall the present bus companies.”

As for what the subcommittee might do, “the choice will be politically and intellectually tough.” If it approved the legislation, it will be accused of ignoring the evidence. The possibility of rejecting the plan “seems unthinkable to those with the city’s welfare in mind; a start must be made toward solving a problem that isn’t getting any easier.”

Eisen wondered if “a middle ground” existed. “Is there something—part of the commuter railroad line, facilities for express buses, a section of downtown subway, perhaps a station or terminal—that could be started soon.” In the meantime, commuters could be sure “that the ad writer wasn’t talking about his daily journeys when he wrote that seductive line: ‘Getting there is half the fun.’” [Eisen Jack, “A City Must have a Heart and Arteries,” *The Washington Post and Times Herald*, July 28, 1963; the ad line was for Cunard Lines’ luxury ships]

The Whitener hearings ended on July 31 with citizen groups endorsing NCTA’s transit plans. Edward J. MacClane said his group, the District Federation of Civic Associations, still opposed the Three Sisters Bridge and North Leg, suggesting that commercial interests were behind support for the District’s freeway program. Peter Glickert of the federation did not want the dispute over the transit organization to delay its plan. Representing the Fairfax Federation of Civic Associations, John Ellicott criticized “persons or groups who because of their own selfish interests deliberately or unwittingly delay or defeat” the proposed rapid transit plan. John Hoke, chairman of the Interfederation Council representing 400 civic associations in the area, said his organization was enthusiastic about the NCTA rail rapid transit system.

The only opposition on the final day, and it was mild, was from Arthur Miller of AAA’s district branch. “While we have no opposition to a rapid transit rail system,” he said, his group was concerned that the rapid transit plan was being presented as the one answer to the area’s transportation problems. “We are deeply concerned by the unjustified sabotaging of the highway program by the NCTA report.” [Flor, Lee, “Citizen Groups Testify For Rail Transit System,” *The Evening Star*, July 31, 1963]

### **While Whitener Considers the Options**

While the two subcommittees held nearly simultaneous hearings on related issues, the debate in the public arena continued.

In early July 1963, a meeting at the New Bethel Baptist Church resulted in formation of the Citizens Committee on Homes and Highways to fight “all who place the selfish interests of highway users above the needs of human beings.” The chairman, Eugene Davidson, was a member of the D.C. advisory committee to the U.S. Civil Rights Commission and a vice president of the Washington Real Estate Brokers Association. The new group, determined to represent displaced families, called on District residents to engage in President Kennedy’s “careful reexamination” of the freeways. Davidson said the committee would “give voice to the feelings of the community about the effect the proposed Three Sisters Bridge-North Leg Inner Loop truck highway complex would have on countless homes and community facilities.” He said:

The proposed freeways would take the homes of at least 19,000 residents and require condemnation of homes, churches, businesses and schools valued at some \$190 million.

A special committee had concluded that 19,000 residents, many within the Northwest Urban Renewal area, would be displaced, although the District placed the figure between 7,000 and 12,000. [Flor, Lee, “Foes of Loop Fear Ousting Of 19,000,” *The Evening Star*, July 3, 1963; “Citizens Join In Attack on Freeways,” *The Washington Post and Times Herald*, July 3, 1963]

On July 10, the Maryland State Roads Commission met with a delegation of citizens from North Chevy Chase about the impact of the Capital Beltway through Rock Creek Park between Kensington Parkway and Edgemoor Drive. The *Star* explained:

More than 100 North Chevy Chase citizens complained to State road builders and Maryland members of Congress last month that the half-mile stretch of planned roadway would uproot a large number of trees, cut across five or six homesides and adversely affect 50 other residences.

State road officials, who planned to award a construction contract later in the month, said they could not route the highway through a marshland north of Rock Creek, but would consider small realignments to save more trees to lessen the impact on homes. Maurice Donegan, representing the citizens, told reporters after the 2½-hour meeting, that he was “optimistic and hopeful.” He said, “Mr. Funk cannot guarantee or commit himself to changes but we feel he will do all he can to help us.” [“Beltway Route Revision Due,” *The Evening Star*, July 11, 1963]

Eugene Davidson told District Commissioner John B. Duncan on July 12 that the Citizen Committee on Homes and Highways wanted to participate in the reexamination requested by President Kennedy. Davidson thought that instead of spending additional funds, the District should rely on the studies NCTA had already compiled. Further, he wanted the study to not be limited to families displaced by freeways; it should be expanded to all government actions resulting in displacements. [Schuette, Paul A., “New Group Would Join Road Study,” *The Washington Post and Times Herald*, July 13, 1963]

(Commissioner Duncan had taken office on July 24, 1961. He was the city’s Recorder of Deeds when President Kennedy nominated him for the position. He was, as newspapers put it at the time, “the District’s first Negro Commissioner.” Judge David L. Bazelon of the U.S. Court of

Appeals administered the oath of office “before an overflow crowd in the public hearing room at the District Building.” During an organizational meeting after the ceremony, Duncan was named to oversee the city’s health and welfare activities previously handled by outgoing Commissioner McLaughlin. Duncan said:

I believe that the only way that we can win the goals we seek at home and abroad is for all of us to work together on a united front, irrespective of any personal interests we may have by reason of our different circumstances.

If this feeling of togetherness is adequately developed, I see the possibility of the greatest degree of progress that our city has ever witnessed.

(The appointment was for 3 years with an annual salary of \$19,000. Duncan, a graduate of Howard University, lived with his wife and two children at 5330 Second Street, NW. in the Petworth neighborhood. [“Duncan Gets Commissioner Nomination,” *The Evening Star*, July 11, 1961; Pierce, Charles D., “Duncan, ‘Taking Oath, Asks ‘Togetherness,’” *The Evening Star*, July 24, 1961])

By mid-month, NCPC had approved a route “in principle” for the East Leg along the west bank of the Anacostia River from an interchange with the Northeast Freeway above New York Avenue and the Southeast Freeway on Virginia Avenue near the Navy Yard. At the urging of T. Sutton Jett, NPS district area chief, NCPC insisted that any park land taken for the road be replaced.

The planners also retained final say on “precise alignment, grades, connections, landscaping and replacement of parkland.” Joseph Barnett, representing Administrator Whitton, voted against this retention of authority. “That’s the trouble with this commission,” Barnett said, “it spends too much of the staff’s time on detail.” This practice was “insulting” to highway agencies. Barnett thought construction could begin in 1964, with completion in 1965. [“NCPC Approved Route for Inner Loop,” *The Washington Daily News*, July 19, 1963; Lewis, Robert J., “Anacostia Renewal Boundaries Fixed,” *The Evening Star*, July 18, 1963]

On July 27, Aitken appeared on WWDC’s “Report to the People.” Freeway construction, he said, had come “quite near” to a halt in the city because of the reexamination, negotiations with the Architect of the Capitol on the Center Leg, and additional approvals needed on the East Leg. Although NCPC had approved the East Leg in principle, Aitken said the District would need “several months” to work out details. He estimated that construction would not begin for a year to a year and a half.

Asked if he could “conceive of anything” that would make the Three Sisters Bridge and the North Leg unneeded, he said highway builders were “never short of customers.” Transit could meet some needs, but the “bulk of the trips” will still be on freeways and streets. [“Near Halt Seen in D.C. Freeways,” *The Sunday Star*, July 28, 1963]

In early August, Lee Flor reported that Virginia highway officials were in no doubt about the need for the Three Sisters Bridge. In a January letter never officially released, Governor Albertis S. Harrison, Jr., had said that Virginia was “not opposed to rapid transit,” but he objected to

NCTA's claim that rapid transit would seriously cut the need for highways. More recently, F. A. Davis, deputy commissioner of the Virginia Highway Department, had written to Chairman Fallon, with copies for the State's congressional delegation, in support of the bridge. Not building the Three Sisters Bridge would be "an almost intolerable situation." Davis sincerely hoped Chairman Fallon's subcommittee would recommend construction of the bridge. "It is our feeling that all of the highways now planned will be needed, particularly those on the interstate system, regardless of any mass transit system as now proposed."

The uncertainty about the bridge was delaying completion of plans for I-66 "because we have no way of knowing the number of lanes that will be required." The planned freeway was to be eight lanes through suburban areas, but an interchange was to separate six lanes to cross the Potomac River on the six-lane Theodore Roosevelt Bridge while other lanes were diverted to the Three Sisters Bridge. [Flor, Lee, "Virginia Will Press For Sisters Bridge," *The Evening Star*, August 2, 1963; "State Halts Planning on River Route," *The Washington Post and Times Herald*, August 3, 1963]

Colonel Duke, in an August 17 appearance on "Report to the People," said officials had still not decided whether the city would hire expert consultants for the reexamination. The concern was that the resulting report would be just another expert report to be piled atop other, conflicting reports on the same subject. Instead of resolving the dispute, it might simply prolong it. Nevertheless, the District expected to complete the reexamination in mid-December. ["Road Restudy Finish Slated In December," *The Washington Post and Times Herald*, August 18, 1963]

As Congress returned from its August recess, the District of Columbia was awaiting action on measures affecting such subjects as crime, urban renewal, home rule, and transportation. NCTA's proposal for a \$793 million subway and rapid rail system was among them. Chairman Bible was delaying action until the House completed its work on the proposal. However, Representative Broyhill thought that passage of legislation was "highly improbable" in the first session of the 88<sup>th</sup> Congress. The national bill to establish a national urban transit program was in trouble in the economy-minded House:

Since the local bill calls for twice as much total expenditures as the national bill, it would be premature to try to push through the local bill, Mr. Broyhill said.

He did not see any evidence of "a vicious highway lobby opposing the transit program," but he recognized that highway supporters were defending freeways from cutbacks that NCTA had recommended.

Meanwhile, O. Roy Chalk continued seeking legislation that would ensure a private role in the transit plan. He promoted a bill calling for a Senate study of D.C. Transit's profits. A House bill would establish a 6.5-percent rate of return as a floor rather than a ceiling. He favored a bill that would transfer decisions on the company's fuel and real estate tax exemptions from the D.C. Public Utilities Commission to the Washington Metropolitan Area Transit Commission. ["Sheaf of D.C. Bills Waits in Congress," *The Sunday Star*, September 1, 1963]

On September 3, the District commissioners held a public hearing to consider the Center Leg and South Leg of the Inner Loop Freeway. The hearing began with discussions of the Center Leg by Albert A. Grant, chief engineer of the District's Office of Planning and Programming, and the South Leg by NPS Director Wirth.

Grant said the Central Leg Freeway, from the Southwest Freeway to New York Avenue, would be built in a tunnel under the Mall on the west side of the Capitol. In all, it would displace an estimated 630 housing units with 1,600 occupants, and 105 businesses. However, by using the airspace over the freeway, the District could completely replace the housing. (Congress had approved air-rights legislation nationally, but Grant said that Congress would have to pass legislation allowing the District to build over the freeways.)

BPR had questioned the eligibility of the Center Leg for Interstate 90-10 funds because it was too close to another Interstate route. Recently, however, BPR had informed the city that the Center Leg Freeway was eligible for Interstate funds. As a result, the District's 10-percent share amounted to \$4.6 million instead of \$23.3 million if built on the 50-50 matching ratio of non-Interstate Federal-aid projects.

Regarding the Center Leg Freeway, Wirth recommended that the city shift it west to avoid trees near the Ulysses S. Grant Memorial at the foot of Capitol Hill. Jack Eisen pointed out:

The project's biggest single stumbling block was not even mentioned—the refusal of the House Office Building Commission to back legislation that would permit a freeway tunnel beneath a small corner of the Capitol grounds at Independence ave. and Canal st., sw.

This action, apparently reflecting the views of the late House Speaker Sam Rayburn, would block the freeway or distort its design. Rayburn didn't want the freeway to run close to the new House Office Building that now bears his name.

Despite such concerns, he summarized the statements during the hearing:

Almost everybody who appeared before the District Commissioners either agreed the Center Leg of the Inner Loop Freeway is needed or that its construction is a foregone conclusion. The big question was what route it should take once it leaves the foot of Capitol Hill and heads toward its north end near Jersey and Florida aves. nw.

Referring to the citizen speakers, he said:

The main freeway critics were young men who are old hands at such appearances—Peter Glickert, representing the Federal of Citizens Associations, and Peter S. Craig, spokesman for the Committee of 100 on the Federal City.

Glickert suggested building the Center Leg under 3<sup>rd</sup> Street north of Pennsylvania Avenue, NW. He also said that the plan to limit east-west crossings to five streets (Pennsylvania, Constitution, New York, E and K) would hamper crosstown traffic and bus service. He also recommended

enlarging the northwest urban renewal area to make renewal funds available for relocation of those displaced by the freeway.

Craig said that in planning freeways, the city had disregarded the L'Enfant plan, but he acknowledged that it was too late to do anything about that. He commended the South Leg plans, but said the Center Leg Freeway represented a "shocking failure" in highway planning. It was "a parody on planning . . . an ugly gash . . . an impenetrable motor vehicle sewer . . . a moat." As for using freeway airspace for housing, Craig said that highway officials were showing "absolutely nothing" to prove its claims. He also recommended shifting the Center Leg to a location between 3<sup>rd</sup> and 4<sup>th</sup> Streets, NW., with vertical walls.

(Aitken responded to Craig by writing to Neill Phillips, chairman of the Committee of 100, to say that "your spokesman was unaware of or chose to ignore, other proposals for structures over the center leg. Recognizing your own objectivity and your sense of fair plan, I urge you to call these facts to the attention of the members of your committee.")

Bishop Smallwood E. Williams of the Bible Way Church located at 1130 New Jersey Avenue, NW., insisted on two recommendations. First, the Center Leg must not disturb his church. Second, he urged the District commissioners to "see to it that adequate housing be provided before one bulldozer or steam shovel demolishes any housing in the area" of the Center Leg:

The city's Negro residents, he said, "look upon the bulldozer as the people in Europe looked upon the Panzer tanks, demolishing our homes."

He also questioned the city's estimate of the number of people who would be displaced by the Center Leg.

Several witnesses were concerned about the impact on specific properties:

Similarly, other critics assailed the highway's taking of the Esso Building, the McShain Building, Holy Rosary Catholic Church and a soon-to-be-started 10-story apartment house, to cost \$2.5 million, at 3d and E sts. nw.

Other witnesses were more supportive. Robert H. Levi of Downtown Progress told the commissioners that the Center Leg was necessary to complement the "action plan" for revitalizing a 148-block downtown area through use of urban renewal powers. Groups such as the D.C. Advisory Board of AAA, the Metropolitan Washington Board of Trade, and the Federal City Council supported the plans. (Harold Wirth of the board of trade urged the city to allow enough clearance in the South Leg tunnels (14½ feet instead of the planned 12½ feet) to permit their use by military vehicles in the event of a national emergency.)

Overall, as *The Washington Daily News* summarized, "The District Plans for the South and Center Legs of the Inner Loop highway system met with surprisingly little opposition at the Commissioners' public hearing today."

The South Leg segment of the public hearing will be discussed separately. [Eisen, Jack, "Width and Design of Freeway Draw Criticism at D.C. Hearing," *The Washington and Times Herald*,

September 4, 1963; “Inner Loop Plans Are Praised,” *The Washington Daily News*, September 3, 1963; “Center Leg Freeway to Evict 1,600 Persons, 105 Firms,” *The Evening Star*, September 3, 1963; “Officials Answer Highway Critics,” *The Sunday Star*, September 8, 1963]

City officials, and the editors at the *Star*, were encouraged by the public hearing. The editors wrote:

There was high praise from almost every witness for the carefully planned south leg, which will route traffic through park areas around the Lincoln Memorial and the Washington Monument. And while there were understandable protests from property owners in the direct path of the center leg, virtually no one challenged the need for the central freeway.

This is a tribute to the good sense of the community.

The only negative was the dispute with the Architect of the Capitol. “It is high time that someone in Congress, with a little more authority than Mr. Stewart, and a little more willingness to act, should stop it.” [“Support for the Loop,” *The Evening Star*, September 9, 1963]

General Duke held a press conference on September 11 to discuss the Policy Advisory Committee reexamination of the Three Sisters Bridge and the North Leg. The review was proceeding smoothly. The committee, which he said was “not even considering” dropping either proposal, had identified four alternatives for the North Leg as Lee Flor described them in the *Star*:

1. A pair of one-way streets, similar to the NCTA proposal;
2. Two westbound and two eastbound one-way streets;
3. Two three-lane tunnels beneath surface streets; and
4. Interstate freeways with 200- and 300-foot rights of way.

Jack Eisen provided a different summary in the *Post*:

In planning for the North Leg of the Inner Loop Freeway, a crosstown route somewhere near T st. nw., Duke said one entirely new approach is being considered.

A pair of double-deck roads would be built along existing streets. The bottom decks would be 3-lane tunnels, 1½ to 2 miles long, for freeway traffic. The top decks would be on the surface, permitting access to cross streets and with signals timed for swift traffic movement.

The other four proposals are two variations on standard 8-lane freeways—one of a narrow right-of-way, the other of “optimum” width—and two combinations of express one-way streets.

The committee had assigned staff subcommittees to study each alternative. The result would be multiple reports on possible transportation corridors for the freeway.

The committee also was studying two alternative sites for the bridge (one upstream from Key Bridge and one downstream).

In reexamining the two proposals, General Duke said, the committee was covering four areas: the social and economic impact of the Three Sisters Bridge and the North Leg, estimates of costs for the alternatives, the aesthetic designs for the projects, and traffic estimates.

He acknowledged that the agencies represented on the committee had feuded in the past. "I am particularly pleased with the spirit of the group . . . it has been a conscientious group."

The key was that the resulting projects must be eligible for inclusion in the Interstate System because financing was "very important." Fortunately, he said, "the man who has a great deal [to do] with making the decision is on the committee." He was referring to Federal Highway Administrator Whitton.

General Duke told reporters that committee members hoped to get their report to the District commissioners in early November. They would, he thought, be able to reply to President Kennedy "by the end of December." [Flor, Lee, "Road, Bridge Restudy Progressing, Duke Says," *The Evening Star*, September 11, 1963; Eisen, Jack, "3 Sisters Span Shift Is Studied," *The Washington Post and Times Herald*, September 11, 1963]

### **The Freeway-Transit Link**

By the time of the press conferences, officials and observers recognized a link between resolution of the freeway debate and initiation of legislation to launch the rapid rail transit plan. "The committee," General Duke told reporters, "is conscious that there may be a relationship developing between the re-examination and the transit bill." The schedule he outlined meant that Congress would adjourn before President Kennedy reacted to the city's recommendations. In that case, action on NCTA's rail rapid transit plan would be postponed until 1964, an election year where action might be harder.

Eisen had reported the link as early as September 7 following Chairman Whitener's statement making clear that the transit legislation would have to wait until the freeway fight is over:

His statement, made from his home-town office in Gastonia five weeks after transit hearings ended, was no surprise. The highway lobby and its allies in Congress have made it clear they will fight the Washington transit measure unless a green light is flashed for the city's freeway program.

The villain of the situation, as the highway groups—and even some transit advocates—see it, is Administrator C. Darwin Stolzenbach of the National Capital Transportation Agency.

The White House had reportedly tried to get Chairman Whitener to move on the bill and to get the Senate District Committee to hold hearings, but neither was budging. Chairman Whitener explained, "There is not much sense setting out on a collision course if the chances are good of

having our craft destroyed.” Meanwhile, Senators wanted to use a House-passed bill as the basis for their hearings.

Chairman Fallon’s Subcommittee on Roads was the heart of support for the freeways:

Fallon made it clear to a reporter that he regards completion of the freeway system here as vastly more important than a rail rapid transit system. If transit fails, it would be Stolzenbach’s own fault. [Eisen, Jack, “Subway Bill Derailed By Freeway Advocates,” *The Washington Post and Times Herald*, September 7, 1963]

Or, as the *Post* editors put it:

The political impasse is clear enough. Until the subway authorization is guaranteed, the road program will be blocked in the Administration. And until there is a guarantee of the road program, the subway bill will be blocked in Congress.

