Pathogen Genomes as Global Public Goods (and why they should not be patented)

Jorge L. Contreras*

Abstract: During past viral outbreaks, researchers rushed to patent genomic sequences of the viruses as they were discovered, leading to disputes and delays in research coordination. Yet similar disputes did not occur with respect to the genomic sequence of SARS-CoV-2, the virus responsible for COVID-19. With respect to COVID-19, global research collaboration occurred rapidly, leading to the identification of new variants, the ability to track the spread of the disease, and the development of vaccines and therapeutics in record time. The lack of patenting of SARS-CoV-2 is likely due the U.S. Supreme Court's 2013 ruling in *Association for Molecular Pathology v. Myriad Genetics*, which established that naturally occurring genomic sequences are ineligible for patent protection, a decision that has had repercussions around the world. Recently, however, legislative proposals have been made in the U.S. to overturn this decision. Such legislation, if enacted, would enable researchers, likely based in countries where pathogenic outbreaks first occur, to obtain U.S. patents on pathogen genomes. Given that ample opportunities exist for patenting of diagnostics, vaccines, therapeutics and other downstream innovations, steps should be taken at national and international levels to ensure that pathogenic sequence data cannot be appropriated by individual researchers, institutions, or states.

Keywords: patent, genome, WHO, COVID-19, pathogen, access and benefit sharing, Myriad

Jensen Endowed Professor of Transactional Law and Director of the Program on Intellectual Property and Technology Law, University of Utah S.J. Quinney College of Law; Adjunct Professor, Department of Human Genetics, University of Utah School of Medicine. This essay has benefitted from presentation and discussion at the NYU 28th Annual Herbert Rubin and Justice Rose Luttan Rubin International Law Symposium: "Inter-pandemic Vaccine Regulation: Justice and Global Equity", as well as invaluable feedback from Margo Bagley, Rochelle Dreyfuss, Nicholson Price, Michelle Rourke, Ana Santos Rutschman, Jacob Sherkow, and Peter Yu. New York University provided travel funding to attend the symposium noted above. The author declares no conflicts of interest.

INTRODUCTION

The genomic sequence¹ of SARS-CoV-2 (the virus responsible for COVID-19) was first elucidated in early January 2020 by a team of researchers in China.² On January 5, they uploaded the sequence to the publicly accessible GenBank database maintained by the U.S. National Center for Biotechnology Information.³ On January 11, an Australian researcher posted the sequence to the website Virological.org and attracted widespread attention to its availability via Twitter.⁴ Days later, new diagnostic tests for the virus had been developed.⁵ Within months, new COVID-19 vaccines were being tested.⁶ By October 2021, nearly five million different sequences of the SARS-CoV-2 virus had been uploaded to public databases,⁷ where they continue to be used to monitor the evolution of the virus, to identify virulent mutations and to trace the spread of infection.⁸

The speed and extent of international research cooperation in response to COVID-19 was immediate and widespread.⁹ SARS-CoV-2 sequence data was utilized by a broad range of researchers from geneticists and virologists to epidemiologists and public health officials.¹⁰ As one researcher observed, '[t]he enormous, immediate impact of sharing this data highlights the wealth of information encoded in pathogen genomes, particularly for understanding their origins and potential to cause disease.'¹¹ This sentiment was echoed by the Director

¹ Though usages vary across the literature, this essay uses the convention that a 'genomic' sequence comprises the entire nucleotide sequence of an organism's DNA or RNA, while 'genetic' sequence data comprises a portion of the full sequence.

¹¹ Eden, *supra* note 4.

of the U.S. Office of Science and Technology Policy (OSTP), who stated that “[i]mmediate public access to COVID-19 research is a powerful case study on the benefits of delivering research results and data rapidly to the people.”¹² The COVID-19 pandemic has brought into sharp focus the value of open access to and rapid sharing of pathogenic genomic data in response to infectious disease outbreaks.¹³

Data sharing at the speed and on the scale observed with COVID-19 has not always been the norm. During the H5N1 influenza pandemic and the SARS and MERS coronavirus outbreaks, researchers sought to patent newly identified viral genomic sequences shortly after they were determined.¹⁴ These efforts stymied research cooperation and imposed delays and barriers to the development of diagnostics, vaccines, and therapeutics.

The genomic sequence of SARS-CoV-2 and its many variants, however, were not patented. This lack of patenting activity on a potentially lucrative pathogen is likely due to the unavailability of U.S. patents on naturally occurring genomic sequences following the 2013 Supreme Court decision in *Association for Molecular Pathology v. Myriad Genetics*.¹⁵ Since this decision, U.S. patents have not been available on pathogenic genomes and while few countries have explicitly followed the U.S. in abolishing patent protection on naturally occurring genomic sequences, such patents have rarely been sought.¹⁶ It is probable that the unavailability of patent protection for pathogenic sequences motivated researchers in China to share SARS-CoV-2 sequence data so rapidly.

Nevertheless, recent legislative proposals in the U.S.¹⁷ seek to reverse this trend and once again allow the patenting of basic genetic sequence data. Doing so may result in administrative, financial, and competitive barriers to rapid, global research on emergent disease outbreaks. Yet patents on pathogenic genomes are not necessary to incentivize research on vaccines, therapeutics, or genetic modifications, all of which remain patentable.¹⁸ What’s more, nationalistic sentiments seeking to bolster U.S. industry through stronger patent protection are misguided in this context, given that the parties most likely to obtain U.S. patents on newly discovered pathogens are entities based not in the U.S., but in the countries where those pathogens are first identified.¹⁹ Accordingly, attempts to amend U.S. patent law to allow pathogen patenting should be resisted.²⁰ International rules should also be

established to prevent individual states from enacting legislation to patent pathogen sequence data.

Discussions convened by the World Health Organization (WHO) are currently under way to develop a global ‘pandemic treaty’ that would address numerous aspects of the international response to future pandemics.²¹ Under particular consideration is the treatment of genetic resources. Such an international agreement would ideally ensure continued open access to pathogenic sequence data and prevent this data from being appropriated by individual researchers, institutions, or states through patents.

Finally, the WHO and research-funding bodies can independently deter the patenting of genomic sequence data by incorporating rapid data release requirements into their policies and funding arrangements, emulating the open data sharing model established by the Human Genome Project under its Bermuda Principles.²² Together or separately, measures like these can help to ensure that pathogenic genomic data remains a global public good in the service of scientific research and public health while leaving in place ample incentives for the private development of biomedical technologies that are based on these shared global resources.

I. GENOMIC PATENTING

A. PATENTING OF GENOMIC SEQUENCES

Patents have been granted on genetic material in the United States since the late 1950s,²³ and the eligibility of living organisms as patentable subject matter was confirmed by the U.S. Supreme Court in the 1980 case *Diamond v. Chakrabarty*.²⁴ After *Chakrabarty*, the debate over patenting genetic material intensified. Biotechnology firms began to file patent applications covering an increasing number of DNA-based inventions, including those claiming human DNA sequences, and the Patent and Trademark Office (USPTO) began to issue these patents in large

MORE EQUITABLE FUTURE 137 (S. Burris et al. ed., 2021) (introducing argument against pathogen patenting).

²⁴ 447 U.S. 303 (1980) (involving a patent claiming a bacterium genetically modified to break down hydrocarbons more efficiently).

numbers.²⁵ Other countries and regions, including Australia, Canada and the European Union, followed suit.²⁶

The controversy surrounding the patentability of DNA sequences soon found its way into plans for the Human Genome Project (HGP), the international effort to map the entire sequence of 3.2 billion DNA base pairs in the human genome.²⁷ In 1988, as the HGP was being planned, the National Research Council and leading genetics researchers recommended that all human DNA sequences be placed in the public domain.²⁸ This approach was consistent with norms of collaboration and sharing in the scientific communities from which leading researchers in the HGP came.²⁹ The U.S. National Institutes of Health, though an early seeker of patents on short DNA segments known as expressed sequence tags (ESTs),³⁰ came to the conclusion that ‘raw human genomic DNA sequence, in the absence of additional demonstrated biological information, lacks demonstrated specific utility and therefore is an inappropriate material for patent filing.’³¹

At a policy level, HGP leadership also felt that the results of the massive taxpayer-funded genome effort should be returned to the public to accelerate the translation of scientific information to health improvements.³² Finally, many commentators felt that the human genome, representing the shared history of humankind, ‘belongs to everybody’ and should be freely shared with the world.³³ The USPTO and representatives of the biotech industry, however, argued that patents on genes should be encouraged because they could foster new businesses and fuel the discovery of drugs and diagnostic tests.³⁴

B. BERMUDA, DATA RELEASE AND OTHER PATENT DETERRENDS

In early 1996, HGP leaders convened in Bermuda and agreed on a new policy that required that all genomic sequence data generated by the HGP to be released to GenBank within *twenty-four hours* after being generated.³⁵ This unprecedented policy was enshrined in a short document that became known as the Bermuda Principles.³⁶ In addition to maximizing public access to publicly funded HGP outputs, the ‘rapid data release’ requirement of the Bermuda Principles was designed to deter the patenting of human genomic data.³⁷

The Bermuda Principles achieved this goal in several ways. First, they ensured that HGP data would be made public before laboratories performing sequencing work could file patent applications claiming that data.³⁸ In jurisdictions such as the European Union and Japan, which have so-called ‘absolute novelty’ requirements, an invention may not be patented if it has been publicly disclosed (e.g., deposited in GenBank) before the filing of a patent application.³⁹ Second, publicly released sequence data would act as prior art, preventing others from patenting the same sequences later, even if independently discovered.⁴⁰ Finally, publicly released sequence data could serve as prior art for purposes of determining whether similar third party sequences are patentable in view of patent law’s ‘nonobviousness’ requirement.⁴¹ Taken together, these features effectively prevented the patenting of

³⁵ See Kathryn Maxson Jones, Rachel A. Ankeny & Robert Cook-Deegan, *The Bermuda Triangle: The Pragmatics, Policies, and Principles for Data Sharing in the History of the Human Genome Project*, 51 J. HIST. BIOLOGY 693 (2018).

