

BASAJAUN

Demonstrating innovative wood-based materials and products in green public procurement:
The co-design of the BASAJAUN demo building following the New European Bauhaus values and principles

Vanesa Baño¹, Uwe Kies¹, Javier Garcia Jaca², Julen Astudillo Larraz² and Tom Minderhoud³

This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement N° 862942

Introduction

Climate benefits of building with wood for the green transformation are gaining more attention

IRIC

EU policies affecting building with wood

- European Green Deal (2019)
- Renovation wave (2020)
- Circular Economy Action Plan (2020)
- Fit for 55 package (2021)
- Carbon Removals Certification Regulation (CRC, 2022)
- Construction Products Regulation (CPR revision, 2022)
- Energy Performance of Buildings Directive (EPBD 2018, recast 2023)
- EU Taxonomy Environmental Delegated Act (Taxonomy, 2023)
- **New European Bauhaus** (2020)

Timber construction : contribution to NEB principles

sustainable

- managed ecosystems protecting natural cycles & climate
- true carbon pump
- wood = renewable building material

together

- whole forest-based value chain
- Interdisciplinarity
- society

beautiful

- aesthetic buildings & interiors
- healthy living

wood4bauhaus.eu

Objectives

1. Description of the co-design process on the case study of BASAJAUN demo building.
2. Implementation of wood-based innovations in the demo building.
3. NEB Compass assessment of the co-design process in the demo building

Wood building of a new school complex in rural Southern France BASAJAUN demo

BASAJAUN demo: public policies in France

Action plan in the construction sector: public policies supporting the development of wood and bio-based materials in construction

National policy guidelines:

- The construction sector has been identified as the most promising market for timber, with policies to enhance competitiveness and industrial performance to create jobs
- Public policy priorities are the design, innovation and technological development for:
 - 1) wood construction (mainly multistorey buildings),
 - 2) resource valorisation (mainly hardwoods, and waste),
 - 3) demonstrator projects, etc.

The Department of Gironde has a specific requirement for including **wood in at least 7.5% of the building volume** with the aim that buildings fit well into its natural surrounding forest environment (Landes pine and oak forest).

The college is located in the town of Pian Médoc. The department has a plot of 3 hectares, of which 2 hectares are classified as wooded area.

The construction floor area of the Project is 9.600 m², of which 520 m² are destined to the construction of an apartment building with 4 flats for the school staff

Co-design process

Objectives

1. Description of the co-design process on the case study of BASAJAUN demo building.
2. Implementation of wood-based innovations in the demo building.
3. NEB Compass assessment of the co-design process in the demo building

Main innovations a nutshell

WP1 Sustainable wood construction value chain

European forest potential, rural and urban areas

WP2 Recyclability, environmental issues

End of Life - recyclability and reusability of BASAJAUN products

WP3 Forest 2 building digital framework

Design of a 'backbone' architecture

WP4 Innovative materials

Fire retarded WPC • Foamed WPC • Insulations •
Structural insulation panels (SIP) • Coatings

WP5 Building systems and products

Structural components, Facades, Roofs,
Bio-composite profiles

WP6 Demo buildings

Demo building Southern France

Wood-based innovations

Thermal insulation material

Interior walls, exterior panels and roof substructure

Project innovation fact sheet

Wood Pulp Panels
Fibre panels for thermal building insulation

APPLICATION

- Thermal insulation material as core layer of structural insulation (e.g. SIP) for building walls
- Many applications of structural insulation systems, e.g. glass facades

BENEFITS

- Equal insulation performance as existing conventional materials
- Very light weight, no compaction need for assembly
- Made from renewable wood pulp
- Recycled wood can be used as a raw material
- Lower greenhouse gas emissions and lower CO₂ in building walls
- Easy recycling and use of circular economy value chains if suitable for re-plant to used

NEXT STEPS

- Increasing strength for exterior walls at same thickness of insulation
- Other applications: facade panels, wall protection panels, sandwich materials, packaging

APPLICATIONS

- Low energy walls and partitions
- Roofs and ceiling components
- Conventional building types by facade

BASAJAUN Slide n° 19 IBC 13-14 September 2023, Inns, Slovenia

Project innovation fact sheet

G-Brick-Eco
Biobased Structural Insulation Panel

APPLICATIONS

- Low energy walls and partitions
- Roofs and ceiling components
- Conventional building types by facade

BENEFITS

- G-Brick-Eco panels are self-bearing and thermally insulated building wall elements allowing for very short construction times both in erection and on-site
- Suitable for prefabricated construction systems
- Easy handling on-site
- High resistance for fire and moisture buildings
- The mechanical resistance is enhanced by vertical ribs (rigid connecting beam) support surface
- When compared to competing products such as Gips-Laminate Timber (GLT), G-Brick-Eco is much more cost efficient and resource efficient

NEXT STEPS

- Optimizing of the production facilities
- Controlling the adhesion process
- Automating of the production process

APPLICATIONS

- Low energy walls and partitions
- Roofs and ceiling components
- Conventional building types by facade

BASAJAUN Slide n° 21 IBC 13-14 September 2023, Inns, Slovenia

Project innovation fact sheet

Thermoplastic composite sheet
from recycled wood and bioplastomers

APPLICATIONS

- Replacement of high-pressure laminate (HPL) as plywood top sheet
- Applications where usability is optimized, and for use of other wood-based panels such as particle board based (OSB)

BENEFITS

- Application to structural steel for walls and furniture in other uses (e.g. concrete formwork)
- The carbon-reduced (secondary) products of sawmills
- 100% biobased materials
- Fire-resistance (the material was classified as B-s1-d0 in EN 13501)
- Customizable exterior finish
- Easy recycling
- Cost efficient