General Duke’s encouraging words suggested that if the impasse could not be broken until 1964, at least the intervening “time will have been well invested.” [“Hint of a Compromise,” *The Washington Post and Times Herald*, September 13, 1963]

Horsky had spoken with Chairman Whitener and Senator Bible about getting the transit bill moving, but they saw two major problems, namely the cost of the District portion of the plan and the opposition from the Committee on Public Works. The White House had suggested that they separate transit and freeways, but the politicians did not think such a divided plan, no matter how carefully drawn, would last through even 1 day of hearings. Chairman Whitener said, “I think it might be very helpful if the ad hoc committee made its recommendation. It would deflate the highway-transit fight, which is an exaggerated controversy in that we need both rail and highway systems.” [Bassett, Grace, “White House Prods For Transit Action,” *The Sunday Star*, September 8, 1963]

The city was, in the *Post*’s opinion, “paying the predictable price for the grievous political error made two years ago by Mr. Stolzenbach . . . who succeeding in elevating two projects, the Three Sisters Bridge and the Inner Loop’s North Leg, into symbols of the whole expressway system.” After the White House supported his views, “the partisans of the highway, convinced that the White House means to hold up the entire road construction program, are retaliating against the subway bill with vehemence and effect.” If the White House did not decide in favor of the freeways in the next few weeks, Congress would not act on the transit bill this year. Success in 1964 was even “less likely.” Failure to begin the transit program “would constitute an unmitigated misfortune to this city.” [“Symbolism and the Subway,” *The Washington Post and Times Herald*, September 10, 1963]

A hint of compromise came from an unlikely source: Polly Shackleton. In brief testimony before the Senate District Subcommittee on September 25, she “offered the olive branch,” as the *Post* put it. On public witness day, she acknowledged that her committee had “opposed vigorously several Highway Department proposals because they involved wholesale destruction of homes, schools, churches, parks, and playgrounds.” Other groups shared the committee’s

“deep concern” about the impacts the freeways would have on “the thousands of families who would be uprooted.” Their combined voices had “been effective.” The East Leg Freeway had been shifted to the sparsely populated Anacostia River bank. Public agencies and private groups were attempting to increase the supply of low- and middle-income housing.

Her committee was “particularly gratified” by President Kennedy’s call for reexamination of the North Leg Freeway, the Three Sisters Bridge, and the associated segment of the Potomac River Freeway. “We are hopeful that the committee chaired by General Duke and representing the various Federal and District agencies involved will be able to come up with a solution which, unlike the Highway Department plans, will largely eliminate or at least minimize the loss of homes and destruction of neighborhoods and community facilities.”

Members of her committee were “much encouraged” by press accounts of the Policy Advisory Committee’s “completely new approach to the problem.” Because this new approach might help break the impasses, “I intend to propose to the Democratic central committee that we give careful and sympathetic study to the possibility, which has been suggested by General Duke, of utilizing tunnels under existing streets for freeway traffic, and await with interest further details of the plan.”

Briefly, she said her committee was “in favor generally of a center leg,” but not the current location. She urged the District to restudy the location “to eliminate what we believe to be entirely unnecessary destruction of homes and church and neighborhood facilities.” [District of Columbia Appropriations for 1964, Hearings on H.R. 7431 Before the Subcommittee of the Committee on Appropriations, United States Senate, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, pages 793-794]

The *Post* saw her brief testimony as suggesting that a truce was “rapidly taking form between the highway men and the subway men.” The Democratic Central Committee was, the editors suggested, dropping their campaign against the freeway segments, but had succeeded in focusing attention on the housing problem the bulldozers would cause:

Our future historians will find it odd that the city, in this time of great urgency, chose to waste a year in shrill wrangling over these particular projects. The Three Sisters Bridge has nothing whatever to do with either the future transit system or with relocation. The north leg of the Inner Loop will not be built in this decade.

The long debate was near a conclusion:

Washington can afford to build expressways where they do not cause a net reduction in the housing supply. Where houses must be knocked down, they must be replaced. On that firm ground the whole city can meet. [“A Negotiated Peace,” *The Washington Post and Times Herald*, September 27, 1963]

The *Star* referred to Shackleton’s statement as a “Ray of Hope” in an editorial, but added that it was too soon “to start tossing our hats in the air.” Nevertheless, her comments “offer strong hope that there may yet be a settlement of this nonsensical dispute.” Quoting several of her hopeful phrases, the editors did not want to underestimate “the job of reaching a ‘reasonable’

compromise.” Still, if the impasse could be settled “amicably,” the editorial said, “the chance for the Washington area to get to work on an equally essential rapid transit program will be increased immeasurably.” Perhaps, the editors mused, Mrs. Shackleton realized this:

If so, she is wiser than a number of others in Washington, who apparently would rather see the transit program go down the drain, too, than to see any major freeways built. [“Ray of Hope,” *The Evening Star*, September 28, 1963]

### **The Bobtail Plan**

Even as freeway advocates began to feel hopeful, NCTA’s rapid transit plan continued to lose momentum. Chalk continued to bash the plan. On October 9, the newly formed D.C. Committee for Balanced Transportation held a well-attended \$100-a-plate testimonial for Chalk in the banquet hall of the Shoreham Hotel. The committee’s invitation stated that the purpose was to recognize the “many accomplishments for the area’s mass transportation system” by Chalk and his D.C. Transit System. F. Joseph (Jiggs) Donohue, a former District Commissioner under President Truman and currently with the District Democratic Central Committee, had created the organization.

The *Star* referred to the committee’s name in quotes because it was organized by D.C. Transit System’s advertising agency. In the *Post*, Jack Eisen added, “So loaded is Donohue’s letterhead with the names of Chalk colleagues and business associates that no great mental effort is needed for a quick assumption that Chalk is giving himself a party.” He added that the committee’s address, where guests were to send their checks, was in the building housing the headquarters of AAA, which also opposed the rail transit plan.

In brief remarks, Chalk recommended that NCTA’s transit and highway program be turned over to established agencies and his private company. At present, NCTA’s proposal was impractical. The agency had proposed halting highway projects without consulting highway officials, and developed transit proposals without consulting privately owned bus companies.

Donohue, an attorney who had lived in the District for 45 years, said his committee supported the Three Sisters Bridge and the rest of the District’s planned freeway system. He said the committee would take a position on NCTA’s transit proposal at a later date. [Eisen, Jack, “‘Balanced Transportation’ Interests Slate \$100-a-Plate Dinner for Chalk,” *The Washington Post and Times Herald*, September 29, 1963; “Chalk at Testimonial Hits Transit, Road Plans,” *The Evening Star*, October 10, 1963]

While Chalk was enjoying the testimonial, Chairman Whitener had still not advanced a transit bill for review by the subcommittee. At one point, he suggested the problem was that as a member of the Judiciary Committee, he was deeply involved in the committee’s consideration of the Kennedy Administration’s Civil Rights Act of 1963. As an opponent of the bill, he was attending as many as three committee meetings a week on the subject. He thought the next step in the transit bill would be hearings in the Senate by the Bible subcommittee, but Senator Bible indicated he was waiting for the House to act. [“Civil Rights Debate Perils Subway Bill,” *The Washington Post and Times Herald*, October 15, 1963]

While continuing his efforts to halt the Civil Rights Act, Chairman Whitener had been considering the transit measure. He had concluded that the NCTA plan could never pass the House in view of its high cost. He also was concerned by opposition from the highway forces on the Subcommittee on Roads. Further, he was concerned that Stolzenbach had been unable to rally support in Maryland and Virginia.

According to Professor Schrag, Chairman Whitener recalled Louis Justement's suggestion during the hearings that, "I would much rather start with the body and have the downtown distribution system to which you could always add arms." On October 16, the chairman surprised subcommittee members by summoning them for a meeting on October 23 to consider a scaled down transit system. Jack Eisen described it in the *Post*:

The network omits most long hauls into the suburbs, with two lines stopped just inside Maryland and Virginia. Silver Spring would be served, but not Bethesda. Other suburban extensions would come later.

As revised, the system would entail 23.3 miles of track costing nearly \$401 million, contrasted with the 83 miles costing \$793 million proposed last November by the National Capital Transportation Agency.

Instead of a subway loop encircling the Mall with lines crossing at 12<sup>th</sup> and G sts, nw., the reduced system would be built around a single downtown subway along G st.

Its general shape would be a lopsided X, with lines radiating to Anacostia, Silver Spring-Woodside, Van Ness st., and Connecticut ave. nw. and Pentagon City. Short branches would go to the Rosslyn gateway to Arlington and to 17<sup>th</sup> st. and Columbia rd. nw.

. . . . The new plan contemplates an investment of \$141.7 million and borrowing of \$259 million.

From the start, the proposed network was known as the "bobtail" system. Eisen pointed out that it "bears a strong similarity to the total network proposed by the Mass Transportation Survey of 1959."

Chairman Whitener said he worked out the system following talks with NCTA and "the Public Works Committee and the highway people." The White House, which had been NCTA's strongest backer, supported the plan. The *Star* reported that, "Specifically, the proposal by Mr. Whitener has the strong indorsement of Charles A. Horsky . . . ."

The bobtail plan was silent on highway routes and bridges, a feature the chairman hoped would help it advance on the House floor. He said there would be "no elimination of needed outlying highways, at least." [Eisen, Jack, "Shorter Subway System Here Weighed," *The Washington Post and Times Herald*, October 17, 1963; Eastman, Sam, "White House Backs Shorter Rail Plan," *The Evening Star*, October 17, 1963; Schrag, pages 57-58]

The early reaction to the bobtail plan was largely favorable. Edwin Seeger of NCTA, which had drafted the bobtail plan at Chairman Whitener's request, said officials were satisfied with the

abbreviated plan because it might lead to faster congressional action. Engineer Commissioner Duke said the District commissioners had endorsed the original NCTA plan, but liked the bobtail plan even better, in part because it might help resolve the freeway controversies. John Kohl of the Housing and Home Finance Agency also endorsed the bobtail plan, saying the proposals “seem to be consistent with the long-range plan” for the area. The Metropolitan Area Highway Users Conference endorsed the plan as “far more realistic” than the original NCTA proposal, telling Chairman Whitener in a letter that, “the proposal is worthy of serious consideration, but it must be kept in mind that the freeway program is still stalled.”

The *Star* concluded that the plan “makes good sense,” especially since the broader NCTA plan “does not have a chance of passing this year.” [From *The Evening Star*, “Scaled-Down Transit Plan Meets Favor” (October 18, 1963), “Transit-State One” (October 18, 1963), “Highway Users Back New Transit Proposal (October 20, 1963), and “Transit Aide Indorses 23.3-Mile Rail System” (October 21, 1963); “Subway Plan Hailed as ‘Realistic,’” *The Washington Post and Times Herald*, October 20, 1963]

On October 23, the District Subcommittee met in executive session to consider the new plan. The chairman was hoping for a quick okay, but members anticipated the questions that would be raised during floor consideration – and they wanted answers the chairman did not have. In particular, they wanted to be sure the financing plan for the bobtail system was sound.

Instead of voting for the plan, the subcommittee decided to ask more than 20 government agencies and organizations, including civic, transportation, labor, and special interest groups, to review and comment on it by November 12. The request made clear that the subcommittee was looking for comments on the financial details and estimates that were made public only on the day of the meeting. Lee Flor summarized the plan:

According to the single financial table made public today, here is how the system would be financed and constructed:

The transportation agency would need \$120 million in Federal grants, plus \$21.7 million from the District, by 1967. The financial table shows no provision for repayment of these funds.

Then between 1967 and 1973, the transportation agency of the Federal Treasury would issue the \$310 million in Federally guaranteed bonds to pay for construction.

As Jack Eisen put it, “Washington’s bobtailed subway bill began to nose off its congressional sidetrack yesterday at the speed of a bus caught in a traffic jam.” He added that the chairman had already received one response without even asking for it. Chalk called the bobtail plan “wasteful” and “archaic,” reiterating his view that the private sector should build and run the subway. According to Eisen, Whitener replied with a “polite thank you.” [Flor, Lee, “Rail Transit Comment Asked of 20 Agencies,” *The Evening Star*, October 24, 1963; Eisen, Jack, “Congress Calling for Citizens’ Views on Budgeting Sidetracked Subway Bill,” *The Washington Post and Times Herald*, October 24, 1963]

Chairman Whitener discussed the bobtail plan on television station WTTG-TV's "Community Dialogue" program on October 27. He said highway and transit supporters should "fall in line" with the bobtail plan "because of the great need of some solution for our traffic and transportation problems here in the District." He added, "Certainly those who commute daily should look forward with great pleasure to having a rapid transit system." He anticipated that the bill would pass the House before adjournment. The Senate District Committee, he predicted, would then "move with dispatch" to complete Senate work on the bill.

Polly Shackleton, also on the program, told viewers, "We could never build enough highways to accommodate all the commuters and all the people who use them." Therefore, it was "absolutely imperative to get started on a rail rapid transit system in order to accommodate thousands of commuters . . . ."

Executive Director Delmer Ison of the transit commission raised a concern relating to the fact that the current bus system had 640 downtown stops while the bobtail rail system would have only 14 stops. He said the transit commission had "considerable doubt as to whether 14 stops can adequately replace 640 stops." ["Subway Transit Action Seen Soon in House," *The Evening Star*, October 28, 1963]

The White House endorsed the plan in a November 4 letter from Phillip S. Hughes, Assistant Director for Legislative Reference, Bureau of the Budget. Hughes wrote:

Since the proposed schedule for the longer transit regional development program extended in any event over the period 1964-73, it would not be inappropriate for the Congress at this time to authorize construction of parts of that program which are consistent with, and at the same time essential elements of, the longer range regional development plan. Indeed, the knowledge gained in the development of the limited system will provide factual data upon which to base future decisions to expand the system into the regional transit program originally proposed by the Agency.

Hughes observed that the proposed bill "would not interfere with negotiations currently underway looking to the establishment of a regional compact agency with authority for development and administration of a regional transportation program."

The White House continued to believe the original NCTA plan was "the most desirable transit system from the standpoint of service, downtown distribution, and maximum contribution to a balanced regional transportation system." Any shorter-range program should be advanced with the understanding that a large plan was awaiting implementation. However, Hughes concluded:

The system outlined in H.R. 8929 is the essential core of a long-range transit development program and is in line with recognized broad regional developmental objectives. Accordingly, its enactment would be consistent with the administration's objectives.

Also on November 4, Commissioner Tobriner wrote to Chairman McMillan of the District Committee on behalf of the District commissioners. Development of mass transit facilities was

“a critical need,” Tobriner wrote. After years of intensive study, the time had come for “positive action,” with an early start “a matter of vital concern to the District, as well as to the Federal Government.”

Tobriner commented that the original NCTA plan called for 25 miles of rail-transit facilities in the District, with a local contribution of \$21.7 million. The bobtail plan called for only 16.5 miles of rail-transit facilities, but the District’s contribution was the same amount as for the larger system:

Thus, in the substituted version, the taxpayers of the District contribute the same sum for a reduced rapid transit system. Nevertheless, the Commissioners are confident that this contribution is a reasonable one. However, the Commissioners are hopeful that no additional contribution beyond the contemplated \$27.1 million will be required of the District in the event that the system is subsequently expanded to that originally planned.

In view of the serious need to improve mass transportation facilities in the District, the Commissioners recommend approval of H.R. 8929.

The District subcommittee published the more than 50 comments received on the bobtail legislation in: Transportation Program for the National Capital Region (Supplement to Hearings before Subcommittee No. 6 of the Committee on the District of Columbia, U.S. House of Representatives, 88<sup>th</sup> Congress, 1<sup>st</sup> Session (Hughes letter, pages 16-17, Tobriner letter 18-19).

On November 13, the Whitener subcommittee approved the bill authorizing the bobtail plan. The chairman told reporters after the closed session that the members approved the plan without controversy. He added, “It’s fair to say that there are some members who wanted to approve the 83-mile system.” However, as Representative Broyhill told reporters, the bobtail plan was “all we thought we could sell to Congress.” He was satisfied that the bobtail plan would not harm the private bus companies with lines into Maryland and Virginia because passengers would have to use the buses to reach the rail system.

The House District Committee approved the bill authorizing the bobtail plan on December 5, 1963, by an 11-2 vote. The committee adopted only one amendment, requested by Architect of the Capitol Stewart. The amendment provided that any construction through the Capitol grounds would be prohibited unless approved by the Congressional Commission for Extension of the U.S. Capitol.

Representatives Abraham J. Multer (D-NY) and Richard L. Roudebush (R-In.) were the negative votes. The committee had rejected Representative Multer’s two amendments. One, in line with D.C. Transit System’s views, would have required that private enterprise build and operate the transit network. The other amendment would have protected labor interests. Representative Broyhill said committee members thought those issues should not be written into a bill that merely authorizes the system. [Eastman, Sam, “D.C. Subway Bill Advances,” *The Evening Star*, December 5, 1963; Carper, Elsie, “House Unit Approves D.C. Subway,” *The Washington Post and Times Herald*, December 6, 1963]

The committee issued a report on the bill on December 6. The report emphasized the urgency of the need:

The National Capital region faces a transportation crisis. Its streets and highways are burdened with ever-increasing volumes of traffic creating a congestion problem that has grave consequences for the District and the suburbs alike. Traffic congestion limits mobility within the District and the region. It results in excessive amounts of premium land, particularly in downtown Washington, being used for surface parking facilities. The daily crush of commuters moving between their homes and places of employment entails costly losses in time and money . . . .

There is universal agreement that it is impossible to meet this growing demand for transportation, or to ease today's traffic problems, by means of highways alone . . . . In other words, the people of the National Capital region must be provided a real choice between using public transportation, or using their private automobiles for trips to and from their places of employment.

Commuters did not have that choice "in any meaningful sense" because of the inadequacies of bus service:

The conclusion is inescapable that if Washington is to achieve a higher percentage of public transportation – as it must do if the traffic congestion problem is to be solved – nothing short of a rail rapid transit system operating in subway and on exclusive rights-of-way can do the job. [Transit Development Program for the National Capital Region, U.S. House of Representatives, 88<sup>th</sup> Congress, 1<sup>st</sup> Session, Report No. 1005 to accompany H.R. 8929, December 6, 1963, pages 7-8]

The report also addressed union concerns. Unions wanted the bill to make clear that the Davis-Bacon Act, approved in the 1930s to ensure prevailing wages, applied to construction of the system. Unions also wanted the bill to establish a labor relations policy for employees after the system began operating. Because the Davis-Bacon Act applied to every contract with Federal funds exceeding \$2,000, the report said that since NCTA was a Federal Agency, the committee concluded that explicitly applying the law to the project was unnecessary.

As for the second issue, the bill provided for construction, but left open whether the system would be operated by NCTA, another Federal Agency, or an agency created by compact among local jurisdictions. With operations possibly not beginning until 1970, "the proposal for immediate establishment of a labor relations policy is premature." Further, the provision of the National Capital Transportation Act of 1960 on labor relations remained in effect. Under the provision, NCTA could not establish a labor relations policy until Congress established a policy on the right to organize, to bargain collectively, to arbitrate disputes, and safeguard job rights. This provision, in the committee's view, "provides adequate protection for transit workers during the construction phase." [pages 14-15]

On the day before the House was to consider the bill, opposition forces made their plans clear. Chalk accused the White House's District advisor, Horsky, of plotting to put D.C. Transit System

out of business. Horsky, according to Chalk, had applied “terrific pressure” behind the bill. Chalk said he spoke with Horsky on December 6 to ask if private enterprise would be allowed to operate the system. Horsky provided only “evasive answers.”

Chalk sent a night telegram to all 435 Representatives saying the legislation “provides for a minimum addition of \$400 million to the national debt to build an outmoded, stopgap subway system for the District of Columbia with no provision protecting private enterprise against public operation.” The bill would “saddle the government with public ownership of this system and create a governmental Frankenstein without any experience in the transit field to run it.” Chalk urged the House to amend the bill to “provide for experienced private operation by D.C. Transit System, Inc., pursuant to the act of Congress granting its franchise.” [Flor, Lee, “D.C. Transit’s Head Attacks City Rail Plan,” *The Sunday Star*, December 8, 1963]

As debate began on December 9, Chalk arrived in the House gallery around noon. “I’m very confident it will go my way,” he told reporters.

Meanwhile, Representative Multer, who represented a district in New York City, was mapping out his strategy for the floor debate. He intended to introduce his two rejected amendments during the debate. The National Transit Workers Union was canvassing House members urging them to reject the bill. The union also sent telegrams to all Representatives.

Nevertheless, Chairman Whitener was cautiously optimistic. “I don’t think it’s in the bag, but I could see no reason why we shouldn’t go on and make our decision. I hope it will be favorable.” [“House Fight on Subway Mapped Out by Multer,” *The Evening Star*, December 9, 1963]

*Post* editors were worried about the labor issues, which posed the “most immediate danger to the bill.” The editors referred to the 1960 Act’s provision calling on Congress to establish a labor relations policy:

If the unions force a debate now on labor standards, they will jeopardize the whole system upon which their members’ future jobs depend. They will only invite the opponents of the subway to strike up an alliance with the antagonists of organized labor.

If the unions were wise, they would “wholeheartedly support” the bill now and defer subsidiary issues such as labor relations “until the system with its promise of jobs is securely authorized.”

After 5 years of planning, the bill offered an alternative to sprawl and “unimaginable traffic congestion everywhere.” The editorial concluded that, “A vote for this bill is a vote for a more comfortable and convenient life for the city’s people.” [“Subway and Sanity,” *The Washington Post and Times Herald*, December 9, 1963]

## **The House Debates the Bobtail Plan**

On the House floor, Chairman Whitener asked that the House resolve itself into a Committee of the Whole and that debate be limited to 2 hours and divided equally between Representative Broyhill and himself.