³⁶ Summary of Principles Agreed at the First International Strategy Meeting on Human Genome Sequencing, U.S. Dept. Energy Genome Program, http://www.ornl.gov/sci/techresources/Human_Genome/research/bermuda.shtml (visited Nov. 4, 2022) [hereinafter Bermuda Principles].

³⁷ See Contreras, *Bermuda*, *supra* note 29, at 64 n. 6, and accompanying text.

³⁸ The 24-hour period specified in the Bermuda Principles was viewed as almost instantaneous release of the data. Today, with electronic filing of patent applications, it might be possible for researchers to file within this 24-hour window and subvert the intention of the policy (the author thanks Rochelle Dreyfuss for this observation).

³⁹ See 2 BAXTER, WORLD PATENT LAW & PRACTICE § 4.01 (Sept. 2022; Release No. 171). In the United States, under the then-prevailing rule, a patent application could be filed up to one year after its description in a ‘printed publication’ or its first ‘public use’. 35 U.S.C. § 102(b) (2006); Rebecca S Eisenberg, *The Promise and Perils of Strategic Publication to Create Prior Art: A Response to Professor Parchomonsky*, 98 MICH. L. REV. 2358, 2363-64 (2000) (discussing HGP’s rapid data release policy as defeating patenting by sequencing centers). *But see* Margo A. Bagley, “Just” Sharing: The Virtues of Digital Sequence Information Benefit-Sharing for the Common Good, 63 HARV. INTL. L.J. 1, 33 (2022) (noting GenBank disclaimer as to patent rights claimed in deposited sequences).

⁴⁰ See U.S. Pat. & Trademark Off., Learning and resources, <https://www.uspto.gov/patents/apply/sequence-listing-resource-center/learning-and-resources> (noting that examiners may search GenBank for prior art sequence listings) (visited Nov. 6, 2022).

⁴¹ 35 U.S.C. § 103. See Jorge L. Contreras, *Genomic Data Sharing and Intellectual Property*, in GENOMIC DATA SHARING: CASE STUDIES, CHALLENGES, AND OPPORTUNITIES FOR

human genomic data generated by the HGP and contributed to the creation of a large public ‘commons’ of genomic data accessible around the world.⁴²

C. CONTINUED GROWTH OF GENE PATENTING

Despite the patent deterrence mechanisms described in Section I.B above, the U.S. NIH never adopted a general requirement prohibiting patenting of genomic data generated with the benefit of federal funding. This, coupled with increasing corporate gene discovery activity, resulted in the patenting during the 1990s and early 2000s of thousands of human genes discovered at academic and corporate laboratories, mostly associated with hereditary diseases and traits.⁴³ The resulting gene patenting ‘gold rush’⁴⁴ gave rise to increasing concerns among policy makers and advocates.

D. THE U.S. *MYRIAD* DECISION

In 2009, a group of twenty plaintiffs represented by the American Civil Liberties Union (ACLU) and Public Patent Foundation brought suit against Myriad Genetics, a Utah-based genetic diagnostic company that held patents claiming the *BRCA1* and *BRCA2* human genes, which were closely associated with hereditary breast and ovarian cancer.⁴⁵ The plaintiffs argued that the *BRCA* genes (along with all human genes), are ‘products of nature’ that are ineligible subject matter for patent protection under Section 101 of the U.S. Patent Act. After several years of litigation,⁴⁶ the Supreme Court agreed, holding that the sequence of naturally occurring DNA is not patent-eligible subject matter, while human-created

PRECISION MEDICINE 189 (Jennifer McCormick & Jyotishman Pathak eds., 2023) (creation of prior art through disclosure of DNA sequences).

⁴² See Jorge L. Contreras & Bartha M. Knoppers, *The Genomic Commons*, 19 ANN. REV. GENOMICS & HUMAN GENET. 429 (2018).

⁴³ See Kyle Jensen & Fiona Murray, *Intellectual property landscape of the human genome*, 310 SCIENCE 239 (2005) (finding 20% of human genes subject to patent protection by 2005). The patenting of human genes slowed after the early 2000s for a variety of reasons. First is the HGP’s continuing release of human genomic data; an initial draft of the human genome was released in 2000, with the largely final version released in 2003. IHSGSC, *supra* note 27, at 862. (Note, however, that it took an additional two decades to sequence the entirety of the human genome, an effort that was finally completed in 2021. See Carl Zimmer, *Scientists Finish the Human Genome at Last*, N.Y. Times, Jul. 23, 2021.) Various empirical studies have found that the patenting of DNA-based discoveries peaked around 2001. See Mateo Aboy et al., *Myriad’s impact on gene patents*, 34 NATURE BIOTECHNOLOGY 1119, Supp. Table 1 (2016) (citing prior studies).

⁴⁴ KOEPEL, *supra* note 25.

⁴⁵ Under the Patent Act, eligible subject matter for patenting includes machines, articles of manufacture, processes, and compositions of matter. 35 U.S.C. § 101. Composition of matter claims are powerful, as they enable the patentee to control all uses of a new form of matter such as a synthetic fiber or metallic alloy. See Jorge L. Contreras, *Association for Molecular Pathology v. Myriad Genetics: A Critical Reassessment*, 27 MICH. TECH. L. REV. 1, 38-39 (2020).

⁴⁶ For a detailed account of this litigation see JORGE L. CONTRERAS, *THE GENOME DEFENSE: INSIDE THE EPIC LEGAL BATTLE TO DETERMINE WHO OWNS YOUR DNA* (2021).

sequences not occurring in nature (i.e., DNA constructs consisting only of the coding regions of a gene) are eligible for patent protection.⁴⁷ The *Myriad* decision had an immediate effect in the U.S., effectively invalidating all composition of matter claims directed to naturally occurring genetic sequences.⁴⁸

E. GENOMIC SEQUENCE PATENTING OUTSIDE THE U.S.

While the *Myriad* decision had a direct impact on the availability of genomic sequence patents in the U.S., it is not binding in other jurisdictions and there has been little attempt to harmonize national laws in this regard.⁴⁹ Thus, while the Australian Supreme Court invalidated Myriad's *BRCA*-related patents on grounds different than those relied upon by the U.S. Supreme Court,⁵⁰ courts in Germany and the UK have found claims to isolated genetic material to be valid,⁵¹ while the situation remains unclear in Canada, China, India, and elsewhere.⁵² Even so, users and public health agencies in countries like Canada successfully ignored patents held by companies like Myriad, even when issued in their countries.⁵³

F. LEGISLATIVE PROPOSALS TO REINSTATE GENOMIC PATENTING IN THE U.S.

Critics have portrayed the *Myriad* decision, as contributing to the elimination of patents for genetic diagnostic products—a potentially devastating result for the genetic diagnostics industry.⁵⁴ The emergence of the COVID-19 pandemic led to renewed calls for increased patent protection of biomedical discoveries. As a result,

⁴⁷ *Assn. for Molecular Pathology v. Myriad Genetics*, 569 U.S. 576 (2013). Though not expressly discussed in the case, its holding would also support the patent eligibility of altered or synthetic molecules, including genetically engineered pathogens, so long as their nucleotide sequences are not found in nature.

⁴⁸ While the genomic sequences of pathogens such as viruses consist of single-stranded RNA rather than double-stranded DNA, it would be surprising if the holding of *Myriad* did not apply with equal force to DNA and RNA, which are nearly identical from a chemical standpoint and serve related information-carrying functions.

⁴⁹ See Nicol et al., *supra* note 26, at 520 (observing ‘an increasing level of inconsistency in the patent eligibility of genes and related subject matter across countries’). See also Molly Jamison, *Note: Patent Harmonization in Biotechnology: Towards International Reconciliation of the Gene Patent Debate*, 15 CHICAGO J. INTL. L. 688 (2015).

⁵⁰ See Nicol et al., *supra* note 26, at 530 (discussing *D’Arcy v. Myriad Genetics, Inc.*, 258 CLR 334 (2015)). See also Rochelle C. Dreyfuss, Jane Nielsen & Dianne Nicol, *Patenting nature—a comparative perspective*, 5 J. L. & BIOSCIENCES 550 (2018) (comparing U.S. and Australian law).

⁵¹ See Nicol et al., *supra* note 26, at 532 (discussing German and UK cases).

⁵² See *id.* at 531-33 (discussing Canadian and Chinese cases); Rebant Juyal, *Patent Eligibility of the Human Genome in India*, 23 AUSTRALIAN J. ASIAN L. 77 (2022).