NEXT STEPS

- Optimizing of the production process
- Determination of physical, mechanical and chemical properties including durability
- The identification of their product of other applications in construction and furniture (selecting products with a low carbon footprint, biobased products)

APPLICATIONS

- Low energy walls and partitions
- Roofs and ceiling components
- Conventional building types by facade

BASAJAUN Slide n° 25 IBC 13-14 September 2023, Inns, Slovenia

Project innovation fact sheet

Wood-based curtain wall façade system

APPLICATIONS

- Prefabricated building envelope
- Low, mid and high-rise buildings
- Classical and modern architecture buildings

BENEFITS

- Applicable to replace and clean grids of the building
- Available with high thermal insulation properties
- Low, easy and fast on-site assembly
- Customizable exterior finish
- Many made from renewable biomass materials
- Designed for disassembly for use in closed circular economy material loops

NEXT STEPS

- Increasing cost efficiency
- Increasing biobased parts
- Reducing weight
- Production process optimization

APPLICATIONS

- Low energy walls and partitions
- Roofs and ceiling components
- Conventional building types by facade

BASAJAUN Slide n° 22 IBC 13-14 September 2023, Inns, Slovenia

Furniture finishing

Curtain-walls façade system

VTT

BENEFITS

- Equal insulation performance as existing wood-based products
- Very **light weight**, no training need for assembly
- Made from **renewable wood** pulp
- Recycled wood can be utilized as a raw material
- **Lowers** greenhouse gas emissions and stores CO₂ in building walls
- **Easy** recycling and use in circular economy value chains (if suitable fire retardant is used)

Project innovation fact sheet

VTT

Wood Pulp Panels

Fibre panels for thermal building insulation

APPLICATION

- Thermal insulation material as core layer of Structural Insulation Panels (SIP) for building walls
- Many applications of similar conventional materials (e.g., glass wool)

NEXT STEPS

- Increasing strength for structural applications
- Upscaling of production
- Other applications e.g., acoustic panels, wind protective panels, cushioning material (e.g., packaging)

Thermal insulation material

Interior walls, exterior panels and roof substructure

Project innovation fact sheet

Wood Pulp Panels
Fibre panels for thermal building insulation

BENEFITS

- Equal insulation performance as existing conventional materials
- Very light weight, no compaction need for assembly
- Made from renewable wood pulp
- Recycled wood can be used as a raw material
- Lower greenhouse gas emissions and lower CO₂ in building walls
- Easy recycling and use of circular economy value chains if suitable for re-plant to used

NEXT STEPS

- Increasing strength for exterior walls at same thickness of insulation
- Other applications: facade panels, wall protection panels, partition materials, packaging

APPLICATION

Thermal insulation material as core layer of structural insulation (e.g. SIP) for building walls. Many applications of structural insulation, e.g. glass roof.

Project innovation fact sheet

G-Brick-Eco
Biobased Structural Insulation Panel

BENEFITS

- G-Brick-Eco panels are self-bearing and thermally insulated building wall elements allowing for very short construction times both in erection and on-site.
- High resistance for fire and moisture buildings.
- Easy handling on-site.
- The mechanical resistance is enhanced by vertical the rigid connecting beam (topical surface).
- When compared to competing products such as Gips-Laminate Timber (GLT), G-Brick-Eco is much more cost-effective and resource-efficient.

NEXT STEPS

- Applying of the production facilities.
- Optimizing the adhesion process.
- Automating of the production process.

APPLICATIONS

- Load-bearing walls and partitions.
- Roofs and ceiling components.
- Conventional building applications by facade.

BASAJAUN Slide n° 21 IBC 13-14 September 2023, Inns, Slovenia

Project innovation fact sheet

Thermoplastic composite sheet
from recycled wood and bioplastomers

BENEFITS

- Application to structural steel for walls and furniture or other uses (e.g. concrete formwork).
- The carbon footprint (cradle-to-gate) is around 100% biobased materials.
- Fire-resistance (the material was classified as B-s1-d0-p0).
- Customizable exterior finish.
- Easy recycling.
- Cost efficient.

NEXT STEPS

- Applying of the production process.
- Determination of physical, mechanical and chemical properties including durability.
- The identification of their product of other applications in construction and furniture design (e.g. a table, desk, chair, etc.).

APPLICATIONS

- Replacement of high-pressure laminate (HPL) as plywood top sheet.
- Applications where usability is required, and for use of other wood-based panels (such as particle board, etc.).

BASAJAUN Slide n° 25 IBC 13-14 September 2023, Inns, Slovenia

Project innovation fact sheet

Wood-based curtain wall façade system

BENEFITS

- Applicable to replace and show parts of the building.
- Available with high thermal insulation properties.
- Low weight and fast on-site assembly.
- Customizable exterior finish.
- Many made from renewable biomass materials.
- Designed for disassembly for use in closed circular economy material loops.

NEXT STEPS

- Increasing cost efficiency.
- Increasing fire-resistance.
- Reducing weight.
- Production process optimization.

APPLICATIONS

- Pre-fabricated building envelope.
- Low- and high-rise buildings.
- Climate and noise control of the building.

