# Operationalising Critical Realism for Case Study Research

Qualitative Research Journal

## Abstract

### Purpose

Critical realism is an increasingly popular ‘lens’ through which complex events, entities and phenomena can be studied. Yet detailed operationalisations of critical realism are at present relatively scarce. Our objective here is built on existing debates by developing an *open systems model of reality*, a basis for designing appropriate, internally consistent methodologies.

### Approach

We use a qualitative case study examining changing practices for client contact management in professional services firms during restrictions imposed by the COVID-19 crisis to show how the model can be operationalised across all stages of a research study.

### Findings

Our study contributes to the literature on qualitative applications of critical realism by providing a detailed example of how the research paradigm influenced choices at every stage of the case study process.

### Originality

More importantly, our model of reality as an open system provides a tool for other researchers to use in their own operationalisation of critical realism in a variety of different settings.

## Key words

**Critical realism, case study research, open system models, abduction, retroduction, thematic analysis, elements of reality, critical realist mechanisms**

## Introduction

Studying developments triggered by humans and their behaviour requires careful consideration on what truth is and how it can be assessed. Amongst different options, critical realism, based on the seminal works of Bhaskar (1978), is an increasingly popular choice (Williams, 2016), but not without challenges when it comes to research design and correctly identifying the elements of reality in critical realism (O'Mahoney and Vincent, 2014). In this article, we reflect on a study based on a critical realist stance and develop a model of reality as an open system and the determinants/components of structure in critical realism. In relation to this, we explore the methodological approach chosen based on critical realist ontology and epistemology, namely a qualitative case study.

Our aim is first to develop a model of critical realist reality that distils the main elements and acting forces defining and influencing structure, thus showing how what occurs is likely to be caused by a complex system of interacting forces. Second, we operationalise critical realism through a reflective process that maintains the critical realist focus on understanding rather than just describing a social reality (Vincent and O'Mahoney, 2016). We also explore abductive reasoning and why, in combination with retroduction, this research logic is best suited to identifying causal mechanisms behind the (visible) events under scrutiny.

First, we provide an overview of the study in question, which involved studying client contact management practices in a crisis. Next, we use a critical realist philosophical stance to develop an open system of reality and link this to the ensuing research strategy and design choices made. We include a specific example of application of the model and conclude with a discussion of our approach and its contribution to the literature on critical realism and case study research.

## Overview of the Study

The study in question examined changing practices for client contact management in professional services firms during restrictions on personal contact imposed by the COVID-19 crisis. The aim was to explore how the crisis was experienced and what respondents learned for the future. Investigating communication in a crisis and the resulting changes in practice was a matter of social construction and personal interpretation by respondents. Yet, allowances were still required for an underlying reality, such as changes in the environment due to the pandemic. Therefore, a critical realist paradigm and abductive research logic were adopted.

1  
2  
3 The resulting research design was a sectoral case study of the consulting industry in the German  
4 speaking countries of Europe with semi-structured interviews as the main source of data. Early  
5 'grey literature' publications on the topic, mainly from the industry under investigation, served  
6 as a secondary source. Data were structured and analysed using thematic analysis (following  
7 the approach of Braun and Clarke, 2006), investigating the emergence of improved practices  
8 around client communication in times of crises and ensuing changes in practices. The consulting  
9 industry was chosen because of it traditionally requiring close personal contact which was  
10 significantly disrupted during the period in question. The DACH region was chosen for  
11 pragmatic reasons of closeness and being a relatively homogeneous sub-region of Europe.

12  
13  
14  
15  
16  
17  
18  
19 Thirteen qualitative, semi-structured interviews were conducted, with four in the pilot phase  
20 and the remainder thereafter. Thematic analysis was the method of analysis, and data were  
21 coded in two rounds, one of initial and one of axial coding, in order to allow arranging them  
22 into categories and subsequently themes. Using an extensive personal network, thirteen  
23 participants were recruited for the expected relevance of their information. In order to ensure  
24 variety, participants included consultants from different companies, different hierarchical levels  
25 and both genders.

26  
27  
28  
29  
30  
31  
32 Interviews were planned in a way that encouraged participants to get into a flow of speech to  
33 let topics emerge, "keep(ing) them talking" Outhwaite (1998, p.293). The questions also needed  
34 to be helpful in capturing and understanding emotions, a factor which also influences coding as  
35 described in section 5.7 (Kouamé and Liu, 2020). This led to a semi-structured design, also  
36 asking whether interviewees believed any topic or question to be missing and ensuring a  
37 conversational approach allowing to probe for informant reflexivity, an important goal of  
38 critical realist interviewing (Smith and Elger, 2014). Interviews were conducted electronically  
39 as personal meetings were not possible under the COVID-related restrictions in place. The first  
40 four were transcribed manually, the remainder using MS Teams functions. The interview  
41 yielded close to 7000 lines of transcription.

### 50 **Modelling Critical Realist Reality**

51  
52  
53 When studying a crisis and resulting emergence of improved practices, one is looking at  
54 peoples' beliefs based on their experience. Thus, reality, as experienced by interview  
55 respondents, springs foremost from their minds. According to Bhaskar (1978, 1998a, 1998b),  
56 however, a reality exists independently from the human mind. Therefore a purely social  
57 constructionist view (e.g. Berger (1966); Gergen (1992)) might not take into account economic  
58  
59  
60

1  
2  
3 or even medical realities around the topic. Further, constructionist or interpretivist approaches  
4 may be prone to distorting effects or held back in their possibilities for interpretation through,  
5 for instance, ideology (Fleetwood, 2014).  
6  
7

8  
9 Nevertheless, critical realism has been criticised for its detachment from values and thus the  
10 ideologically ‘good’ (Denzin and Lincoln, 2005). A thorough reflection on ones’ own beliefs  
11 as a researcher is therefore critical if a study is to have meaning and validity. Guba and Lincoln  
12 (2005), setting qualitative work in a non-positivist environment, warned that any finding is open  
13 to challenge based on underlying paradigm. Yet reality is more complex. Reflections on the  
14 approach best start with a framework of what led to the methodology and methods used (Müller  
15 and Klein, 2019). Elements of ones’ stance are interdependent throughout the different  
16 decisions that need to be made when designing a study – a rigorous approach requires such  
17 decisions to be made explicitly.  
18

20  
21  
22  
23  
24

25 Making epistemology & ontology, the research question, data collection and analysis one  
26 system, taking into account interdependencies and influence between these aspects, can help  
27 (Sullivan, Gibson and Riley, 2012). The critical realist approach is still much discussed, it might  
28 “blur at the edges” (Elder-Vass and Morgan, 2022, p.216) and there are constant additions and  
29 new insights on how to apply it, also taking into account other ontological approaches such as  
30 processual ones (Rutzou and Elder-Vass, 2019). However, critical realism, as discussed below,  
31 offers an excellent way of designing a research project as a logical, harmonious and  
32 comprehensive whole. The next sections explore the philosophical approach and the research  
33 logic, then provide an overview of the resulting method and analysis of the data. This requires  
34 some initial reflections on the ontological basis.