⁵⁴ Rebecca S Eisenberg, *Diagnostics Need Not Apply*, 21 J. SCI. TECH. L. 256 (2015).

advocates of stronger patent protection have repeatedly sought to overturn the *Myriad* decision through legislative means.⁵⁵

In 2022, Senator Thom Tillis (R-NC) introduced the Patent Eligibility Restoration Act, a bill that, if enacted, would explicitly overturn the Supreme Court's ruling in *Myriad* and other patent eligibility cases.⁵⁶ The proposed Act would expressly allow patenting of 'a human gene or natural material that is isolated, purified, enriched, or otherwise altered by human activity'.⁵⁷ The result directly negates the Supreme Court's holding in *Myriad* that 'genes and the information they encode are not patent eligible under §101 simply because they have been isolated from the surrounding genetic material.'⁵⁸ Accordingly, the Act would return pathogenic and other non-human genomic sequences, as well as newly-discovered human genetic variants,⁵⁹ back to the category of patentable subject matter.⁶⁰

II. PATHOGENIC SEQUENCE PATENTING

⁵⁵ See Jorge L. Contreras, *Another Legislative Attempt to Revive Gene Patenting*, Bill of Health blog, Aug. 4, 2022 (discussing prior legislative attempts).

⁵⁶ Patent Eligibility Restoration Act of 2022, S.4734 — 117th Congress (2021-2022) (Introduced Aug. 2, 2022). The bill is intended to address numerous areas in which the Supreme Court's patent eligibility jurisprudence has been criticized, including, in addition to genetic sequences, 'medical diagnostics, biotechnology, personalized medicine, artificial intelligence, 5G, and blockchain'. Sen. Thom Tillis, Tillis Introduces Landmark Legislation to Restore American Innovation, Aug. 3, 2022, <https://www.tillis.senate.gov/2022/8/tillis-introduces-landmark-legislation-to-restore-american-innovation> (visited Nov. 17, 2022).

⁵⁷ Patent Eligibility Restoration Act, *supra* note 56, § (b)(2)(B).

⁵⁸ 569 U.S. at 596.

⁵⁹ New human genomic variants are discovered on a regular basis. See, e.g., Nicoletta Lanese, *Woman diagnosed with 12 tumors in her lifetime has a never-before-seen genetic mutation*, LIVESCIENCE, Nov. 6, 2022, <https://www.livescience.com/woman-with-genetic-mutation-tumor-prone> (visited Nov. 5, 2022); Colette Gallagher, *Mayo Clinic researchers pinpoint genetic variations that might sway course of COVID-19*, MAYO CLINIC NEWS NET., Jul 25, 2022, <https://newsnetwork.mayoclinic.org/discussion/mayo-clinic-researchers-pinpoint-genetic-variations-that-might-sway-course-of-covid-19/> (visited 31 March 2023). See also Megan Molteni, *Eight years after a landmark Supreme Court ruling on DNA ownership, its ramifications are becoming clearer*, STAT, Oct. 25, 2021 (interviewing Jorge Contreras). This issue is beyond the scope of this essay.

⁶⁰ Even if newly discovered genomic sequences are treated as patent-eligible subject matter under Section 101 of the Patent Act, these 'inventions' must also be shown to be non-obvious in order to merit patent protection, a hurdle that may be difficult to overcome. See Arti K. Rai, *Addressing the Patent Gold Rush: The Role of Deference to PTO Patent Denials*, 2 WASH. U. J.L. & POL'Y 199, 205-06 (2000); Brief of Amici Curiae Christopher M. Holman and Robert Cook-Deegan in Support Of Neither Party at 14, *Assn. for Molecular Pathology v. Myriad Genetics*, No. 2010-1406, Fed. Cir. (filed Oct. 28, 2010); Kristin Wall, *Patently Obvious: Why the District Court's Ruling in Association for Molecular Pathology v. USPTO is Incomplete*, 93 J. PAT. & TRADEMARK OFF. SOC'Y 237 (2011). In addition, pathogenic sequences must be 'useful' in order to be patented. However, unlike the EST sequences found not to have patentable utility in *In re Fisher* (see note 31, *supra*) the genomic sequences of disease-causing pathogens have a known and specific utility: researching and developing vaccines, diagnostics and therapeutics to counter that disease.

Though the debate over genomic patenting discussed in Part I and the *Myriad* case itself related to the patenting of human DNA,⁶¹ significant patenting activity has also occurred with respect to genomic sequences of non-human organisms including pathogens. Unlike human DNA, the fundamental, ‘wild type’ sequence of which was decoded and publicly released by the HGP, pathogens are continually evolving and new variants are discovered only after causing disease in their hosts (plants, animals or humans), giving rise to new opportunities for patenting.

A. PATHOGEN PATENTING BEFORE *MYRIAD*

Prior to *Myriad*, research laboratories and institutions that identified a new pathogenic variant routinely filed patent applications covering its genomic sequence.⁶² This Section II.A describes pathogen patenting in the context of several high-profile disease outbreaks. Numerous other pathogen sequences were also patented prior to 2013.⁶³

1. *Hepatitis C Virus (HCV) (1987)*

Because the genomic sequences of viruses are considerably shorter and simpler than those of more complex organisms,⁶⁴ researchers succeeded in sequencing viral genomes long before it was possible to sequence the complete genomes of other organisms. The first widely reported patent on a pathogenic genome claimed the hepatitis C virus (HCV), a blood-borne infection largely transmitted through transfusions. HCV was sequenced in 1987 by a team of researchers at Chiron Corporation using samples from infected chimpanzees provided by the U.S. Centers for Disease Control and Prevention (CDC).⁶⁵ Chiron obtained over one hundred patents in more than twenty countries covering the viral components of HCV.⁶⁶ It then enforced its exclusive rights in the HCV genome to prevent other providers

⁶¹ See Lori B. Andrews & Laura A. Shackelton, *Influenza genetic sequence patents: where intellectual property clashes with public health needs*, 3 FUTURE VIROLOGY 235, 238 (2008) (noting human DNA focus in debate over genomic sequence patenting).

⁶² See Carrie Arnold, *Gene patents remain controversial in biomedical research*, 382 LANCET 495, 496 (2013) (citing researcher stating that patenting viral sequences is ‘a common occurrence in research circles’); Debora Mackenzie, *Saudis say Dutch patent on MERS virus hampers research*, NEW SCIENTIST, May 24, 2013 (‘all labs that discover viruses routinely patent the sequences they work to uncover, and their prospective applications’ (citing researcher)).

⁶³ See, e.g., Maureen A. O’Malley, Adam Bostanci & Jane Calvert, *Whole-genome Patenting*, 6 NATURE BIOTECH. 502, 503 Table 1 (2005) (listing pathogen patents).

⁶⁴ For example, the complete genome of the SARS-CoV-2 virus consists of a single RNA strand comprising approximately 30,000 nucleotide bases. Wu, *supra* note 2, at 266. In contrast the human genome consists of approximately 3.2 billion DNA nucleotide base pairs. IHSGSC, *supra* note 27.

from developing and distributing diagnostic and therapeutic products utilizing the sequence.⁶⁷

2. *Severe Acute Respiratory Syndrome (SARS) (2002-03)*

Shortly after the 2002 outbreak of the Severe Acute Respiratory Syndrome (SARS) epidemic in China, several institutions joined in a contentious international ‘race’ to identify and patent the sequence of the emergent SARS-CoV coronavirus.⁶⁸ Research institutions around the world including the CDC, Health Canada (on behalf of the British Columbia Cancer Agency), Versitech Ltd. (the technology transfer arm of the University of Hong Kong), and CoroNovative BV (a company spun out of Erasmus Medical Centre) filed patent applications on the SARS genomic sequence.⁶⁹ When issued, the resulting patents would be, according to the WHO, ‘sufficiently broad to allow their holders to claim rights in most diagnostic tests, drugs, or vaccines that have been or would be developed to cope with the outbreak.’⁷⁰ As observed by Professor Eileen Kane, the ‘question of patent rights’ in the SARS viral sequence ‘complicated the coherence of an international public health strategy to contain the epidemic.’⁷¹ The WHO warned that ‘the manner in which SARS patent rights are pursued could have a profound effect on the willingness of researchers and public health officials to collaborate regarding future outbreaks of new infectious diseases.’⁷²

Among other outcomes of this patenting race were fears of an emerging patent ‘thicket’ in SARS research, where the need to obtain authorization to conduct research and product development from multiple independent rights holders could slow or prevent research.⁷³ Accordingly, the WHO and NIH recommended that the holders of patent rights on the SARS virus explore the formation of a patent pool

to aggregate their rights for more efficient licensing.⁷⁴ Though the primary patent holders agreed to participate in such a pool and signed a nonbinding letter of intent to that effect, the pool was never formed given the natural decline in SARS cases by the time that the pool's legal structure and other details had finally been agreed.⁷⁵

3. *H5N1 Influenza (2005-08)*

Unlike the SARS-CoV virus, which was relatively unknown until its emergence in 2002, various influenza strains have infected human populations for centuries. The H5N1 'avian' flu was first identified in Chinese poultry in 1996, then migrated to human populations in Hong Kong.⁷⁶ The H5N1 strain re-emerged in avian populations in 2003 then spread around the world, becoming a significant threat to human health from 2005-08.⁷⁷

Patenting of the avian H5N1 viral sequence and related technologies began in 2004.⁷⁸ Among the entities seeking patents was the CDC.⁷⁹ In response to concerns over the patenting of influenza, the WHO commissioned a 2007 study by the World Intellectual Property Organization (WIPO).⁸⁰ WIPO found that patenting of H5N1-related inventions had accelerated significantly in the years prior to 2007, and while it opined that '[b]are genetic information or genetic isolates routinely extracted from a wild organism or flu virus are generally not considered patentable ... certain genetic isolates and similar derivatives have been found in many cases to be genuine inventions under the law of a number of countries.'⁸¹

