The synthesis, crystal structure and spectroscopic analysis of (*E*)-1-(2,3-dihydrobenzo[*b*][1,4]dioxin-6-yl)-3-(4-chlorophenyl)prop-2-en-1-one ($C_{17}H_{13}ClO_3$), a substituted chalcone, are described. The overall geometry of the molecule is largely planar (r.m.s. deviation = 0.1742 Å), but slightly kinked, leading to a dihedral angle between the planes of the benzene rings at either side of the molecule of 8.31 (9)°. In the crystal, only weak interactions determine the packing motifs. These include C—H···O and C—H···Cl hydrogen bonds and π — π overlap of aromatic rings.

1. Chemical context

Chalcones exhibit a wide range of fascinating biological and pharmacological properties. Some of their beneficial attributes include anti-inflammatory, antimicrobial, antifungal, antioxidant, cytotoxic and anticancer activities (Dimmock *et al.*, 1999). Moreover, several chalcones have demonstrated significant antimalarial properties (Troeberg *et al.*, 2000). The efficient second-harmonic generation (SHG) conversion efficiency of some chalcones has also made them promising organic nonlinear optical (NLO) materials (Sarojini *et al.*, 2006). The presence of phenolic groups in many chalcones has garnered attention due to their radical quenching capabilities, making these compounds and chalcone-rich plant extracts potential candidates for drug development or food preservation (Dhar *et al.*, 1981; Di Carlo *et al.*, 1999). The design, synthesis and evaluation of 1,4-benzodioxane-substituted chalcones as selective and reversible inhibitors of human monoamine oxidase B was reported by Kong *et al.* (2020). Furthermore, Shinde *et al.* (2020) have conducted experimental and theoretical studies on the molecular structure, FT-IR, NMR, HOMO/LUMO frontier orbital, molecular electrostatic potential (MESP) and reactivity descriptors of (*E*)-1-(2,3-dihydrobenzo[*b*][1,4]dioxin-6-yl)-3-(3,4,5-trimethoxyphenyl)-prop-2-en-1-one. They have also reported the synthesis, antibacterial and computational studies of halo-chalcone hybrids derived from 1-(2,3-dihydrobenzo[*b*][1,4]dioxin-6-yl)ethan-1-one (Shinde *et al.*, 2021) and of two trifluorinated chalcones derived from 1-(2,3-dihydrobenzo[*b*][1,4]dioxin-6-yl)ethan-1-one (Shinde *et al.*, 2022a), as well as investigations of (*E*)-4-(3-(2,3-dihydrobenzo[*b*][1,4]dioxin-6-yl)-3-oxoprop-1-en-1-yl)-benzonitrile (Shinde *et al.*, 2022b). Additionally, Zhuang *et al.* (2017) presented a comprehensive review on the chalcone

framework as a privileged structure in medicinal chemistry, while Elkanzi *et al.* (2022) have published a review on the synthesis of chalcone derivatives and their biological activities.

Given the general significance of chalcones, we report herein the synthesis of (*E*)-1-(2,3-dihydrobenzo[*b*][1,4]dioxin-6-yl)-3-(4-chlorophenyl)prop-2-en-1-one, $\text{C}_{17}\text{H}_{13}\text{ClO}_3$ (**I**), along with its crystal structure and related studies.

2. Structural commentary

As shown in Fig. 1, the overall conformation of the molecule of **I** is determined by the torsion angles $\text{C}3-\text{C}2-\text{C}1-\text{C}10$ [169.9 (2) $^\circ$], $\text{C}2-\text{C}1-\text{C}10-\text{C}11$ [-171.3 (3) $^\circ$], $\text{C}1-\text{C}10-\text{C}11-\text{C}12$ [-179.0 (3) $^\circ$] and $\text{C}10-\text{C}11-\text{C}12-\text{C}17$ [-176.7 (3) $^\circ$] of the propenone moiety. In magnitude, these are all within about 10 $^\circ$ of 180 $^\circ$, which makes the molecule largely flat (r.m.s. deviation for the non-H atoms is 0.1742 \AA), though slightly bent, leading to a dihedral angle between the chlorophenyl and dihydrobenzodioxine rings of 8.31 (9) $^\circ$. The conformation of the dihydrodioxine ring, as determined by its Cremer–Pople puckering parameters (Cremer & Pople, 1975) [Q = 0.466 (3) \AA , θ = 51.2 (4) $^\circ$ and φ = 282.6 (4) $^\circ$], is closest to half-chair (Boeyens, 1978). This puckering places atoms C5 and C6 at 0.499 (4) and -0.207 (4) \AA on either side of the mean plane of the dihydrobenzodioxine ring. All bond lengths and angles lie within the typical ranges found in organic structures.