BASAJAUN Slide n° 22 IBC 13-14 September 2023, Inns, Slovenia

Furniture finishing

Curtain-walls façade system

BENEFITS

- G-Brick-Eco panels are load bearing and thermally insulated building wall elements allowing for very **short construction times** both in renovation and new built.
- Suitable for **diffusion-closed construction** systems.
- Easy handling on site.
- **Fire resistance** for low- and midrise buildings.
- The **mechanical resistance is enhanced** by vertical ribs rigidly connecting both plywood surfaces
- When compared to competing products such as Cross Laminated Timber (CLT), G-Brick-Eco is much more cost, energy and resource efficient

Project innovation fact sheet

G-Brick-Eco

Biobased Structural Insulation Panel

APPLICATIONS

- Load-bearing walls and partitions
- Roofs and ceiling components
- Conventional buildings and tiny houses

NEXT STEPS

- Upscaling of the production facilities
- Optimising ribs adhesion process
- Automation of the production process

Thermal insulation material

Interior walls, exterior panels and roof substructure

Project innovation fact sheet

Wood Pulp Panels
Fibre panels for thermal building insulation

BENEFITS

- Equal insulation performance as existing conventional products
- Very light weight, no compaction need for assembly

- Green and blue urban buildings

BASAJAUN Slide n° 22 IBC 13-14 September 2023, Inns, Slovenia

Furniture finishing

Curtain-walls façade system

BENEFITS

- Applicable to **opaque** and **vision** units of the buildings
- **Breathable** with high thermal insulation properties
- **Save, easy and fast on-site assembly**
- **Customisable** exterior finish
- Mainly made from **renewable biobased materials**
- Designed for **disassembly** for use in closed circular economy material loops

Project innovation fact sheet

Wood-based curtain wall façade system

APPLICATIONS

- Prefabricated building envelope
- Low-, mid- and high-rise buildings
- **Opaque** and **vision** units of the buildings

NEXT STEPS

- Increasing cost efficiency
- Increasing biobased parts
- Reducing weight
- Production process optimization

Wooden cladding

Biocomposite profile

Fireshield (plywood)

Thermal insulation material

Interior walls, exterior panels and roof substructure

Project innovation fact sheet

Wood Pulp Panels
Fibre panels for thermal building insulation

BENEFITS

- Equal insulation performance as existing conventional materials
- Very light weight, no compaction need for assembly
- Made from renewable wood pulp
- Recycled wood can be added as a raw material
- Lowest greenhouse gas emissions and Green ECO in building walls
- Easy recycling and use of circular economy value chains if suitable for re-plant to used

NEXT STEPS

- Increasing strength for exterior walls and roofs
- Optimizing of production
- Other applications: facade panels, wall protection panels, partition materials, packaging

APPLICATION

Thermal insulation material as core layer of structural insulation (EPS/GPI) for building walls. Many applications of structural insulation. E.g. glass roof.

BASAJAUN Slide n° 19 IBC 13-14 September 2023, Inns, Slovenia

Project innovation fact sheet

G-Brick-Eco
Biobased Structural Insulation Panel

BENEFITS

- G-Brick-Eco panels are self-bearing and thermally insulated building wall elements allowing for very short construction times both in erection and use built for prefabricated construction systems
- Easy handling on site
- High resistance for fire and moisture buildings
- The mechanical resistance is enhanced by vertical the rigid connecting fasteners on surface
- When compared to competing products such as Gips-Laminate Timber (GLT), G-Brick-Eco is much more cost energy and resource efficient

NEXT STEPS

- Applying of the production facilities
- Optimizing of the adhesion process
- Automating of the production process

APPLICATIONS

- Load bearing walls and partitions
- Roofs and ceiling components
- Conventional building systems by facade

BASAJAUN Slide n° 21 IBC 13-14 September 2023, Inns, Slovenia

Project innovation fact sheet

Thermoplastic composite sheet
from recycled wood and bioplastomers

BENEFITS

- Application to structural steel for walls and furniture or other uses (e.g. concrete formwork). The carbon-reduced secondary products of sawmills
- 100% biobased material
- Fire-retardancy (the material was classified as B2-s1, d0, s2,0)
- Customizable exterior finish
- Easy recycling
- Cost efficient

NEXT STEPS

- Applying of the production process
- Determination of physical, mechanical and chemical properties including durability
- The identification of their product of other applications in construction and furniture design (e.g. a table, desk, chair, stool, etc.)

APPLICATIONS

- Replacement of high-pressure Laminate (HPL) as plywood top sheet
- Application where usability is required, and for use of other wood-based panels such as oriented strand board (OSB)

BASAJAUN Slide n° 25 IBC 13-14 September 2023, Inns, Slovenia

Project innovation fact sheet

Wood-based curtain wall façade system

BENEFITS

- Applicable to replace and clean grids of the building
- Available with high thermal insulation properties
- Low, easy and fast on-site assembly
- Customizable exterior finish
- Many made from renewable biomass materials
- Designed for disassembly for use in closed circular economy material loops

NEXT STEPS

- Increasing cost efficiency
- Increasing fire safety
- Reducing weight
- Production process optimization

APPLICATIONS

- Prefabricated building envelope
- Low, mid and high-rise buildings
- Classical and modern interior of the buildings

BASAJAUN Slide n° 22 IBC 13-14 September 2023, Inns, Slovenia

Furniture finishing

Curtain-walls façade system

BENEFITS

- Application to architectural interior walls and furniture or other uses e.g., concrete formwork
- The non-fire-retarded version consists of almost 100% bio-based materials
- Fire-retardancy: the material was classified as V-0 at 4 mm (UL94)
- Customisable exterior finish
- Easy recycling
- Cost efficient

NEXT STEPS

- Upscaling of the production process
- Determination of selected mechanical and physical properties including durability
- Fire classification of final product
- Other applications in construction and furniture, vehicle production, decorative laminates, thermoplastic sheets

Project innovation fact sheet

Thermoplastic composite sheet from recycled wood and biopolymers

APPLICATIONS

- Replacement of High-Pressure Laminate (HPL) as plywood top-sheet
- Applications where HPL acts as top-sheet, and for use on other wood-based panels such as oriented strand board (OSB)

