

New hosts for *Amblyomma argentiniae* Neumann, 1905 (Acari: Ixodidae) in the Dry Chaco of Argentina

Nuevos hospedadores para *Amblyomma argentiniae* Neumann, 1905 (Acari: Ixodidae) en el Chaco Seco de Argentina

Ruiz García José Augusto^{1*}, Debárbara Valeria Natalia², Zaracho Víctor Hugo¹, Tedesco María Esther¹

ABSTRACT: *Amblyomma argentiniae* Neumann, 1905 (Acari: Ixodidae) is a hard tick that parasitizes mainly reptiles. During amphibians and reptiles samplings in Miraflores locality, Chaco Province, Argentina, we collected a total of 34 nymphs and one adult of *A. argentiniae* from the colubrid snakes *Chironius maculiventris*, *Philodryas erlandi*, *P. psammophidea*, and the turtle *Acanthochelys pallidipectoris*. Additionally, we add other records of *A. argentiniae* in lizards previously reported in the Semi-arid Chaco of Argentina, and provide information on the behavior of the snake *P. erlandi* infested with 19 nymphs. These findings represent the first records of parasite-host association for Argentina.

Keywords: snakes, turtle, ticks, parasite-host association, Chaco.

RESUMEN: *Amblyomma argentiniae* Neumann, 1905 (Acari: Ixodidae) es una garrapata dura que parasita principalmente reptiles. Durante muestreos de anfibios y reptiles en la localidad de Miraflores, Provincia del Chaco, Argentina, recolectamos un total de 34 ninfas y un adulto de *A. argentiniae* de las serpientes colúbridas *Chironius maculiventris*, *Philodryas erlandi*, *P. psammophidea* y de la tortuga *Acanthochelys pallidipectoris*. Adicionalmente, agregamos otros registros de *A. argentiniae* en lagartijas previamente reportados en el Chaco semiárido de Argentina, y aportamos información sobre el comportamiento de la culebra *P. erlandi* infestada con 19 ninfas. Estos hallazgos representan los primeros registros de asociación parásito-hospedador para Argentina.

Palabras clave: serpiente, tortuga, asociación parásito-hospedador, Chaco.

Amblyomma is a genus of Neotropical and Afro-tropical ticks characterized by having a parasitic cycle of three hosts (Nava et al., 2017; Guglielmone et al., 2021). Currently, 136 species are recognized within the genus, 25 of which have been recorded in Argentina (Guglielmone et al., 2021). The ixodid tick *Amblyomma argentiniae* Neumann, 1905 is a South American species that was found only in nine provinces of Argentinian territory (Nava et al., 2017; Guglielmone et al., 2021). The biogeographic distribution of *A. argentiniae* in the Neotropical region includes Chaco and Monte of Argentina (Nava et al., 2017). The taxonomy of the species is complex (see Guglielmone et al., 2001) and little is known about its ecology (Nava et al., 2017). The principal host is the Class Reptilia (snakes, lizards and turtles). All stages of *A. argentiniae* are usually found in its main host, the Chaco tortoise *Chelonoidis chilensis* Gray (Testudines: Testudinidae), with which shares its distribution range, although it has also been reported in a species of amphibian (Guglielmone et al.,

2021). Records of infestation by *A. argentiniae* in snakes and turtles are scarce, there are only reports for the family Boidae: *Boa constrictor*, *Epicrates alvarezi* and *Eunectes notatus*; the family Viperidae: *Bothrops neuwiedi* and *Crotalus durissus*, the family Testudinidae: *C. chilensis* and the family Chelidae: *Phrynos hilarii* (Guglielmone et al., 2021). Here, we report for the first time the ectoparasitism by *A. argentiniae* on colubrid snakes *Chironius maculiventris* Dixon, Wiest and Cei, *Philodryas erlandi* Lönnberg, *P. psammophidea* Gunther, and the tortoise *Acanthochelys pallidipectoris* Freiberg, from the Dry Chaco of Argentina.