The chairman began by saying he had heard a great deal of discussion of the bill already and had “observed there is a great deal of misunderstanding about some of the content of this legislation, as well as the effect of some of the amendments which I understand will be offered.” He discussed the area’s congestion and the long battle to achieve balance among highways and transit. The bill, he said, called for a total Federal contribution of \$120 million compared with Federal expenditures of about \$75 million a year on highway construction in the region. Considering all the highways the area’s highway departments want to build in the absence of a transit system, “and that these additional highways still won’t provide the answer, it seems clear to me that the proposed Federal contribution to the rapid transit system is entirely reasonable.”

He emphasized that this bill was completely separate from the Urban Transportation Act of 1963, still pending in Congress. That bill created a national program, while the present bill was limited to the Washington area. Without Federal involvement, the District would never build a subway or the extended rail rapid transit system:

I, for one, consider the national mass transit bill to raise issues of Federal financial and administrative involvement in local matters that are completely unrelated to the issue at hand. In contrast, under the Constitution, the Federal Government is very deeply involved in the affairs of the Nation’s Capital, for these affairs were rightly considered by the framers of the Constitution to be matters of national concern.

Therefore, he supported the present bill for the Washington area while the national bill remained to be decided on its merits later.

In closing his opening statement, he addressed the two issues that had caused the most concern in recent days. First was the proposal to amend the bill to allow private enterprise to construct and operate the rapid transit system. A proposed project of this magnitude “requires the constant scrutiny of the Congress,” a goal that could best be achieved by allowing a Federal Agency, namely NCTA, to build it. By the time the system becomes operational in 4 or 5 years, “Congress will have ample opportunity to consider the question of how the system should be operated.” He did not see any reason to delay construction while Congress debated how the system will be operated.

Second was the proposal to include “a rather complicated labor relations policy” in the bill. He pointed out that in passing the National Capital Transportation Act of 1960, Congress had considered a similar provision. “Congress included in the act a provision stating in the clearest of terms that before an operation could begin, Congress would enact a bill establishing such a labor relations policy.” The thinking at the time was that such a policy would be premature until Congress decided what entity would operate the system. In the meantime, labor is fully protected throughout construction by the 1960 Act and other existing Federal laws.

During the 10 years that Congress had been considering transit options for the area, “the very problem that this program is designed to solve . . . has grown worse and worse. The time for action to solve the problem has arrived, if it is not in fact overdue.” [Transit Development Program for the National Capital Region, *Congressional Record-House*, December 9, 1963, pages 23854-23855]

Representative Broyhill, the ranking Republican on the House District Committee, told his colleagues that he considered the bill “absolutely essential to the health, well-being, and beauty of our Nation’s Capital.” It involved bringing “a major innovation” to the area in the form of “a modern, high-speed, high-capacity rail rapid transit system.” He discussed the history leading to this bill, including the Mass Transportation Survey and the 1960 Act.

He assured his colleagues that the Federal cost for the bill’s bobtail plan would be \$120 million, while the District’s share would be \$21.7 million:

The balance of \$258.9 million plus interest requirements during construction will be repaid out of the revenues of the system. It is anticipated that the system will repay its bonded debt over a period of 36 years, and that we may reasonably expect a refunding of government grants during later years.

These projections were based on a 25-cent base fare within the 10-mile square of the original District of Columbia and a maximum of 55 cents to the farthest point, which was Bowie, Maryland.

The bill left “many important questions unanswered.” It was designed to begin construction of needed facilities, “a time-consuming proposition.” With construction underway, additional legislation would be introduced to authorize bond financing and determine how the system would be operated. The operational issue involved “complex questions concerning the nature of the organization which is to control and operate the system, the rights of the private transportation companies that are presently serving the region, labor relations, and many others.” These questions needed to be answered, but the answers can come after construction is underway.

Representative Charles R. Jonas (R-NC) said he was undecided about the bill, but wanted to know why the taxpayers of every State should pay 30 percent of the cost of the system while District residents paid only 5 percent. Representative Broyhill replied that the percentages were based on the national urban transit bill under consideration in Congress, where the Federal Government would contribute two-thirds of the cost of Federal-aid transit projects. Further, the taxing authority of the District was limited. “We could tax the District of Columbia to a point of diminishing returns but this would accomplish no useful purpose.” He added, “I do not think we can shirk our responsibility to see that the Nation’s Capital is properly financed or properly run.” [pages 23856-23857]

Representative B. F. Sisk (D-Ca.), a member of the House District Committee, discussed the importance of the bill, which would get construction underway:

In the meantime the rights of the private transportation companies in the area and the interests of my good friends in the labor movement will be undisturbed. In fact . . . the bill by providing new jobs here . . . will be a very great help to labor.

Transit labor's concerns would be met before operation began, while the 1960 Act expressly prohibits NCTA from acquiring "facilities, property, or rights-of-way of private motorbus companies" and operate buses or similar motor vehicles "or make agreements for the provision of motorbus service competitive with private transit companies." While construction was underway, Congress would decide whether the system would be operated by a public agency or private company. In closing, he said, "Transportation relief in Washington can come about only if the Federal Government commits itself to the task and takes the first step." [pages 23857-23859]

Representative Roudebush said that he had voted against the bill in committee. "For the life of me I am unable to differentiate between a system of this type as proposed by this legislation and those systems to be proposed in the so-called mass transportation legislation." He intended to oppose the national legislation and the current bill for the Washington area. He questioned the projection that the bobtail rapid transit system would pay for itself. "What if this curtailed system does not pay off financially." He continued:

It looks to me as though the Federal Government will not only lose its \$121 million contribution but will be saddled with [the] requirement that we make good the \$258.9 million in bonds and possibly be on the hook for the \$21.7 million for the District contribution.

He was opposed not just to the Washington plan but to Federal involvement in mass transit anywhere in the country "if the Federal Government is required to pay for it." He planned to support the planned motion to recommit the bill to committee. [page 23859]

Representative William B. Widnall (R-NJ) said it was time "to start talking sense." He was referring to "the apparently useless debate over the so-called highway transit issue." He used the phrase "so-called" because everybody agreed the area needed its Interstate highways as soon as possible and felt the same way about the rapid transit system. Only two portions of the Interstate System were in doubt, but they were "temporarily deferred to see if there is not a way to construct them so as to avoid injury to parklands and undue displacement of people." He understood that rapid progress was being made and that President Johnson would soon announce the results.

Constructing the rapid transit system was essential. "Indeed, the usefulness of the Interstate Highway System depends to a very large extent on the existence of a companion rapid transit system." He was concerned that without the transit system, the area's Interstate highways "will suffer the fate of so many other urban freeways around the country which are intolerably congested with automobiles almost from the moment the ribbon is cut." Congress owed it to the citizens of the Nation's Capital to "maintain an efficient transportation system." He would vote for the bill. [page 23860]

Representative Multer discussed his objections to the bill. First, he thought Congress should start with the highest District priorities. If Congress had only \$20 million to spend in the District, spending it on “education and educational facilities” should come first. As for the \$400 million cost of the bobtail system, anyone reading the bill will “find this is a blank check.” The bill does not limit how much NCTA will spend, but it does guarantee that whether the money comes from the Federal Government or the District, “every dollar will be Government money or Government guaranteed.”

Second, the bill “completely ignores the rights of labor.” As a member of the Committee on Banking and Currency, he was “a little amused by the irony” that the same people who often accused him “of driving private enterprise out of our system . . . and replacing it with Government” were now “advocating public ownership and operation of a new transit system in the District of Columbia.”

Third, “the planners who came in with the plan are utterly incompetent as planners, and if they are incompetent as planners, they are more incompetent as builders and operators of a subway system.” He explained this charge by saying that the best way to relieve congestion in the center city was to provide parking lots in the suburbs so people can leave their cars and take transit into the city, “as we do in New York City”:

These planners are going to compound the difficulty by building a subway first, the experimental part right in the heart of the city. How are you going to get there except by bringing the automobiles to the heart of the city in order to use the subway? That is why I say the planners were incompetent.

The bill should be returned to committee to develop “a proper plan . . . so that we can get a rapid transit system that will do the job.”

Representative Multer also took exception to a colloquy between Chairman Whitener and Representative Horton about whether anyone had testified during subcommittee hearings that private interests would construct the subway system. The chairman had replied, “I remember no such testimony.” Representative Multer pointed out that the supplemental hearing record included proposals by private enterprise to build the transit network. “They tell you they can do a job of improving transportation in the District of Columbia by spending \$103 million of their own money.” They also said that after doing so, they would “provide for a realistic test project, a rail rapid transportation system, in an area most suitable for such a system.”

The Congressman was referring to a letter dated October 31, 1963, that Chalk submitted to Chairman McMillan. Chalk said that “even to the untrained eye,” the only difference between the NCTA and bobtail plans was that “the suburban arteries, originally declared to be vital, have been eliminated.” The result was “an otherwise impractical and inadequate system is rendered even more impractical and inadequate.” He proposed the construction of 160 additional miles of express busways on separate lanes, reserved for buses during peak periods, along with a minibus service in the downtown area, all for \$103 million. Once that service was in operation, he would test the Lockheed monorail technology on 5 miles of elevated, suspended railway – all before the

area spent \$1 billion on a subway system. (Supplement to Hearings before Subcommittee No. 6 of the Committee on the District of Columbia, pages 41-44]

Representative Multer summarized his point by saying the job “must be done” to provide transit in the Washington area, but “whenever private enterprise can do the job, the Government should not do it.” He concluded:

Sure you have a lot of clamor from all around the city and all the agencies to do something about transit. I want to do it now, but I want to do it correctly.

Chairman Whitener pointed out that Chalk had sent a telegram to every member of the House “in which he said the proposal was a proposal of an outmoded system, but he wound up saying he wanted to operate it.” Representative Multer said he had not seen it, but would offer an amendment that would invite D.C. Transit System or anyone else in the private sector to take over the job. [pages 23860-23861]

Representative Mathias talked about the urgency of getting started:

We have reserved to the Congress virtually all of the authority contemplated by the Constitution to control practically everything that happens within the District of Columbia. With that authority goes responsibility. It is that responsibility which we are being called upon to discharge today.

He planned to vote for the bill “because it is a sheer necessity.”

Representative Frank T. Bow (R-Oh.) suggested to Representative Mathias that much of the congestion could be relieved if federal agencies were dispersed out of the Washington area instead of concentrating them in the District. Representative Mathias replied that the reason so many agencies are located in the Washington area is that the District of Columbia is the seat of the national government designated under the Constitution. Nevertheless, Representative Mathias said, “90 percent of the Federal Government employees today are located in places other than the Washington metropolitan area.” He added that with the expected population increases over the next 30 years, “we have to make an urgent decision now.” [page 23862]

Representative Alvin E. O’Konski (R-Wi.) wanted to put the bill in “its true perspective.” The Senate, he said, had passed the Urban Mass Transportation Act authorizing grants and loans totaling \$325 million. The House, “in its wisdom,” had refused to take up the bill. And yet:

Here you have a bill that calls upon the taxpayers of the United States of America to underwrite in one way or another \$406 million for just one little speck on the map of the United States; namely, the District of Columbia.

True, the District would contribute \$22 million, but “when the District of Columbia in its great feeling of good will says that they will donate \$22 million they will just come to us and ask for \$22 million of the taxpayers’ money as that share because they are using that money for this purpose.”

He also questioned the revenue estimates that assured repayment of the Federal contribution and payment of expenses out of the farebox. Everyone knew that every transit system in the country is “operating in the red.” Moreover, the fact that the bill calls for the bonds to be guaranteed by the Federal Government “is an admission of the fact that the bonds could not be sold on the open market; nobody would buy a dollar’s worth” otherwise.

The House had recent experience with such revenue projections in the congressional experience with the District Stadium. “The stadium is operating at a deficit, the bonds are in default, and the Government which guaranteed those bonds . . . are paying off those bonds.”

He added that no one should think “that I am naïve enough to swallow the notion that this \$259 million is going to be paid back.” In his 22 years in the House, he had never seen a single proposal where a revenue-proposal involving Federal funds resulted in the Federal Government recouping “any of its money.”

And this bobtail plan is just a start. “This is just the first bite, my friends, and remember that, when I propose a motion to recommit the bill back to the District Committee for further study.” [pages 23862-23863]

Representative Everett G. Burkholter (D-Ca.), representing a district based in Los Angeles County, said that no matter how many city streets, highways, and freeways are built, “that is not the answer to the traffic problems in the urbanized cities today.” People suggest that private enterprise would become interested in mass transportation given that over 200 communities have populations over 50,000 people. However, all statistics and reports proved that mass transportation pays its own way, with public subsidy, in only three cities. They are Cleveland, San Diego, and Chicago, “and some of them are going in the red, I have been told recently.” That was why private enterprise was not interested in financing urban mass transportation.

The number of vehicles on the roads must be reduced:

Therefore, you are going to have to go overhead or underground by either subway or elevated, such as the monorail, or any kind of mass transportation, as long as it is elevated or underground. You are going to have to provide off-street parking facilities in all of the urbanized cities.

In sum, experts said let private industry do the job; no need for public funds. “We have been talking about that for 25 or 30 years, but we are no further ahead than at the beginning.” It was time to pass this bill for the Washington area. [page 23863]

Representative Carlton R. Sickles (D-Md.) expressed concern that one of the problems with NCTA was its inadequate coordination with local jurisdictions. He wanted to be sure that once the bobtail plan was underway, NCTA would coordinate with Maryland and Virginia before decisionmaking.

Regarding the labor issue, local jurisdictions were in negotiation on an interstate compact agency for operating the transit system. As a member of Maryland’s negotiating team, Representative Sickles could tell his colleagues that, “We are just at the point of considering the issue of the

labor policy with respect to the operational employees of the system.” The negotiators would be helped greatly if they knew the congressional policy. He had reviewed the labor policy proposed in 1960, “and for the life of me, I cannot see the reason for the delay in their consideration.” His constituents who worked for the transit company were “concerned, deeply concerned, about their seniority rights, and pension benefits, and they are concerned now.” He intended to vote in support of the labor amendment. [page 23765]

Representative Harsha questioned passenger predictions based on surveys that he considered inadequate. Only 2,005 commuters had been surveyed. They had been asked:

Considering bus and rail vehicles, with no difference in cost, time, or convenience, which would you prefer?

The Congressman emphasized the word “convenience” because the bobtail system would be less convenient than NCTA’s original system, if only because of needed transfers or having to drive somewhere, park, and board a transit vehicle. “Now, in this age of convenience, this is not equivalent to the convenience of a commuter’s automobile.” As a result, patronage would decline, meaning that the financing plan is not sound – “and the taxpayers have to subsidize the program.” He wondered how anyone could vote for this bill but against the national bill. He urged the House to reject the bill. [pages 23865-23866]

The time had come for amendments. First was Representative Multer’s amendment prohibiting NCTA from beginning construction until it had “given private enterprise at least 6 months to submit offers to build, own and/or operate a transit system.” Similarly, once the system is built, NCTA must give private enterprise the opportunity to operate it.

Representative Gross wanted to know if the amendment meant that private enterprise would pay for the system. Representative Multer replied, “This is the intent of my amendment,” adding:

I have in mind we have a mass transportation bill pending in the Rules Committee which calls for money for the entire country, grants and loans, including the District of Columbia. If private industry comes forward after that bill is enacted into law, and is law, we should not exclude private enterprise from coming in and qualifying if they can.

Chairman Whitener asked if Representative Multer was referring to D.C. Transit System, which the chairman indicated “is now receiving substantial subsidies from the Federal and District taxpayers.” Representative Multer denied he was referring to the company, but said the company did not receive a subsidy. “They get a certain tax exemption if their net income does not give them a 6-percent return. They have never yet earned that 6 percent. They get no subsidy from the Government.” He urged adoption of his amendment.

The chairman admitted that a certain aspect of the amendment appealed to him since “I am a strong advocate of private enterprise and an opponent of excessive Government intervention.” He continued:

But the hard, cold fact is that no private enterprise in the 7 or 8 days of the hearings we had appeared to talk on this situation here in the District of Columbia.

They knew, he said, “it is not feasible.” A private operator would have trouble with financing and acquiring right-of-way. He added that Representative Multer is fully familiar with the New York City subway and, therefore, “knows that no private operator could operate that system nor could they have built it originally.” He recommended the House defeat the amendment.

The House agreed to the amendment, 82 to 37.

Representative Multer offered his lengthy amendment containing labor provisions. He stated that the AFL-CIO prepared the amendment, but it had been rejected by the subcommittee and the committee:

Mr. Chairman, this amendment will preserve for the workers of the District of Columbia the right to bargain but not to strike. It will preserve for them the right to bargain as to wages, fringe benefits, and all of the other things that a worker should be entitled to bargain for. It contains this further provision that in any dispute—and I emphasize “any dispute”—the matter must be submitted to arbitration and the determination of the arbitrators is final and binding on all concerned.

The amendment, if adopted, would affect what would happen after the system is built, but to those who suggested waiting until then to consider the amendment as provided for in the 1960 Act, he said, “it also goes to what will happen the day after this bill is enacted into law. It will apply to anybody and everybody who is working in connection with the construction of this system.” True, the Davis-Bacon Act guarantees construction workers will be paid the prevailing wage. But beyond the prevailing wage, the amendment would “guarantee to them the fringe benefits and also the right to go in and bargain and present their grievances and obtain whatever remedy they may be entitled to.”

Representative Charles A. Halleck (R-In.) asked if the amendment provided for compulsory arbitration. Representative Multer replied that he did not “want to quibble about words.” If after negotiating in good faith, the sides could not agree, “they must submit to arbitration.” Arbitrators appointed by both sides would listen to their arguments and make a determination that would be “binding on both sides.” That, he added, is what the unions recommended for this bill.

Mr. Halleck. If the gentleman will yield further, is not that compulsory arbitration?  
Mr. Multer. I suppose it is.

After some further questions and discussion of the amendment, the House rejected it, with 61 votes for and 91 opposed.

Representative Barratt O’Hara (D-Ill.), a journalist, editor, and commentator in Chicago, introduced an amendment that would prohibit the acquisition of any occupied home until the residents had been relocated. The House rejected the amendment.

With debate and consideration of amendments concluded, Chairman Whitener called for a vote on the bill. Before that vote could take place, Representative O’Konski offered a motion to

recommit the bill to committee. The House voted in favor of the amendment to recommit the bill, 278 to 76. [pages 23872-23873]

After 4 hours of debate, the House, in this way, rejected the bobtail plan and the bill to implement it.

### **In the Aftermath**

After the House overwhelmingly defeated the bobtail plan, Commissioner Tobriner was bitter:

I say a pox on both their houses. One thing is certain, unless the transportation problem is solved and effectuated shortly, the city and its environs face a dismal future.

He added:

I am not biased in favor of subways or highways but I am definitely biased in favor of the people of the District and surrounding area having adequate transportation to and from their homes and places of employment in vehicles of their choice at costs commensurate with their means and with minimal dislocation of homes and businesses.

The highway work currently authorized or shortly to be, must continue.

He was particularly angry at NCTA:

The arrogant, unilateral approach of NCTA to this problem has done much to create the impasse which, if no solution is found, will doom the city's economic future.

What was needed, he said, was a presidential commission consisting of Members of Congress, representatives of the District and surrounding jurisdictions, citizens, governmental, business and labor groups. With support from a technical advisory group, the commission would be directed to reach decisions by a firm deadline.

Horsky, the White House aide who had strongly supported the bobtail plan, discussed options with Chairman Whitener, who was "not at all optimistic." If the \$400 million plan was too expensive for the House, he doubted a less costly plan could be developed that would be economically feasible.

Stolzenbach, who had watched the debate from the House gallery, told reporters he was "quite disappointed," but the "basic idea is sound. We've got to keep going." He remained determined:

I didn't become administrator of the National Capital Transportation Agency to preside over its dissolution. I presume this is not the last word of Congress."

NCTA's staff was determined to find out why the House vote as it did:

Part of the opposition, they found, resulted from complaints by the AFL-CIO that federal operation of transit would deny labor unions either binding arbitration or a right to strike, leaving them in an even worse position than under the Wolfsons [Chalk's predecessors in

operating the District's bus service]. But the real reason for recommitment [sic, to the District Committee] was that the House as a whole had paid little attention, and many members had no idea what the vote was about. When Deputy Administrator Quenstedt talked to some congressmen and their staffs, they assured him that the vote for recommitment had been made out of caution, confusion, and a reluctance to make a big decision near the end of a session. Try again, they said.

That was fine as a legislative strategy, but what was the NCTA staff to do? The agency was humbled by its initial defeat. Stolzenbach morosely canceled his earlier request for tens of millions of dollars for land acquisition and construction. More seriously, the agency's staff was cut in half. [Thomas] Deen left for a consulting job, leaving transportation planning in the hands of William Herman, who was trained in finance, not engineering. [Schrag, pages 58-59]

By contrast, Chalk was delighted. "The House acted wisely," he said. "The vote indicated that Congress felt the Stolzenbach-Horsky plan is not the right plan." In addition, he said, the House had "reasserted the right of private enterprise. Stolzenbach was discredited—or, at least, his plan is discredited."