Thermal insulation material

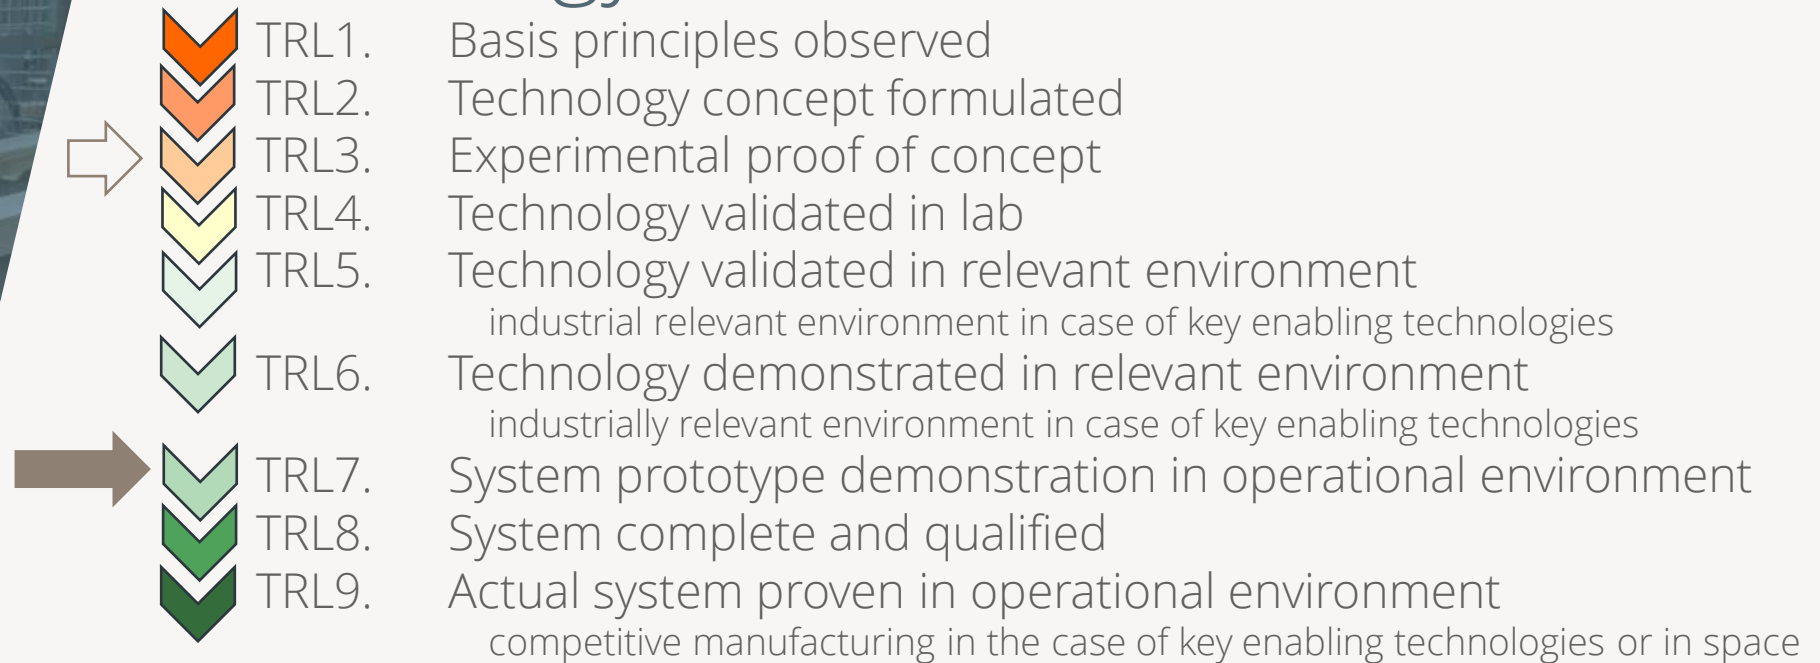

Interior walls, exterior panels and roof substructure

Furniture finishing

Curtain-walls façade system

Technology readiness levels (TRL)