### 43 ***Ontology and Critical Realism***

44  
45 When investigating experience and conclusions drawn thereupon, a researcher cannot look at  
46 statistics and hard figures to arrive at a system of principles that can be applied. Social dynamics  
47 resulting from human interaction are a result of personal interpretation, and all claims and  
48 beliefs relate to social and cultural influences (Smith, 2005). This means that one cannot ‘know’  
49 in detail what determines the outcome of a piece of research (Noonan, 2008). Reality is  
50 therefore not a fixed object, which has implications for both research strategy and design.  
51  
52  
53  
54  
55  
56

57 The above stance is a relativist ontology, which Rashid *et al.* (2019) argue is a prerequisite for  
58 a qualitative study. Dogmatic relativism, however, means no ‘universal truth’ exists at all  
59 (Smith, 2005, p. 750). Critical realist thinking suggests that reality is not reduced to how one  
60

1  
2  
3 finds out about it (Fletcher, 2016). Reality is possible, even if one accepts that human  
4 experience and the rendering of it is a social product (Bhaskar, 1998a). Neorealist authors (e.g.  
5 Hammersley (1990, 2013)) avoid ‘classical’ realism, which rejects the relativist view and see  
6 results as relative to particular social and/or cultural practices, using plausibility and credibility  
7 as criteria for evaluating research (Williams, 2016).  
8  
9  
10

11  
12 All researchers seek to find what is ‘real’ and ‘true’, but opinion differs on what that means  
13 (Edwards, O'Mahoney and Vincent, 2014b). Further, some suggest ‘truth’ does not exist, its  
14 definition bound by social conventions of the person interpreting it (Gergen and Thatchenkery,  
15 2004). Subjectivist approaches dominate qualitative research (Ratner, 2005) and tend to claim  
16 that one cannot know what is real. Critical realism offers a way out of this dilemma by accepting  
17 the ‘ontological drift’ between what is physically and socially real (Archer, 1998b, p. 189), and  
18 acknowledging that even the social world does not depend entirely on what people think and  
19 do (Groff, 2000). Critical realism therefore offers a rich potential for numerous purposes.

22  
23  
24  
25

### 26 27 ***Reality as an Open System*** 28

29 Bhaskar (1998b) describes reality as an ‘open system’, i.e. not a one-to-one relationship  
30 between what occurs and a cause but as the result of the interaction of many factors (Wynn and  
31 Williams, 2012). Thinking along this system helps understanding the underlying reality (the  
32 domain of the ‘real’) through visible events (the ‘actual’) which in turn are experienced (and  
33 interpreted) by humans (the domain of the ‘empirical’) in a ‘stratified’ view of reality and how  
34 it is accessible (Bhaskar, 1978; Edwards, O'Mahoney and Vincent, 2014a). This stratified view  
35 can also help establishing a systems view of the different elements of reality (Armstrong, 2019).  
36 We develop a model of this reality system based on a synthesis of influential critical realist  
37 writings (see figure 1) and will detail its development below.  
38  
39  
40  
41  
42

45

46 -----  
47 INSERT FIGURE 1  
48 -----  
49

50 Critical realism has features in common with constructionist/post-modernist views (Gray, 2014;  
51 Madill, Jordan and Shirley, 2000), but suggests that there is a visible reality that exists. Bhaskar  
52 (1998b) suggests the existence of real things existing in a world without humans, thus not  
53 dependent on being socially constructed, and proposes the aforementioned ‘strata’ of reality.  
54 Thus ‘real’, in a critical realist world, is determined by causal structures or generating factors,  
55 which then give rise to empirical events (Groff, 2000) from which one could assume  
56 preconditions to be present (Archer, 1998b). Causal powers emerge because the structure is  
57  
58  
59  
60

1  
2  
3 organised in the one specific way which triggers a result. Elder Vass gives the example of a  
4 queue which works as a mechanism for access to a resource only because it is organised as a  
5 queue (Rutzou and Elder-Vass, 2019). This example also helps to illustrate the influence of  
6 other shaping elements such as culture and rules – queues do not work and form in the same  
7 way in different cultural environments. According to Outhwaite (1998), from an ontological  
8 point of view, social reality is:  
9

- 14 • Intransitive, existing independently of descriptions or observation. This is the basis of  
15 being able to explain social matters (Archer, 1998b)
- 18 • Characterised by relatively enduring underlying mechanisms ('transfactual'), which  
19 makes a story behind observations possible, and
- 21 • Stratified according to Bhaskar's levels of reality,

23  
24 all the while subject to being changed by agents, who do not necessarily create but transform  
25 or reproduce (Fleetwood, 2014). Agents may or may not be aware of underlying structures that  
26 govern their actions, but nonetheless are 'real' (Outhwaite, 1998). Critical realism views  
27 interaction between agents as a primary 'mechanism' for change ('mechanisms' causing the  
28 visible 'events'), but they also form stability via 'structures' (Ryan *et al.*, 2012).

33  
34 These structures, including their components (sub-structures, rules and practices as well as  
35 discursive entities (Archer, 1998b)) plus additional – material or immaterial – 'essences'  
36 (Bhaskar, 1998b) form the body of the so-called 'entities' which can generate or trigger  
37 mechanisms. By exploring social structures allowing for the actions of agents, critical realism  
38 rejects static and a-historic interpretations of social phenomena (Kaidesoja, 2009; Archer and  
39 Morgan, 2020). While agency is not determined by structure (Bhaskar, 1978), all entities can  
40 shape agency so that action and structure presuppose each other (Archer, 2010). Entities like  
41 structures can have causal power, but this depends on the given context – they create effects by  
42 being organised in just the way they are, which can make interpretation difficult (Elder-Vass,  
43 2010). Not only the properties but also relationship between the elements of reality are relevant.

51  
52 The above shows that research depends on our values and stance and knowledge is therefore  
53 relative to the people involved, their culture and surroundings (Williams, Rycroft-Malone and  
54 Burton, 2016; Bhaskar, 2008b). So is any learning process such as the development of  
55 improved practices, but there is also causality based on real occurrences and real experience:  
56 the social world is based on the physical, and the social constructions interact with it. Such  
57  
58  
59  
60

1  
2  
3 mechanisms find specific use in research, for instance in an analytical tool for realist interviews  
4 (Mukumbang *et al.*, 2020).  
5  
6

7 This interaction makes reality said ‘open system’ (Bhaskar, 1998b), and structure, in turn, can  
8 also influence mechanisms (O'Mahoney and Vincent, 2014). This is also a cyclical process,  
9 newly emerged structures will for instances contributing to the next set of changes (Archer and  
10 Morgan, 2020), interacting with cultural elements, rules, practices, or values, all socially  
11 constructed (Elder-Vass, 2019). Which phenomenon pertains to which element of reality is,  
12 however, difficult to determine and might depend on which influences of it are being  
13 scrutinised. An example of critical realist research in Fletcher (2016) shows that something can  
14 be an entity, but at the same time a component to another structure, witness the Canadian  
15 agricultural sector, the farms within and the individual farm workers, who can also act as agents.  
16 Hoddy (2019) directly relates mechanisms (and the resulting events and experiences), to the  
17 three Bhaskarian levels of reality, and to this system, authors like Fleetwood (2014) and Archer  
18 (1998a, 2010, 2011) add transforming actions by agents, leading to the overview in figure 1.  
19  
20  
21  
22  
23  
24  
25  
26  
27

