Dear colleagues and friends,

We have great pleasure to welcome you to the Advanced Ceramic and Application XI Conference organized by the Serbian Ceramic Society in cooperation with the Institute of Technical Sciences of SASA, Institute of Chemistry Technology and Metallurgy, Institute for Technology of Nuclear and Other Raw Mineral Materials and Institute for Testing of Materials.

It is nice to host you here in Belgrade in person. We are very proud that we succeeded in bringing the scientific community together again and fostering the networking and social interactions around an interesting program on emerging advanced ceramic topics. The chosen topics cover contributions from fundamental theoretical research in advanced ceramics, computer-aided design and modeling of new ceramics products, manufacturing of nano-ceramic devices, developing of multifunctional ceramic processing routes, etc.

Traditionally, ACA Conferences gather leading researchers, engineers, specialists, professors and PhD students trying to emphasize the key achievements which will enable the widespread use of the advanced ceramics products in the High-Tech industry, renewable energy utilization, environmental efficiency, security, space technology, cultural heritage, etc.

Serbian Ceramic Society was initiated in 1995/1996 and fully registered in 1997 as Yugoslav Ceramic Society, being strongly supported by American Ceramic Society. Since 2009, it has continued as the Serbian Ceramic Society in accordance with Serbian law procedure. Serbian Ceramic Society is almost the only one Ceramic Society in South-East Europe, with members from more than 20 Institutes and Universities, active in 9 sessions..

Dr. Nina Obradović  
*President of the Serbian Ceramic Society*

Dr. Suzana Filipović  
*President of the General Assembly of the Serbian Ceramic Society*

### Conference Topics

- Basic Ceramic Science & Sintering
- Nano-, Opto- & Bio-ceramics
- Modeling & Simulation
- Glass and Electro Ceramics
- Electrochemistry & Catalysis
- Refractory, Cements & Clays
- Renewable Energy & Composites
- Amorphous & Magnetic Ceramics
- Heritage, Art & Design

oscillation time. In this work, the influence of different sizes of bentonite particles from the Bogovina deposit on the Briggs-Rauscher oscillatory reaction in the conditions of a closed reactor was investigated. Five particle sizes of bentonite, ( $< 25 \mu\text{m}$ ,  $< 50 \mu\text{m}$ ,  $< 75 \mu\text{m}$ ,  $< 150 \mu\text{m}$  and  $< 300 \mu\text{m}$ ) having identical mass of 0.15 g, were tested. The addition of different particle sizes of Bogovina clay does not significantly influence the basic BR oscillogram.

**Acknowledgment:** This work was supported by the Ministry of Science, Technological Development and Innovation of the Republic of Serbia (Contract numbers: 451-03-47/2023-01/200146 and 451-03-47/2023-01/200026).

## P20

### **Synthesis and characterization of luminescent $\text{Pr}^{3+}$ -doped hydroxyapatite nanopowder as a potential biomaterial for bioimaging applications**

Vojislav Stanić<sup>1</sup>, Mia Omerašević<sup>1</sup>, Dragoslav Mutavdžić<sup>2</sup>, Dragana Jugović<sup>3</sup>,  
Dušan Bučevac<sup>1</sup>, Tamara Gerić<sup>4</sup>, Ivana Jelić<sup>1</sup>

<sup>1</sup>“VINČA” Institute of Nuclear Sciences—National Institute of the Republic of Serbia, University of Belgrade, Belgrade, Serbia

<sup>3</sup>Institute of Technical Sciences of SASA, Belgrade, Serbia

<sup>4</sup>Institute of Meat Hygiene and Technology (INMES), Belgrade, Serbia

Praseodymium doped calcium hydroxyapatite (PrHAP) nanopowder was synthesized by the co-precipitation method and characterized by X-Ray Diffraction, Fourier Transform Infrared, and Fluorescence Spectroscopy. Characterization studies from XRD and FTIR spectra showed that obtained crystals are monophase hydroxyapatites and that the sample particles are of nano size. A fluorescence study has shown that PrHAP particles have fluorescent emission under UV- Visible excitation. These results may open new avenues for developing bioactive materials for bone regeneration and fluorescent probes for bio-imaging applications

## P21

### **Vertically aligned $\text{TiO}_2$ nanorod array as an electron transport layer in perovskite photodiode**

Milica Stefanović<sup>1</sup>, Rada Petrović<sup>2</sup>, Đorđe Janačković<sup>2</sup>

<sup>1</sup>Innovation Center of Faculty of Technology and Metallurgy, Ltd, Karnegijeva 4, Belgrade, Serbia

<sup>2</sup>University of Belgrade, Faculty of Technology and Metallurgy, Karnegijeva 4, Belgrade, Serbia

The development of metal oxide-based electron transport layers in perovskite solar cells (PSCs) is being intensively researched to achieve highly efficient PSCs. They offer the advantage of higher charge carrier mobility and stability compared to typical organic materials. To reduce the recombination of charge carriers, methylammonium lead bromide ( $\text{MAPbBr}_3$ ) perovskite was coupled with vertically aligned  $\text{TiO}_2$  nanorods (NRs) as an