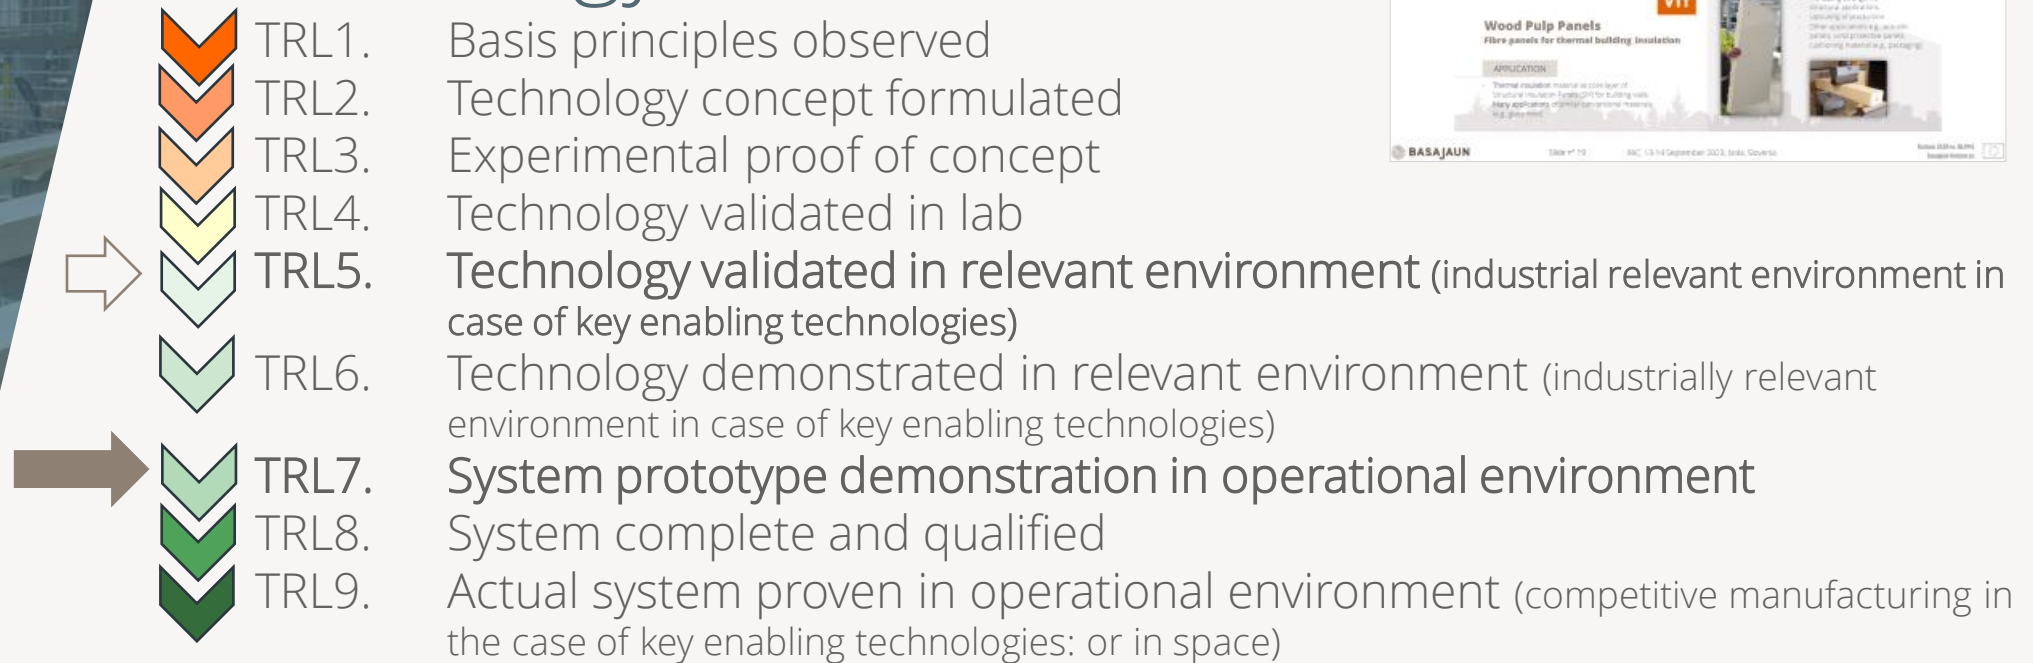

Basic Requirements
Construction Product
Regulation (CPR)

- 1. BR1: Mechanical resistance and stability**
- 2. BR2: Safety in case of fire**
- 3. BR3: Hygiene, health and the environment**
- 4. BR4: Safety and accessibility in use**
- 5. BR5: Protection against noise**
- 6. BR6: Energy economy and heat retention**
- 7. BR7: Sustainable use of natural resources**

Technology readiness levels

It needs final scaleup in an industrial production line

Thermal insulation material

Technology readiness levels

-  TRL1. Basis principles observed
-  TRL2. Technology concept formulated
-  TRL3. Experimental proof of concept
-  TRL4. Technology validated in lab
-  TRL5. Technology validated in relevant environment (industrial relevant environment in case of key enabling technologies)
-   TRL6. **Technology demonstrated in relevant environment (industrially relevant environment in case of key enabling technologies)**
-  TRL7. System prototype demonstration in operational environment
-  TRL8. System complete and qualified
-   TRL9. **Actual system proven in operational environment (competitive manufacturing in the case of key enabling technologies: or in space)**

