Tecting Dequirements	for water tha	t comoc into contac	t with produce du	ring harvest/nost-harvest activities	••		

Testing Requirements for water that comes into contact with produce during harvest/post-harvest activities:

- ▶ Public Water System or Public Water Supply: No testing is required, but annual results or certificates of compliance must be obtained from the supplier which demonstrates that the water meets the requirements of NO detectable E. coli.
- ▶ Ground Water (wells): For every source/well-- Year 1: Test 4 times during the growing season OR cumulative over a 1-year period. After Year 1, test annually thereafter. If any annual test fails to meet microbial limits, discontinue use and make necessary changes to ensure water is of acceptable criteria (treating water is an option). Resume testing of water 4 times per growing season or year to show no E. coli is present.
- ► Surface Water (creeks, springs, rivers, ponds): NEVER use untreated surface water. If this is the only water source available, it must be treated with approved methods before using it in harvest/post-harvest activities.

For sampling techniques or tips, please visit: https://extension.unh.edu/agriculture-gardens/food-safety

Total Coliform: N/A E. Coli: ABSENT or < 1 MPN/100mL

Acceptable Limits:

Laboratory Results:

Although the lab report may show results for both Total Coliform and E. coli, the PSR is only concerned with the detection of E. coli. *Other approved methods may be referenced on lab reports, such as Idexx, Colilert, or Colisure.

Testing requirements effective: January 2023 for Large Covered farms, January 2024 for Small Covered farms, and January 2025 for Very Small Covered farms.