In 2006, a consortium called the Global Initiative on Sharing Avian Influenza Data (GISAID) was formed to facilitate the sharing of avian influenza sequence data.⁸² GISAID based its policies on those of the HGP, calling on its members to

voluntarily ‘set aside’ proprietary rights and ‘barriers of exclusivity such as the filing of patents’ to enable research collaboration and data sharing.⁸³

Then, in late 2006, the government of Indonesia announced that it would no longer share H5N1 samples with the WHO. It claimed, among other things, that foreign companies had impermissibly patented data generated from influenza samples previously provided by Indonesia and other countries.⁸⁴ As explained by David Fidler,

Developing countries provided information and virus samples to the WHO-operated system; pharmaceutical companies in industrialized countries then obtained free access to such samples, exploited them, and patented the resulting products, which the developing countries could not afford.⁸⁵

Indonesia insisted that it was entitled to ‘access and benefit sharing’ from discoveries, such as vaccines and antivirals, arising from samples originating within its borders.⁸⁶ Other countries, including India and Thailand, soon followed suit,⁸⁷ resulting in the WHO’s adoption in 2011 of the Pandemic Influenza Preparedness (PIP) Framework.⁸⁸ Though proposals were made during the negotiation of the PIP Framework to include express prohibitions on patenting influenza biological materials,⁸⁹ these did not succeed. The final Framework document says little about intellectual property, offering only an ambiguous provision appended in a template material transfer agreement which states that neither the provider nor the recipient of a shared virus sample ‘should seek to obtain any intellectual property’ in those

⁸³ Cassier, *supra* note 77, at 12 (quoting GISAID FAQ, 2008 (no longer available online)).

⁸⁴ See David P. Fidler, *Influenza Virus Samples, International Law, and Global Health Diplomacy*, 14 EMERGING INFECTIOUS DISEASES 88 (2008). Indonesia had numerous other grounds for this refusal. For an extensive analysis, see Yu, *supra* note 68, at 1605-15.

⁸⁵ Fidler, *supra* note 84, at 88.

⁸⁶ The requirement for ‘access and benefit sharing’ of genetic resources (ABS) arises under the 1992 United Nations Convention on Biological Diversity and its 2010 Nagoya Protocol on Access to Genetic Resources and the Fair and Equitable Sharing of Benefits Arising from their Utilization (the United States is not a party to either of these instruments, though most other countries have ratified one or both). In the context of pathogenic sample sharing, the assertion of ABS rights by different countries has led to international tensions and disputes. See Bagley, *supra* note 39; Yu, *supra* note 68, at 1611-18. Some commentators contend that countries asserting their ABS rights have become impediments to global research collaboration and sharing of pathogenic samples and genetic information. See, e.g., Mark Eccleston-Turner & Michelle Rourke, *Arguments Against the Inequitable Distribution of Vaccines Using the Access and Benefit Sharing Transaction*, 70 INTL. & COMPARATIVE L.Q. 825 (2021); Rourke et al., *supra* note 10, at 716; Sam Halabi, *Viral Sovereignty, Intellectual Property, and the Changing Global System for Sharing Pathogens for Infectious Disease Research*, 28 ANNALS HEALTH L. 101 (2019).

⁸⁷ See Yu, *supra* note 68, at 1615 (describing actions by India and Thailand).

⁸⁸ World Health Org., *Pandemic Influenza Preparedness Framework for the Sharing of Influenza Viruses and Access to Vaccines and Other Benefits*, World Health Assembly Res. WHA64.5 (May 24, 2011). For thorough discussions of the PIP negotiation process, see Amy Kapczynski, *Order without Intellectual Property Law: Open Science in Influenza*, 102 CORNELL L. REV. 1539 (2017); Yu, *supra* note 68, at 1616-17.

⁸⁹ See Beldiman, *supra* note 73, at 37 n.25 (describing anti-patenting proposal made by Bolivia).

‘materials’.⁹⁰ This statement is of questionable binding force (‘should’ rather than ‘must’ or ‘shall’), and even the ‘materials’ referred to are unclear.⁹¹ Nevertheless, this is as far as WHO has gone with respect to constraining the patenting of pathogenic genomic sequences.⁹²

4. *Middle Eastern Respiratory Syndrome (MERS) (2012)*

A year after the WHO’s adoption of the PIP Framework, a new coronavirus-based infection named the Middle Eastern Respiratory Syndrome (MERS) emerged in Saudi Arabia. Researchers at the Erasmus Medical Centre in the Netherlands filed a patent application claiming the genomic sequence of the MERS-CoV virus based, in part, on a patient sample from Saudi Arabia.⁹³ The Saudi government claimed that Erasmus’s patenting activity delayed the development of diagnostics for the new viral strain and interfered with the Saudi public health response to the outbreak.⁹⁴ Erasmus freely distributed samples of the virus to other researchers, but only pursuant to written material transfer agreements that were criticized for being too restrictive and for slowing research on the virus.⁹⁵ According to the head of Canada’s National Microbiology Laboratory, the Erasmus patent resulted in ‘a lot of negotiation and a lot of lawyers involved both with us and the Americans and others around the world ... which slowed things down quite a bit.’⁹⁶ At a meeting of the World Health Assembly in Geneva, WHO Director-General Margaret Chan publicly stated that ‘No intellectual property should stand in the way of [countries] protecting [their] people’.⁹⁷ Despite the controversy, Erasmus continued to

⁹¹ Beldiman, *supra* note 73, at 40 (discussing ambiguities in clause); Kapczynski, *supra* note 88, at 1586 (critiquing clause).

⁹² It is not clear whether this WHO policy influenced patenting behavior during the 2008-09 H1N1 ‘swine flu’ influenza pandemic, as patents on the H1N1 viral sequence do not appear to have been obtained. See Maurice Cassier, *Flu Epidemics, Knowledge Sharing, and Intellectual Property*, in *INFLUENZA AND PUBLIC HEALTH: LEARNING FROM PAST PANDEMICS* 13-14 (Tamara Giles-Vernick & Susan Cradock eds., 2010), <https://halshs.archives-ouvertes.fr/halshs-02165461>. Yet the H1N1 pandemic was not without patent disputes. See Greene, *supra* note 75, at 1400 (discussing Medimmune’s exclusive license of patents covering ‘reverse genetics’ technology important to developing a vaccine).

prosecute its patent application, which was finally granted by the European Patent Office in 2021.⁹⁸

B. PATHOGEN PATENTING AFTER MYRIAD

1. *Ebola* (2014)

The Ebola virus emerged in Zaire in 1976 and reemerged sporadically over the next several decades. In 2008, following an outbreak of the Ebola Bundibugyo virus (EboBun) strain in Uganda, the CDC filed a patent application claiming the genomic sequence of the virus.⁹⁹ In 2014, another major Ebola outbreak occurred in West Africa and soon spread to other countries including the U.S.¹⁰⁰ By that time, the sequence of the virus had been uploaded to GenBank by a German researcher who had obtained virus samples from Guinea.¹⁰¹ The CDC abandoned its U.S. patent application on the Uganda strain in 2015,¹⁰² though it continued to prosecute a Canadian patent with similar claims which was issued in 2022.¹⁰³

A 2021 study of the patenting landscape of the Ebola virus identified numerous patents covering Ebola-related medical countermeasures and interventions, but none covering the viral genomic sequence itself.¹⁰⁴ Thus, while the Ebola outbreak of 2014-16 resulted in international tensions and claims by West African countries that their sovereign rights in viral samples were violated by Western companies that profited from drugs developed using those samples, these claims do not appear to have involved patents on the viral sequence itself.¹⁰⁵

2. *Zika* (2013-16)

The Zika virus was first identified in 1947 at the Virus Research Institute in Entebbe, Uganda, an institute funded by the U.S.-based Rockefeller Foundation.¹⁰⁶

¹⁰⁵ See Eccleston-Turner & Rourke, *supra* note 93, at 836; Bagley, *supra* note 39, at 3-5.

¹⁰⁶ Rockefeller Fndn., Background on The Rockefeller Foundation and Zika (n.d.), <https://www.rockefellerfoundation.org/zika-statement/> (visited Nov. 2, 2022).

Following the outbreak of Zika in humans in Brazil in 2013,¹⁰⁷ a rumor circulated that Rockefeller had patented the virus.¹⁰⁸ This rumor has been denied by Rockefeller and there is no evidence of such a patent.¹⁰⁹ Other literature concerning Zika discloses patents on vaccine candidates,¹¹⁰ but not on the viral genomic sequence itself. Likewise, despite international disputes over viral samples involving Brazil,¹¹¹ and criticism of the exclusive licensing of patents covering the Zika vaccine developed by the U.S. Army,¹¹² these disputes did not involve patents on the Zika viral genomic sequence.

3. COVID-19 (2019-22)

The SARS-CoV-2 viral genomic sequence was uploaded to the public GenBank database almost immediately after its identification in China.¹¹³ From 2020 to 2023, there have been several studies of the patenting landscape of SARS-CoV-2 and COVID-19 diagnostics, vaccines and treatments.¹¹⁴ While these studies have identified numerous patents in each of these areas, no patents or published patent applications have been identified as claiming the genomic sequence of the SARS-CoV-2 virus or any of its variants.