Engineer Commissioner Duke was "very disappointed. I was hopeful . . . . That short version seemed to fit in with the balanced system we have all been trying to arrive at." He was not sure what the next step was. "The District really needed it," he said, but "we'll have to withdraw and regroup."

Walter Bierwagen, the local union chief, had been disappointed when the House rejected the labor policy. Although defeat of the bill would cost union jobs in the area, he said, "Without the labor guarantees, I'd rather the bill was rejected."

Jack Eisen in the *Post* and Grace Bassett in the *Star* analyzed the debate to determine how the vote ended up so lopsided. Eisen wrote:

There was no clear pattern in the House debate. Opponents attacked the cost, expressed doubt that its financing plan was workable and said Government decentralization would be preferable to paying for rapid transit.

One thing surprised him. "Washington's noisy freeways-transit dispute was hardly mentioned."

Bassett said of the "stunning" defeat:

Administration planners could calculate in adverse votes the cost of failing to compromise their differences with business, labor and some suburban jurisdictions. The most perfect plans could not have convinced the House yesterday to accept a \$400 million network opposed by three such politically potent factions.

Opposition to the bill teamed such unlikely allies as pro-labor Representative Roosevelt, Democrat of California, with anti-spending Republican Gross of Iowa, and Democrat

Multer of New York, a spokesman for small business, with Judge Smith of Virginia, guardian of suburban independence.

They discussed turning points. One such event was a quorum call requested by Representative Harsha just before Representative Roudebush spoke. With only 69 Representatives responding, the Speaker briefly resumed the chair to summon the other members, 345 of whom responded. Bassett wrote, "They had not expected to be summoned for the local debate and began mumbling about the cost of the unfamiliar project," the very point Representative Roudebush made when debate resumed.

Eisen and Bassett singled out Representative O'Konski's comments as helping to focus the opposition on cost issues, and Bassett cited Representative Roudebush for the same reason. "House Members," Eisen wrote, "obviously were wary of the legislation as soon as they realized its magnitude."

Defeat of the Multer amendment on labor was a turning point as well. Bassett thought the labor provisions were "doomed after Minority Leader Halleck of Indiana drew from their author, Mr. Multer, an acknowledgement that they included compulsory arbitration." After that, "Republicans voted in a bloc against guaranteeing rights [that] workers now have under private contracts should union members be shifted to a public operation." She concluded:

More than any other single factor, the labor argument probably defeated the bill. Once it was rejected, labor champions, who otherwise were for the administration program, voted to bury it.

As for the future, Eisen wrote:

Recommittal could be a death sentence. But the District Committee is free to rewrite the measure and send it back to the floor for a second try. Or a rescue attempt could be made in the Senate, which generally is regarded as friendlier to the District.

However, Bassett wrote, "Chances are slim that the Senate can reshape a transit bill to suit the House next year." She added that "this is almost sure to be tested." [Bassett, Grace, "Bitter Tobriner Asks Solution In Rail Defeat," *The Evening Star*, December 10, 1963; Eisen, Jack, "Bobtailed Subway Plan Overwhelmed by House," *The Washington Post and Times Herald*, December 10, 1963]

On December 11, Representative O'Okonski explained his motion to recommit the bill to committee:

If the bill had been defeated, which it would have been, it would have been dead for at least 10 years. By referring it back to committee, there is time for a real hardcore look at another proposal.

He did not believe that highway supporters or Chalk were factors in the recommittal vote. The \$400 million price tag was a key factor in the defeat, a fate that would meet any similar high-cost proposal. He was sure that Congress would give a transit bill for the District another look if

NCTA could address the financing and private enterprise issues. He also thought that a subway-rail transit network with an underground system was “a thing of the past.” Officials should consider innovative transit technology.

Representative Broyhill agreed that recommitment, which he voted against, offered some hope. He added, however, that, “Unless something is done pretty quickly, the justification for the agency’s existence will terminate.” Some alternative such as express bus service might be considered, but prospects for an alternative subway plan “look dim.”

Chairman Whitener was not planning any immediate action. “We’ll take a good serious look” at what to do, but he saw little support for Commissioner Tobriner’s suggested presidential commission. [Flor, Lee, “Transit Bill Vote Cited As Keeping Issue Alive,” *The Evening Star*, December 11, 1963]

In editorials, the *Post* and *Star* made clear who was at the heart of the defeat. No one, the *Post* editors wrote, thought it would be easy. The “shocking vote” was a setback, “but not a final disaster.” The need had not changed. All the conditions leading to the bill, such as a transportation crisis and support for a rapid transit system, were still in place. However, “Congress never supports major improvements for Washington unless they enjoy very nearly unanimous local support.” The House vote was “a sharp and explicit personal repudiation of Mr. Stolzenbach”:

Mr. Stolzenbach committed three errors of political judgment. He believed that he could build the subway only by vehemently attacking the Inner Loop. He believed that he could build the subway only if revenue estimates promised to pay its whole cost; the figures were demonstrably incredible. He believed that he could build the subway only by refusing to answer questions, however legitimate. He offered no reassurance whatever to the bus companies that he proposed to displace, or to their employes [sic]. They worked hard, and successfully, to beat the bill. It is now time to replace Mr. Stolzenbach.

In view of the House rejection, Stolzenbach could “serve the city best by promptly resigning.” If he stays, the *Post* doubted that in view of the wide distrust he had engendered, “any bill can succeed while he retains office.”

His successor would not have it easy:

A new administrator will have to work out, in detail, the relationship between the bus companies and the transit system, protecting the interests of the companies and of their employes [sic]. He will have to meet and dispose of the absurd proposal for private ownership; one might as well talk of private ownership of the post office, or of the sewers.

With all that accomplished, the President should send a rewritten bill back to Congress. “The need for action is urgent” because Congress “cannot hold back the steady waves of citizens coming to live and work in Washington.” [“The Next Step,” *The Washington Post and Times Herald*, December 11, 1963]

In “The Transit Fiasco,” *Star* editors understood Commissioner Tobriner’s “bitterness about the highway-transit controversy,” but that “silly feud” was not responsible for the defeat in the House. The editors attributed the House defeat of the bobtail bill to several factors, including labor opposition, Chalk, the “inadequacy of the arguments” by NCTA and other supporters, the lack of defense by House leaders for Federal expenditures, and the Washington community’s failure “to exert itself as strongly in behalf of the bill as the spokesmen for special interests exerted themselves in the fight to kill it.” But make no mistake:

It was derailed by the pipsqueak arrogance of C. Darwin Stolzenbach, the NCTA director, who, over a long period of time, has managed to generate nothing but ill will toward the agency. Drawing himself up to his best Churchillian stance after the vote on Monday, Mr. Stolzenbach typically announced that he had not become the NCTA head “to preside over its dissolution,” and that he presumed “this is not the last word of Congress.”

It must not be the last word, not because Stolzenbach said so, but because “a rail-transit system is absolutely essential to the health and well-being of the Washington area and of the Nation’s Capital itself.” To achieve that goal, NCTA and “others within the administration are going to have to correct a number of faults before the next effort is made.”

Those faults were correctable. Freeway construction should proceed. Except where a freeway should provide right-of-way for a rapid transit line, NCTA “should keep its nose out of highway business.” NCTA also must reach accord with labor, private enterprise, and area jurisdictions outside the District. “Most of all the vital importance of an effective rail-transit system to the Nation’s Capital must be made apparent to everyone.”

The editors thought Chairman Whitener summed it up best. “The cost to the Federal Government of not building a rapid-transit system will be far greater than the cost of building one.” That was “the essential truth” that Congress must come to accept. [“The Transit Fiasco,” *The Evening Star*, December 11, 1963]

### **Locating the Three Sisters Bridge**

By late 1963, the Three Sisters Bridge was the most controversial of several controversial Interstate projects. As *Post* editors had put it in the July 9 editorial cited by Representative Cramer:

Bridges seem to bring out the worst in Washington’s government. Nothing could illustrate more sadly its constitutional state of indecision than the announcement that we are now to have still another study of the future Three Sisters Bridge, at a cost of another half million dollars. The city wasted seven years wrangling over the designs for the Theodore Roosevelt Bridge, and the questions raised by Three Sisters are far broader.

As for the “economic, social and aesthetic considerations” the reexamination was to explore, they were “precisely the kind of value judgments that most Americans consider to be political issues.” [“In Lieu of a Decision,” *The Washington Post and Times Herald*, July 9, 1963]

Virginia highway officials supported the bridge. As Deputy Commissioner F. A. Davis of the Virginia Highway Department had told Chairman Fallon in a letter, failure to build the bridge would result in “an almost intolerable situation.” He added, “It is our feeling that all of the highways now planned will be needed, particularly those on the Interstate system, regardless of any mass transit system as now proposed.”

Meanwhile, Virginia had halted design of I-66 approaching the river “because we have no way of knowing the number of lanes that will be required.” The current plan was for I-66 to have six lanes north of the Capital Beltway to the Dulles access road. Between the Capital Beltway and the Potomac River, I-66 would have eight lanes to the junction with I-266 to the Three Sisters Bridge. Beyond the I-266 interchange, I-66 would continue with six lanes to the six-lane Theodore Roosevelt Bridge. If the bridge were not built, I-66 would have to be rethought to find a way to carry eight lanes of traffic instead of six lanes. [Flor, Lee, “Virginia Will Press For Sisters Bridge,” *The Evening Star*, August 2, 1963; “State Halts Planning on River Route,” *The Washington Post and Times Herald*, August 3, 1963]

On November 7, 1963, the White House released Commissioner Tobriner’s letter stating that the seven-member Policy Advisory Committee had agreed on a compromise location for the bridge. “The committee recommends against the proposed location at the Three Sisters Island site.” Instead, the bridge would be built between Roosevelt Island and Key Bridge.

This new location meant that the bridge would touch down in the District near the foot of Wisconsin Avenue, NW., on the Georgetown waterfront. It would connect with the Potomac River Freeway parallel to the Whitehurst Freeway. This location had “distinct aesthetic advantages” and, with “appropriate design will insure essential service to highway users.”

One result of this new location was that it might affect the number of lanes on I-66 through Rosslyn. Instead of a six-lane freeway leading to the six-lane Roosevelt Bridge, Virginia would have to plan for additional lanes through a community that was expanding with new apartment and office buildings. That development would make locating the freeway even more challenging than it already was. The interim report stated that, “The committee trusts that this agreement will have the concurrence of the Commonwealth of Virginia.” (Horsky told reporters that this reference to Virginia’s position was “stronger than hope but weaker than a no.”)

The committee also endorsed construction of the North Leg, but said that in its design, “maximum consideration should be given to the concept of tunneling within the bounds of engineering feasibility to assure minimum disturbance during construction and to minimize displacement and esthetic impact.” The bridge and North Leg were to be built to Interstate standards with six or eight lanes.

Precise locations were yet to be determined, but Lee Flor summarized the general location of the North Leg:

[The] north leg would connect to the inner loop freeway around Pennsylvania avenue near Rock Creek park and then would curve north and eastward, running a few blocks south of

Florida avenue. The route most usually mentioned is along R and S streets N.W. until the freeway connects to a center leg freeway around Third street and New York avenue N.W.

The decisions described in Tobriner's letter were general and tentative. The Policy Advisory Committee would not make final decisions until a public hearing was held after the members reviewed additional design and alignment alternatives. [Flor, Lee, "Three Sisters Out, Span Downstream," *The Evening Star*, November 7, 1963; Eisen, Jack, "Modification Of Highway Links Urged," *The Washington Post and Times Herald*, November 8, 1963]

One thing the committee had not done was consult with the Arlington County Board or Virginia highway officials. As Roye Lowry, a member of the board who would become its chairman in 1964, pointed out, "A bridge has two ends." Virginia and county officials were analyzing the decision, with the most difficult issue being the impact on Rosslyn. Board Chairman Thomas Richards thought the problem might be manageable, but "such lack of cooperation when the planning is under way is no way to handle a metropolitan-wide-area problem."

Representative Broyhill, by contrast, called the Policy Advisory Committee's decision "a perfect solution." He thought homeowners in the Arlington Palisades would agree with the decision. [Eisen, Jack, "Bridge Project Action Angers Arlingtonians," *The Washington Post and Times Herald*, November 9, 1963]

Rosslyn, cited earlier as the site of an oil terminal, was a 100-acre unincorporated village in the northeast corner of Arlington County across the Potomac River from Georgetown. The opening of the Aqueduct Bridge had spurred development of a lawless community at its base. The coming of the electric trolley in the 1890s spurred a civic cleanup, but Schrag described the area's evolution:

Though named for a farm, the area had been home to breweries, slaughterhouses, and saloons since the late nineteenth century. As the New Deal and World War II inflated Washington's construction industry, Rosslyn became the city's staging area, with storage yards and firms dealing in lumber, millwork, and asphalt. Then in April 1957, the Marriott company took a 99-year lease on a former brewery to use as a hotel, and in November county planner Dorothy Muncy suggested redeveloping Rosslyn with office buildings and tourist hotels. With the expansion of federal government employment in the early 1960s, investors thought this a fine idea, and by 1963 four office buildings were under construction, with plans approved for ten more. [Schrag, page 222]

The coming of the Theodore Roosevelt Bridge spurred the development.

*Post* editors praised the decision, not for "the genius of its engineering or the brilliance of its planning [but] by the unanimity of its support." Everyone—highway people, transit people, park people, city-beautiful people—had signed "the terse little statement." The committee should be renamed the Road and Rail Truce Commission" because it had "restored the balance of the city's intricate transportation politics."

By shifting the bridge downstream, the “Truce Commission” had reassured several Senators that the bridge would not harm Glover-Archbold Park. The new location had its drawbacks, particularly the need to shift I-66 through Rosslyn, possibly in a tunnel. “But the political values here clearly outweigh the planning considerations.” [“Declaration of Truce,” *The Washington Post and Times Herald*, November 9, 1963]

Engineer Commissioner Duke, who headed the advisory committee, said officials would coordinate with Arlington County and Virginia officials after they received President Kennedy’s response to Tobriner’s letter. Appearing on WWDC’s “Report to the People,” Duke conceded that the reaction in Virginia and particularly Arlington County had not been “extremely enthusiastic.” Nevertheless, he thought that solutions, particularly for the routing of I-66 through Rosslyn, would be reached jointly. He also thought that once the precise location of the bridge was set, “the Potomac River Freeway I don’t think will pose any particular problem” for Georgetown residents. [“Duke to Seek Arlington Views on New Bridge,” *The Sunday Star*, November 10, 1963; Eisen, Jack, “Decision Awaited on Next Bridge Site,” *The Washington Post and Times Herald*, November 10, 1963]

President Kennedy replied to Tobriner on November 12, 1963. The President was pleased to have the letter informing him that the District Board of Commissioners concurred in the Policy Advisory Committee’s decisions. “The recommendations are likewise acceptable to me, and will be included in my budget recommendations to the Congress in January.” He added:

The Policy Advisory Committee is an example of the possibilities for cooperative action among Federal and District agencies in resolving difficult problems, and the fact that its recommendations are unanimous is particularly gratifying. The concurrence of the Board of Commissioners in those recommendations should assure that the entire District Highway Program can now move forward.

He added, “the fact that its recommendations are unanimous is particularly gratifying.”

With release of President Kennedy’s letter, Chairman Whitener’s subcommittee took time from developing the bobtail legislation to approve a resolution drafted by Representative Broyhill calling upon the District commissioners to “proceed forthwith to implement the construction” of the bridge and North Leg. Chairman Whitener, who said the vote was unanimous, was hopeful that the agreement would diminish opposition by highway supporters to his transit bill. [Flor, Lee, “Kennedy backs Georgetown Bridge Plans,” *The Evening Star*, November 12, 1963; Eisen, Jack, “Georgetown-Rosslyn Bridge Gets Kennedy Endorsement,” *The Washington Post and Times Herald*, November 13, 1963]

*Star* editors thought that in saying the projects could move forward, President Kennedy had “struck precisely the right note.” Many details needed to be worked out to determine whether the new bridge location was feasible or the disruptive impacts of the North Leg really could be minimized:

The important thing is that the agencies represented on the committee, which previously were fighting over the need for both these projects, now agree they should be built. We

trust that the President will make sure there is no backsliding on that crucial point.  
[“Forward, March!” *The Evening Star*, November 15, 1963]

By November 16, the first sign of a problem with the new location of the bridge was evident. Members of the Arlington County Board were “outraged” that they had not been consulted, criticized the plan unanimously, and urged consideration of alternate sites. The board had received the plan only on November 5, without a chance to comment on it before Commissioner Tobriner’s letter to President Kennedy. The board was concerned that the uncertainty would affect their development decisions. Chairman Richards said, “This Fairfax Drive-Route 66 area can be another real good hot area where we can develop a high yield tax base,” similar to Rosslyn. Board member Leo Urbanske, Jr., denounced the plan, pointing out that, in contrast to the prior upstream location, the bridge in its new location would compound congestion in Rosslyn.

The board advised County Manager Bert W. Johnson to write to the Virginia Highway Department to express the county’s disapproval of the new plan. He also was authorized to send a copy of the letter to the White House. [“Arlington Board Scores Bridge Site,” *The Washington Post and Times Herald*, November 17, 1963; Kelly, Brian, “Not Consulted on Bridge, Arlington to Tell Kennedy,” *The Sunday Star*, November 17, 1963]

Reacting to the dispute in Virginia, Engineer Commissioner Duke met with Virginia highway officials and representatives of the Arlington Board for a strategy session. Deputy Federal Highway Administrator D. Grant Mickle represented BPR. “As of this moment,” he said, “there appears to be an impasse between the District and Virginia.” The city wanted the District terminus of the new bridge to be as near as possible to 31<sup>st</sup> Street, NW., because that was the end of the present Potomac River Freeway project, the District’s portion of I-266. The District was open to any Virginia terminus for I-266 as long as it ended at the desired location in the city.

On December 4, General Duke announced the results of the meeting. Officials had agreed on a joint study. Virginia officials were to study a site upstream from Key Bridge and a tunnel-bridge crossing near Three Sisters Islands. As described by Jack Eisen in the *Post*, the two alternatives were:

- Rte. 266 to branch off near N. Kirkwood st., Arlington, tunnel beneath the Palisades near the upper end of Spout Run Parkway, then cross the river on a diagonal bridge about one-quarter mile downstream from Three Sisters.
- The route to cross the river about on line with Arlington Oak st., one-quarter mile upstream from Key Bridge and roughly parallel to it.

At the same time, the District would conduct engineering studies of a site downstream from Key Bridge, the site the Policy Advisory Committee and President Kennedy had endorsed. They all agreed not to study the original Three Sisters Islands location, thus seemingly killing the idea of a bridge named Three Sisters Bridge.

General Duke told reporters he was confident the differences could be resolved. Chairman Richards said he was “quite heartened by the spirit of co-operation and the desire on the part of the District to undertake a joint study.”

In short, as Eisen put it, “Virginia and Arlington County officials yesterday torpedoed the Rosslyn-Georgetown bridge plan that was supposed to end Washington’s freeway warfare.”

Unaware of the strategy session, Representative Broyhill decided to intervene. At his request, the House District Committee named him a special peacemaker. Having previously called the location approved by the Policy Advisory Committee “a perfect solution,” he now called it “bad and costly” in view of the Virginia opposition. He wanted to set up an emergency committee to identify a location for the bridge that all parties could accept. The committee would include the District, Virginia, Arlington County, NPS, and BPR, as well as citizens from both sides of the river. He also intended to invite Horsky to participate. They would, he said, “sit down and thresh out all objections.”

Reaction to Representative Broyhill’s initiative was mixed. Chairman Richards, saying that officials in the strategy session had developed “a fine working rapport,” said of this additional initiative:

Further expansion of the decision-making process by Mr. Broyhill’s intrusion is going to further complicate the situation and muddy the water. We would reach a reasonable decision without his entry.

General Duke, by contrast, said he would “cooperate with the Congressman and look forward to helping in any way we can.” [“Eisen, Jack, “Rosslyn Bridge Plan Is Scuttled By Virginians,” *The Washington Post and Times Herald*, December 5, 1963; “Broyhill Proposed New Bridge Group,” *The Evening Star*, December 5, 1963; “Broyhill Named Peacemaker in Bridge Wrangle,” *The Washington Post and Times Herald*, December 6, 1963]

Despite the mixed reaction, officials met in the House District hearing room at 2 p.m. on December 11, 1963, just 2 days after the House rejected Chairman Whitener’s bobtail plan. Participants included Jett of the NPS, Lowry of the Arlington County Board, Acting District Highway Director Thomas F. Airis, and Engineer Commissioner Duke. Representatives of Arlington County and Georgetown civic associations were present in the hearing room.