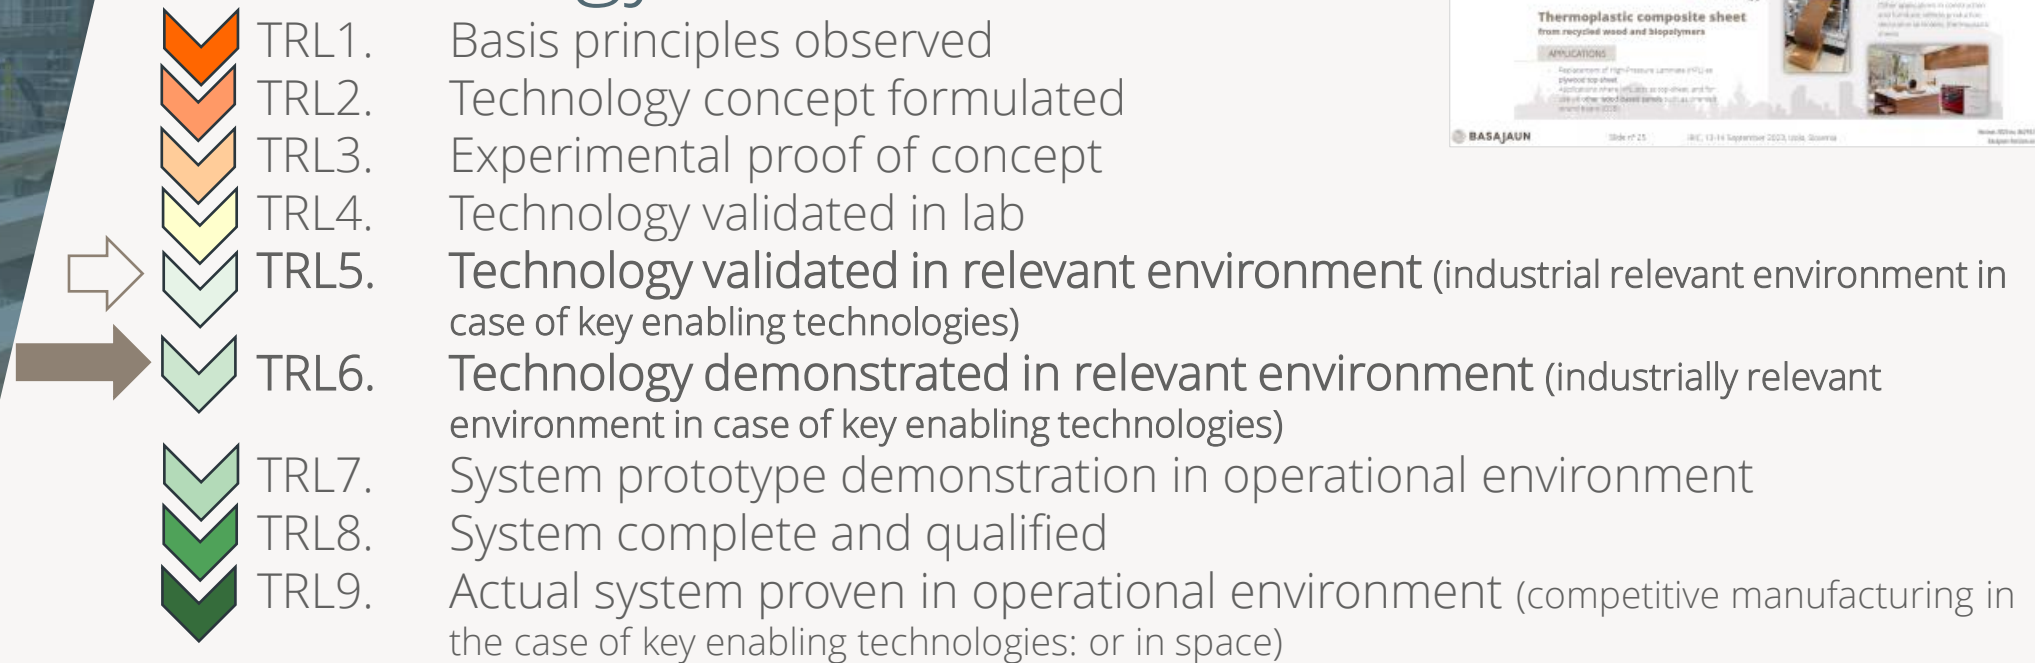

Already commercial

Interior walls, exterior panels
and roof substructure

Technology readiness levels

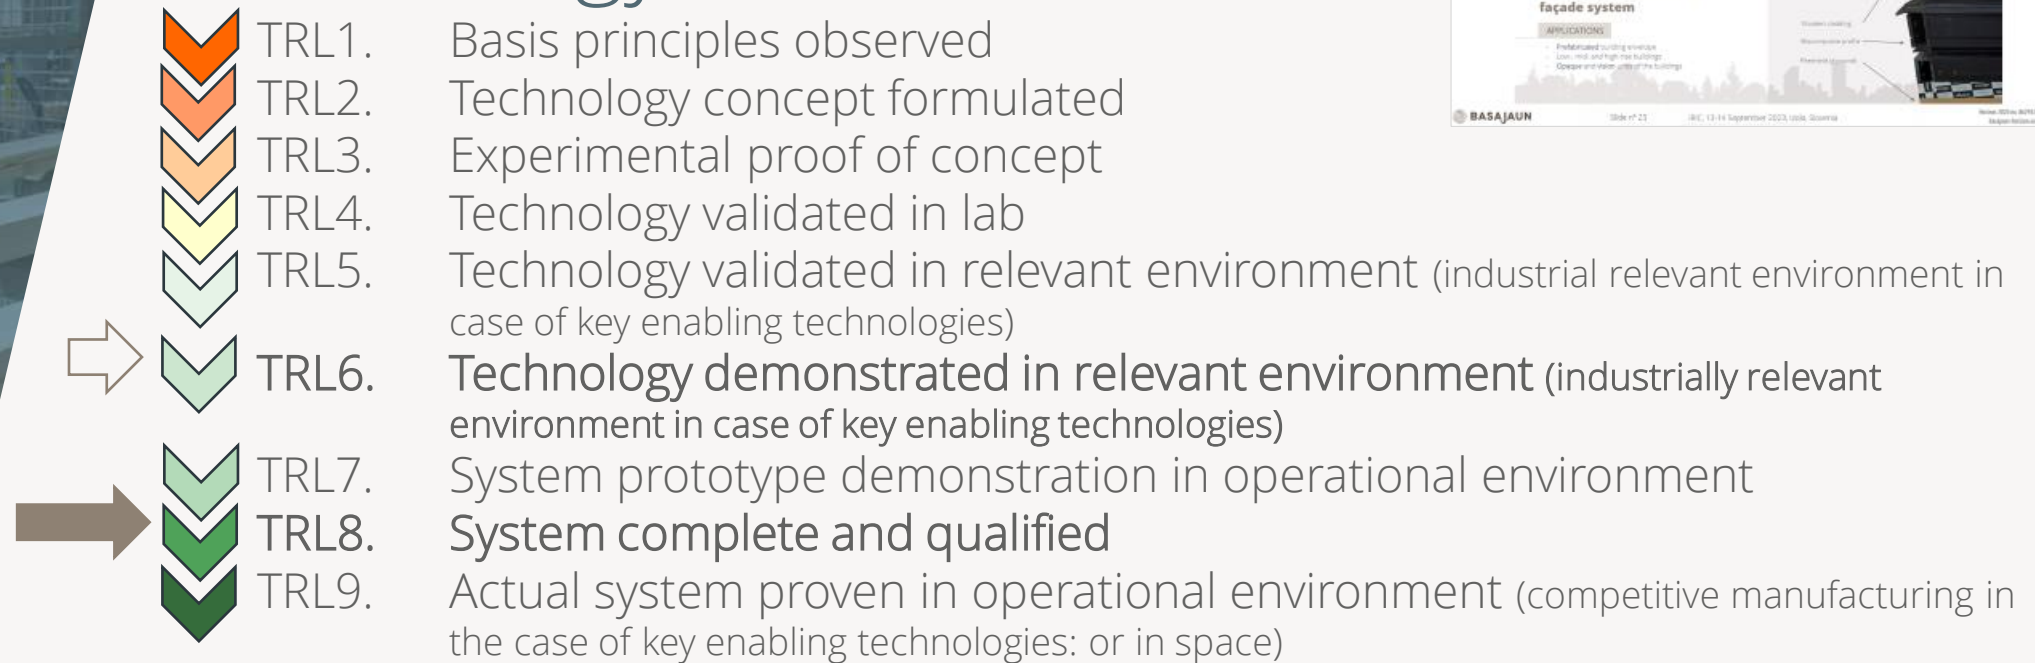

Samples for small demos

Technology readiness levels

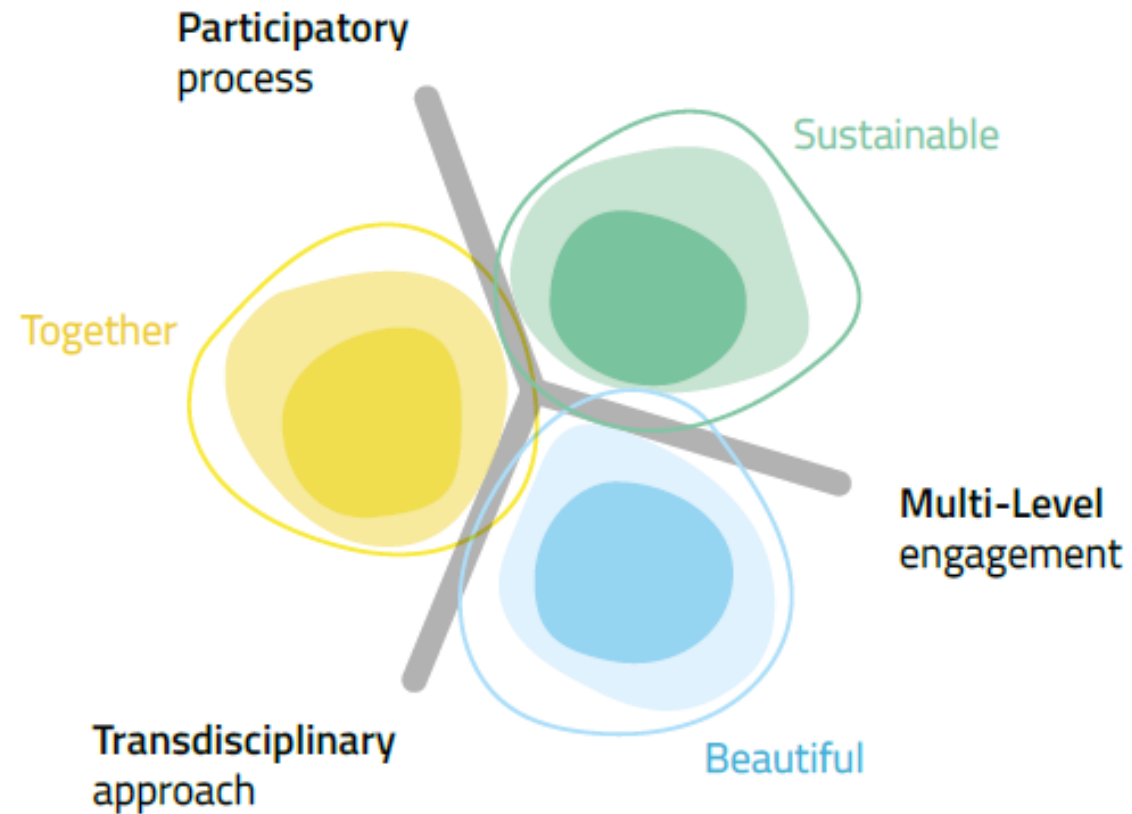

Several doubts because the final product is always customized in the normal commercial activity, like this one

Objectives

1. Description of the co-design process on the case study of a wood building of a new school complex in rural Southern France.
2. Show the implementation of wood-based innovations in the demo building to maximise the use of wood in response to green public procurement (GPP) criteria set by the regional authority.
3. NEB Compass assessment of the co-design process in the demo building

BASAJAUN demo building

France (2023)

Slide n° 35

Project description

BASAJAUN presents a new approach to the co-design process throughout the whole value chain, from forests to building construction and end-of-life. The building, destined as a residence for the staff, is part of an education complex for high school students from ten to fifteen years old owned by the Gironde Department. It was originally designed using a concrete structure, which was substituted by wood. Several Wood-based innovations were developed and implemented in the building to solve roofs, walls, and partitions and improve the health and safety of persons involved throughout the life cycle of the construction Works and comfort and safety throughout the whole building life.

IRIC, 13-14 September 2023, Izola, Slovenia

BASAJAUN demo building

Beautiful

AMBITION I: to activate

BASAJAUN considers the comfort of its users in terms of materials, and thermal and acoustic insulation. Its timber structure is conceived to remain visible inside the building, enhancing sensorial perceptions (visual, tactile and olfactory).

AMBITION II: to connect

The building aesthetics connect with the surroundings, a forest of pines. It provides attractive and comfortable apartments to accommodate school staff, which lets people with different backgrounds experiment with temporary living in a wood-based building, interchange impressions and learn about wood-based innovations thanks to the building process information located in the hall.

AMBITION III: to integrate

The project reflects the future needs of the users in terms of offering the chance to learn more about sustainable materials, lifecycle thinking and the possibility of reusing.