28 The (causal) mechanisms, which critical realist research is investigating, together with events  
29 and experiences are related to the three domains of reality (Bhaskar, 1998b). Fletcher (2016)  
30 uses an iceberg metaphor where only experiences, thus the empirical, are visible, and reinforces  
31 the idea that, unlike in nature, social structures and activity are interdependent. Starting from  
32 the sociological research problem that humans constitute society, which in turn forms said  
33 humans, Archer (2010) shows that these (‘morphogenetic’) cyclical interchanges as described  
34 in the figure above are constantly changing and endless, while allowing for basic structural  
35 properties integral to the social constitution (see also Archer, 2003; Archer and Morgan, 2020).  
36  
37  
38  
39  
40  
41  
42

43 A central conclusion is that reality is a dynamic process (Noonan, 2008) one cannot fully  
44 document, but it is possible to learn from observations and earlier occurrences. Identifying  
45 structures is difficult (Bhaskar, 1998b), but explanation is possible. Conclusions may not,  
46 however, be universal and results must be seen in context. Therefore accepting an independent  
47 reality and trying to reconcile real and constructed domains, the empirical, actual and real strata  
48 (Clark, 2008), acknowledges the impossibility of ever being certain.  
49  
50  
51  
52  
53

54 Critical Realism, however, goes beyond ontology (Fleetwood, 2014). Choosing the right  
55 approaches to analysis is therefore crucial, as is reflexivity (Fletcher, 2016; Sobh and Perry,  
56 2006). As Outhwaite (1987) remarks: while critical realism is bold ontologically, it is  
57 epistemologically cautious.  
58  
59  
60

### *Epistemological Implications and Abductive Research Logic*

While theory might be relative to subjective interpretation, real structures in critical realism are not (Groff, 2000). The question is how to bring generative elements to light (Outhwaite, 1998) taking different concepts of interpretation into account. This contrasts with approaches such as interpretivism, accepting knowledge only through studying humans from the ‘inside’ (Fleetwood, 2014p. 182). Others such as social constructionism or postmodernism focus entirely on social knowledge dependent on its identification – or fabrication – by individuals (Henningk, Hutter and Bailey, 2020).

Critical realism combines both positivist and subjectivist approaches, positioning itself between those two (Taylor, 2018). Even if part of reality is not socially constructed, however, when one researches, it is done in a ‘value laden’ way (Bhaskar, 1978). Therefore, critical realist epistemology is closer to the subjective approach, which permits opinion, attributed meanings and contextual interpretation as well as entailing a reflexive axiology.

Alternatively, one could simply adopt pragmatism. Calls exist for critical realists to engage thoroughly with pragmatist approaches when presenting their own solution (Smith, 2013), and some beliefs are similar, e.g. that both real and constructed phenomena exist. Pragmatism, however, emphasises that truth in pragmatism is only what ‘matters’ or has an effect (Williams (2016). Further, examples show that pragmatist researchers have a wide margin of choice of methodology and methods, making rationales over being likely to produce the desired results difficult (Kaushik, Walsh and Lai, 2019).

Complex and constantly changing reality means that critical realist research can be viewed as ‘modified objectivist’ (Healy and Perry, 2000p. 1195), i.e. findings are only likely to be true and the world is only apprehensible using probabilities, not necessarily statistical ones. Reality is determined by multiple factors, thus one can only look for potential mechanisms (O'Mahoney and Vincent, 2014), and while critical realist researchers are value aware (Healy and Perry, 2000), they must work cautiously, be aware that some observations might be illusions or certain facts cannot be observed, taking many potential causal powers, dependencies and relationships into account (O'Mahoney and Vincent, 2014).

The epistemological view in critical realism is therefore a ‘stratified’ one, following the aforementioned recommendations along the three domains (Edwards, O'Mahoney and Vincent, 2014a). Objectivism can be applied, but only to the domain of the actual (what occurs) and the real domains. Where aspects of these domains become visible, objectivist research becomes

1  
2  
3 possible (Vincent and O'Mahoney, 2016). This does not apply to the realm of the empirical,  
4 and thus the differences between natural and social reality are being taken into account (Archer,  
5 1998b). The distinction between the domains also is relevant when finalising, for instance,  
6 interview questions (Mukumbang *et al.*, 2020).  
7  
8  
9

10 There are other caveats. Because Bhaskar believes in a reality independent of empirical  
11 observation (a transcendental one), critical realists are bound to research using transcendental  
12 analysis (Kaidesoja, 2009). This means using the agents' conception of phenomena, then from  
13 this infer conditions for the said phenomena. Kaidesoja concludes that in addition to that, some  
14 patterns – empirical regularities – can be found by other means of analysis, sometimes even  
15 statistical, in order to become less abstract. Thus, at least some triangulation might be necessary,  
16 adding rigour, and recent approaches of critical realist research describe a wide variety of  
17 potential methods for gathering and analysing data (O'Mahoney and Vincent, 2014). Interaction  
18 between agents and social 'subsystems' also needs to be considered, which can be taken as  
19 involving any stakeholders in an organisation (Kaidesoja, 2009).  
20  
21  
22  
23  
24  
25  
26  
27  
28

29 From these reflections follows that applying a critical realist paradigm in epistemology will  
30 require caution and thoroughness. In a comparison with a constructionist paradigm, Taylor  
31 (2018) warns that while a critical realist stance may help to exclude the danger of dogmatism  
32 inherent to social constructionism, the researcher will need to make sure not to get wrong what  
33 is real. People are under the constraints of a real world, physically and socially, and realities  
34 cannot be fully construed – and what belongs to which domain? On top of that, the 'real' can  
35 change, there are transitive elements to knowledge (Bhaskar, 1998b), the already described  
36 'agents' transform things – and there is even a 'social real' (Fleetwood, 2014, p. 191).  
37  
38  
39  
40  
41  
42

43 Knowledge also has both transitive and intransitive ('real') elements, of which intransitive  
44 elements of knowledge are beyond human influence (Bhaskar, 1998b; Bhaskar, 1978). With  
45 critical realism moving towards a naturalised version, semi-transitive elements have been added  
46 and there is a distinction between human influence and knowledge as ontological and  
47 epistemological dimensions (Modell, 2023). Critical realist research tries to explain rather than  
48 predict (Wynn and Williams, 2012), acknowledging the value of subjective relation and  
49 interpretation by the actors. Outhwaite (1998) only sees knowledge emerge when there is no  
50 better alternative to an explanation. However, when there are multiple possible explanations,  
51 one can check for the one with the best explanatory power, but this is obviously a matter of  
52 judgement (Wynn and Williams, 2012).  
53

55  
56  
57  
58  
59  
60

1  
2  
3 So, critical realist research is challenging, but it thoroughly looks for causalities instead of  
4 simply acknowledging experiences, and it helps understanding complexity (Williams, Rycroft-  
5 Malone and Burton, 2016). Interpreting data in critical realism takes all aspects of social  
6 structure into account, including emotions, important in social research – especially so in the  
7 example study as it deals with a crisis, a highly emotional event.  
8  
9

10  
11  
12 When looking at phenomena like crisis management and communication, one is exploring,  
13 describing and, where possible, looking for explanation. Especially in cases where there is not  
14 enough material available to be able to formulate hypotheses or promulgate theories, a  
15 deductive approach will not work. As viewpoints are in the focus of the analysis, an inductive  
16 one might also frequently not be appropriate. This already speaks for adopting abduction as a  
17 research logic in many cases of critical realist research (Rashid *et al.*, 2019).  
18  
19  
20  
21  
22