Participants agreed to hire a consultant to conduct a 4-6 month study of the options as soon as Congress granted the funds. If the conference committee on the District’s appropriations act, 1964, included \$330,000 for the Three Sisters Bridge, the funds would be used for the study. The study, to be financed by the District and Virginia, would cover two layouts, one upstream and one downstream of Key Bridge. Participants explicitly excluded the original Three Sisters Bridge location from the study. Jett was very pleased by that decision, but was neutral on the remaining options. [“Outside Consultant Called to Referee Battle Over Three Sisters No-Bridge,” *The Washington Post and Times Herald*, December 12, 1963; Flor, Lee, “D.C., Virginia In Accord on Bridge Study,” *The Evening Star*, December 12, 1963]

With approval from the House and Senate appropriations committees, the District committed \$5,000 for the study of two alternative sites for the bridge, with Virginia committing an equal amount. BPR provided the 90-percent match of \$90,000. The New York firm of Howard, Needles, Tammen and Bergendoff received the contract to conduct the study. [“Consultants to Study Two Sites for Bridge,” *The Sunday Star*, January 12, 1964]

### **The North Central Corridor**

Following the assassination of President Kennedy, the Kennedy family remained in the White House for several days before moving out. On December 7, President Johnson and his family were ready to move in.

During that period, the country did not have a Vice Presidential residence as at present. The new President had come to Washington after winning a special House election in 1937. In 1943, the Johnsons purchased a red-brick colonial at 4921 Thirtieth Place, NW., in the District’s Forest Hills neighborhood. As Vice President, Johnson and his family moved to a three-story mansion named Les Ormes (The Elms) that they purchased in May 1961 at 4040 52<sup>nd</sup> Street, NW., in the Spring Valley section of the city. Perle Mesta, a fixture on the Washington social scene for years, had been the previous owner. (Her lavish parties for Washington’s social and political leaders had earned her the nickname: “the hostess with the mostest.”)

On moving day, the new President decided to take a walk around his soon-to-be former neighborhood, accompanied only by his friend and adviser, Jack Valenti, the Secret Service, a limousine, and a motorcycle escort. Hatless and in a light raincoat, he walked south on 52<sup>nd</sup> Street to a cul-de-sac where a dog in one of the yards barked at him. “Down, down,” he told the dog. At that moment, Alvin Howard Thompson, a stone mason from Cabin John who had worked on the Johnsons’ home, pulled up. “Good morning, Mr. President,” he said, from his pickup truck. After they shook hands, the President continued his walk. A neighbor rushed out to take a picture of the President. They shook hands.

He continued onto Rockwood Parkway until it intersected Glenbrook Parkway. Part of the way, he could walk in the middle of the street because of light traffic and the Secret Service waving cars to the side. In all, he walked a little over a mile before traveling by limousine to the White House to begin his official day.

One of the events on that day was a ceremony honoring 31 distinguished men and women with a President Medal of Freedom. In a surprise climax, President Johnson added President Kennedy and Pope John XXIII, who had died on June 3, 1963, to the list of recipients. Of the former President, Johnson said, “we are the lesser for his death . . . but each is somehow larger because he lived.” Not visible to the attendees, Mrs. Jacqueline B. Kennedy watched the ceremony before leaving with her children for a Georgetown home made available to her by Undersecretary of State W. Averell Harriman. [“Johnsons Buy Mesta Mansion,” *The Evening Star*, May 20, 1961; “Johnsons Plan To Spend Night In White House,” *The Evening Star*, December 7, 1963]

For years, the new President had been a frantic commuter in the Connecticut Avenue corridor, as biographer Robert A. Caro described based on a 1951 article in the *Saturday Evening Post*:

He was the old Lyndon Johnson driving to work in the morning from his home, a two-story, white-painted brick colonial at 4921 Thirtieth Place in a quiet residential area in northwest Washington—driving down Connecticut Avenue with one hand on the wheel, the other frenziedly twisting the dial on the car’s radio back and forth from one station to another searching for news broadcasts, shouting obscenities at broadcasters who said something with which he didn’t agree. He was constantly sounding his horn to get other drivers out of his way—if they didn’t move aside quickly enough, he would lean out the window and curse them; passing them on their right, he would bang his big left hand down on the outside of his car to startle them. [Caro, Robert A., *Master of the Senate: The Years of Lyndon B. Johnson*, Alfred A. Knopf, 2002, page 140. His source was: Healy, Patrick F., “The Frantic Gentleman from Texas,” *Saturday Evening Post*, May 19, 1951]

Now, his commuting years were over. The Secret Service and police would keep his limousine moving.

Still unresolved in December 1963 was how Montgomery County motorists would commute between home and their jobs in the District. The congressional freeze on freeway construction in the District’s northwest quadrant was to be in effect for another 2 years, so time remained to find a solution.

For many motorists, the planned I-70S western leg entrance along the Potomac River was impractical because it involved an indirect route between suburban homes and jobs in the District. Officials were still considering the Wisconsin Avenue corridor for the North Leg of the Inner Loop to carry the eastern leg of I-70S, but the affluent, heavily populated area seemed an unlikely place for an eight-lane freeway. Even so, NCTA had identified the corridor for upgrading with grade separated intersections to speed traffic.

The North Capitol Street corridor east of Rock Creek Park appeared to have fewer negatives. NCTA endorsed the corridor for a freeway and rail line from Silver Spring because the road could be built along the Baltimore and Ohio Railroad tracks to minimize disruption of neighborhoods already separated by the trains. In January 1963, Donald Gingery of the Maryland-National Capital Park and Planning Commission called this idea “impractical nonsense.” He said, “You simply can’t funnel all traffic down one corridor. If it has to carry traffic from Rte. 70-S, the proposed northern parkway and other main arteries, it will take 28 lanes to get it through Silver Spring.” Moreover, the plan to merge I-95 traffic within the District with the corridor would add to the traffic volumes. [Kendrick, Thomas R., “Planners Critical of NCTA Idea,” *The Washington Post and Times Herald*, January 24, 1963]

In April, BPR Deputy Administrator Mickle called for “a work session” among Maryland, District, and BPR officials to resolve location issues. Chairman Funk sent a telegram to Maryland planning officials urging them not to take any action on the Wisconsin Avenue corridor before the meeting:

It is my opinion that these meetings will clear up the questions involved in Route Interstate 95, the north central corridor and the Wisconsin avenue corridor as they affect

Montgomery and Prince Georges' Counties and the District of Columbia. ["Parley Called On Maryland Road Routes," *The Evening Star*, April 4, 1963]

During the meeting, BPR asked Aitken to consider a change in the District's plan to build I-95 to intersect I-70S in the vicinity of Catholic University. From there, the joint freeways would follow the Center Leg. BPR suggested considering an intersection of I-70S and I-95 in the Montgomery County suburbs before entering the District from Silver Spring. According to the *Post*:

Aitken is not receptive to the Bureau's suggestion. He pointed out that it has been almost five years since the city began laying out the Northeast Freeway and that the route has been endorsed by the National Capital Planning Commission and also fits in with the plan of the National Capital Transportation Agency.

"It doesn't make much difference to us what they do in Maryland," Aitken said. "But any change here in the District would mean we'd have to throw away five years of planning."

Maryland highway officials were considering whether a shift of I-95 to the west would be advisable. Chief Engineer David H. Fisher said, "we are wondering if we could better serve some of the growth taking place further west." [Clopton, Willard, "Maryland Planners Weigh Relocation of Interstate Route," *The Washington Post and Times Herald*, April 22, 1963]

As will be discussed, Funk negotiated with BPR and NPS to designate the Baltimore-Washington Parkway as I-95. He would reconstruct the NPS portion for truck use and provide a link to New York Avenue in the District. This plan, which had the advantage of limiting the taking of homes and businesses, was abandoned in mid-1963, leaving Maryland and District officials to continue debating how to get I-95 traffic between the Capital Beltway and the Inner Loop.

In November 1963, the Maryland State Roads Commission issued its preliminary 5-year construction program. It omitted the North Central Freeway south from the Silver Spring-Wheaton area, a link between I-70S at Pooks Hill and the District, and the first leg of the planned Outer Belt connecting I-70S to the North Central Freeway. No routes had yet been selected for the expressways, but the Maryland State Roads Commission had included them in August in a list of 48 critically needed projects.

After seeing the omissions, the Montgomery County Council voted unanimously to ask Governor Tawes to intercede with the legislative council, meeting in Baltimore, to defer action until the three "vitally needed" expressways were reconsidered. County Public Works Director Joseph C. Kordella said that Chairman Funk "repeatedly supported the 1959 Transportation Plan," but had "virtually ignored its major elements" by dropping the three expressways from the 5-year plan. [Kendrick, Thomas R., "State Road Plan Omits 3 Major Area Highways," *The Washington Post and Times Herald*, November 17, 1963; Christmas, Anne, "County Urges Tawes to Save Road Projects," *The Evening Star*, November 27, 1963]

During the meeting on November 27, Delegate James R. Miller, Jr., of the county's delegation, told Funk, "If these roads were needed in August, they certainly are needed now." Funk

explained that he dropped the three expressways because District officials had not yet pinpointed where I-70S or the North Central Corridor would enter the city. He offered to include them in the plan as “footnote items” to be revived pending District decisions and the availability of funds for future work. Miller replied, “This seems reasonable and I hope it will speed up action in the District.” [Rowland, James B., “Road Projects Put on ‘Critical’ List,” *The Evening Star*, November 18, 1963]

*Star* editors agreed with “the howls of protest from county officials,” saying they were “entirely justified.” Leaving the projects out of the 5-year plan had “shortchanged the citizens of Montgomery unconscionably.” No project in the State was “more urgently needed than the north-central route.” True, the alignment had not been determined. However, Maryland, the District, and BPR had funded a \$350,000 consultant study on the issue, with the results due in January. If agreement could be reached, construction might begin sooner than 5 years if, that is, Funk was determined to do so. Relegating the items to footnotes raised questions about how hard Funk would fight to secure agreement on an alignment and get construction underway. What was needed was for Maryland, the District, and BPR “to drum up enough courage to face jointly difficult problems involved in locating freeways which cross jurisdictional lines in the Washington area. [“Footnote Items,” *The Sunday Star*, December 1, 1963]

Reacting to the dispute, Senator Beall called a meeting in his office on August 10 to discuss the issue just 2 hours before the Maryland-National Capital Park and Planning Commission held a public hearing on the I-70S western leg along the Potomac River Palisades. In addition to Funk, Governor Tawes’ representative, and State legislators, Senator Beall had invited BPR and District representatives to the meeting.

Following defeat of the bobtail plan the day before, Senators Beall and Daniel B. Brewster (D) asked participants what Congress could do to resolve the disputes between Maryland and the District over freeway links. Funk, Engineer Commissioner Duke, and Administrator Whitton suggested repealing the freeze on freeway construction in the northwest quadrant. The two Senators and Representatives in the meeting said they would consider legislation to reverse the freeze.

The highway officials also expressed doubts about the proposed Palisades Freeway, subject to the freeze, that would be presented to a public hearing later in the day. Whitton offered “a personal opinion” that he did not think that building an expressway would be possible parallel to the George Washington Parkway that NPS had under construction. [“Attack Considered On Freeway Freeze,” *The Evening Star*, December 10, 1963; Eisen, Jack, “House Vote Stirs Plans For Roads,” *The Washington Post and Times Herald*, December 11, 1963]

The Maryland-National Capital Park and Planning Commission had only recently begun considering the Palisades Freeway. Three weeks after ordering a study, the commission released a report on November 11 explaining that the county needed more than one entrance (North Central Freeway) to the District. The report said the \$11.4 million freeway would run from the Capital Beltway along the Potomac River from Cabin John Creek Valley west of Bannockburn, under MacArthur Boulevard, through and virtually erasing the old community of Glen Echo west

of the Glen Echo Amusement Park. The freeway would connect to the proposed Rosslyn-Georgetown bridge downstream from Key Bridge before linking with the Inner Loop.

Because the freeway would carry trucks, the route would be eligible for Interstate designation and 90-10 Federal-State funding. It also would remove the need for a freeway in the Wisconsin Avenue corridor. Funk, who had not read the report, said that J. E. Greiner, already studying the routing of the North Central Freeway, would also study the new proposal for a Potomac River entrance. [“Consultants to Review Palisades Freeway Plan,” *The Evening Star*, November 12, 1963; Eisen, Jack, “\$11.3 Million Palisades Freeway Outlined by Maryland Planners,” *The Washington Post and Times Herald*, November 12, 1963]

The *Post* summarized the December 10 public hearing by saying, “Montgomery County citizens, who have been building up steam against the proposed Palisades Freeway, gave the plan a tongue lashing yesterday.” The central criticism was that the freeway was not needed because it would parallel the George Washington Parkway. The critics rejected the commissioners’ explanation that the freeway was needed to carry the trucks that were banned from the parkway. The Potomac Valley League representing 14 civic groups pointed out that on the existing I-70S, trucks comprised 11 percent of traffic, but only 3 percent of the trucks would use the Palisades Freeway according to studies by the planning commission’s staff. Further, the freeway, if built, would result in “unthinkable congestion at the intersection where the Potomac Freeway will join the inner loop in the District.” A letter from NPS Director Wirth, introduced into the record, criticized the plan and favored the Wisconsin Avenue corridor.

The result, the *Star* indicated, was that the Palisades Freeway “appears to be scuttled.” Commission Vice Chairman Brewer said after the public hearing that he was “bloody and bowed.” He said he would support a proposal by Commissioner Caroline Freeland to revive plans for a routing along the western fringe of Rock Creek Park. [Tuck, Lon, “Palisades Citizenry In Arms Over Road,” *The Washington Post and Times Herald*, December 11, 1963; Segraves, John, “Palisades Interstate Route Appears to Be Scuttled,” *The Evening Star*, December 11, 1963]

On December 18, the Maryland-National Capital Park and Planning Commission adopted the Freeland resolution dropping the Palisades Freeway from its plans. To find an alternative route, the commission planned to work with the Maryland congressional delegation to end the freeze on freeway construction in the northwest quadrant. The resolution also urged President Johnson to ask for Stolzenbach’s resignation as NCTA Administrator. [“Major Planning Shifts Faced in Montgomery,” *The Evening Star*, December 18, 1963; Tuck, Lon, “Planners Drop Palisades Route,” *The Washington Post and Times Herald*, December 19, 1963]

The Maryland congressional delegation introduced legislation on December 18 to lift the northwest freeway freeze. It had been put in place in the expectation that construction of rail rapid transit would begin during that period and reduce or eliminate the need for freeways in the area. Citing House rejection of the bobtail plan, Senator Beall said, “Recent events foreshadowed great difficulty for any attempt to construct a rapid rail transit system in the District. We must therefore re-examine the effects of this freeze on highway planning.” With the Palisades Freeway rejected, the focus was on the North Central Freeway to carry I-70S traffic

into the District, but Senator Beall emphasized he was not specifically supporting that alternative, or even the lifting of the freeze. They wanted early hearings on the bill “to reevaluate the results of this highway construction ban, both in the District of Columbia and in our own State of Maryland.”

The Washington area, he said, faced critical transportation problems. As population and traffic increased, “the situation will worsen unless we have imaginative traffic and transit research and planning now.” He continued:

We need rapid mass transit and we need an expanded but sensible highway program. We are not likely to get either by restricting the highway and transit experts and denying them the tools they need to meet present and future transportation needs. [Eisen, Jack, “Bill Would Lift Freeze on D.C. Highway Jobs,” *The Washington Post and Times Herald*, December 19, 1963; “Bill Proposed to Lift N.W. Freeway Ban,” *The Evening Star*, December 18, 1963; Amendment of National Capital Transportation Act of 1960, *Congressional Record-Senate*, December 18, 1963, page 24949]

With a Potomac River entrance for the I-70S western leg remaining in doubt, those hoping for an eastern leg along the North Central Freeway faced doubts. BPR’s chief engineer, Francis C. “Frank” Turner, pointed out that BPR had not approved the North Central Freeway for I-70S. The decision on Interstate status depended on a study underway by the J. E. Greiner Company for the District and Maryland highway departments. Eisen wrote of Turner’s statement:

From the standpoint of Federal officials, one big question is whether interstate truck and auto traffic approaching Washington from the northwest [on I-70S in Maryland] ought to be diverted over the Capital Beltway from Pooks Hill, Bethesda, eastward to Silver Spring before heading southward into Washington. [Eisen, Jack, “Long Delay for Freeway Seen in Stalled Approval of 70-S,” *The Washington Post*, December 26, 1963]

As reflected in the Policy Advisory Committee’s report, the District was planning to mitigate freeway impacts by building some segments in tunnels, trenches, or elevated designs with joint use of the air rights above or below them for other desired community assets, such as buildings, playgrounds, plazas, and arcades. By year’s end, the District was working on such a plan for the Center Leg, although the city had not yet decided on the best occupants for the air rights. [Eisen, Jack, “Up in the Air,” *The Washington Post and Times Herald*, December 26, 1963]

The District received good news on December 30, 1963, when Representative Carl Vinson (D-Ga.) of the House Office Building Committee, agreed to a plan for building the Center Leg Freeway in the Third Street corridor in a tunnel further west of the Capitol and one block longer than originally planned. Representative Vinson said he would recommend the plan to the other members of the committee: Speaker of the House John W. McCormack (D-Ma.) and Representative James C. Auchincloss (R-NJ). With their support, they would introduce a bill authorizing the tunnel.

According to General Duke, Representative Vinson agreed to the plan the Sunday before Christmas after touring the site. The Engineer Commissioner said the agreement was “very

encouraging,” but several steps, including congressional approval, remained before design and construction could begin. [Flor, Lee, “Mall Freeway Tunnel Gets Vinson Approval,” *The Evening Star*, December 31, 1963; Eisen, Jack, “Inner Loop Mall Tunnel is Approved,” *The Washington Post and Times Herald*, December 21, 1963]

## D.C. Freeway Revolt and the Coming of Metro

### **Part 3** **The Citizens' Revolt**

From the 1940s through the early 1960s, the District's freeway plans were a source of battle among agencies. Citizen associations kept the pressure on the agencies to settle their debates, with many associations fighting to block the planned freeways.

By the end of the 1950s, citizen protests against urban Interstates were taking place around the country. The objections to each freeway were unique to the location, but had much in common from city to city. Homeowners did not want to lose their homes or neighborhoods. Business owners did not want to lose their livelihood. African Americans, still typically called Negroes, fought against efforts to divide their neighborhoods with freeways. In a period before Federal highway law authorized the "just compensation" called for in the Fifth Amendment of the Constitution, protesters hardened in their opposition.

How citizens protested differed based on geographic and income levels, as illustrated in Washington. George Lardner, Jr., in his new *Washington Post* "Potomac Watch" column, described the difference in December 1964 by describing citizen protesters in upper income northwest and lower income northeast Washington neighborhoods:

In the Northwest, protectors of the status quo use phone calls, first names, and chats at the country club.

On the other side of town, they use picket signs, jeers and letters of protest.

[Lardner, George, Jr., "The Game in Upper Northwest," Potomac Watch, *The Washington Post and Times Herald*, December 28, 1964; the column was originally called "Watch on the Potomac."]

(*Post* editors had asked staff reporter Lardner, who covered national and local topics, to write a 5-day-a-week column on urban affairs involving the District, Maryland, and Virginia. His columns began on December 21, 1964, and provided interesting sidelights and insights into the news of the day, and will used for that purpose in this history of the Washington area's transportation battles. The first column, to be discussed later, was about the North-Central Freeway. Lardner continued the column through January 1966, but finding it too confining in subject matter, returned to general reporting. The *Post* continued the column with other reporters.]

Roadbuilders fought back with public relations campaigns on the theory that if people understood the benefits they would gain when the urban Interstate networks were complete, supporters would drown out the critics. However, the growth of the environmental movement accelerated after publication of Rachel Carson's *Silent Spring* (1962), in which the author demonstrated how human action, such as deploying chemicals, affected the environment. The revitalized movement, previously focused on conservation, gave critics a new front to oppose highways. At the same time, the Civil Rights Movement was shaking the established order, increasing opposition to freeways through minority neighborhoods, and providing a template for anti-

highway protests. Soon, protests against the Viet Nam War, added to the growing acceptance of fighting governments – and the view they were not telling the truth.

In the view of the impassioned citizens and other critics, freeways could not be improved. They had to be stopped. The ideal alternative was rail rapid transit focused on subways.

In the District, with its built-in network of official critics, the battles continued as public objections escalated.

### **The Pressure of a Deadline**

President Eisenhower had proposed a program based on issuing bonds to pay upfront for completion of the Interstate System in 10 years. Congress, opting to employ highway user tax revenue credited to the new Highway Trust Fund on a pay-as-you-go basis, authorized Interstate construction funds through FY 1969. Those final funds would remain available through FY 1971 – the intended final year of the program. The goal was to apportion the funds on a needs basis to complete the Interstate System in every State around the same time at program's end.