3. Supramolecular features

The crystal packing in **I** is governed solely by weak interactions, as the only possible hydrogen-bond donors are of type

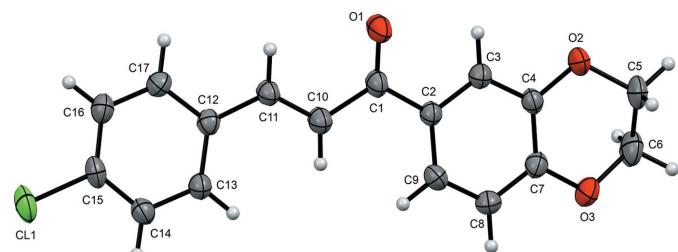

Figure 1

The molecular structure of the title compound, showing the atom labelling and displacement ellipsoids drawn at the 50% probability level.

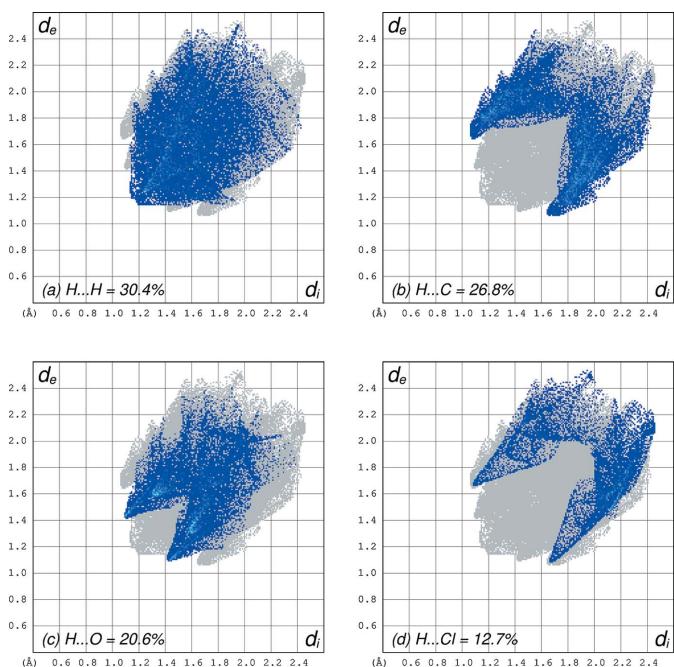

Figure 2

Hirshfeld surface fingerprint plots showing (a) $\text{H}\cdots\text{H}$ contacts = 30.4% coverage, (b) $\text{H}\cdots\text{C}$ = 26.8%, (c) $\text{H}\cdots\text{O}$ = 20.6% and (d) $\text{H}\cdots\text{Cl}$ = 12.7%. Reciprocal contacts are included in the coverage fractions. Other contact types were unremarkable.

C—H. The absence of any sharp spikes protruding to the lower left in the Hirshfeld surface fingerprint plots (Fig. 2) calculated using *CrystalExplorer* (Spackman *et al.*, 2021) clearly marks the absence of any very close contacts. Indeed, only two such contacts are flagged as intermolecular hydrogen-bond-type interactions by the default *SHELXL* HTAB command. These are $\text{C}5-\text{H}5\text{A}\cdots\text{O}3^{\text{i}}$ and $\text{C}5-\text{H}5\text{B}\cdots\text{Cl}1^{\text{ii}}$ [symmetry codes: (i) $x - \frac{1}{2}, -y + \frac{3}{2}, z$; (ii) $x - 1, y, z - 1$], shown in Table 1. The benzene rings of the 4-chlorophenyl and dihydrobenzodioxine groups, however, exhibit π – π overlap, which link the molecules into chains that extend parallel to [001], as shown in Fig. 3. The centroid–centroid distances [3.747 (18) \AA] and the dihedral angle between the

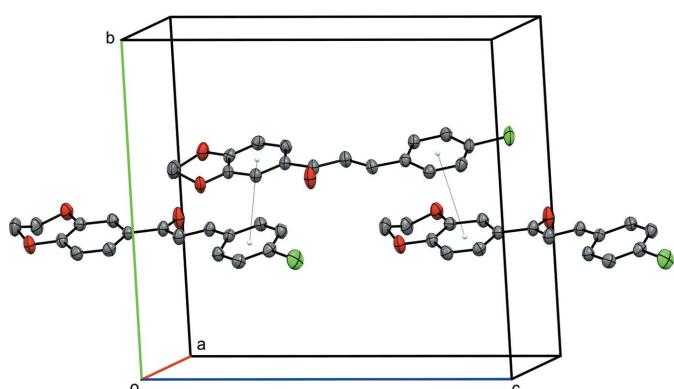

Figure 3

A partial packing plot of **I**, viewed approximately down the *a* axis. The stacking of the aromatic rings is shown by dotted lines between ring centroids, which lead to chains of molecules that extend parallel to [001].

participating rings [6.12 (11) $^\circ$] imply that these are rather weak interactions.