During amphibian and reptile samplings on Miraflores locality, General Güemes Department, Chaco Province, Argentina, in February 2020, November 2021, and January 2022, we captured the colubrid snakes *C. maculiventris*, *P. erlandi*, *P. psammophidea* and the turtle *A. pallidipectoris* infected by ticks (Fig. 1 a-d). The study area is found in the Dry Western District (Semiarid Chaco Subregion), vegetation is xerophilous,

the climate is subtropical warm continental with annual precipitation varying between 500 and 550 mm and annual mean temperature range from 21 to 22°C (Morello et al., 2012).

Each tick was removed from the host with tweezers, and identified using the keys and descriptions from Martins et al. (2014) and Nava et al. (2017). The ticks were preserved in 70% ethanol and deposited in the Parasites Collection of Facultad de Ciencias Exactas y Naturales y Agrimensura, Universidad Nacional del Nordeste, Corrientes, Argentina (UNNEP N° 167-172). The reptiles collected were housed in the Colección Herpetológica Blanca Beatriz Álvarez of the Universidad Nacional del Nordeste, Corrientes, Argentina (UNNEC). The turtle was released in the place of capture after taking morphological measures and photographed.

A total of 34 nymphs and one adult male of *A. argentinae* were identified in the hosts (Table 1, Fig. 2 a-b). The examined nymphs present large body size and body outline oval, chitinous tubercles at the posterior body margin absent, eyes flat located on lateral scutal angles at the level of scutal mid-length, cervical grooves reaching mid-level of the scutum, deeper in the scutal anterior third and basis capituli

dorsally subtriangular, without cornua. The hypostome is spatulate and dental formula 3/3 for most of the length and 2/2 at the base. The coxa I presents two pointed spurs, the external longer than the internal.

Morphologically *A. argentinae* is closely related to *A. dissimile* Koch, 1844, and *A. rotundatum* Koch, 1844 (Nava et al., 2017). *Amblyomma argentinae* can be distinguished from *A. rotundatum* by having the coxa II-IV with only one spur; and differs from *A. dissimile* by having the scutum with deep punctations evenly distributed, larger and deeper laterally.

The ticks were concentrated in the dorsal and mid-lateral region of the host body. One adult host specimen of *P. erlandi* was infested with 19 nymph ticks (Fig. 1b, Table 1). The snake was captured by hand and made no attempt to escape during capture; the snake presented a skinny body and a reduction of mobility (Ruiz García, pers. obs.). Furthermore, we found *A. argentinae* infesting the lizards *Tropidurus etheridgei* Cei (UNNEC 13646, 25° 35' 11" S, 61° 00' 14" W, Fig. 2c) and *Teius teyou* (Daudin) (UNNEC 13645, 25° 39' 34.6" S, 61° 00' 55.7" W). These associations have already been reported by Debárbara et al. (2015) at ca. 108 km northwest in

the Parque Natural Provincial Fuerte Esperanza (Semi-arid Chaco), Chaco province, Argentina.

According to Guglielmone *et al.* (2001), the abundance and survival of *A. argentinae* strongly depend on *C. chilensis*, which is “Vulnerable” species in Argentina due to mascotism, habitat loss by the expansion of the agricultural frontier, and the effect of livestock in the Dry Chaco (Waller and Micucci, 1997; Prado *et al.*, 2012). The new hosts recorded are considered as “Not threatened” and “Threatened” species (Table 1), and live in sympatry with *C. chilensis* in Chaco, Formosa, Salta, Santa Fe, Santiago del Estero, and Tucumán provinces from Argentina (Arzamendia and Giraudo, 2012; Prado *et al.*, 2012; Scrocchi and Kretzschmar, 2012; Scrocchi *et al.*, 2012; Williams *et al.*, 2021). The new associations could behave as new alternative hosts and favor the survival of *A. argentinae* populations. Furthermore, it demonstrates the importance of snakes and lizards as hosts of *A. argentinae* and provides data for future studies related to the ecology of this species.

We thank Dirección de Áreas Protegidas y Biodiversidad of the Chaco province for research authorization and the collection permit (Disposición N° 985/21). We wish to express our gratitude to Godoy family for their assistance and research authorization in “Campo Doña Irma”. We also acknowledge the two anonymous reviewers and the editorial committee of RAP that provided valuable suggestions and comments that improved the manuscript.

This study received financial support from Secretaría General de Ciencia y Técnica de la Universidad Nacional del Nordeste (Resolución 124/21-PI 20F003).