C. THE IMPACT OF MYRIAD ON GLOBAL PATHOGEN PATENTING

As shown in Part II.A, attempts by research groups to patent pathogenic genomic sequences were fairly routine prior to the 2013 U.S. Supreme Court decision in *Myriad*, resulting in disruption and delays to research in response to major disease outbreaks such as SARS, H5N1 influenza and MERS. After *Myriad*,

INTELL. PROP. REV. (2023 forthcoming).

though the sharing of pathogenic sequences has not always been without political controversy,¹¹⁵ patents on genomic sequences appear to have played little or no role in these disputes. Though some patents on pathogenic sequences have recently been issued in, for example, Europe (MERS)¹¹⁶ and Canada (Ebola),¹¹⁷ these are largely the result of legacy applications filed prior to the *Myriad* decision. Few patents claiming pathogenic genomic sequences have been filed anywhere after the *Myriad* decision.¹¹⁸

Why does *Myriad*, a U.S. court decision, seem to carry such weight on a global scale? One possibility is that the demise of genomic sequence patents in the U.S. established a new set of international norms and expectations around pathogenic patenting. Researchers identifying a new pathogenic strain, aware that patents are unavailable in the U.S., might not find it worthwhile to file elsewhere when research, development and production could proceed there unimpeded by such patents.

III. AVOIDING A RETURN TO PATHOGEN PATENTING

In Part III, I summarize arguments against the re-introduction of pathogen patenting in the U.S. (and elsewhere) and make three specific policy proposals to prevent it in the future.

A. ARGUMENTS AGAINST A RETURN TO PATHOGEN PATENTING

Despite the unavailability of patents in the U.S. on genomic sequences following *Myriad*, proposals have been made in the U.S. to repeal its holding via legislative means.¹¹⁹ Further, patenting of pathogenic sequences remains possible in other jurisdictions.¹²⁰ This Section summarizes arguments against pathogen patenting.

1. Pathogen Sequences are Unpatentable Products of Nature

Pathogens that emerge naturally are not human inventions and should thus remain beyond the scope of patent protection. Though genomic sequencing was once a rarified skill requiring substantial scientific expertise, the sequencing of a pathogen today is a routine matter performed using inexpensive equipment that is

¹¹⁵ See Bagley, *supra* note 39; Eccleston-Turner & Rourke, *supra* note 93.

¹¹⁶ See note 98, *supra*, and accompanying text.

¹¹⁷ See note 103, *supra*, and accompanying text.

¹¹⁸ See Bagley, *supra* note 39, at 44 n. 221 (“While isolated genomic DNA sequences may be eligible for patent protection outside of the United States, not surprisingly, there appears to be no major effort underway to patent, at considerable cost, the large quantities of DNA sequence information obtained during non-commercial research expeditions.”)

¹¹⁹ See Section I.F, *supra*.

¹²⁰ See Section I.E, *supra*.

readily available around the world.¹²¹ Thus, there is little justification for issuing patents claiming whole pathogen genomes, which are naturally occurring molecules.

2. *Pathogen Patents Impose Barriers to Research*

Pathogen genomic sequences enable research into disease origins, etiology, spread, response, and cure.¹²² As discussed above, patenting these sequences has been shown to delay research collaboration, impose legal requirements for licensing and collaboration agreements, and exclude others from the conduct of research and the development, manufacture, and distribution of diagnostics, vaccines, and therapeutics, as well as the monitoring of the spread and evolution of diseases. As a result, Margaret Chan, then Director-General of WHO, criticized these patents as impediments to public health.¹²³ Even when relevant patent holders have shown a willingness to cooperate and pool their patents—as several patent holders did toward the end of the SARS outbreak—the legal and administrative arrangements necessary to effectuate such pooling arrangements are resource-intensive and time-consuming, resulting in substantial delays.¹²⁴

3. *Patents are Unnecessary to Incentivize Pathogen Detection and Sequencing*

In the United States, Congress was constitutionally authorized to enact a patent system to incentivize the creation of new and useful inventions.¹²⁵ The exclusivity conferred by patents has played an important role in encouraging private biopharmaceutical firms to make large investments in costly R&D, clinical trials and regulatory approvals.¹²⁶ Yet this instrumentalist rationale does not necessarily justify patents that claim pathogen genomic sequences.¹²⁷ First, the identification of new pathogens in disease outbreaks is rarely undertaken by private parties seeking to develop commercial products.¹²⁸ Instead, the identification of emergent pathogens is typically undertaken by public health authorities and academic institutions in

¹²¹ See notes 148-150, *infra*, and accompanying text.

¹²² See notes 10-12, *supra*, and accompanying text.

¹²³ Arnold, *supra* note 62, at 496 (citing Margaret Chan).

¹²⁴ See note 75, *supra*, and accompanying text.

¹²⁵ U.S. Const., Art. I, Sec. 8, Cl. 8 (authorizing Congress to establish laws granting inventors exclusive rights to their discoveries for the express purpose of promoting ‘the progress of science and useful arts’).

¹²⁶ See Bhaven N. Sampat & Kenneth C. Shadlen, *The COVID-19 Innovation System*, 40 HEALTH AFFAIRS 1, 2 (2021) (‘The dominant pull for the private sector has been through the patent system. Patents allow innovators to avoid competition for limited periods of time. The absence of competition allows innovators to charge higher prices than they would otherwise. Patents promote innovation through the lure of high profits.’)

¹²⁷ Criticism of patents covering diagnostics, vaccines, and therapeutics have also been made over the years. See, e.g., sources cited in note 132, *infra*. These issues are beyond the scope of this article.

¹²⁸ The 1987 discovery of the Hepatitis C virus (HCV) by researchers at Chiron (see note 65, *supra*) is an early exception and, as a blood-borne disease that was transmitted largely through blood transfusions in U.S. hospitals, presents a very different factual pattern from the other pathogenic outbreaks discussed in this essay.

geographic proximity to the outbreak. Unlike vaccines and therapeutics, the development of which is costly, risky, and time-consuming,¹²⁹ sequencing a new pathogen genome is relatively inexpensive and requires little unique expertise.¹³⁰ Thus, the financial incentives offered by patent exclusivity are not necessary to incentivize this activity, which is performed primarily by state actors in their public capacities.¹³¹

4. *There are Ample Opportunities to Patent Downstream Innovations beyond Pathogen Sequences*

It is not necessary to patent underlying pathogenic sequences in order to protect novel and innovative technologies such as diagnostics, vaccines, therapeutics, and genetic modifications. There are, in fact, numerous innovative aspects of these technologies that can be and routinely are patented.¹³² For example, the manufacture and delivery of vaccines involves multiple complex technologies and processes including active ingredients, adjuvants, delivery vectors and manufacturing, storage, and transport processes.¹³³ According to a 2012 WIPO study, there were more than 50,000 patents and published patent applications in fifty-seven countries that claimed the active ingredients of vaccines for pneumonia, typhoid and influenza alone.¹³⁴ Similar levels of variety and opportunities for innovation exist in the area of therapeutics.¹³⁵ For instance, Regeneron filed more

¹²⁹ *But see* E. Richard Gold, *What the COVID-19 pandemic revealed about intellectual property*, 40 NATURE BIOTECH. 1428 (2022) (challenging the need for patents to incentivize even vaccine or therapeutic development in the face of large government subsidies and procurement contracts during COVID-19); Sampat & Shadlen, *supra* note 126, at 6 (“we have seen rapid vaccine innovation despite considerable uncertainty about whether or when firms will be able to secure and enforce patents.”)

¹³⁰ *See* notes 148-151, *infra*, and accompanying text.

¹³¹ And even with respect to vaccine development, significant work is often conducted by public agencies. *See* Matthew Herder, Janice E. Graham, Richard Gold, *From discovery to delivery: public sector development of the rVSV-ZEBOV Ebola vaccine*, 7 J.L. & BIOSCIENCES, doi:10.1093/jlb/lisz019 (2020) (“The discovery and development of the Ebola rVSV-ZEBOV vaccine challenge the common assumption that the research and development for innovative therapeutic products and vaccines is best carried out by the private sector ... The development of rVSV-ZEBOV, from sponsoring early stage research through to carrying out clinical trials during the epidemic, was instead the result of the combined efforts of the Canadian government, its researchers, and other publicly funded institutions”). *See also* RUTSCHMAN, *supra* note 9, at 48-55 (discussing public sector and military contributions to vaccine R&D).

¹³² There is significant debate regarding the benefits and drawbacks of patenting vaccine technologies. *See, e.g.*, Q. Claire Xue & Lisa Larrimore Ouellette, *Innovation Policy and the Market for Vaccines*, 7 J.L. & BIOSCIENCES 1 (2020); Ana Santos Rutschman, *The Vaccine Race in the 21st Century*, 61 ARIZONA L. REV. 728 (2019); Douglas Lichtman, *The Central Assumptions of Patent Law: A Response to Ana Santos Rutschman’s IP Preparedness for Outbreak Diseases*, 65 UCLA L. REV. 1268 (2018); Ana Santos Rutschman, *IP Preparedness for Outbreak Diseases*, 65 U.C.L.A. L. REV. 1200 (2018). This essay takes no position on the merits of such patents, and simply observes that such patents are available.

than one hundred patent applications around the world for its Ebola drug Inmazeb,¹³⁶ even though the viral sequence was publicly available in GenBank.