The Federal-Aid Highway Act of 1961 authorized additional funds for Interstate construction through FY 1971, with the funds to remain available for expenditure through FY 1972. As a result, BPR and State highway officials were well aware that 1972 was the program's deadline.

Administrator Whitton made the deadline clear to State highway officials during his address to the annual meeting of AASHO in December 1962. The half-way point in the Interstate program, he said, was 1964. Therefore, he challenged the assembled State highway officials to get at least 50 percent of the 41,000-mile Interstate System open by the end of that year. With 13,100 miles open (including 2,300 miles of toll facilities incorporated into the System) and 4,900 miles under construction, he considered the 50-percent completion goal attainable.

Whitton urged State highway officials to focus on “those projects that will link up continuous, long route sections, especially those connecting the larger cities.” Those segments not only would make big contributions to achieving the 50-percent goal by the end of 1964, but would “best demonstrate to the public the benefits of the system,” including time saved and improved safety.

Whitton made the point again when he addressed AASHO in October 1963:

We have a task before us—a task which is definite in its scope—a task which lends itself to orderly accomplishment if approached under an orderly program . . . . I believe every State can do it. But those States which fail to finish on time may well face what in effect amounts to a financial penalty. If only the ABC Federal-aid program continues after 1972 [referring to funds for the Federal-aid primary, secondary, and urban systems], the uncompleted parts of the Interstate System will have to be finished with 50-50 matching Federal-aid, instead of 90-10.

Even if the Congress provides for some sort of extension of the Interstate System program after 1972, it may well be at less than the 90-10 matching ratio. It might be 70-30, or 60-

40 as it was [for Interstate projects] just before the 1956 Act. Certainly it is quite possible that Congress may not see fit again to offer 90 percent Federal aid. So work not completed under the existing law may have to be built under a program with less favorable financing arrangements at the State level. The best insurance against this happening, of course, is to finish this program on schedule.

Whitton estimated that the final construction contracts must be awarded during 1970, at the latest, to ensure 90-percent reimbursement as late as 1972.

As Whitton had testified during congressional hearings in 1963, the District did not have any “continuous, long route sections.” Its nearly 29 miles of designated Interstates included only short sections. As of the end of 1963, the status of the District’s Interstate network was:

- Engineering or right-of-way: 3.3 miles
- Under construction: 5.6 miles
- Improved to standards adequate for present traffic: 1.9 miles
- Completed to full or acceptable standards: 2.4 miles
- Preliminary status or not yet in progress: 15.4 miles.

[“Improvement Status of System Mileage as of December 31, 1963,” Table I, Quarterly Report on the Federal-Aid Highway Program (as of December 31, 1963), news release, Bureau of Public Roads (BPR 64-9), February 7, 1964]

The city’s longest route, I-95, was 8.9 miles long, but the Southwest Freeway was the only open segment. The Southwest Freeway was instructive. As part of redevelopment of the southwest quadrant, the District had removed longstanding lower-income, minority neighborhoods. The mass clearance left room for the Southwest Freeway without protests from citizens who already had been uprooted or businesses that had been torn down.

Much of the mileage that was not open or in an active status was controversial. The District had no choice but to plan on building this mileage in the midst of populated, close-knit District neighborhoods that did not want to be disrupted. Nevertheless, these segments, too, were subject to the completion date specified by Congress.

### **Farewell to Harold L. Aitken**

On November 19, 1963, Harold L. Aitken announced his plan to retire on December 20:

A person in public life with a job like mine inevitably meets with resistance from various groups and I consider that it would be in the best interest of the District to retire and let a new man come in. I hope, for the sake of the city, it can resolve the transportation situation because if it doesn’t it is going to be in trouble.

Aitken was 55 years old, having met the retirement age in May, but he could have remained in the position for many years. (The mandatory retirement age was 70.) He said, however, that now was “an opportune time” to step down. He did not say so, but observers in the District Building and reporters interpreted his decision as being a result of frustration. He told reporters,

“It’s just a combination of things. At best, this job isn’t an easy one in terms of winning friends and accomplishing objectives.”

Engineer Commissioner Duke called Aitken’s departure “a great loss to the District.” He added, “He is a very strong, experienced man. I’m wondering how we’re going to fill the gap.” He had not yet begun the search for a new Director. [Schuette, Paul A., “Aitken Resigns as Chief of D.C. Highway Dept.,” *The Washington Post and Times Herald*, November 20, 1963; “Aitken Plans to Retire As D.C. Highway Chief,” *The Evening Star*, November 19, 1963]

A *Star* editorial referred to Aitken as “an able, conscientious highway director” and said his loss at this critical time “is regrettable.” The editorial reflected the widespread view of why Aitken was retiring:

Obviously he is discouraged . . . by the series of political stalls and setbacks which have brought the freeway construction program to a virtual standstill. And we suspect, although he had nothing to say about it, that the final straw was the recent agreement by the President’s Policy Advisory Committee on the Three Sisters Bridge and the inner loop freeway.

The editorial acknowledged that the goal of the advisory committee was “to overcome political objections, and to minimize the disruptive impact of the highways.” However, studying the new location for the bridge, between Key Bridge and Roosevelt Island, meant further delay. This did not mean “the highway program is going down the drain”:

If the modifications do not pan out, however, these projects will still have to be built, perhaps as they were proposed initially by the Highway Department . . . . This is the point on which the Commissioners, as the policy makers of the city, must not waver.

More than ever, they will “need a strong highway director on whose judgment they can rely to make the right decisions.” [“Mr. Aitken Departs,” *The Sunday Star*, November 24, 1963]

Aitken left office on December 7, having taken “terminal leave” until his official resignation on December 20. Jack Eisen visited Aitken in his office:

Aitken plucked a collection of plaques and awards from the walls of his office, put a few final papers in the out-basket of his uncluttered desk and departed Thursday on terminal leave before taking a new, as-yet-unannounced job.

His friends, Eisen wrote, were not surprised by his departure:

They report that events of the past several months pushed him beyond the boiling point. Some break seemed inevitable.

The big explosion was over freeways and rapid transit. Aitken, who believes with an evangelistic fervor in the benefits of urban freeways, was indignant at suggestions that roads be curtailed to benefit rail rapid transit patronage.

He had little patience with the generalization that freeways, being disruptive, are bad. Failure to build modern roads, he feels, would bring economic stagnation to Washington as surely as building a wall around it.

Like many observers, he was concerned by how the city was governed. Authority and responsibility were scattered among agencies that answered only to the President, who had other things on his mind for the most part:

Aitken's friends say it was not restraints as such that triggered his ultimate frustration, but the uncertainties and interminable bickering invited by the labyrinthine organization.

Of course, he had critics:

Aitken's critics reply that the retiring highway director had too great a sense of his own rightness, was given too frequently to seeking speedy approval for fragments of a program without fitting these into a meaningful pattern.

The pending issues might have been resolved if not for NCTA's decision to oppose the Three Sisters Bridge and downgrade the North Leg of the Inner Loop Freeway:

But NCTA found firm friends at the White House. The late President Kennedy's endorsement of its transit program and his order that the disputed interstate links be restudied muffled official criticism. A new District Engineer Commissioner, Brig. Gen. Charles M. Duke, was reportedly given clear orders on the subject.

Duke's first major task was to preside over sessions of the special, top-level restudy panel. It recommended a bridge in a new location and the maximum possible use of tunnels for the Inner Loop's North Leg.

His friends say Aitken felt that the new bridge scheme created more problems than it solved, and that the panel's inconclusive language on the North Leg was an invitation to protracted bickering.

A week later, he announced his resignation. "The job will be hard to fill." The District lost "a skilled highway builder, a precise engineer, a hard-working department administrator":

What is needed is someone who is all these things—and, unlike Aitken, a diplomat, a political operative and an image-maker as well. [Eisen, Jack, "A Man and His Frustration," *The Washington Post and Times Herald*, December 8, 1963]

Aitken's deputy, 57-year old Thomas F. Airis, was named Acting Director of the District Highway and Traffic Department.

On February 14, General Duke announced that after considering 76 applicants, the Board of Commissioners had chosen Airis to be Director. The commissioners "place great importance on getting along with other agencies," and they concluded that the soft-spoken Airis was "exceptionally skillful" in that regard. As acting coordinator for District mobilization in snow

emergencies, Airis had experienced three “pretty good snows” to deal with. “He’s done such a fabulous job,” General Duke said with a smile, “I kind of hate to take it away from him.

Airis, a native of Eau Clair, Wisconsin, graduated with a civil engineering degree from the University of Wisconsin. In 1929, he became a civilian employee of the U.S. Army Corps of Engineers in Detroit, but was called to active duty with the Corps in World War II and the Korean War. He met his wife, Marcia Morse, while in charge of rehabilitating the road network of northern Greece. He, his wife, and three children lived at 10119 Gary Road in Potomac, Maryland.

After working on the U.S. section of the St. Lawrence Seaway, Airis joined the District’s Department of Highways and Traffic as deputy director in 1959. Like Aitken, Airis was pro-highway, but in an interview after the announcement of his promotion to Director, he said he believed strongly in comprehensive transportation planning. Bus usage should be encouraged, he said, and as for rail transit, “I don’t think that’s up to me.” The District’s highway program was “predicated on a mass transit program, and if there isn’t going to be a rapid transit program, something’s got to be done about beefing up in other quarters.” [Flor, Lee, “Airis Named Director of District Highways,” *The Evening Star*, February 14, 1963; Eisen, Jack, “Airis Promoted to Highway Chief; Backs Over-All Transit Program,” *The Washington Post and Times Herald*, February 15, 1964]

On April 8, Airis announced that Richard Dana Wallace would be the new Deputy Director. Wallace, who had been chief of construction and maintenance since 1959, was a native of the District, having graduated from Western High School and received a civil engineering degree from George Washington University in 1941. He lived in McLean, Virginia, at 205 Guilford Court. [“Road Director Names Deputy,” *The Washington Post and Times Herald*, April 9, 1964]

## **A New President**

The presidential election year of 1964 had begun on a promising note for those hoping the freeway and rail transit battles could finally be resolved. On January 21, 1964, President Johnson sent his annual message to Congress on the District of Columbia’s budget. The section on transportation began:

The Administration and the Congress have been wrestling with the transportation problems of the District for many years. While some progress has been made, I hope for further progress during the coming year.

A major barrier had been surmounted, he said, when the District Commissioners accepted the Policy Advisory Committee’s November 1963 recommendations for “an additional central city Potomac River crossing and an interstate connection making maximum use of tunneling across the north central part of the District.” President Kennedy had accepted the recommendations “and they likewise have my approval.”

While location and design remained to be worked out, the breakthrough justified inclusion of funds in the budget for “major additional segments of the urgently needed Interstate System in the District.” The need was, indeed, pressing:

The financing of the construction of the Interstate System requires immediate attention. The System must be completed by 1972.

To meet growing needs, President Johnson proposed a loan authorization for the District’s highway fund of \$35 million in addition to the \$50.2 million already authorized. He also supported the District commissioners’ plan to request approval of a penny increase in the city’s 6-cent gasoline tax to provide \$2 million annually, “a sum sufficient to retire the \$35 million loan in 30 years.”

The FY 1965 proposal called for a District highway construction and planning budget of \$14.5 million. With a Federal matching share of \$48.4 million, the District’s highway construction outlay would be \$62.9 million. The budget included funds for:

- Planning to put 14<sup>th</sup> Street in a tunnel or depressed expressway under the National Mall – District share: \$300,000/Federal share: \$300,000.
- Planning to replace the superstructure of the 14<sup>th</sup> Street Bridge to handle reversible lanes on Shirley Highway - \$30,000/\$270,000.
- West section, North Leg Freeway - \$597,000/\$5,373,000.
- Central section, North Leg Freeway - \$80,000/\$720,000.
- East section, North Leg Freeway - \$423,000/\$3,807,000.
- Center Leg Freeway - \$1,450,000/\$13,050,000.
- North-Central Freeway - \$300,000/\$2,700,000.
- Georgetown-Rosslyn bridge - \$250,000/\$2,250,000.
- East Leg Freeway - \$1,000,000/\$9,000,000.
- 9<sup>th</sup> Street Expressway - \$2,200,000/\$3,000,000.
- Intermediate Loop - \$1,700,000/\$1,700,000.
- 11<sup>th</sup> Street Bridge - \$165,000/\$1,465,000.

After more than 10 years of study, President Johnson said, the problems of providing rail rapid transit had not yet been resolved. After all this study, what was clear was that “such a system is a critical necessity if intolerable traffic congestion is to be avoided.” He was certain that Congress agreed:

The recent recommittal of H.R. 8929 to the House District Committee demands a redoubling of efforts to find an acceptable program which will permit a transit development plan to proceed. I have instructed the National Capital Transportation Agency, together with other Federal agencies, to work with affected local jurisdictions to that end. I am confident that the Congress agrees on the need, and I trust that an acceptable program can be formulated at this session of the Congress.

His message concluded:

A comprehensive transportation system must, of course, be the result of joint efforts between the District and its neighboring jurisdictions. Indeed, the Congress has conditioned continuing Federal assistance in highway development in urban areas after mid-1965 on the existence of such cooperation. Many other local problems, too, extend beyond the District's boundaries, just as many problems in the suburbs cannot efficiently and economically be solved without the full cooperation of the District. I intend to give my full support to the development of cooperative efforts to meet these regional problems and to provide for the orderly development of the National Capital Region.

While encouraging Congress to advance rapid transit legislation, President Johnson proposed cutting NCTA's budget in half. Officials of NCTA could not say, initially, how the cut would affect the agency's staff of about 60. [Flor, Lee, "Johnson Indorses Rapid Transit Here," *The Evening Star*, January 21, 1964; "President Backs Gasoline Tax Boost," *The Washington Post and Times Herald*, January 22, 1964]

(President Johnson also called for construction of a building for the Housing and Home Finance Agency, which at the time was scattered among several buildings. The building would be located at 7<sup>th</sup> and D Streets in the redeveloped southwest quadrant of the city. The President also recommended creation of a Department of Housing and Community Development, his version of President Kennedy's Department of Urban Affairs and Housing, an idea that Congress had not supported.

(On September 9, 1965, President Johnson signed the Department of Housing and Urban Development Act, creating the new department. It would move into the building the President had recommended for the housing agency at 451 Seventh Street, SW., across the street from the privately owned building that would be the rented headquarters of the U.S. Department of Transportation by the end of the decade. ["Johnson Asks Better, Fewer New Buildings," *The Evening Star*, January 21, 1964; Horner, Garnett D., "President Asks Cabinet Post For Housing," *The Evening Star*, January 21, 1964])

On April 14, 1964, Administrator Whitton confirmed the following District routes and descriptions for ICE purposes:

66 – From the District of Columbia-Virginia line eastward via the Theodore Roosevelt Bridge crossing of the Potomac River to a junction with FAI Route 695, thence northward and eastward to a junction with FAI 95.

70S – From the District of Columbia-Maryland line to a junction with FAI Route 95.

95 – From the District of Columbia-Virginia line at the south end of the 14<sup>th</sup> Street Bridges northeasterly to the District of Columbia-Maryland line enroute to Baltimore.

266 – From the District of Columbia-Virginia line in the vicinity of Key Bridge to a junction with FAI 66.

295 – From the District of Columbia-Maryland line in the vicinity of Oxon Run northward to a junction with FAI Route 695, thence easterly and northerly to a junction with FAI Route 95.

495 – On the Woodrow Wilson Bridge from the District of Columbia-Virginia line to the District of Columbia-Maryland line.

695 – South leg of Inner Belt from FAI Route 66 at the east end of the Theodore Roosevelt Bridge, to FAI Route 295 in the vicinity of 11<sup>th</sup> Street, SE., excluding the portion coincident with FAI Route 95.

This list adopted the routing of I-70S on the North-Central Freeway from the District line to the link with I-95 (Northeast Expressway). The two routes would follow the same freeway from the link to the Inner Loop.

By August 1, 1964, the District had to turn in an estimate of the cost to complete the remaining mileage for BPR's 1965 ICE. BPR could drop routes it did not believe could be completed on time. District officials, therefore, had to convince BPR to leave the controversial segments in the ICE, and then had to overcome the many obstacles to beginning construction by 1969.

### **Chairman Natcher's Concerns About Decisionmaking**

Chairman Natcher had been concerned by NCTA's November 1, 1962, report to President Kennedy. The routes NCTA wanted to abandon were part of the Interstate System and as such, he thought they should be built.

As Congress got back to business in 1964, Chairman Natcher began hearings on the District's appropriations act for FY 1965. On February 5, Engineer Commissioner Duke, Director Airis, and other highway officials appeared before his subcommittee. Near the start, Chairman Natcher said he knew that at some point, Airis would bring up matters involving the freeway system:

As you have heard me say on more than one occasion, that certainly I am against any program that has for its purpose the stopping of our highway program in the District of Columbia. For some 3 years now I have believed that any program that attempted to do this would fail.

Although he believed the District of Columbia needed rapid transit and the present highway program, he was not surprised when the House rejected the bobtail plan 2 months earlier. "I thought it was a serious mistake to proceed as they proceeded." He did not blame the District's highway officials. "As you know, it pertained to those in the other groups and agencies, and I thought the action of the House of Representatives was correct."

Airis summarized the status of key freeway segments:

- Theodore Roosevelt Bridge and approaches: construction was underway with completion "no later than mid-1964." Initial service would be limited to connections with Constitution Avenue and the George Washington Parkway. "The additional service will

have to await completion of our E Street Expressway, which is now under construction and is scheduled for opening in late 1965, together with the remaining Virginia connections.”

- Potomac River Freeway: North of the Roosevelt Bridge, construction was underway on the G Street Tunnel. When it is completed in early 1966, it will provide a connection with the Roosevelt Bridge complex to the north. Another portion of the freeway, including its K Street interchange, was under construction. Major work would be finished in late 1964, with additional contracts needed to complete the facility.
- Central Potomac River Bridge: This name referred to the successor of the Three Sisters Bridge. In accordance with the Policy Advisory Committee’s recommendations, the District and Virginia had concluded arrangements with a consultant to study the new location. “Two locations are being studied, one above and one below Key Bridge, and we are optimistic now about moving the project off ‘dead center’ soon after our study is completed.” Airis added, “We think we will.”
- South Leg of Inner Loop: The South Leg included a tunnel under the Lincoln Memorial grounds, a center section that contained a tunnel in the Tidal Basin area, and an interchange on the eastern end with the 14<sup>th</sup> Street corridor and the Southwest Freeway. NPS and BPR, which were responsible for the western and central segments, were preparing PS&E documents to advertise for bids. The city was responsible for the interchange, which was “practically designed.”
- Center Leg Freeway: The Board of Commissioners had approved a design for the Center Leg between Constitution and Massachusetts Avenues, NW. With tentative congressional approval of a tunnel under the Capitol and U.S. Botanic Garden grounds, the city now had an acceptable plan for tunneling under the Mall. “As a result we have now targeted design for the entire section north of the center leg all the way to Massachusetts sometime this year.”
- Southwest Freeway: Completed and put in operation as far as South Capitol Street, including the Center Leg connection.
- Southeast Freeway: Construction was underway as far east as 6<sup>th</sup> Street, SE., with completion by mid-1964. Temporary ramps were to be provided for the street system until the city could complete the freeway beyond 6<sup>th</sup> Street.
- Interchange “C”: A study was underway for a modified interchange and connections to the Sousa and 11<sup>th</sup> Street Bridges. The goal was to begin design and preparation of the PS&E in the spring. “Construction should begin next year.”
- Anacostia Freeway: On the east side of the river, the freeway connects the Baltimore-Washington Parkway with the Capital Beltway at the District’s southern border via the Kenilworth interchange. “It will syphon off a sizable percentage of through traffic, including truck traffic that now traverses the Washington streets, particularly Third Street just west of the Capitol. The freeway was in use between the Naval Air Station and the Pennsylvania Avenue interchange. “The main facility will be opened for use by mid-1964.”
- 11<sup>th</sup> Street Bridge: Construction was underway on the first of a pair of spans. When it opens in late 1964, work would immediately begin on the second structure.
- East Leg of the Inner Loop: Negotiations with a consultant were concluding for a route study along the west bank of the Anacostia River. “The study is targeted for completion

by the end of this year, with the intention of moving to public hearings and design stages in early 1965.”

- Northeast North-Central Freeway: A consultant study was nearing completion. The city hoped to have a recommended plan in the spring for presentation during a public hearing and NCPC review. “We plan to be able to start design by mid-1964.”
- North Leg of the Inner Loop: In accordance with the Policy Advisory Committee’s recommendations, the District was preparing a scope of work for a planning study for the west segment. “Studies will be targeted for completion by the end of 1964, with the expectation of securing approval rapidly thereafter, so that we can proceed to design by early 1965.” [District of Columbia Appropriations, 1965, Hearings on H.R. 10199 Before Subcommittee of the Committee on Appropriations, U.S. House of Representatives, 88<sup>th</sup> Congress, 2d Session, 1964, pages 719-725]

After covering other activities, Airis discussed the status of Interstate completion. He estimated total program costs to be in the neighborhood of \$457 million. To date, the city had obligated \$122 million in Federal-aid Interstate funds, instead of the \$359 million it should have obligated for steady progress to the deadline. He reminded the subcommittee of BPR’s decision that any projects not started before the 3-year period before the 1972 endpoint would not be eligible for 90-10 Interstate funds. “This means that in order to complete the Interstate System on schedule, we must obligate interstate funds at an annual rate of approximately \$58 million per year.”