Sustainable

AMBITION I: to repurpose

The original project design, conceived with a concrete structure, was modified for a timber one, common insulation materials (petroleum or rock wool derivatives) were replaced by wood-based ones, and new bio-based coatings were developed to improve the wood durability.

AMBITION II: to close the loop

The process design of the building considered the whole life cycle analysis for both materials and components from the forest resource to the end of life of the building, allowing the possibility of reusing or recycling the wood-based components.

AMBITION III: to regenerate

Most of the elements that compose the structure and envelope (except connectors) are made of wood and derived materials from sustainably managed forest. The wood building becomes a carbon store during its service life and beyond due to the possibility of reusing.

Together

AMBITION I: to include

The building is inclusive by design, with no physical barriers on the ground floor. The school staff can access it without any distinction.

BASAJAUN demo building

Participatory Process

AMBITION I: to consult

BASAJAUN team maintained a continuous dialogue with the public representatives in meetings and with the general public, communicating the progress of the developed innovations and the design and construction process through presentations, publications, etc.

AMBITION II: to develop

The building was developed in collaboration with stakeholders in the whole value chain, from producers to end-users, from the forest resources to the building construction, and from rural areas to the urban environment.

Multi-level engagement

AMBITION I: to work locally

The Project was conceived as a demonstrator for a wood-based building from local resources (with the exception of the glulam), trying to influence the local living environment.

AMBITION II: to work across levels

The building is integrated in an educational complex for high school students, connected with other regional/national educational institutions. In addition, the commune of Le Pian-Médoc is connected with others in the Gironde Department and geographically at the border of the metropolitan area of Bordeaux. The building is an example to comply with the policy of the Department of at least 7.5% of the building volume made with wood.

AMBITION III: to work globally

Stakeholders from different countries were involved in the design and building process. The French demo building was taken as an example of replicability in a virtual model for a building in Finland.

Transdisciplinary approach

AMBITION I: to be multidisciplinary

The project brings together academics with professionals and industry through an innovative co-design approach with people from different backgrounds (foresters, chemical, industrial, structural and timber engineers, architects, rural planners, etc.)

AMBITION II: to be interdisciplinary

The project was characterised by a high intensity of communication between the players, led by one coordinator and different responsible for tasks, as usual in European projects. The creation of knowledge and development of innovations was in a chain, e.g. development of SIP panels depending on pulp-based insulation

AMBITION III: to be beyond disciplinary

A collaborative process in the development of wood-based innovations for building facilitated the merging of different knowledge fields. Different institutions and people with different background worked to develop and integrate more sustainable materials and products in building.

NEB Compass

Examples

BUGA Wood Pavilion

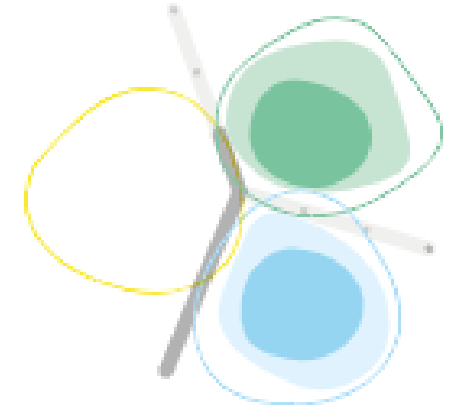

Germany (2019)
by ICD/ITKE & University of Stuttgart

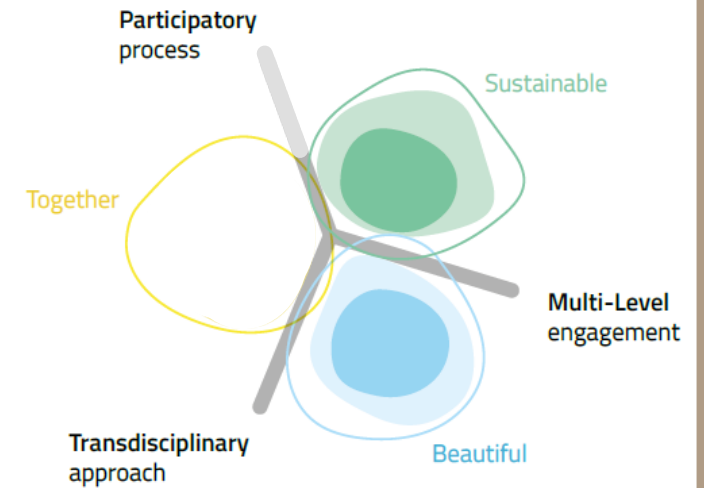

Project description

The BUGA Wood Pavilion celebrates a new approach to digital timber construction. The stunning wooden roof spans 30 metres over a public event area, using a minimum amount of material while also generating a unique architectural space. The pavilion was developed by an interdisciplinary team of architects, engineers, scientists, craft and public stakeholders. Due to its innovative building system it can be fully reassembled at a new location and completely recycled at the end of the structure's life.

BUGA Wood Pavilion

BASAJAUN Wood building

Conclusions

1. The NEB compass applied to the Basajaun demo building resulted in complying with the ambitions 3 for *Beautiful*; 3 for *Sustainable*, and 1 for *Together*; and with the ambition 2 for the *Participatory process* and 3 for *Multilevel* and for *Transdisciplinarity*.
2. The co-design process of the Basajaun project improved the scores of *Together* and *Participatory process*. This is a model for replication according to NEB principles.
3. However, it seems difficult to define and apply objective terms in the NEB evaluation. Developing NEB-related questions and indicators for checking could help to better compare projects.
4. CPR requirements ensuring the performance of the building need to be considered in parallel to the NEB values and principles, especially in aspects related to the structure of buildings that may result in a safety risk.