The broad availability of patents protecting innovation directed to the containment and prevention of pathogenic disease outbreaks was clearly demonstrated during the COVID-19 pandemic. While, as noted in Part II.B, there are no known patents claiming the SARS-CoV-2 genomic sequence or its variants, several diagnostics and vaccines for COVID-19 were developed, tested, and administered to the public in record time. Even without patents covering the viral genomic sequence, the governmental and private sector researchers that developed these technologies applied for large numbers of patents. For example, one 2020 study found that with respect to mRNA vaccine technology alone, fifty-six different entities ranging from large pharmaceutical companies such as Bayer, Bristol Myers Squibb, and GlaxoSmithKline to small and medium-sized firms including Moderna, CureVac, and BioNTech, controlled nearly 120 different patent families.¹³⁷ Several reports and studies describe the different patented vaccine technologies developed to address COVID-19, from novel spike proteins to lipid nanoparticle delivery mechanisms to specialized adjuvant excipients.¹³⁸ Perhaps the most convincing evidence that sizeable numbers of patents have been issued in this field is the patent litigation being waged by half a dozen vaccine manufacturers and technology developers, recently dubbed the ‘COVID-19 Patent Wars’.¹³⁹ All of these examples demonstrate that COVID-19 technology innovations—and vaccines in particular—have been amply protected by patents and are extremely profitable, all without patents on pathogenic sequences.

5. *Pathogen Patents Will Advantage Other Countries Over the U.S.*

When Senator Thom Tillis introduced the proposed Patent Eligibility Restoration Act in the U.S. Senate, he explained that one of the bill’s principal goals

Shores, *COVID-19 Patent Wars: mRNA and Lipid Nanoparticle Pioneers Clash over Vaccine Delivery Patents*, 15 LANDSLIDE (Sept./Oct. 2022), https://www.americanbar.org/groups/intellectual_property_law/publications/landslide/2022-23/september-october/covid-19-patent-wars-mrna-lipid-nanoparticle-pioneers-clash-over-vaccine-delivery-patents/ (visited 31 March 2023).

was to promote ‘the economic and global competitiveness of the United States’.¹⁴⁰ He and others faulted judicial decisions like *Myriad* for ‘undermining American innovation and allowing foreign adversaries like China to overtake us in key technology innovations.’¹⁴¹ Supporters of the bill have predicted that it will ‘rev the US innovation engine once again’, warning that ‘[e]conomic growth, job creation, global competitiveness, public health and national security are all at risk until Congress repairs the law of patent eligibility that the Supreme Court has distorted.’¹⁴² Yet, ironically, at least in the case of pathogen genomic sequences, the benefits of the proposed legislation would accrue largely to institutions in China and elsewhere.

As discussed in Part II, most infectious disease outbreaks can be traced to the transmission of pathogenic agents from animals to humans.¹⁴³ A majority of these outbreaks originate in regions with extensive animal husbandry or live animal markets, where populations rely on hunting for sustenance or where habitat loss has resulted in the encroachment of wild animals into human settlements.¹⁴⁴ Across regions with these characteristics, the precise location of a future outbreak is impossible to predict. The earlier outbreaks described in Part II have been traced, respectively, to China (SARS and H5N1), Saudi Arabia (MERS), Zaire and Congo (Ebola), Uganda and Brazil (Zika).¹⁴⁵ Once a pathogenic strain has infected a human population, the location(s) where its variants will emerge is also hard to predict. For example, *Table 1* illustrates the documented locations of the emergence of the major variants of SARS-CoV-2:

Original strain	China
Alpha	United Kingdom
Beta	South Africa
Gamma	Brazil
Delta	India
Omicron	South Africa, Botswana ¹⁴⁶

Table 1¹⁴⁷

The fact that some of these countries are low-income and do not possess large biopharmaceutical facilities does not prevent governmental and non-profit agencies in those countries from sequencing emergent pathogenic genomes. Today, genomic sequencing equipment is available around the world at a modest cost.¹⁴⁸ In 2021, the cost of sequencing a SARS-CoV-2 genome (only 1/100,000 the size of the human genome)¹⁴⁹ was estimated at approximately \$120 -- well within the reach of researchers in most countries. As a result, by mid-2021, Gambia had sequenced more SARS-CoV-2 genomes than Germany.¹⁵⁰

Further, under the World Trade Organization’s Agreement on Trade-Related Aspects of Intellectual Property Rights (‘TRIPS Agreement’),¹⁵¹ signatory countries must extend ‘national treatment’ to patent applicants from other signatory countries.¹⁵² This implies that applicants from any TRIPS country will be afforded the same rights to U.S. patents as applicants from the U.S. Indeed, over the past several years, more U.S. patents have been issued to non-U.S. than U.S. applicants.

¹⁵¹ Agreement on Trade-Related Aspects of Intellectual Property Rights, Apr. 15, 1994, Marrakesh Agreement Establishing the World Trade Organization, Annex 1C, 1869 U.N.T.S. 299 [hereinafter TRIPS Agreement].

¹⁵² *Id.* Art. 1(3).

In 2021, approximately 53% of all U.S. patents were issued to foreign applicants.¹⁵³ And of the top one hundred universities obtaining U.S. patents in 2021, thirty-eight were based outside of the U.S. (eighteen in China).¹⁵⁴ This situation is indicative of today's global economy, where national patents are readily available to any entity that wishes to exploit a national market.

The combination of pathogenic emergence in certain less developed countries, the availability of inexpensive genome sequencing, and national treatment of applicants under TRIPS suggests that if U.S. patents become available for pathogenic sequences, the applicants most likely to obtain these patents will be entities based outside the U.S. The SARS-CoV-2 genome was first sequenced by a team of researchers at institutions in China.¹⁵⁵ As noted above, these researchers immediately released the viral sequence to the public GenBank database. Had patenting been an option and had the Chinese researchers elected to file a patent application in the U.S., the resulting U.S. patent on the baseline sequence of SARS-CoV-2 would most likely be owned by a group of Chinese state-owned institutions. Similar results would have occurred with respect to the major SARS-CoV-2 variants, each of which was first identified and sequenced outside of the U.S. (see Table 1). As a result, allowing pathogen patenting, as proposed by the draft Patent Eligibility Reform Act, would likely result in patents being issued to non-U.S. applicants. As a result, American companies and others that wished to develop diagnostics, vaccines, and other technologies dependent on those patented sequences would either be excluded from the market, required to pay excessive prices, or make other onerous commitments in exchange for licenses to practice those patents.

Further, as discussed in Sections II.A and II.B, certain foreign governments have sought to delay international research on outbreaks and response efforts in order to gain concessions under the banner of 'access and benefit sharing' (ABS).¹⁵⁶ The most prominent example of this approach occurred during 2006-07, when the government of Indonesia refused to share samples of the H5N1 influenza virus with the WHO.¹⁵⁷ Some countries adopted similar approaches during the MERS, Ebola and Zika outbreaks.¹⁵⁸ If countries are willing to delay international research and the response to a pandemic in order to secure ABS benefits for themselves, then they are also likely to use patents to extract further concessions from the international community. Demands for ABS concessions are not necessarily unjustified in view

of past exploitation of local resources by foreign firms.¹⁵⁹ Yet, these barriers to the international response to emergent disease outbreaks can negatively impact global health. Reintroducing pathogen patenting will give countries where outbreaks emerge yet another tool to hold up critical international research and development to the detriment of all.

B. IS THIS REALLY A PROBLEM?

While Section III.A above points to potential risks inherent in the issuance of pathogen patents, some might argue that these risks are mitigated by several factors, including patent holders' voluntary forbearance from enforcing their patents during a global health crisis, as well as built-in limitations on enforcement measures.

1. *Informal Non-Enforcement Commitments Are Not Enough*

In the past, some entities that have patented pathogenic sequences have claimed to have done so with no intention of profiting from those patents or excluding others from conducting research or developing competing products. The Erasmus researchers who patented the MERS virus insisted that their patent would be used not to inhibit research, but to foster collaboration.¹⁶⁰ Likewise, the U.S. CDC, which obtained patents covering the SARS, H5N1, and Ebola viruses,¹⁶¹ has stated that such patents are 'protective measure[s] to make sure access to the virus remains available to anyone.'¹⁶² Similar sentiments were expressed by the British Columbia Cancer Agency, which obtained patents claiming SARS-CoV.¹⁶³ One Canadian researcher suggested that the government participated in obtaining this patent only to prevent private companies from doing the same.¹⁶⁴

¹⁵⁹ The appropriateness of ABS in international disease response remains contested. *See* note 86, *supra*.

¹⁶⁰ *See* Arnold, *supra* note 62, at 496 (quoting Erasmus researcher and patent applicant Ab Osterhaus).

¹⁶¹ *See* notes 69, 79 and 99, *supra*, and accompanying text.

¹⁶² Antonio Regalado & David P. Hamilton, *CDC Seeks Patent on SARS To Keep Discovery Public*, WALL ST. J., May 7, 2003 (quoting CDC director Julie Gerberding with reference to SARS patent). With respect to Ebola, the CDC stated that it applied for patents on the 2008 EboBun strain (see note 99, *supra*, and accompanying text) in order to 'grant rights to use the virus strain for the commercialization of diagnostics, vaccines, and antibody/antigen testing, and make them more quickly and readily available to patients, doctors and research scientists' and 'to ensure that another entity does not acquire a patent in a similar space and restrict the beneficial uses of the invention.' Reuters, *supra* note 108.

¹⁶³ Regalado & Hamilton, *supra* note 162.

¹⁶⁴ *Id.* Even taking at face value patent holders' assurances that they obtained patents only to prevent others from doing so, this strategy is a flawed one, at best. A more effective, and less costly, way to prevent patenting by others is to publish the discovery without restriction, as the HGP and other public-spirited genomic research projects have done. *See* notes 38-41, *supra*, and accompanying text.

Of course, not all holders of pathogen patents have made such assurances and there is no guarantee that future holders, even of the same patents, will do so.¹⁶⁵ It would be imprudent to rely on the goodwill of future (or current) holders of pathogen patents when assessing the threat posed by these patents. Additionally, it is not clear that much comfort can be derived even from those patent holders that have made such informal assurances regarding their intentions concerning enforcement. While patent holders' expressions of public-spirited intent may help defuse criticism, these statements taken alone are unlikely to result in legally binding commitments.¹⁶⁶ Even when public pledges are sufficiently robust to be legally binding, patentees have been known to violate these commitments, even during global health crises, thereby causing uncertainty in the market and requiring significant cost to enforce.¹⁶⁷

Absent legally binding commitments—which no pathogen patent holder appears to have made yet—the public cannot rely on statements of goodwill by patent holders, even when they are government agencies and academic institutions. NIH was partially responsible for enabling Myriad Genetics to corner the U.S. market for *BRCA* testing by granting the company full control over NIH's rights in the *BRCA* patents—patents that Myriad then asserted against other clinical test providers.¹⁶⁸ Governmental and academic institutions have increasingly engaged in patent assertion and litigation, both directly and through professional patent assertion entities, for the sole purpose of monetizing their patent assets.¹⁶⁹ The CDC is an aggressive enforcer of patents, as exemplified by its recent infringement action against one of its own researcher collaborators—an action held by a federal court

¹⁶⁵ During the H1N1 swine flu pandemic, the WHO's Initiative for Vaccine Research (IVR) apparently took comfort from the fact that Medimmune, the exclusive licensee of patents covering important 'reverse genetics' technology, committed to 'act benevolently' with respect to the enforcement of those patents. Greene, *supra* note 75, at 1401. Yet questions were raised when Medimmune was acquired by Astra Zeneca, causing IVR to admit '[i]t is not yet known what effect, if any, this acquisition will have on the access to the reverse-genetics intellectual property.' *Id.* at 1401 n. 11 (quoting IVR, Mapping of Intellectual Property Related to The Production of Pandemic Influenza Vaccines 18 (2007)).

¹⁶⁶ Though unilateral commitments not to enforce patents (so-called 'patent pledges') can become binding obligations under legal theories such as promissory estoppel, a greater degree of formality and certainty is usually required to bind the promisor. See Jorge L. Contreras, *The Open COVID Pledge: Design, Implementation and Preliminary Assessment of an Intellectual Property Commons*, 2021 UTAH L. REV. 833 (2021); Jorge L. Contreras, *A Market Reliance Theory for FRAND Commitments and Other Patent Pledges*, 2015 UTAH L. REV. 479 (2015).

¹⁶⁷ See, e.g., Jorge L. Contreras, *No Take-Backs: Moderna's Attempt to Renege on its Vaccine Patent Pledge*, BILL OF HEALTH, Aug. 29, 2022, <https://blog.petrieflom.law.harvard.edu/2022/08/29/no-take-backs-modernas-attempt-to-renege-on-its-vaccine-patent-pledge/> (visited 31 March 2023)(discussing Moderna's patent infringement litigation against Pfizer and BioNTech that seemingly violated its prior pledge not to assert its mRNA patents during the COVID-19 pandemic).

¹⁶⁸ See Contreras, *Association for Molecular Pathology*, *supra* note 45, at 46.

¹⁶⁹ See Jorge L. Contreras, *'In the Public Interest' - University Technology Transfer and the Nine Points Document—An Empirical Assessment*, 12 U.C. IRVINE L. REV. Part III.C.3 (2023, forthcoming).

to violate CDC's agreements with that collaborator.¹⁷⁰ For all of these reasons, informal assurances that patents will not be asserted or monetized should not be relied upon. While more formal pledge mechanisms may be utilized by some patent holders,¹⁷¹ a more reliable and comprehensive solution is to stop issuing pathogen patents at all.

2. *Legal Limitations on the Enforcement of Patents During Public Health Crises*

Some might argue that pathogen patents need not be limited because patent holders are already constrained from enforcing their patents, especially during global health crises. For example, in the United States, a patent holder cannot obtain a permanent injunction preventing an infringer from practicing a patented invention unless it demonstrates that the public interest would not be disserved by the entry of the injunction.¹⁷² Likewise, the International Trade Commission, when assessing the appropriateness of an exclusion order barring the importation of infringing goods into the United States, must take into account 'the effect of such exclusion upon the public health and welfare.'¹⁷³ These limitations have significantly reduced the number of injunctions and exclusion orders that are issued with respect to medical and health-related technologies.¹⁷⁴ And under 28 U.S.C. § 1498, injunctions may not be obtained for patent infringement against the U.S. federal government or its contractors; the remedy for such infringement is limited to monetary damages as assessed by the Court of Federal Claims.¹⁷⁵

These limitations might suggest that, at least in the United States, the existence of patents claiming pathogenic sequences might not represent a significant threat. However, the existence of patents on these basic research tools, no matter the eventual litigation outcomes, can chill research, impose delays, and provide leverage for the demand of unwarranted fees.¹⁷⁶ Even meritless claims are costly to defend against and impose some level of risk to defendants, particularly in the U.S., where fee shifting is rare. Despite the seeming assurance under § 1498 that firms operating under government contracts to produce vaccines and other biomedical supplies will

Allen, *The Public Interest Inquiry for Permanent Injunctions or Exclusion Orders: Shedding the Myopic Lens*, 17 VAND. J. ENT. & TECH. L. 751, 766-67 (2015).

¹⁷⁵ 28 U.S.C. § 1498.

¹⁷⁶ See Jorge L. Contreras, *Patent Reality Checks—Eliminating Patents on Fake, Impossible and Other Inoperative Inventions*, 102 J. PATENT & TRADEMARK OFF. SOC'Y 3, 8 (2021) (discussing economic and market effects of 'bad' patents).

be shielded from actions in district court, this has not always been the case.¹⁷⁷ Accordingly, while various litigation doctrines may tend to lessen the threat that pathogen patents will successfully be enforced in the U.S., that threat is not entirely eliminated and may still impose a significant cost on firms that are engaged in research and development of pathogen-based biomedical products.

C. OPTIONS FOR AVOIDING PATHOGEN PATENTS

As shown in Section III.A, above, the reintroduction of pathogen patenting could delay or impede research on new pathogen outbreaks with few offsetting benefits. Accordingly, this Section III.C outlines three policy options for avoiding pathogen patents in the future.

1. *Leave Myriad Intact under U.S. Law*

The U.S. Patent Act should not be amended to overturn the Supreme Court's *Myriad* decision and once again allow the patenting of naturally occurring genomic sequences, even if corresponding genomic material is 'isolated, purified, enriched or otherwise altered by human activity'.¹⁷⁸ Accordingly, the proposed clause of the Patent Eligibility Restoration Act that expressly *allows* patenting of such sequences should be struck from the bill and excluded from any future legislative amendments to the Patent Act. Further, the Patent Act should be amended expressly to enshrine the *Myriad* holding in the law and to discourage future attempts to reverse it by legislative means. These revisions would preserve U.S. law as a model for other countries to follow and as a signal for norms in the scientific community.

2. *Ban Pathogen Patenting Under the WHO Pandemic Treaty*

Objections to patenting pathogenic sequence data have previously been made at the WHO, particularly in the context of sample sharing during the H5N1 influenza outbreak.¹⁷⁹ These efforts were largely subsumed by the 2011 PIP Framework that established a set of procedures for the international sharing of influenza samples.¹⁸⁰ The issues today are different. Though patenting of naturally occurring genomic sequences today has largely been eliminated, this situation could change. As noted in Part I.F above, legislative proposals have been made in the U.S. to overturn *Myriad*, and several countries, including Germany and the UK, still allow patenting of genomic sequences. For these reasons, an international ban on pathogen patenting is the best way to ensure that efforts at the national level to reintroduce this practice do not succeed. As such, the WHO should include in its pending Pandemic Treaty¹⁸¹ a provision by which signatory states expressly agree to

¹⁷⁷ See *Arbutus Biopharma Corp. v. Moderna, Inc.*, Case 1:22-cv-00252-MSG, Memorandum (D. Del. Nov. 2, 2022) (denying defendant's Motion to Dismiss based on § 1498).

¹⁷⁸ See note 57, *supra*, and accompanying text.

¹⁷⁹ See note 89, *supra*, and accompanying text.

¹⁸⁰ See note 88, *supra*, and accompanying text.

¹⁸¹ WHO Pandemic Treaty Draft, *supra* note 21.

exclude from patentability naturally occurring genomic sequences, even if isolated and purified.¹⁸²

3. *Reversing the WHO's Accommodative Stance Toward Pathogen Patenting*

It is important that the WHO take a public stand against the patenting of pathogenic sequences. Recent statements by the WHO have been ambivalent at best, and accommodating at worst, with respect to the patenting of pathogenic genomes. Most notably, WHO's November 2022 *Guiding Principles for Pathogen Genome Data Sharing*,¹⁸³ a sweeping call for researchers around the world to share genomic data relating to pathogenic outbreaks, makes no mention whatsoever of patents or other intellectual property. Instead, the WHO seemingly concedes the right of researchers to secure intellectual property rights in pathogenic data, urging them to use 'unrestricted open access models for sharing [data]' only when they 'do not wish rights to be reserved.'¹⁸⁴ The *Guiding Principles* go on to provide that

[w]here submitters opt to retain certain protections related to pathogen genome data, platforms that preserve data generators' rights should be used. In this case, any user seeking access should be granted such access under agreed terms. Access should be free of charge for users.¹⁸⁵

Statements like this urge researchers to make data freely available 'under agreed terms', though not to charge for access. While at first blush this arrangement may seem to eliminate the impact that pathogenic patents could have on research collaboration, it does not. First, a requirement that users seeking access to data agree to unspecified terms opens the door to a range of restrictive conditions on data usage, including bans on commercial usage that could severely disrupt efforts at diagnostic, vaccine, and drug development. Second, free 'access' does not imply that *usage* of sequence data would be free of charge, particularly in commercial applications, or that such usage would be permitted broadly, if at all.¹⁸⁶ Only by eliminating patents on pathogen sequences entirely would the threat of these potential impediments be overcome.

¹⁸² Other international organizations that could conceivably sponsor such a treaty include the World Trade Organization (WTO), which recently enacted a COVID-19 IP Waiver (World Trade Org., Ministerial Decision on the TRIPS Agreement, WT/MIN(22)/30 (2022)), and the World Intellectual Property Organization (WIPO), which has collaborated with WHO on various outbreak and related patenting issues in the past (see notes 80-81 and 134, *supra*).

¹⁸³ World Health Org., *Guiding Principles for Pathogen Genome Data Sharing* (2022), <https://apps.who.int/iris/bitstream/handle/10665/364222/9789240061743-eng.pdf> (visited 31 March 2023) [hereinafter WHO Pathogen Guiding Principles].

¹⁸⁴ WHO Pathogen Guiding Principles, *supra* note 183, at 4.

¹⁸⁵ *Id.*

¹⁸⁶ The distinction between access and usage is fundamental under patent law. In most countries, a patent applicant is legally required to disclose its invention to the public at no charge. Yet even with this disclosure, usage of the invention is permitted during the term of the patent only with the authorization of the patent holder, which is often subject to charge or which may be withheld entirely for competitive reasons.

4. *Consistency with the TRIPS Agreement*

Some may question whether the proposed treaty ban on pathogen sequence patenting would be consistent with the minimum protections that countries are required to provide in their national laws under the WTO TRIPS Agreement.¹⁸⁷ Such a ban would, in fact, be entirely consistent with signatory states' obligations under TRIPS. Article 27 of the TRIPS Agreement includes the following provisions:

1. [P]atents shall be available for any inventions, whether products or processes, in all fields of technology, provided that they are new, involve an inventive step and are capable of industrial application ... without discrimination as to the place of invention, the field of technology and whether products are imported or locally produced.

2. Members may exclude from patentability inventions, the prevention within their territory of the commercial exploitation of which is necessary to protect *ordre public* or morality, including to protect human, animal or plant life or health ...

The proposed exclusion from patentability for pathogen genomes could be authorized under Article 27 under the following rationales: (a) a naturally occurring pathogen is not an 'invention', (b) sequencing a naturally occurring pathogen is a routine activity that involves no inventive step, and (c) the exclusion is necessary to protect human health. And while the proposed exclusion relates to patent eligibility (Art. 27) rather than patent enforcement (Art. 28) or compulsory licensing (Art. 31), it is consistent with the intent and spirit of prior WTO instruments addressing public health matters, namely, the 2022 Ministerial Decision creating the COVID-19 Vaccine IP Waiver¹⁸⁸ and the 2001 Doha Declaration on the TRIPS agreement and public health.¹⁸⁹

Of course, patents are not the only legal mechanisms that have been used to enclose pathogenic data and samples from global research. As noted above, certain foreign governments have, in the past, sought to delay international research and responses in order to gain concessions under the banner of ABS.¹⁹⁰ Further recognition of ABS principles is currently under discussion as part of the WHO Pandemic Treaty negotiation, and clarifications should be introduced to ensure that individual states cannot use ABS demands to hold-up global public health research.¹⁹¹

5. *Policy Restrictions*

In addition to the legislative and treaty measures proposed above, the WHO, governmental public health agencies, and public and private research funders could

deter the filing of patents on pathogenic sequences through express policies and restrictions placed in procurement and funding agreements.¹⁹²

First, such policies could explicitly prohibit the patenting of pathogenic genomic sequences discovered by researchers supported by these bodies. Several commentators have observed that during the COVID-19 pandemic, government funding and procurement bodies around the world could have imposed conditions on funded entities relating to vaccine and drug pricing, access, production, and knowledge transfer;¹⁹³ such provisions could also be adapted to prohibit patenting of pathogen genomic sequences.

Less directly, and in cases where statutory or other requirements prevent governmental bodies from directly prohibiting the acquisition of patents by funded researchers,¹⁹⁴ funders can adopt rapid data release requirements modeled on the Bermuda Principles.¹⁹⁵ As discussed in Section I.C, the 24-hour data release requirement under the Bermuda Principles served to deter patenting of HGP sequence data both by HGP sequencing centers and third parties. A similar data release requirement could be imposed, for example, on researchers participating in a WHO pathogen sharing arrangement such as the PIP (which is limited to influenza)¹⁹⁶ or who are supported by public health agencies or other public or private funders. Given that the vast majority of pathogenic sequences have been identified by public agencies or publicly funded researchers, and not by corporate labs, such measures could effectively limit the emergence of patents on these global public resources.

Far from constituting a radical departure from current practice, genomics researchers routinely deposit genomic data into public databases around the

¹⁹² Major philanthropic funders of biomedical research such as the Bill & Melinda Gates Foundation and the Wellcome Trust routinely include grant conditions relating to intellectual property access and use. *See, e.g.*, Bill & Melinda Gates Fndn, Global Access, <https://globalaccess.gatesfoundation.org> (visited Dec. 4, 2022); Wellcome Trust, Intellectual Property Policy, <https://wellcome.org/grant-funding/guidance/intellectual-property-guidance/intellectual-property-policy> (visited Dec. 4, 2022).

¹⁹³ *See, e.g.*, Ana Santos Rutschman, *Vaccine Contracts in The Context of Pandemics And Epidemics*, NYU J. INT'L L. & POL. *3-4 and *13-15 (2023, forthcoming) (identifying funder requirements in vaccine contracts); Gold, *supra* note 129, at 1429 (government should 'insist that companies follow existing policies that require broad licensing of IP to speed development'); Sapna Kumar & Ana Santos Rutschman, *Contractual solutions to overcome drug scarcity during pandemics and epidemics*, 40 NATURE BIOTECH. 301 (2022); Jorge L. Contreras, *What Ever Happened to NIH's "Fair Pricing" Clause? BILL OF HEALTH* (2020), <https://blog.pctrieflom.law.harvard.edu/2020/08/04/nih-fair-pricing-drugs-covid19/> (visited 31 March 2023) (discussing historical fair pricing clauses in NIH cooperative R&D agreements); *see also* Contreras, *Association for Molecular Pathology*, *supra* note 45, at 46-51 (discussing similar approaches in the context of genetic diagnostics).

¹⁹⁴ *See* Contreras, *Bermuda*, *supra* note 29, at 94, 121-22 (noting NIH's position that prohibiting patenting by its funded researchers could be at odds with the Bayh-Dole Act).

world.¹⁹⁷ In fact, it may be these very norms that motivated the Chinese research team that sequenced SARS-CoV-2 to upload the viral sequence to GenBank within days of its identification.¹⁹⁸ Though policy requirements such as this are less comprehensive than global treaty agreements and may have less legal force than national legislation, they can play a valuable role in deterring patenting behavior by most participants in the global pathogen research community.

The imposition by the WHO of policy requirements such as these would be far more useful than the accommodative posture that the WHO has adopted in its recent *Guiding Principles for Pathogen Genome Data Sharing*.¹⁹⁹ These *Guiding Principles* make the open release of pathogenic data optional when researchers wish to retain intellectual property rights.²⁰⁰ Moreover, the ‘agreed terms’ that the *Guiding Principles* contemplate could easily include requirements that users keep shared pathogen data confidential, thereby eliminating it as a prior publication that defeats patenting.²⁰¹ For all of these reasons, the WHO in particular should adopt more stringent data release and sharing requirements for pathogen sequence data that effectively deter patenting of that data by its discoverers and third parties.

CONCLUSION

Open, global research collaboration will be essential to address future pathogenic disease outbreaks, and measures should be taken to ensure that pathogenic sequence information is not appropriated by individual researchers, institutions, or states. A first step toward this goal is defeating legislative attempts in the U.S. that would overturn judicial precedents establishing that naturally occurring genomic sequences are ineligible subject matter for patent protection, while retaining ample opportunities to patent downstream innovations.

But given the fractured landscape of national patent laws and the inconsistent positions of different countries regarding genomic patenting, an international agreement that keeps the genomic sequences of pathogenic agents free from legal enclosure and appropriation is a preferred avenue for addressing this pressing global need.

At the same time, the WHO, national public health agencies and research funders should independently seek to limit researchers’ ability to patent pathogenic sequences either directly or by imposing rapid data release requirements on researchers over which they have authority. Together, these measures can ensure

that pathogen genomic sequences remain global public goods that are available to all researchers in the service of public health while interfering little with private incentives to develop innovative biomedical technologies.