Chairman Natcher asked if any of the delays in the past 3 years put Interstate routes in jeopardy. He wanted to be sure the city had “no chance of losing any part of our program as a result of the time delay.” Airis replied, “It will be difficult.” Some jobs needed to get started very soon:

The only thing that will hold us up, sir, is in the decisionmaking field. The ordinary engineering planning, the engineering design, the engineering construction can all be completed in the time that is allotted. We have I think about 8 years yet.

Chairman Natcher asked if Airis was referring to the Three Sisters Bridge. “Yes, sir.” Was time of the essence? “That is correct, sir.”

General Duke said that whenever a serious problem affects the basic decision, such as whether to build the bridge, “a considerable amount of time can transpire before that affirmative decision is reconfirmed.” The analysis and reanalysis of the bridge illustrated the problem, as did design of the North Leg to include tunneling. He discussed the ongoing negotiations with “all of the responsible elements” and advised that, “At least, we are in agreement that the facilities should be built”:

So it is a matter of reaching agreement, by negotiation as it were, and reaching a consensus as to these particular matters. We are confident now that these decisions can be reached, and in a minimum of time, because a lot of time can be lost in the process.

Chairman Natcher said, “The committee is delighted to know that you are proceeding to stay within the time limit, so that we can construct this all-important system here in the District of Columbia.”

Airis wanted to reassure Chairman Natcher by explaining why he was confident of completion on schedule. First, “the basic differences in the elements of the interstate system appear to have been resolved.” Planning studies could proceed to completion, followed by a logical and orderly process to construction.

Second, the city was cooperating with other local jurisdictions to establish the 3C planning process the Federal-Aid Highway Act of 1962 had required. “This should insure community consensus and agreement and tend to avoid the kind of controversy that has slowed down our program in the past.”

Third, congressional approval of pending legislation to provide relocation services and assistance as well as to allow the use of air rights would help the District “implement our right-of-way and construction programs, and to provide a fresh and imaginative use of air rights for housing, office buildings, and recreation facilities over and under our freeways.”

Finally, the city was “using up-to-date advance scheduling techniques, the latest in electronic computer equipment” that would allow the city to “aggressively prosecute the forthcoming design, right-of-way, and construction phases to ensure the successful completion of our program.” [pages 728-730]

When General Duke referred to the “responsible elements,” he had in mind those with authority in the review process. President Kennedy had endorsed the freeway plan in November, as had President Johnson in January, leaving responsible elements to work out the details of how to build the approved freeway network. The collapse of the bobtail plan in the House was a separate matter, but with the future of rail rapid transit in doubt, the highway network was more important than ever.

### **Congress and the Center Leg**

Although Congressman Vinson had approved the plan to build the Center Leg tunnel under a section of the Capitol and U.S. Botanic Garden grounds, formal congressional action on legislation was needed. On January 14, 1964, the House Office Building Commission approved the plan. The next step was for General Duke to work with Architect Stewart on legislation authorizing the tunnel to traverse a small portion of the grounds. Construction would be by cut-and-cover tunnel. North of the tunnel, District officials were still studying the path, with a goal of relocating and narrowing the right-of-way to avoid Holy Rosary and Bible Way Churches. [Eisen, Jack, “House Group Approves Freeway’s Mall Tunnel,” *The Washington Post and Times Herald*, January 15, 1964]

On April 7, 1964, the House Subcommittee on Public Buildings and Grounds held a hearing on H.R. 10392, authorizing the District to locate a portion of a vehicular tunnel under the Capitol and U.S. Botanic Garden grounds. Only two witness panels testified. The first panel consisted of Architect Stewart and associates. Stewart stated that the bill “meets with my endorsement.” Representative Auchincloss confirmed that the House Building Commission “thoroughly approves of this plan.”

General Duke and Director Airis comprised the second panel. After summarizing the history of the Center Leg, its status as part of the Interstate System, and delays in securing approval of the tunnel, General Duke said the bill represented a solution “that does not depreciate the vista of our Nation’s Capitol, and yet still provides the essential traffic service needs within the bounds of engineering feasibility and economy.” After additional discussion of the routing, the hearing ended. [Vehicular Tunnel Under U.S. Capitol Grounds, Hearing before Subcommittee on Public Buildings and Grounds, Committee on Public Works, U.S. House of Representatives, 88<sup>th</sup> Congress, 2d Session, April 7, 1964]

The Committee on Public Works approved the bill on April 27, 1964. The House considered the bill on June 3, approving it without a recorded vote after brief comments from committee members. [Authorizing the Commissioners of the District of Columbia to Locate a Portion of a Vehicular Tunnel Under Parts of the U.S. Capitol Grounds and the U.S. Botanic Garden Grounds, Report on H.R. 10392, Committee on Public Works, U.S. House of Representatives, 88<sup>th</sup> Congress, 2d Session, Report No. 1348, April 27, 1964; Vehicular Tunnel Under U.S. Capitol Grounds, *Congressional Record-House*, June 3, 1964, pages 12504-12505]

In the Senate, the Subcommittee on Public Roads, Committee on Public Works, held hearings on the Federal-Aid Highway Act of 1964 in May 1964. When General Duke and Director Airis testified on May 20 regarding the 1964 Act, subcommittee members asked about the tunnel. General Duke emphasized that the tunnel would maintain the vista of the Capitol while accommodating essential traffic service. It would be a key segment in the I-95 freeway from Maine to Florida, was consistent with areawide planning, and had been cleared by the Architect of the Capitol.

Senator Lee Metcalf (D-Mt.) asked about recent concerns that the District might not have enough local matching funds for the project and that the city’s highway program “faces a complete collapse” as a result. General Duke said that Congress was considering legislation to increase the District’s gas tax and bond authority for the city’s highway fund. However, “if this [tax] legislation is not enacted, this project . . . could be in jeopardy.”

Senator John Sherman Cooper (R-Ky.), the ranking member of the subcommittee, asked a series of questions about the Inner Loop. Does it circle the Capitol? Yes, but in a much larger circle. Has BPR approved it? Yes. Do the District commissioners support it? They do. How long is it? 16 miles. What is the estimated cost? \$340 million.

Would all of it be above ground except the portion under the Capitol grounds? Not necessarily. The Policy Advisory Committee had recommended putting as much of the North Leg as possible in tunnels. Then it has not yet been determined which other parts will be underground? Correct, since the part that is still in the study stage may be underground at least in part.

Senator Cooper recalled the statement that there was no objection to the project. He asked if any people in the way of the Inner Loop had objected. General Duke clarified that he was referring only to the segment that would go under the Capitol grounds. Objections had been raised to several other segments of the Inner Loop, including the Three Sisters Bridge and the North Leg.

Senator Cooper asked about the Policy Advisory Committee's conclusions, which General Duke summarized.

Did the city have letters of support from the National Gallery of Art, the U.S. Botanic Garden, and the Architect of the Capitol. The city had a letter from the National Gallery, while a letter from Architect Stewart covered the Capitol grounds and the portion of the U.S. Botanic Garden involved in the project.

Next, Senator Cooper requested details on the tunnel, such as its width (varies from 170 to 270 feet), how far below ground (not closer than 8 feet to the surface), and whether there would be fumes. "There will be fumes," Airis replied. "It will have quite a large ventilation system which can be located at either portal, or at one portal, we do not know yet." Will the fumes be blown around the Capitol Grounds?" No, Airis replied, because the fumes "would discharge up into the air. We probably will have the ventilating station as a part of some building on either the north end or down at the south end and I doubt if you would notice it in the area here at all."

What about noise? There would be noise in the tunnel, Airis said, but "I doubt if you would hear it outside at all." What was the purpose of the Inner Loop. The purpose was to "provide a distribution system for traffic . . . so that [motorists] will not use and clog up the existing street system."

Senator Cooper then made clear why he had asked such detailed questions. He understood the need for a tunnel "in an area where the traffic is as great as it is here," but he was not sure BPR had approved the plan. "Nevertheless in view of the fact that there have been objections to the proposal, I would hope that the committee would have the chance to get the testimony of other people including the Bureau of Public Roads." He added:

It seems that there is more and more encroachment upon the grounds of the Capitol as if everybody tried to get on it, or go underneath it. We still do not have testimony on its need and I believe that it is necessary for us to get the advice of other bodies.

For example, he asked if the Commission of Fine Arts had approved the plan. No, General Duke said, the city would not submit the plan to the commission until the tunnel segment had been designed. In that case, why was the District before this subcommittee without having secured needed approvals? General Duke tried to make clear that the bill the District was seeking covered only the portion of the Center Leg that would go under the Capitol Grounds. The Center Leg had already been authorized and was not up for review under the pending bill.

Senator Cooper had to attend a hearing of the Rules Committee, but ended his questioning by saying the subcommittee should hear other testimony on the subject. "I am not reassured by the statements now." Senator Metcalf, chairing the hearing, said he agreed. [Federal-Aid Highway Act of 1964, Hearings for the Subcommittee on Public Roads, Committee on Public Works, United States Senate, 88<sup>th</sup> Congress, 2d Session, May 1964, pages 71-81]

Senator Hiram L. Fong (R-Hi.), who apparently was not familiar with the subject, asked what had happened to the funds appropriated for this segment of the Center Leg in prior years. “We have not used it,” Airis replied, pending the legislation under review during the hearing.

Senator Fong asked about the purpose of the Inner Loop, which Airis explained using a map. What would happen if the Center Leg were not built? Traffic would continue to be distributed on city streets at C and 2d Streets, SW. Are there any alternatives to the Center Leg? “We are so far along that it is almost a must.” Airis added that, “other alternatives could conceivably be used, but this is certainly the logical one.”

Did the plan involve “a subterranean loop under the Capitol”? General Duke explained that the tunnel would be under only a portion of the Capital grounds, not the Capitol building. Are you asking for permission to go under the Mall and complete all other elements of the Inner Loop? The legislation covered only the section of the Center Leg that would be built under the Capitol grounds, not any other segments. “The reason we are here is to receive your permission to trespass on Capitol Grounds.” [pages 81-84]

Senator Randolph concluded the questioning of the District panel by asking about the status of Interstate completion in the city compared with the States. General Duke said, “I would say just in very general terms that we probably rank 48<sup>th</sup> or 49<sup>th</sup> out of the States in terms of scheduling and prosecution of this very important interstate highway program.” With the 1972 deadline looming, “we must prosecute all elements of it as fast as we can.” He estimated that the District had committed only 30 percent of the Interstate funds it would receive for its entire network (roughly \$125 to \$130 million expended out of about \$500 million):

- 17.1 miles – preliminary status, not yet in progress
- 2.8 miles – under engineering or right-of-way acquisition
- 6.1 miles – under construction
- 8.9 miles – total underway
- 1.9 miles – open to traffic to standards adequate for present traffic
- 4.1 miles – total open to traffic out of a total designated mileage of 30.5 miles

Senator Randolph referred to the congestion today in a city that “is perhaps growing at a rate comparable to the States of California, Florida, Arizona, and other such areas of the country.” Congestion bottlenecks would only get worse. “All we need is to listen to our radios in our cars as we drive to Capitol Hill from our residences, listen to the helicopter reports to understand the flow of traffic into the District and, of course, out of the District at night, to understand that we need, and need now, a further development and expansion of the necessary arteries for motor transportation.” General Duke agreed with those sentiments. [pages 84-85]

On May 21, General Prentiss testified before the subcommittee about the proposed Federal-Aid Highway Act of 1964. At one point, Senator Randolph asked General Prentiss, in view of his former service as Engineer Commissioner, to comment on the Center Leg bill. General Prentiss said the Inner Loop occupied “a relatively large area due to the fact that Washington has, because of height limitation, the biggest central business district for a city its size in the United States.” As a result, the Center Leg was essential:

Otherwise, people will not utilize the belt when they want to go from Southwest to Northeast. But the center leg will take care of that traffic and be the shortcut from the Southwest to the Northwest and from there to the Northeast.

Further, the Center Leg would take traffic off the Capitol grounds and eliminate congestion in its vicinity.

Senator Randolph asked if the tunnel would enhance the Capitol area by removing traffic from ground level. Yes, General Prentiss replied, it would be “a great aid” to removing traffic that does not have a reason to be on the Capitol grounds. He suggested that if the Senators wanted an idea of what the tunnel would look like, they could go to the 12<sup>th</sup> Street tunnel under the National Mall “and that will give a fine example of the kind of structure which will be built to tie in the Southwest Expressway with the Northwest Expressway.” [pages 127-128]

### **The District’s Funding Deficiency**

On May 18, 1964, Chairman Whitener held hearings of his House District Subcommittee on financing for Federal-aid and local highways. The bill under consideration, H.R. 11022, would increase the loan authorization by \$35 million (to \$85.25 million) for construction of District highways and increase the city’s motor vehicle fuel tax by 1 cent a gallon (to 7 cents).

City officials, including Commissioner Tobriner, General Duke, and Director Airis, were the only witnesses. They testified about the District’s financial crunch. The District, Airis said, had “fallen behind” schedule on completion of the Interstate System. General Duke estimated the District would need \$28 million in matching funds for its 10-percent share of Interstate projects over the next 6 years, plus \$27 million for other Federal-aid highways and \$23 million for local streets. “Funds are not available under current revenue authority to continue these programs beyond fiscal year 1965.” To meet needs, the city needed a transfusion of \$61 million over the next 6 years. The situation at this point was dire, as Airis told the subcommittee:

Starting in 1966, the District of Columbia would have to abandon the completion of its portion of the interstate system and would fail in its obligation to the President and to the Congress. Such action may require a refund of substantial Federal-aid dollars to the Bureau of Public Roads, if the Bureau determines that current interstate projects would have to revert to the ABC category. This would place the District of Columbia in a most serious financial plight.

Beyond the Interstates, the city would have to halt work on “the complementary supporting system of expressways, major arterials, and local streets.”

Airis summarized the history of highway planning in the District dating to the 1950 comprehensive plan of the National Capital Regional Planning Commission. As for the present, he said:

I would like to point out that all current highway planning for the District of Columbia is based on the assumption that a greatly improved mass transit system, such as the one

proposed by the National Capital Transportation Agency in its November 1, 1962, report, will be in place and will attract the number of transit riders estimated by that agency.

At this point, the city was behind BPR's schedule:

With such a timetable, at least half of our program should be under contract by now. However, because of recent planning delays and radical changes in Federal fund availability over the last few years, we have thus far only obligated about one-third of our interstate program.

Now, the District was under pressure to speed up construction, and needed the resources to do that. Even the bill under consideration was insufficient. Airis said, "Without early enactment of H.R. 11022, we must anticipate a collapse of our comprehensive highway improvement programs." [Financing Federal Aid And Local Highways For The District of Columbia, Hearings on H.R. 11022 before Subcommittee No. 6 of the Committee on the District of Columbia, U.S. House of Representatives, 88<sup>th</sup> Congress, 2d Session, May 1964, pages 3-16]

During the question period, Chairman Whitener asked if he detected "a thread of thought" in Airis's statement that the highway program could "fully meet the problem of transportation people in the District of Columbia" with a rapid transit program. Airis said he was not an expert on mass transit:

I would answer it this way: All of our forecasting has been based on the availability of some type of an adequate mass transportation system to handle the passengers that would not be handled by our highways.

In short, the highway network would not be adequate without some type of rapid transit system. In the absence of such a transit system, Airis could not say how much larger the highway network would have to be. [pages 44-45]

The subcommittee held a second day of hearings on May 25. Following the respectful hearing for city officials, the subcommittee on this second day erupted in what the *Post* called a "new outbreak of Washington's protracted freeway war." Jack Eisen commented:

Recently, in the wake of House rejection of the subway bill last December, there has been some undercover sniping at the road program by influential persons. This apparently hit the mark in the Senate, where key members of the Public Works Committee voiced doubts last week over the proposed tunneling of the Mall by the Center Leg of the Inner Loop Freeway. [Eisen, Jack, "New Eruption of Freeway Feud Feared," *The Washington Post*, May 26, 1964]

The first witness, Hyde Gillette of the Metropolitan Washington Board of Trade, said the board was "completely committed to the pressing need for a balanced highway-rapid-transit transportation system to serve Metropolitan Washington." The street and freeway system was integral to the long-range plan:

In fact, because of the delays in finalizing and securing legislative action respecting the mass-transit system to be provided, it is most necessary that the highway projects proceed on or near schedule in order to accommodate the rapidly growing number of residents, visitors and commercial enterprises in the National Capital.

On behalf of the board, Gillette urged approval of the bill. [pages 61-64]

Admiral Phillips of the Committee of 100 on the Federal City was the next witness along with Peter Craig, who chaired the Roads Committee. The Committee of 100 endorsed the penny gas tax increase in H.R. 11022, which would bring the District's gas tax in line with the tax in surrounding jurisdictions. However, the committee opposed the provision increasing the borrowing authority for highway work:

The Committee of One Hundred believes that the place to start achieving a balanced transportation system is to balance the highway fund budget, reducing capital outlays to levels that can be afforded. The Highway Department has been able to expand its program with alacrity in recent past, and it should be able to reduce the program now to levels that are fiscally realistic.

The Committee of 100 recommended deleting the following projects:

- The Georgetown bridge, formerly the Three Sisters Bridge
- The North Leg (west section of the Inner Loop)
- The third 14<sup>th</sup> Street bridge
- Widening South Dakota Avenue, NE,
- Widening Missouri Avenue, NW.

Admiral Phillips concluded his brief statement by praising the District for using \$3.3 million in highway revenue to pay the annual expenses for traffic police instead of using general fund revenue as was done as a temporary measure for 3 years. [pages 64-65]

Admiral Phillips submitted, for the record, a background paper that Craig had prepared. It began:

A balanced transportation system of highways and rapid transit has received much lipservice [sic] but little definition or meaningful action at the District Highway Department. Each year since World War II the newly discovered highway needs grow (at a faster rate than previous projects have been completed) while proposals for transit improvements have been actively opposed or allowed to wither.

He summarized the history of planning since the early 1940s. Even as NCTA came on the scene to promote rail rapid transit, the highway program continued to expand. "When the Planning Commission, the NCTA, or the District's citizens protested, they were told the projects would be 'needed' anyway, even with rapid transit." Despite plans for rail rapid transit, the Highway Department "reckoned all increased travel would be by private automobile." When NCTA released its plan, it was "met with a withering volley of special highway lobby publications,

critiques authored by the District of Columbia Highway Department or Bureau of Public Roads and persistent lobbying on the Hill.”

Although the Policy Advisory Committee had unanimously endorsed a new location for the Three Sisters Bridge and tunneling for the North Leg, many members did so not because they thought either facility was needed. Rather, they did so “because it was assumed that approval was necessary if even a bobtailed subway was to survive the highway lobby gauntlet in Congress.” That theory did not prove true, Craig continued. “Not only was the NCTA plan first cut in half and then recommitted but every voice among planners and government urging moderation in highway construction was silenced.” Overall, 1963 “was tragic for the cause of a balanced transportation system” in the Washington area.

The result was that hundreds of millions of dollars were pending for freeways on the drawing board, “without 1 penny spent for subway construction.” The fruits of this imbalance were all-time highs in motor vehicle travel, transit at its lowest level since World War I, and record highs for the number of people killed or injured, air pollution, and the amount of space devoted to off-street parking.

Perhaps the best way to achieve balance was to force the District to balance its highway fund budget by “reducing capital outlays to levels it can afford.” Craig’s paper cited the northwest quadrant where highway supporters warned that residents would regret opposing expressways through Whitehaven, Glover-Archbold Park, Rock Creek Park, and the Wisconsin Avenue corridor, as well as the widening of Wisconsin and other arterial streets. Despite the dire warnings, northwest had “been the one established residential area of the city which uniquely has been free from blight or any ‘flight to the suburbs’ and in which real estate values (and District tax revenues) have risen precipitously.” [pages 65-67]

In testimony, Craig told the subcommittee that the Committee of 100 saw “little point in borrowing more money that cannot possibly be repaid.” The easy alternative was for the District Highway Department to “revert and reduce its scope of its highway program to bounds which can be more easily financed.” The Interstate System “has been growing every year” with uncompleted projects. He pointed out that the map District officials displayed did not include “freeways which have been completed for 5 years or more that originally were part of the Interstate System.”