4. Database survey

A search of the Cambridge Structural Database (CSD, Version 5.43 with updates to November 2022; Groom *et al.*, 2016) using a molecular fragment consisting of chalcone ($C_6H_5C=OCH=CHC_6H_5$) with no specific substituents returned 4725 hits. With hydrogen attached across the C=C double bond, the search gave 1200 hits. Of these entries, 155 had ‘any halogen’ at the equivalent of C15 in **I**, 62 of which had Cl. A search fragment without the halogen but with ‘any oxygen bound’ substituent at the equivalent of C4 and C7 produced 78 matches. Addition of the aforementioned halogen reduced this to 14 structures, seven of which were chlorides, but only five are unique. These are: BOFFIQ [(2E)-1-(1,3-benzodioxol-5-yl)-3-(4-chlorophenyl)prop-2-en-1-one; Jasinski *et al.*, 2008], FATFIR [(E)-3-(2,4-dichlorophenyl)-1-(3,4,5-trimethoxyphenyl)prop-2-en-1-one; Wu *et al.*, 2012], TICDIT [3-(4-chlorophenyl)-1-(3,4-dimethoxyphenyl)prop-2-en-1-one; Teh *et al.*, 2007], VIDDIW [3-(2,4-dichlorophenyl)-1-(3,4-dimethoxyphenyl)prop-2-en-1-one; Ng *et al.*, 2007] and XOLLOC [3-(4-chloro-3-fluorophenyl)-1-(3,4-dimethoxyphenyl)prop-2-en-1-one; Çelikesir *et al.*, 2019]. A few other related chalcone structures include: QERYOC [(2E)-3-(1,3-benzodioxol-5-yl)-1-(4-bromophenyl)prop-2-en-1-one; Harrison *et al.*, 2006], KUYWOR [(2E)-3-(1,3-benzodioxol-5-yl)-1-(3-bromo-2-thienyl)prop-2-en-1-one; Harrison *et al.*, 2010], TUNTAY [(2E)-1-(1,3-benzodioxol-5-yl)-3-(2-bromophenyl)prop-2-en-1-one; Li *et al.*, 2010], and UNUZUZ {(E)-3-(8-benzyloxy-2,3-dihydro-1,4-benzodioxin-6-yl)-1-[2-hydroxy-4,6-bis(methoxymethoxy)phenyl]prop-2-en-1-one; Zhang *et al.*, 2011].

5. Synthesis, crystallization, and spectroscopic data

1-(2,3-Dihydrobenzo[1,4]dioxin-6-yl)ethanone was prepared by Friedel–Crafts acylation of benzo[1,4]dioxane using ether

Computer programs: APEX3 (Bruker, 2016), SHELXT (Sheldrick, 2015a), SHELXL2019 (Sheldrick, 2015b), Mercury (Macrae *et al.*, 2020), SHELX (Sheldrick, 2008) and publCIF (Westrip, 2010).

as solvent (Fig. 4). 1-(2,3-Dihydrobenzo[1,4]dioxin-6-yl)ethanone (1.78 g, 0.01 mol) and 4-chlorobenzaldehyde (1.40 g, 0.01 mol) were stirred in a 30% ethanolic NaOH and water mixture at 293 K for 4–6 h. The reaction mixture was refrigerated overnight. The precipitate that formed was filtered off and dried. X-ray-quality crystals were obtained from a solvent mixture of DMF–DMSO (dimethylformamide–dimethyl sulfoxide) (1:1 *v/v*) and the corresponding melting point was found to be 410–411 K.

FT-IR (ν in cm $^{-1}$): 3156–2934 (Ar-CH), 1655 (C=O), 1575 (C=C); ^1H NMR (CDCl_3 , 400 MHz): δ 7.71 (*d*, 1H, β -CH), 7.92 (*d*, 2H, Ar-H), 7.62 (*d*, 2H, Ar-H), 7.23 (*d*, 1H, 2,3-dihydrobenzo[1,4]dioxine Ar-H), 7.21 (*d*, 1H, 2,3-dihydrobenzo[1,4]dioxine Ar-H), 7.01 (*d*, 1H, α -CH), 6.93 (*s*, 1H, 2,3-dihydrobenzo[1,4]dioxine Ar-H), 4.14 (*m*, 4H, 1,4-dioxane CH $_2$); ^{13}C NMR (CDCl_3 , 100 MHz): δ 196.1, 156.5, 149.8, 145.1, 133.5, 133.3, 129.0, 128.7, 122.1, 121.4, 121.3, 112.0, 106.8, 64.2.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. All H atoms were found in difference Fourier maps and subsequently included in the

refinement using riding models, with constrained distances set to 0.95 [C(sp^2)H] and 0.99 Å (R_2CH_2). $U_{iso}(H)$ values were set to $1.2U_{eq}$ of the attached atom. The absolute structure was determined using 1035 quotients of the form $[(I^+) - (I^-)] / [(I^+) + (I^-)]$ (Parsons *et al.*, 2013).

Special details

Experimental. The crystal was mounted using polyisobutene oil on the tip of a fine glass fibre, which was fastened in a copper mounting pin with electrical solder. It was placed directly into the cold gas stream of a liquid-nitrogen based cryostat (Hope, 1994; Parkin & Hope, 1998).

The crystals appeared to undergo a destructive phase transition when cooled to 90K. Visual inspection of crystal integrity and diffraction quality vs temperature established a safe temperature for data collection of -73° C.

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement progress was checked using *Platon* (Spek, 2020) and by an *R*-tensor (Parkin, 2000). The final model was further checked with the IUCr utility *checkCIF*.