23  
24 Critical realists abandon the typical inductive/deductive theory-observation model and, among  
25 other things, explore in order to be able to find and explain generative mechanisms (Outhwaite,  
26 1998). Fittingly, abduction, in its ‘modern’ definition (Douven, 2017), gives ‘best explanations’  
27 for phenomena determined through, in a research project, data collection. Theoretical  
28 frameworks evolve with the research undertaking, and rich descriptions will lead to  
29 interpretation and explanation (Rashid *et al.*, 2019). While there is also criticism – Awuzie and  
30 McDermott (2017) give examples amongst which abduction being likened to guesswork is the  
31 most prominent – the same authors show in a persuasive way that they did come up with a good  
32 evaluation of a new infrastructure systems’ viability, based upon abductive reasoning, and there  
33 is more evidence that abduction helps to build a bridge between the data and the explanation of  
34 behaviour or theory (Eriksson and Engström, 2021).  
35  
36  
37  
38  
39  
40  
41  
42

43  
44 Creswell (2006) argues, that one of the issues with qualitative research is the lack of guidelines  
45 or procedures, but a domain-wise selective objective/subjective critical realist approach (what  
46 Vincent and O'Mahoney (2016, p. 2) call the ‘odd dualism’ in Critical Realism) with an  
47 abductive logic provides an anchor for what comes next. However, critical realist research  
48 requires an additional retroductive stage based on the results of abductive thinking.  
49 Retroduction tries to identify the causal powers and tendencies that have generated the research  
50 objects, and includes the relationships of such powers into the analysis, thus being placed at the  
51 core of critical realist generation of knowledge (Wynn and Williams, 2012).  
52  
53  
54  
55  
56  
57

58  
59 Retroduction helps identify the ‘mechanisms’ in critical realism (Ryan *et al.*, 2012), and for  
60 Fletcher (2016), abduction is ‘theoretical retroduction’, asking for the cause (e.g. an event),

1  
2  
3 with retrodution looking, in a sort of metacausal research, for the underlying mechanisms by  
4 searching for the conditions in which such mechanism can take effect. Marks and O'Mahoney  
5 (2014) formulate this as asking what must be the case so that the findings of the research could  
6 actually be possible, a formal step in any critical realist study looking for causal mechanisms  
7 (Hoddy, 2019).  
8  
9

10  
11  
12 This means, that a researcher not only looks at regularities but also at where these apply – if  
13 context changes or is misunderstood, regularities such as ‘what works?’ do not necessarily  
14 apply anymore. ‘Like produces like’ only works if the structure around it is or stays the same,  
15 and while the mechanisms are what takes an effect (O'Mahoney and Vincent, 2014), the context  
16 (structure) determines the outcome and has therefore to be taken into account (Tilley, 2000).  
17 Absences of certain aspects might also be important, they may even have real effects (Bhaskar,  
18 2008b). Understanding why something has not happened or was not mentioned may be as  
19 important as actual occurrences: for example, Bengtsson and Fynbo (2017) show this when  
20 analysing underlying complex power structures.

### 29 **Ensuing Research Strategy and Design Options**

30  
31 In this section we discuss our application of the open systems model of reality to a qualitative  
32 case study. We are keen to acknowledge, however, that critical realism is pluralist and inclusive  
33 when it comes to methodology, as long as the commitment to the concept of emergence is  
34 visible (Hoddy, 2019). In this spirit we present one possible operationalisation of our model  
35 below.  
36  
37  
38  
39

#### 40 ***A Qualitative Approach using Case Study as the Method***

41  
42 Qualitative research design is often presented as inevitable in paradigms such as critical realism  
43 (e.g. Howitt, 2010). While quality criteria might differ depending on the epistemological stance,  
44 however, there is a place for quantitative approaches in critical realism as well (Healy and Perry,  
45 2000). While some researchers even see a pro-quantitative bias in research and attribute it to  
46 qualitative studies exposing a high level of complexity (Brown, 2010), we suggest that such  
47 complexity is needed in order to fully understand a situation. Thus, a qualitative approach was  
48 adopted in the example study.  
49  
50  
51  
52  
53  
54

55  
56 In addition to that, the quality criteria for qualitative work must be taken into account. We used  
57 as a starting point the seminal work of Lincoln and Guba (1985) and the following four criteria:  
58  
59  
60

- 1
- 2
- 3
- 4 • Credibility: ‘do results reflect the truth?’ – as far as possible, as any explanation of the
- 5 truth is fallible (Fletcher, 2016)
- 6
- 7 • Transferability/applicability: findings have to be applicable in similar contexts
- 8
- 9 • Dependability/consistency: given a similar environment, findings can be repeated
- 10
- 11 • Confirmability/neutrality: results must come from the research objects, without
- 12 distortion
- 13

14 Healy and Perry (2000) establish a set of critical realism related criteria overlapping, however,  
15 with most of the above criteria and advocate using triangulation, not always possible, however.  
16 Sobh and Perry (2006) add that this can at least in part be achieved by asking different questions,  
17 to which one can add asking different or different types of people as was done in the study.  
18 Case Study research was the most appropriate design for a number of reasons: it is useful in  
19 providing understanding about an issue and might allow some form of generalisation (Stake,  
20 2005) and it is an appropriate choice when focused on the contemporary and the researcher has  
21 no control over the events (Yin, 2018).

22 Such research does not necessarily have to be exploratory; descriptive and, where possible,  
23 explanatory aims of the study can well be reached and it fits ‘how’ and ‘why’ questions as well  
24 as ‘how do’ ones (Rashid *et al.*, 2019). This links well into typical questions in critical realist  
25 research (Edwards, O'Mahoney and Vincent, 2014a). Further, certain case study techniques  
26 offer excellent responses to quality and validity considerations in critical realist approaches  
27 (Healy and Perry, 2000).

28 Case study research, by focusing on detailed description through an iterative process to  
29 understand social phenomena in terms of what people do and think, lends itself well to an  
30 abductive research logic (Rashid *et al.*, 2019). This is detailed by Dubois and Gadde (2002),  
31 who refer to their abductive approach as ‘systematic combining’ (p. 555), matching and re-  
32 matching case, framework and empirical world, directing and redirecting a study accordingly –  
33 useful for critical realist approaches (O'Mahoney and Vincent, 2014).

34 Potential bias can be minimised by using falsification logic, different data sources or  
35 triangulation (Teegavarapu, Summers and Mocko, 2008). Some issues remained, for instance  
36 being a consultant researching consultancies could lead to biased interpretations. Indeed,  
37 studying what one knows well carries the risk of self-involvement, lack of distance and using  
38 prefabricated opinions (Berger, 2015). On the other hand, because any knowledge, according  
39 to critical realism, is theory-laden, a researcher may use own experience as a source of data  
40

1  
2  
3 (Ryan *et al.*, 2012). To address these potential issues, a reflexive journal was used throughout  
4 the study.  
5

### 6 7 ***Data Collection Through Interviews*** 8

9  
10 Data collection had to fit a ‘detached’ approach of case study research (Vincent and  
11 O'Mahoney, 2016) and there are a number of alternative sources of evidence, amongst which  
12 interviewing is prominent and especially useful when subjective viewpoints have to be analysed  
13 (Flick, 2002). While not without risks around situation and interviewer influence (Baker and  
14 Edwards, 2012; Potter and Hepburn, 2005), this can be addressed by careful design. The  
15 potential ‘co-constructed’ character of interviewing has an influence on validity, this is,  
16 however, a question of degree (Hammersley, 2013a) and can be tackled by taking oneself back  
17 as much as possible as an interviewer (King and Hugh-Jones, 2019).  
18  
19

20  
21  
22  
23  
24 Interviewing is widely used in critical realist work (Smith and Elger, 2014): interviews open  
25 access to rich information on events, experiences and underlying phenomena. With these  
26 arguments in mind, we adopted qualitative semi-structured interviews as the main data  
27 collection method.  
28  
29  
30

### 31 32 ***Looking for Patterns – Options Around Analysis and Coding*** 33

34  
35 Baptiste (2001) describes tagging the data as the start of the analysis phase in qualitative  
36 research, then grouping these ‘tags’ or codes into ‘themes’. This ‘thematic analysis’ (TA)  
37 became an established method with the seminal article by Braun and Clarke (2006) and looks  
38 for patterns, which critical realist research turns around identifying and explaining (O'Mahoney  
39 and Vincent, 2014), looking for ‘demi-regularities’ (Fletcher, 2016). TA is very flexible and  
40 compatible with critical realism (Braun and Clarke, 2022) where any result can only be a  
41 probable one anyway (O'Mahoney and Vincent, 2014).  
42  
43  
44  
45

46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
Consequently, although Karlsson and Ackroyd (2014) deplore a lack of methodology clearly  
assigned to critical realism, TA is a suitable method of analysis and the answers to research  
question can be looked for by searching for themes and their describing and defining factors,  
or ‘categories’ (Vaismoradi *et al.*, 2016). Before finalising the themes, codes are grouped into  
topic domains or ‘sub-themes’ to be aggregated to form the final themes. For a critical realist,  
it is important to see that, as Braun and Clarke (2006, 2013, 2018) emphasise, themes do not  
emerge. They depend on their conceptualisation by the researcher and the research focus, and  
thus are **created** from the data. The emergence of findings thus happens **from** the themes, not  
**as** the themes (Braun, Clarke and Rance, 2014; Braun and Clarke, 2019a).

1  
2  
3 Braun and Clarke later refined the method, defined three approaches amongst which reflexive  
4 TA, with an open and flexible approach to generating codes (Braun and Clarke, 2018). This  
5 approach is recommended especially when searching for so-called latent themes, but also in  
6 general because of it leaving more room for interpretation and the search for meaning beyond  
7 the obvious (Braun and Clarke, 2019b). Reflexive TA is therefore the approach best fitting the  
8 typical critical realist investigation for demi-regularities.  
9

10  
11  
12  
13  
14 When familiarising with the data, coding is a crucial step and needs to fit epistemology and  
15 methodology. Saldaña (2016) sees it as a heuristic exercise, assigning describing tags, 'codes',  
16 to chunks of the data analysed, with the aim to be able to define categories and ultimately  
17 themes. While coding carries the danger of becoming mechanistic in an analysis, it is a tried  
18 way of getting to themes (Braun and Clarke, 2018) and reflexivity can help to address many of  
19 the issues. Amongst the coding methods available, it was necessary to find one responding to  
20 the openness critical realist research advocates (Hoddy, 2019). Initial or open coding is a fitting  
21 choice for many a critical realist study (Charmaz, 2014) and was chosen for the example. It  
22 divides data into chunks it then examines and compares, even allowing the use of other coding  
23 methods within. It therefore also follows what Hedlund-DeWitt (2013) believe to be a good  
24 approach to analysing qualitative data: taking a first, inductive step – which, however, is then  
25 to be followed by a second, deductive (or for critical realists abductive) one.  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35

36 Because of the critical realist focus on looking for regularities on one hand, deeper meaning on  
37 the other, the open coding approach, a second cycle of axial coding is a suitable option (Hoddy,  
38 2019). Axial coding looks for data fitting categories or sub-categories (the 'axes') deriving from  
39 earlier stages of analysis. Sobh and Perry (2006) even believe that as in critical realism codes  
40 are rather generated from the conceptual framework, a single axial coding cycle can suffice.  
41 Yet, this would mean that the axes only stem from the framework, which in turn might narrow  
42 the choices down as compared to having a first coding cycle as an additional source and not all  
43 patterns or axes can be found in the conceptual framework. Two coding cycles thus can lead to  
44 more comprehensive results.  
45  
46  
47  
48  
49  
50  
51

52 When following a critical realist approach with an abductive logic, re-grouping and re-assessing  
53 of elements from the data helps, especially as critical realist coding needs to draw on finding  
54 reasons, not on existing theory (Fletcher, 2016). Looking for categories and 'parent codes' fits  
55 the TA investigation for patterns of shared meaning from which themes can be developed  
56 (Braun, Clarke and Rance, 2014). These can be analysed for the existence of summary themes,  
57  
58  
59  
60

1  
2  
3 in a combined initial/axial approach an outcome of the first coding cycle. This approach  
4 therefore takes the requirements of both critical realism and TA into account.  
5  
6

### 7 ***Research Stages***

9 The study was designed as a ‘no theory first’ case study (Ridder, 2017), and the formal stages  
10 of a critical realist project consist of building an initial description of the research object as far  
11 as can be done through literature or other initial research, then moving on to data research design  
12 and conduction (Hoddy, 2019). Based on these sources, a researcher will then seek trends and  
13 patterns. While critical realist research bases findings on qualitative data and does not focus on  
14 empirical/statistical causality (Roberts, 2014), some figure-based analysis may be used in order  
15 to explain phenomena and could enhance generalisability (Wynn and Williams, 2012). If  
16 applicable, theory building will also happen in this stage (Sobh and Perry, 2006).  
17  
18  
19  
20  
21  
22  
23

24 The results, following the critical realist principle of deep explication of structure, events and  
25 context (Wynn and Williams, 2012) is then used in the next stage of abductive and retroductive  
26 analysis, and finally of concretisation and contextualisation, including validation (Hoddy,  
27 2019). For the analytical stage, Teegavarapu, Summers and Mocko (2008) suggest findings  
28 should be tested against rival theories – or alternatives from different ontological positions  
29 (O’Mahoney in Rutzou, 2016). While this might add time consuming complexity, it answers  
30 the requirements of corroboration and validation within critical realist methodological  
31 principles (Wynn and Williams, 2012). This supports an explorative orientation typical for  
32 critical realist research. In the example study of crisis management, it is going from ‘what is X’  
33 to ‘how does it work and why’ (O’Mahoney and Vincent, 2014, p.9). The critical realist  
34 interview takes into account the formula from Pawson and Tilley (1997): *Mechanism + Context*  
35 = *Outcome* and uses the view of the open system of reality as a guideline for analysis.  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45

46 Given that TA was chosen as the method of analysis, research stages also took account of the  
47 phases of this method (see Braun and Clarke, 2006). Integrating these into what stems from the  
48 aforementioned approaches for research design, the stage model shown in table 1 was  
49 developed:  
50  
51  
52

53 -----  
54 INSERT TABLE 2  
55 -----  
56

### 57 ***Staying Critical Realist Throughout***

1  
2  
3 One of the challenges in critical realism is the correct identification and labelling of all the strata  
4 and elements of reality such as entities, properties, causal mechanisms and so on, a prerequisite  
5 for being able to actually apply critical realism thinking (Vincent and O'Mahoney, 2016). There  
6 are many commentaries on the initial works of Bhaskar, which has evolved itself since it was  
7 first published (Bhaskar, 2008a). Others give examples of application or add reflections on  
8 agency and its influences on social structure as well as reflexivity (e.g. Archer, 2003; Archer  
9 and Morgan, 2020). To achieve the aim of being clear about the critical realist elements of  
10 reality, the example study referred to these throughout, striving to making clear what findings,  
11 ideas, occurrences, structures and people pertain to. Further, before analysing data and grouping  
12 relevant themes, it was necessary to reflect which topics were to be distilled from the data. To  
13 this end, and bearing the research question in mind, open points from the literature research  
14 were mapped with the elements of reality.

15  
16  
17 This means that the questions pertaining to the research question which the literature had no  
18 answer for and which were listed at the end of the literature research sections were then held  
19 against the elements of reality as shown in figure 1. The aim of this was to better understand in  
20 which of these elements answers to these questions could be expected to emerge. An example  
21 of this mapping, using some of the results of the literature research of the study, is provided in  
22 table 2. The open questions were grouped by topic, then put in relation to the reality elements  
23 as used in our model. Finally, we tried to assess in how far the questions and related elements  
24 were relevant when answering the research questions.

25  
26  
27 -----  
28 INSERT TABLE 2  
29 -----  
30

31  
32  
33 This approach allowed us to define themes that helped answer the questions and identify which  
34 elements of reality they pertained to. While mechanisms nearly always play an underlying role,  
35 crosses in this matrix mean a focus in the investigation of a topic and/or an expectation to be  
36 able to identify mechanisms directly. Critically, this process allowed us to identify how, and  
37 ideally why, themes influence the structure under investigation. Thus, experiences and events  
38 described in the data as well as information on additional structure, rules and practices, plus  
39 interpretation of the language (explicit and implicit) were expected to lead to understanding the  
40 interaction of these elements and what they triggered around the management decisions the  
41 study investigated.

1  
2  
3 In line with the abductive logic discussed above, this matrix was then used to determine in  
4 which areas themes might be defined, data permitting. Of course, it could not be ruled out that  
5 the data also contained relevant information on topics not apparent before, and from the early  
6 stages of the analysis on, emergent information from the data was placed in a separate group,  
7 labelled 'miscellaneous' as proposed by Braun and Clarke (2006). Interim results of the ensuing  
8 analysis were then mapped against the topics from the open points from the literature review.  
9 These results were grouped and then defined as themes and sub-themes.

### 16 *An Example for the Application of the Model of Reality as an Open System*

17  
18 The following example is designed to illustrate the process of explaining emerging elements or  
19 changes in existing ones by applying the model. As a starting point, an initial detailed  
20 description of the context is recommended in critical realist research (Wynn and Williams,  
21 2012), and a deep understanding of the structural starting point of the analysis will help identify  
22 changes. Descriptions may have to be empirical as for instance within a group of items under  
23 scrutiny – in this case of a sectoral study different consultancies or even different parts of the  
24 same consultancy – can act and look differently. However, the context needs to be understood,  
25 which is why the study contained a thorough description of pre-COVID structures and client-  
26 consultant communication and co-operation practices.

27  
28 We started by trying to allocate findings to the elements of reality, as discussed, a challenging  
29 exercise (Vincent and O'Mahoney, 2016). Is the fact that mixed client-consulting teams cannot  
30 work in a common office anymore but stay in their offices or even at home, networking and co-  
31 creating content through electronic means of communication, an event, a sub-structure or a  
32 structure? Believing that taking all findings into account when abductively searching for  
33 underlying reasons, we decided to take a pragmatic approach, allocation some phenomena to  
34 more than one element, at the very least in order to be able to assess their effect from different  
35 standpoints, but also because in some instances, one finding can indeed pertain to more than  
36 one element of reality, depending on the standpoint (e.g. Fletcher, 2016).

37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51 Table 2

52  
53 shows how we then used the model in order to illustrate findings we considered to be emerging  
54 structural changes. This could only be done change by change, fitting all the elements of the  
55 study into one model would have been so complex as to be confusing rather than helpful. We  
56 did find overlaps and used many findings in more than one application of the model, but this  
57 was to be expected in a complex reality. In this illustration, we use the finding that some  
58  
59  
60

1  
2  
3 consultancies built structures designed to help clients cope with the challenges of having to co-  
4 operate via electronic means at very short notice, as lockdown rules did not permit personal  
5 interactions anymore.  
6  
7

8  
9 The actual implementation varied from case to case, from formalized structures with training,  
10 documentation and dedicated staff to informal ones at project level, depending on criteria such  
11 as the level of client preparation and skills or resources available at the consultancy. All these  
12 structures and related sub-structures (e.g., at team or project level) served, however, the same  
13 aims: to enable the clients to take advantage of the better preparation, skill level and  
14 infrastructure of the consultancies (as was the case with nearly all companies the consultants  
15 worked with) in order to be able to continue working on ongoing projects as seamlessly as  
16 possible. Shaping these solutions were sub-structural elements such as organization and staff  
17 as well as rules and regulations, e.g., around contact restrictions, data security or software  
18 licensing issues.  
19  
20  
21  
22  
23  
24  
25  
26

27 Discursive entities, however, also had a great influence, albeit with difficulties as language and  
28 culture differed between client and consultant. Even so, at project level a common  
29 understanding was reached more quickly and easily, and cultural elements such as the  
30 understanding of how much co-creation and interaction was desirable in a project. This  
31 contextual element of project management best practices not only was believed to lead to better  
32 solutions and less resistance to the changes a project entailed, it also carried advantages for the  
33 consultancies – the more a client was involved, the less many consultants expected clients to  
34 blame consultants in the case of the projects' results being judged insufficient or unsatisfactory  
35 at a later stage. Hedging mechanisms such as this also were described as cultural elements of  
36 long standing in the industry.  
37  
38  
39  
40  
41  
42  
43  
44

45 Events such as the actual rendering of support to the clients and the implementation of the  
46 necessary communication infrastructure and process were assessed very favourably by the  
47 consultants, even though it meant additional work – the benefits were clear. This was not the  
48 case with all the clients. While the need to continue working on most projects was an obvious  
49 mechanism triggering the events, there were less visible elements present which also shaped  
50 the selected solutions. Some consultants, for instance, experienced reluctance or sluggish  
51 support from some clients, which also was mirrored by low attendance at training sessions.  
52 Applying abductive reasoning to these findings, the authors believed that the likeliest  
53 underlying reasons, thus mechanisms, were the reluctance by client managers to show inept  
54 when asked to use new tools in front of their subordinates or a general hostility to allowing  
55  
56  
57  
58  
59  
60

1  
2  
3 remote working, probably due to a fear of loss of control. This could only be supposed at the  
4 time of the finalization of the study but was later substantiated by post-study probing interviews  
5 by the authors. This illustrates how elements of reality can both support but also impede  
6 developments, an aspect which is useful to take into account, as well as the importance of –  
7 even inconspicuous – absences (Bhaskar, 2008b).  
8  
9

10  
11  
12 -----  
13 INSERT FIGURE 2  
14 -----  
15

16  
17 This is only an excerpt and for the sake of clarity, figure 2 only lists the main elements of reality  
18 pertaining to the new client-supporting structures which emerged in the early months of the  
19 COVID-19-related constraints. Notwithstanding, this example illustrates how, by allocating all  
20 findings which could be extracted from the data to the elements of reality in the model, a  
21 researcher can, in a structured way, make sure to take a large number of factors into account  
22 when analysing the findings and methodically forage for hidden facts and causal powers. The  
23 model helps understanding how the elements interact and what they influence, and applying it  
24 automatically yields insight into how in this open system, change triggers further change, also  
25 illustrating the historicity in any critical realist analysis going both ways (Archer and Morgan,  
26 2020). It also helps to explain how and why this happens as well and may allow make educated  
27 guesses about the future. This analysis' emerged structure may be the next ones' mechanism.  
28 To give an example, the study discussed here yielded that the structure built to help in an  
29 emergency for some consultancies developed into a market offering, and it allowed an  
30 assessment as to how much of the changes would remain in a post-COVID world but also which  
31 of these might later be challenged again, e.g., for reasons of managers trying to regain control  
32 or all participants deploring the loss of important non-verbal parts of communication. Some of  
33 these were already confirmed by time (Erdsiek, Opiel and Bräutigam, 2023; Ng and Stanton,  
34 2023). Many of the steps and decisions described above were based on examples from critical  
35 realist research (e.g. Edwards, O'Mahoney and Vincent (2014b). Other suggestions stemmed  
36 from the literature used for the present article as well as blogs and interviews and the Critical  
37 Realist Network web page. One point, however, was always borne in mind: whether there are  
38 alternatives to ones' findings and interpretation as well as the results alternative approaches  
39 might yield.

## 56 57 **Conclusion** 58 59 60

1  
2  
3 In this article we have described the different stages of a completed research process, and  
4 presented reasoning for decisions on paradigm and research design. Because of the view of  
5 reality based on the critical realist paradigm, the research design is important for the  
6 development of knowledge, and the example study lent itself to describing a thorough and  
7 comprehensive critical realist research approach to a case study. While a number of works exist  
8 dealing with applying critical realism (e.g. Edwards, O'Mahoney and Vincent, 2014b; Karlsson  
9 and Ackroyd, 2014), publications on operationalisation using specific examples are scarce.  
10 Important inspiration for critical realist studies can also be drawn from sources on validity,  
11 analysis or research design (Healy and Perry, 2000; Sobh and Perry, 2006; O'Mahoney and  
12 Vincent, 2014), but the present work is adds to existing studies where reflections around design,  
13 data gathering and analysis are described using examples.  
14

20  
21  
22

23 This article also complements existing work on the influence of research paradigm on the  
24 detailed design of any research or data gathering, especially around case studies using  
25 interviews (Wolgemuth *et al.*, 2014). Moreover, our open system model of reality provides a  
26 tool for researchers looking to operationalise critical realism. This model synthesises a number  
27 of sources and illustrates interdependencies of its elements and the (sometimes) mutual exertion  
28 of influence, thus providing a framework making it easier for the researcher to explore  
29 structures, entities, rules, mechanisms, events, experiences or agents and agency phenomena.  
30 Understanding what pertains to what is central to understanding the causalities critical realism  
31 is looking for, an important quality criterion (Vincent and O'Mahoney, 2016). Furthermore, the  
32 model extends beyond the intervention-actor-mechanism-outcome analytic tool for research  
33 using realist interviews as a source of data, thus supporting analysis taking additional factors  
34 into account. Overall, our model of reality in critical realism offers a comprehensive view of  
35 critical realism at a glance.  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45

46 It is, however, only a simplified view and cannot be applied without a detailed understanding  
47 of how the different elements actually interact. Looking at morphogenesis, according to Archer  
48 (2011) the 'explanatory framework' of critical realism, can provide guidelines for explanation  
49 of the identified phenomena. Finally, the importance of context cannot be forgotten; in a world  
50 changing at an ever increasing pace, a stable context is unlikely (Archer, 2016). The example  
51 study is also only one example, and the model should in future be extended to the analysis of  
52 further studies based on this paradigm.

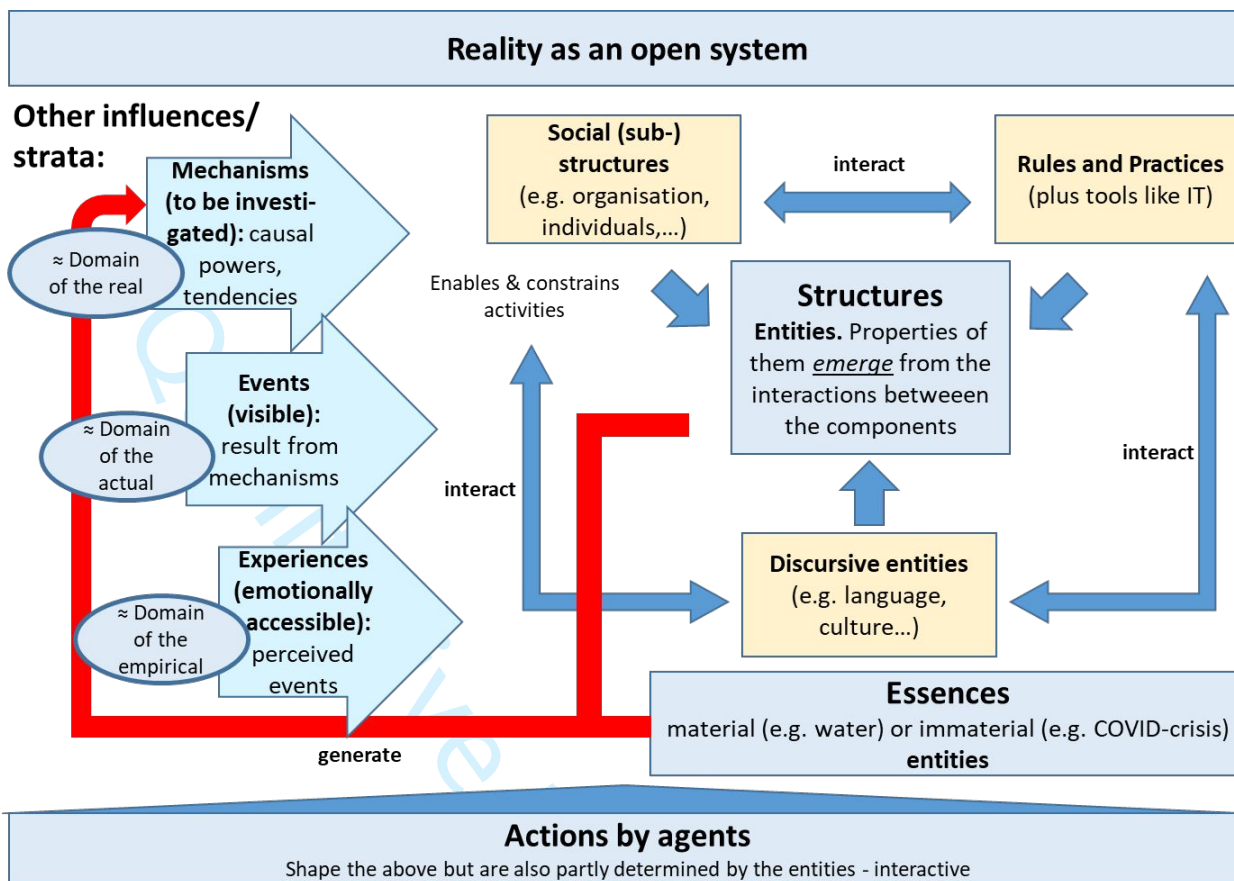

Figure 1 Reality as an open system and the components of structure in critical realism (Source: Authors work)

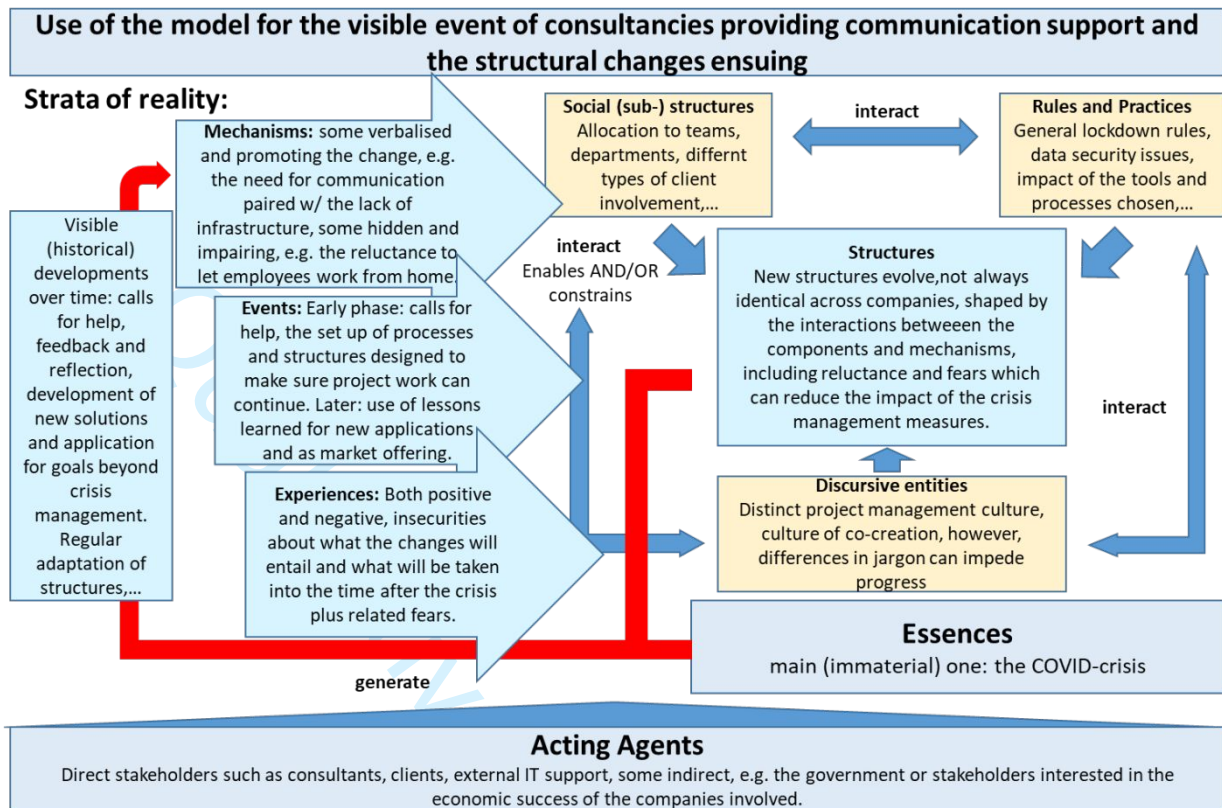

Figure 2 Application example of the model of reality as an open system (Source: Authors work)

Table 1 Research stages of the example study (Source: Authors work)

Stage	Tasks	Specific approach in the present case
Building the basis	Initial literature research, including on philosophical stance, methodology and methods	The focus was laid on examples for the practical application of critical realist research approaches
	Deriving initial context and research object description	
	Identification of first (or expected) "demi-regularities" in the literature	In preparation of first phase one of TA, yielded trends and patterns inspiring theme building
Pre-pilot research design	Detailed initial research design	Included the abductive research logic. TA related decisions taken (see Browne & Clarke, 2006)
	Case selection and data collection method design	Taking into account works on critical realist interviewing
Piloting	Pilot sampling and data collection	4 interviews with people from different consultancies and hierarchy levels
	Pilot conduction, analysis, looking for tentative themes	Already following the research design thoroughly, including two coding phases (initial, axial). Confirmed the usability of the design
Main study research design	Update of research design (if applicable)	Small details adjusted
	Update of data collection method	The interview guideline was revised, some topics emerging in the first interviews added
Main study data collection	Main study sampling	Through personal network
	Main study conduction	Including the pilot, 13 interviews were conducted, 679 minutes yielding close to 7000 lines of transcription. A case study database was built (see Hoddy, 2019).
	Update of context and research object description. First phase of TA. Critical realist approach to explore and explain reality, seeing information emerge	With a focus on data immersion and using the model of reality presented in Figure 1, fitting findings into the categories of structure, events and experiences, trying to identify agents
Analysis (I)	Initial and axial coding (Phase two of TA)	Open coding approach first, then codings against categories ("axes") in order to better understand the data
	Search for and review of themes, phases three and four of TA, first application of abduction and retroduction	Grouping axes into categories and sub-categories, looking for emerging concepts, building the results into themes already trying to identify mechanisms
	Validation, definition and naming of themes, phase five of TA	As a result of a critical review of earlier phases

	Application of abduction/retroduction	Identifying or reviewing causal elements and how they (probably) affected the visible events and structures, explaining relevant interactions between the elements of reality, identifying likely future developments
Validation (Analysis II)	Check for validity	Final review, reflecting alternative results or theories
	Check for corroboration, apply results to finalisation of findings and discussion	The anonymised study was sent to four participants for review, some clarifying questions were asked to others
Write-up	Producing the report, reviews, finalisation of the study	Making clear which result pertains to or represents which of the elements of reality
Enfolding literature research	To be done throughout the work	See recommendations in e.g. Sobh & Perry, 2006

Table 2 Example mapping of literature research results with elements of reality (Source: Authors work)

Groups of topics	Potential influencing factors for the crisis management decisions around the topic	Determinants influencing the structure under investigation							Relevance for the theoretical framework and the research question	
		Sub-structures	Rules and practices	Discursive entities	Actions by agents	Other entities	Experiences and events	Mechanisms		
Preparedness	What was the level of awareness of/access to/experience with relevant technology?	x							x	Aspect of preparedness, the infrastructural setting, mainly relevant for the choice of means (tools, channels)
Preparedness	How well are clients prepared and does this play a role?				x	x				Check for the fit of solutions for communication with the external environment
Environment	What role does the regulatory environment play?					x				Might be a limitation to what can be done, includes data security, health and safety aspects
Cultural aspects	Are certain industries/companies better prepared than others, and what does this yield? (New aspect: also certain groups within)							x		Structural aspect of preparedness
Management, leadership, learning and decision making	How do goals of communication on the crisis influence the decisions on communication in the crisis?	x			x					Relevant for topics and content and for the governance of it by the (crisis) management
Management, leadership, learning and decision making	How were the decisions taken and what role did stakeholder feedback play?	x				x				Relevant for solution design, adaptation and the learning process
Evaluation	What type of channels and tools were used and how well did they work? (New aspect: why were these measures successful?)	x			x					Key aspects of improved practice, also for limitations of the solutions, also checks for increases in e.g. social media use. This includes hybrid work solutions as well
Future, "new normal"	What was learned for the future, and how?	x								Central question for the study, relevant regarding learning in and after the crisis, improved practices and resilience building