Craig cited I-295 as an example. The 1959 Mass Transportation Survey included the route from the Woodrow Wilson Bridge, along the Anacostia River, to East Capitol Street, then along the Kenilworth Avenue Freeway to the Maryland line. However, the completed Kenilworth Avenue Freeway was removed from the Interstate System, as was the portion of the Anacostia Freeway between East Capitol and 11<sup>th</sup> Streets. Then, I-295 was “looped over the river to go along the west side of the Anacostia River.” He listed other segments added to the Interstate System in the past 5 years:

- The second Georgetown bridge
- Potomac Freeway west of Key Bridge
- A third 14<sup>th</sup> Street bridge

- The Northeast Freeway
- The North-Central Freeway
- The North Leg, east section

To save the \$35 million in additional borrowing authority, the District could simply revert to the Interstate System as of 5 years earlier.

During the question period, Chairman McMillan said:

I think it is a wonderful idea you suggested—that by going back to the old concept of building a highway around Anacostia, it would mean much less money, and I believe it would probably serve a better purpose.

He did not want to criticize Airis or General Duke, both of whom were fairly new to their posts. “Their purpose here is to build highways, and we need highways. But what I am interested in is let’s try to stay within our means, and not bite off more than we can chew.”

The only question came from Representative Harsha. He saw the testimony as “creeping up in . . . an effort to curtail the highway program for some other reason.” He asked where Craig worked. Craig said that after a stint as a special assistant to the House Judiciary Committee, he worked at Covington & Burling for 10 years. As for the last 3 or 4 months, “I have been commerce counsel of Southern Railway, dealing in ICC and State regulatory commission problems.” Representative Harsha had no further questions. [pages 75-77]

The next witness, former District Commissioner Renah Camalier represented the District Advisory Board of AAA. He supported the bill in view of the urgency of completing the District’s Interstate highways to meet the deadline before BPR had issues.

During the question period, Chairman McMillan said he did not think anyone objected to the penny increase in the gas tax. The question was whether the additional borrowing authority would cover needs or would have to be supplemented. Schuyler Lowe, director of the District’s Department of General Administration, tried to clarify the situation. “The loans, both present and proposed, would, of course, be a prior lien on the revenue of the highway funds.” Funds to amortize the loan would be sufficient through 1968. But if the highway program progressed as planned, by 1969 the city would “have to have some additional revenues coming into the highway fund in order to carry on with further” work. The additional loan authority was “absolutely essential in order to keep this program moving at a rate which would permit the District to obtain full participation of the interstate program.” [pages 79-80]

John Immer of the District of Columbia Federation of Citizens Associations also endorsed the penny gas tax increase. However, the federation opposed any increase in borrowing authority “until this has been properly cleared by the community.” The point was where capital funds should go. “Are highways more important than children,” he asked:

Should we proceed full speed ahead with an expanded highway program and leave our schools and instructional facilities in the ditch?

Rapid transit was another option. “The amount involved here is approximately that suggested as the District’s contribution to a rapid transit system.” The federation questioned the need for many of the proposed highway projects, as well as the transfer of revenue from the general fund to highways. “We believe that these programs need to be subject to more critical review by the community before they are allowed to displace too many of our residents and deprive our children of needed schools and other social facilities.”

Representative Harsha asked for an explanation of the statement that projects should be “properly cleared by the community.” Immer referred to projects that “we do not feel have been given complete approval of the community, and we think that this should be done before we go into the broader question of the loan.” How would Immer get community clearance? Public hearings revealed strong community and local opposition to some of the freeways “and despite that fact I think they have still remained on the agenda here.” The federation was trying to convey “the feelings of the people who live in the District.” In short, “we cannot have everything.”

Representative Harsha observed that the federation wanted to advance schools ahead of highways, but apparently wanted to advance rapid transit ahead of schools. Immer replied, “The view of the federation at this time is that the \$35 million would probably accomplish more in solving our transit problems applied to a rapid transit system than they would to the highway system.” In short, Representative Harsha told him, the federation was not much opposed to the added borrowing authority but to the highway program. Immer said the federation still would question whether the additional funds should go to schools, but the answer might be different if the alternative were rapid transit. [pages 80-82]

General Duke and Director Airis returned to continue their testimony. Chairman McMillan engaged General Duke in a discussion of the possibility of reopening the old 14<sup>th</sup> Street bridge for U.S. 1 traffic. It might serve traffic while the next span is built. General Duke suggested that “we might have to do that . . . if the proposal to study the new bridge doesn’t progress as rapidly as we would hope.” However, the city would prefer a new bridge to reopening the old one if traffic needs warranted additional capacity. Chairman McMillan said he did not object to a new bridge, but the old one might serve airport traffic while relieving peak period congestion. General Duke agreed that the idea should be explored. “We are keeping that in mind,” he said.

Representative Harsha asked General Duke to comment on Craig’s suggestion that the city revert to the Interstate network of 5 years earlier. General Duke observed that the current plan was the product of a planning process and had been approved by NCPC and NCTA. He had to qualify that statement, in view of NCTA’s position on the Three Sisters Bridge and the North Leg, by saying “I think by and large the official transportation planners of the area agree with the system as we have lined it up now.” As for Craig’s view:

We can fail to recognize the inevitable growth of traffic paralleling the growth of the community generally, and not necessarily within the District of Columbia now, but considering the entire metropolitan area, or we can close our eyes to this long-range requirement and build in an automatic stifling device for the future of the District of Columbia.

This is the balance that the transportation planners are trying to assess.

Reasonable observers, he said, may disagree with official judgments, but “I happen to feel that the current highway plan is the best plan that can be devised.” He emphasized that to meet transportation needs by the end of the century, the highway plan “must be supplemented by the Rapid Transit System about which so much has been said.” Without these programs, people who work in the city will look for jobs elsewhere. “They will balance the adversities of travel, as it were, and it is our job now to plan for this and to make sure that we have a vibrant community for the District of Columbia for the years to come.”

Representative Harsha also wanted to know if the city would be unable to complete the Interstate System if Congress did not approve the additional loan authority contained in H.R. 11022. General Duke said he could not be sure, but “just using my own extemporaneous judgment,” he thought the failure to approve the loan authority “would place in specific jeopardy the 1972 deadline for completion of the Interstate System.”

Chairman McMillan, recalling the long effort to secure the Commission of Fine Arts’ approval of the Theodore Roosevelt Bridge, asked if the city had trouble getting the group’s approval for the new Interstate network. General Duke would say only that “collecting of the various approvals around the District for our projects is a very tedious matter.”

With that, General Duke had to leave because of a prior commitment.

Chairman Whitener asked Airis if he thought the current plans would serve the area better than the 5-year old plan Craig had mentioned. Airis replied, “I don’t think there is any question on that point.” The current plan for the Inner Loop, for example, would “provide much better service” than the old plan.

Chairman Whitener asked about Craig’s statements regarding the Anacostia Freeway and the Kenilworth Freeway. Airis explained that the change in I-295 was made because the freeway leads to the Baltimore-Washington Parkway, which prohibits the use of trucks. In addition, quite a bit of traffic will want to go to or come from the central part of the city:

So, for those two reasons . . . it was decided in the best public interest to change and make the Anacostia Freeway interstate up to the 11<sup>th</sup> Street bridges, and thence into the District, and change the upper end back into merely a Federal-aid highway.

After an exchange with Lowe about whether the 1-cent increase and loan guarantee would ensure completion of the network (Lowe thought the city would return to the committee at some point to seek additional revenue), Chairman Whitener concluded the hearing. [pages 83-91; the subcommittee’s hearing report reprinted a lengthy statement by Peter Craig titled “A Balanced Transportation System on a Balanced Budget” containing his history of transportation planning in the District beginning in the 1930s. pages 97-126]

According to Eisen, “The hearing ended with the District program hanging by its fingernails.” [Eisen, Jack, “New Eruption of Freeway Feud Feared,” *The Washington Post and Times Herald*, May 26, 1964]

The editorial writers at *The Evening Star* agreed, and they knew who to blame. They hoped the District Committee’s “attention will not be diverted . . . by the distorted and divisive poppycock which it heard on the subject Monday from the Committee of One Hundred on the Federal City.”

Referring to the comment by Admiral Phillips that the “place to start establishing a balanced transportation system is by balancing the highway budget,” the editorial commented:

The truth is, of course, that Mr. Phillips and Mr. Craig are not interested in balancing the highway budget. And certainly they have no interest in a “balanced” system—one in which the transportation needs of the Washington area would be reasonably met by both freeways and rapid transit . . . Mr. Phillips and Mr. Craig are interested in halting freeway construction wherever and by whatever means they can.

A few years earlier, the anti-highway perspective they reflected had divided highway and transit supporters, bringing “all transportation planning virtually to a standstill.” Now, “the emphasis in official thinking more recently has swung back to a reasonable balance between freeways and transit.” The editorial concluded, “The divisionists should not be permitted to gain a foothold again.” [“Highways in Trouble,” *The Evening Star*, May 28, 1964]

### **Opening the Theodore Roosevelt Bridge**

On June 23, 1964, officials and about 300 spectators gathered for the dedication of what the *Post* called the “bridge that almost wasn’t”: the \$24.5 million Theodore Roosevelt Bridge. The ceremony took place on the ramp leading to the bridge from 23<sup>rd</sup> Street and Constitution Avenue.

General Duke, the master of ceremonies, introduced the keynote speaker, Senator Jennings Randolph, who said the bridge was a fitting memorial to former President Theodore Roosevelt. “Here are woven together the two threads of his interest and efforts in the conservation of land and water.” Senator Randolph referred to the “skepticism” and “perhaps despair” that some planners and builders felt during what the *Post* called “the years of long and bitter squabbling about the bridge that sometimes was envisioned as a tunnel, or even a tunnel-bridge.”

Those past disputes, according to the *Post*, were not on the minds of those watching Alice Roosevelt Longworth, the former President’s daughter, yank a cord to unveil a plaque that would be set in stone and placed along the bridge:

THEODORE ROOSEVELT

BRIDGE

----- o -----

THIS BRIDGE IS NAMED IN HONOR OF

THEODORE ROOSEVELT

1858-1919

TWENTY-SIXTH PRESIDENT  
OF THE UNITED STATES OF AMERICA  
STATESMAN – SOLDIER – MAN OF LETTERS

After the ribbon cutting ceremony, a motorcade of antique automobiles rolled across the bridge from Washington to Virginia. Mrs. Longworth and other members of the Roosevelt family, including two grandsons, occupied the lead vehicle.

The day before, George Kennedy, who wrote The Rambler column in the *Star*, toured the bridge with Carl Wilson, who was in charge of bridge construction for the District Highway Department. Wilson arrived in his air conditioned Chrysler Imperial for the advance tour:

We went west at Constitution avenue and, instead of making the left turn at Twenty-third street to the Memorial Bridge, continued ahead. The barrier had been removed.

The ramp going up to the bridge swings to the right and back as it goes over underpasses still to be paved.

We stopped to survey the scene. To our right on a bluff 30 feet high were the Naval hospital buildings, more recently used by the CIA. Below, the earth moving machines were working in a man-made valley—the route of the Inner Loop whose course north of K street has yet to be determined.

“There,” said Mr. Wilson, pointing to a triangular knob bordered by the grading of roads under construction, “stood the Heurich Brewery.” If anything had looked permanent on the Foggy Bottom waterfront it was Christian Heurich’s Rhinish castle with its square tower of red brick, a feudal stronghold suggesting a moat around it, a draw bridge and a dungeon within.

Now, nothing remains and the landscape is so altered that it is difficult to determine just where the castle stood.

We drove on to the new bridge and over the East Channel of the Potomac. The safety railing is low, one of those metal bands that bounces errant cars back onto the highway.

The bridge included sidewalks. Wilson told Kennedy, “They are primarily to enable anyone whose car stalls on the bridge to walk off without danger to traffic.” However, he already had observed State Department workers walking across the bridge from the Arlington Towers apartment buildings to their office in the District.

The preview continued:

After it clears the lower tip of Roosevelt Island, the bridge becomes a trident, a three pronged fork.

We took the right fork and rode down to the parkway bound north. We turned across the median strip and came back on the Washington-bound approach. It goes under one road and over another before landing us back on the bridge.

As Kennedy observed, “It takes several years to build a major bridge, but despite this the bridge is invariably completed before the approaches.” The new bridge was “an extreme instance” of this saying. The bridge was expected to carry I-66 traffic between the Virginia suburbs and the Inner Loop. For now, however, Virginia had not built the I-66 section inside the Capital Beltway. As a result, the connecting ramps limited the bridge’s use. According to the *Star*:

Virginia-bound traffic from downtown will be able to go down Constitution avenue, onto the bridge, and then northbound onto the George Washington Memorial parkway. There will never be any way for motorists to turn southbound from the bridge to go toward Alexandria on the parkway.

Inbound traffic likewise will only feed from the Memorial parkway vehicles coming east. Traffic from the direction of Alexandria will not have access to the bridge.

Virginia highway officials hoped to complete a connection between the bridge and Arlington Boulevard.

As Airis had testified earlier in the year, the District approaches were not ready, either. The connection from Constitution Avenue to the bridge was in place. The *Star* continued:

The remaining two-thirds of the District approaches that will feed traffic into the bridge are the connections with the Inner Loop freeway and the E street expressway.

The E street expressway is scheduled to be opened late next year. At that time, traffic will be able to get on the expressway at Nineteenth street N.W., for a clear approach to the bridge.

The Inner Loop was experiencing the most delay:

The inner loop is to be finished from the Whitehurst freeway to the bridge in late 1965. But near the Lincoln Memorial, the freeway is not expected to be finished until 1967 or 1968.

[“Roosevelt Span to Open Tuesday, Links Incomplete,” *The Evening Star*, June 22, 1964; Kennedy, George, “The Rambler . . . Crossed Roosevelt Bridge,” *The Evening Star*, June 23, 1964; Gilliam, Dorothy, “After 14 Years, Roosevelt Bridge Is Opened,” *The Washington Post and Times Herald*, June 24, 1964; “Bridge Over Potomac is Dedicated,” *The New York Times*, June 24, 1964]

The *Star* editors recalled the groundbreaking ceremony 4 years earlier when a cannon that was supposed to “herald the great event” malfunctioned. “For the practical good it is doing, the opening of the bridge this week is nearly as much a dud.” During its first 24 hours of “full operation” (the editors put the phrase in quotes), the bridge had carried only 8,600 vehicles from

the District to Virginia and 6,100 vehicles in the opposite direction. “In contrast, the nearby six-lane Arlington Memorial Bridge regularly handles 71,000 cars a day.”

The *Star* asked: “Pitiful?” It answered: “Of course.” The “controversial ‘spaghetti bowls’ of ramps and access roads, designed to shoot cars on and off both ends of the bridge in all directions, are completely inoperative.” The editors did not blame the builders of the bridge, “which we think is functional and thoroughly handsome.” They knew who to blame:

The current sad state of affairs is very much the fault, however, of countless highway, planning, park and other governmental officials on both sides of the river, whose stalling and bickering have unconscionably delayed the freeway system of which the bridge is merely a part.

Traffic will increase gradually with the connection to Arlington Boulevard and the opening of the E Street Expressway:

Its important connections to Virginia’s Route 66 freeway and to Independence avenue in Washington, however, still remain years away. And its full value will not be realized until the District’s entire inner-loop freeway network is finished.

Nevertheless, the editors considered the opening of the bridge “no mean accomplishment.” Perhaps, they speculated, “its limited use may prove important—as a constant reminder to everyone of the need to complete the freeway system as a whole.” [“Spaghetti Strings,” *The Evening Star*, June 26, 1964]

Donald Beekman Myer, in his book about District bridges, described the Theodore Roosevelt Bridge as “a shallow-arched, multiple-spanned, steel girder structure, lightly resting on low stone piers.” He called its appearance “simple, but not enduring.” He lamented that the District had ignored the advice of the Commission of Fine Arts, the NPS, and “the pleas of numerous agencies and citizens’ groups,” and built the bridge instead of a tunnel. [Myer, Donald Beekman, *Bridges and the City of Washington*, U.S. Commission of Fine Arts, 1974 (1983 edition), page 16]

In the 1992 *Post* feature on Washington’s bridges, Bisbort wrote:

Much maligned for its aesthetic deficiencies (though isn’t this quibbling, with the Kennedy Center so close by?), this bridge is nonetheless a driver’s godsend, flaring off in several directions at either end. Built in 1960, it’s a multiple span steel girder that sits low on the water. [Bisbort, page 9]

### **The Center Leg and the Capitol Grounds**

The House of Representatives had approved the bill allowing the District to build the Center Leg tunnel under a sliver of the grounds of the Capitol and the U.S. Botanic Garden. In June, Senate action was pending. The Subcommittee on Public Roads reported the Center Leg bill to the full Committee on Public Works on June 3, but in view of the concerns raised by Senators Cooper,

Fong, and Metcalf, the subcommittee took the unusual step of holding a second hearing on June 19.

At the start of the hearing, Senator Randolph said that the subcommittee had approved the bill on June 3 “with the reservation that the [final committee] action on this measure would not be taken until the committee has today’s hearing testimony studied and evaluated.” He wanted to stress, however, that the bill in question concerned only one short segment of one portion of the District’s Interstate System. “I would point out that this committee has neither the responsibility nor the authority for determining the alinement of projects in the Interstate System in the District of Columbia.” To clarify, he added, “I would hope that our discussion will be concentrated on that aspect, and not go astray into a consideration of the concept or possible alinement of the inner loop.” [Vehicular Tunnel Under U.S. Capitol Grounds, Hearing before the Subcommittee on Public Roads, Committee on Public Works, United States Senate, 88<sup>th</sup> Congress, 2d Session, June 19, 1964, pages 2-3]

Senator Metcalf said he did not agree that the alignment was beyond the purview of the committee “because after all the alinement does take into consideration where and under what circumstances we are going through some of the Capitol Grounds, which is our responsibility.”

Senator Cooper agreed with Senator Randolph about the lack of authority to determine the location of Interstate roads. “What I do object to, however, is for this committee to be used to determine the alinement, and I think that is what is happening.” He had not known anything about the project until the last hearing on the bill. Now, upon subsequent investigation, he learned that several agencies must approve the alignment of the Center Leg; he wanted to be sure they approved before Congress acted. “As I understand it there is still some controversy and conflict over the alinement, the design, and the cost of the center leg.” If the committee or the Congress approved this bill, advocates of the Center Leg location could then seek further approvals based on congressional approval:

Our decision would have its influence on the other agencies. In my own judgment I think it would be better for the District Highway Department and the Commissioners to complete their plans and to secure approval from these agencies, and then to seek congressional approval of this final part. It seems to me the Highway Department is putting the cart before the horse.

He also wanted to ensure that the tunnel would not affect “the beauty or utility of the Capitol Grounds.” He anticipated “a great deal of noise and fumes, and I just don’t think these matters have been determined, and I think if there is to be a complete design we should have all these facts before we approve what I would call a pig in a poke.” [pages 3-4]

Administrator Whitton and BPR Deputy Director of Engineering Barnett were the first witnesses. Whitton described the Center Leg as part of the Inner loop and a segment of I-95, “the main north-south route on the east coast of the United States.” The purpose of the bill was to allow construction of a vehicular tunnel “under the westernmost projection of the U.S. Capitol Grounds and the U.S. Botanic Garden grounds” under the jurisdiction of the Architect of the Capitol. The tunnel “would in no way disturb the appearance of these grounds” except during construction.

Officials had proposed to build the Center Leg through these grounds because it was “part of the most reasonably direct route” for I-95. “Without it, traffic approaching the inner loop and destined beyond would have extra travel distance by way of the east leg or north and west legs of the inner loop.”

Urban areas such as Washington had encountered “the greatest difficulties and delays” in building their Interstate networks. With congressional approval of the vehicular tunnel bill for the Center Leg, the District could “proceed to construction in the very near future.” [pages 5-6]

Senator Randolph began the questioning on broad terms. The Interstate plan was for all the States to complete their Interstate segments “at approximately the same time; is this true?” It was true. Was it also true that the District of Columbia “is almost on the lowest rung of the ladder” of progress? It was true. Is it correct that the tunnel under the Capitol grounds was needed “if the orderly program is to proceed in the District of Columbia?” Yes, that was correct.

Senator Randolph asked Whitton to elaborate on his statement that the tunnel would not disturb appearances on the Capitol Grounds. Whitton said he had not seen the detailed plans, but the plan was for a cut-and-cover tunnel. There would be “disruptions and unpleasantness during construction” of the channel into which the tunnel would be placed. However, the trench would then be covered and “the surface of the area of the Capitol Grounds will be restored as it now is.”

In response to a question from Senator Randolph, Whitton confirmed that BPR would approve the plans, just as it would for a plan in any State.

Senator Metcalf wanted to know if the District would consider alternatives such as boring the tunnel instead of building it as a cut-and-cover tunnel. Yes, the District would. Has BPR received any of those estimates? No. So BPR doesn’t know which would be cheaper, is that correct? BPR had no information on that subject, which District officials might be able to provide.

Senator Randolph and Barnett discussed the limits of the tunnel, which had changed as a result of negotiations with the Architect of the Capitol. Barnett said:
