MiSTI
Materials in Sustainable Transportation Infrastructure

Michigan Tech

NCHRP 18-13

- Objective - recommend potential improvements to specifications and test protocols to determine the acceptability of fly ash for use in highway concrete

MiSTI
Materials in Sustainable Transportation Infrastructure

MichiganTech

NCHRP 18-13

- Characterization Study – evaluate existing specifications and classification methods for CFA
- Strength Test Study – investigate test methods for characterizing the strength activity of CFA
- Carbon Effects on Air Entrainment Study – develop test methods for characterizing the adsorption properties of residual carbon in CFA
- ASR Mitigation Study – examine test methods to evaluate use of CFA to mitigate alkali-silica reaction in concrete

Characterization Study

- Gathered data on 100+ CFA sources
- Surveyed the SHAs to determine common sources used
- Selected 30 for comprehensive analysis
  - 17 Class F, 13 Class C
  - Selected sources from the 30 best suited for the other testing performed

MiSTI
Materials in Sustainable Transportation Infrastructure

Michigan Tech

Summary of 30 Sources

- Sum of SiO_2, Al_2O_3, and Fe_2O_3: 51.8 to 92.7%
- Calcium oxide (CaO): 0.9 to 30.6%
- Na_2O_e: 0.3 to 7.9%.
- LOI: 0.1 to 5.6%

Also made blends to achieve higher LOI

- Fineness: 10 to 24.0%
- Strength Index (7-day test value): 75 to 112%
- Strength Index (28-day test value): 80 to 120%
- Water requirement: 93 to 100%
- Density: 2.1 to 2.8g per cubic-centimeter

MiSTI
Materials in Sustainable Transportation Infrastructure

Characterization Study

- Characterized 30 sources using ASTM C311 methods
  - All AASHTO M 295 Required and Optional Chemical and Physical Properties
  - Pozzolanic Activity Index (PAI) using ASTM C311 methods
  - Qualitative XRD
- Quantitative XRD and TGA/DTA on 8 selected sources

Chemical Classification

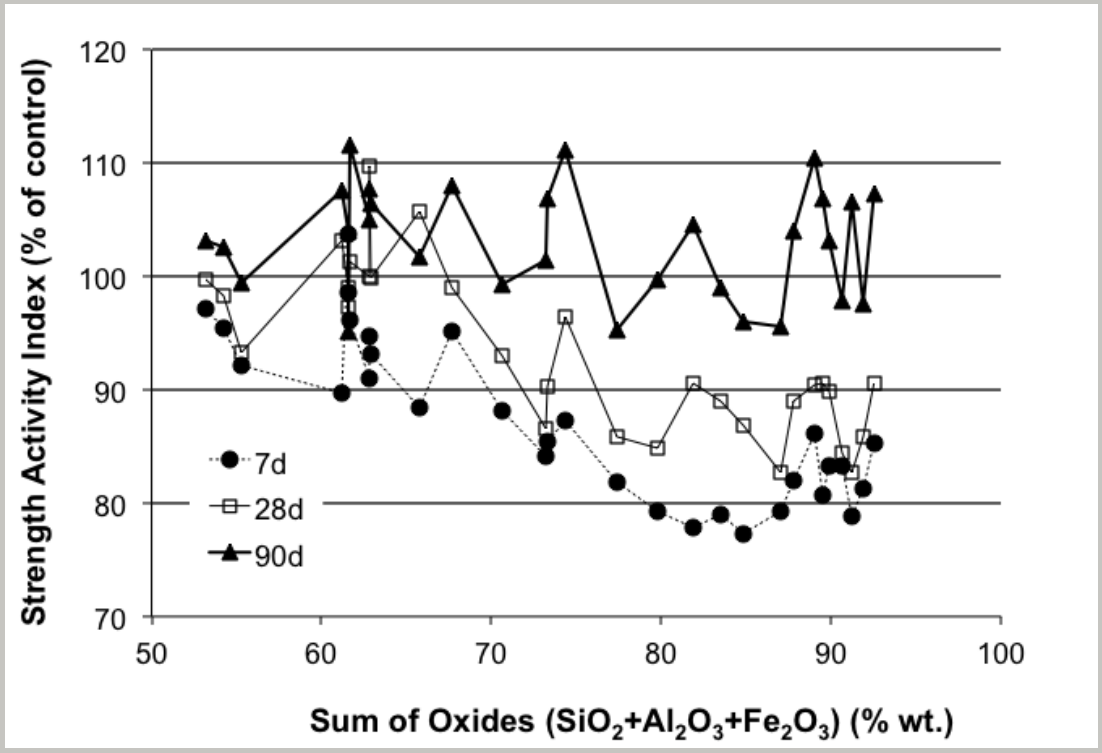
Strength Activity Index



MiSTI
Materials in Sustainable Transportation Infrastructure

Strength Test Study

- Strength Activity Index is questioned as it allows inert materials to pass
- Experiments performed with non-pozzolanic quartz filler

Cement Type	Age (days)	100% Cement	20% Replacement		35% Replacement	
		Strength (psi)	Strength (psi)	SAI	Strength (psi)	SAI

Strength Test Study

- Evaluated the Keil Hydraulic Index
- Replace an equal percentage of the control sample cement with an inert filler
- Evaluated different fillers, replacement levels, and cements

$$Keil\ Hydraulic\ Index = \frac{a-c}{b-c} \times 100$$

Where:

a = the strength of 70% slag/30% portland cement at time t;
b = the strength of 100 percent portland cement at time t;
c = the strength of 70% ground quartz/30% portland cement at time t

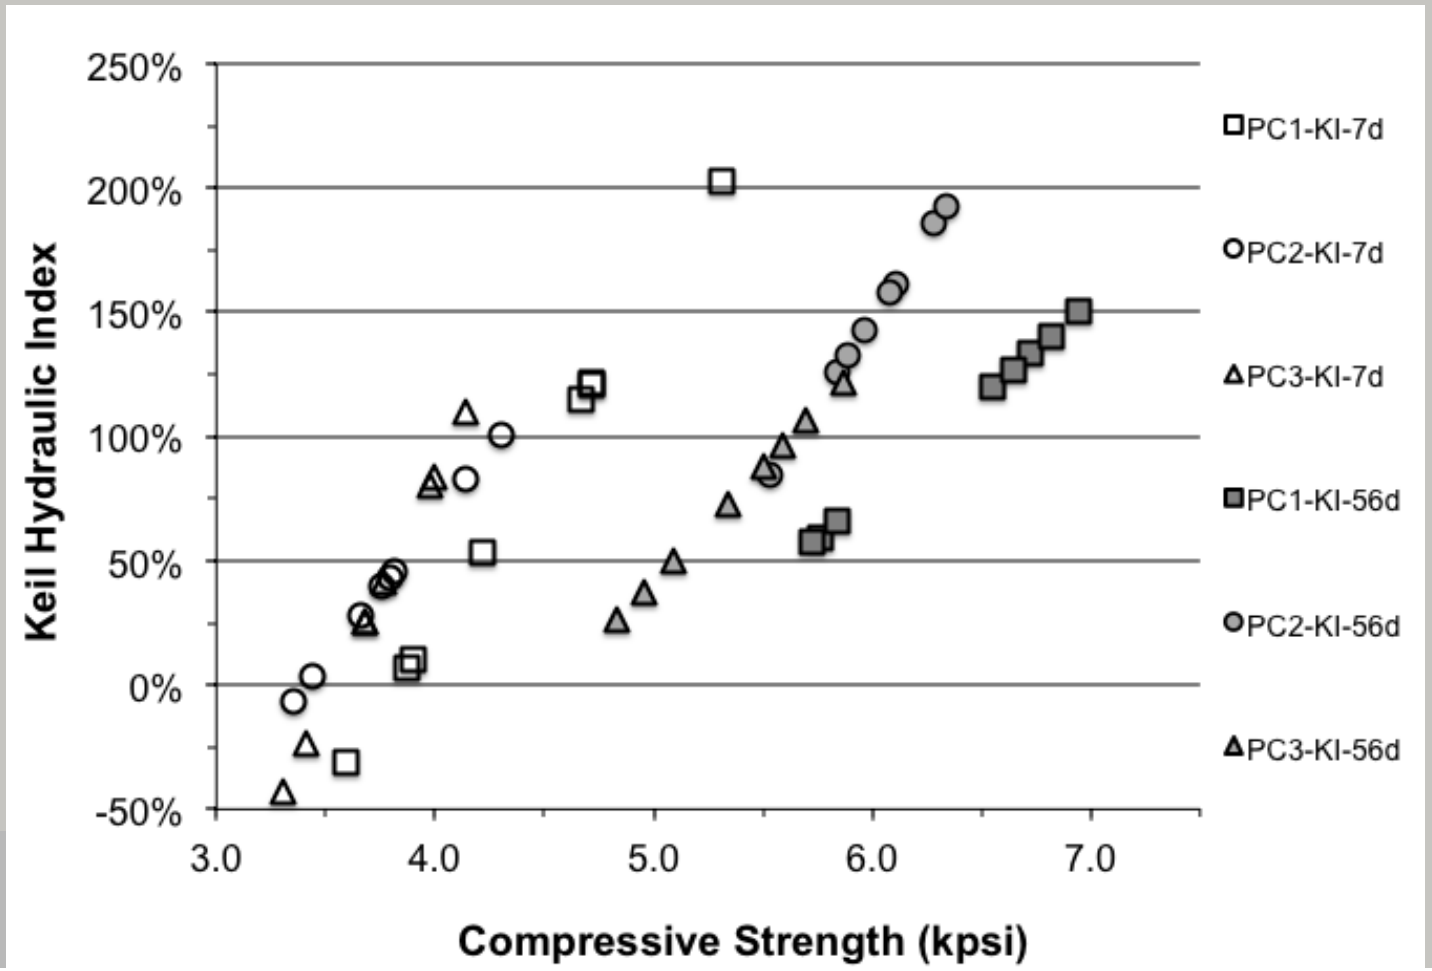
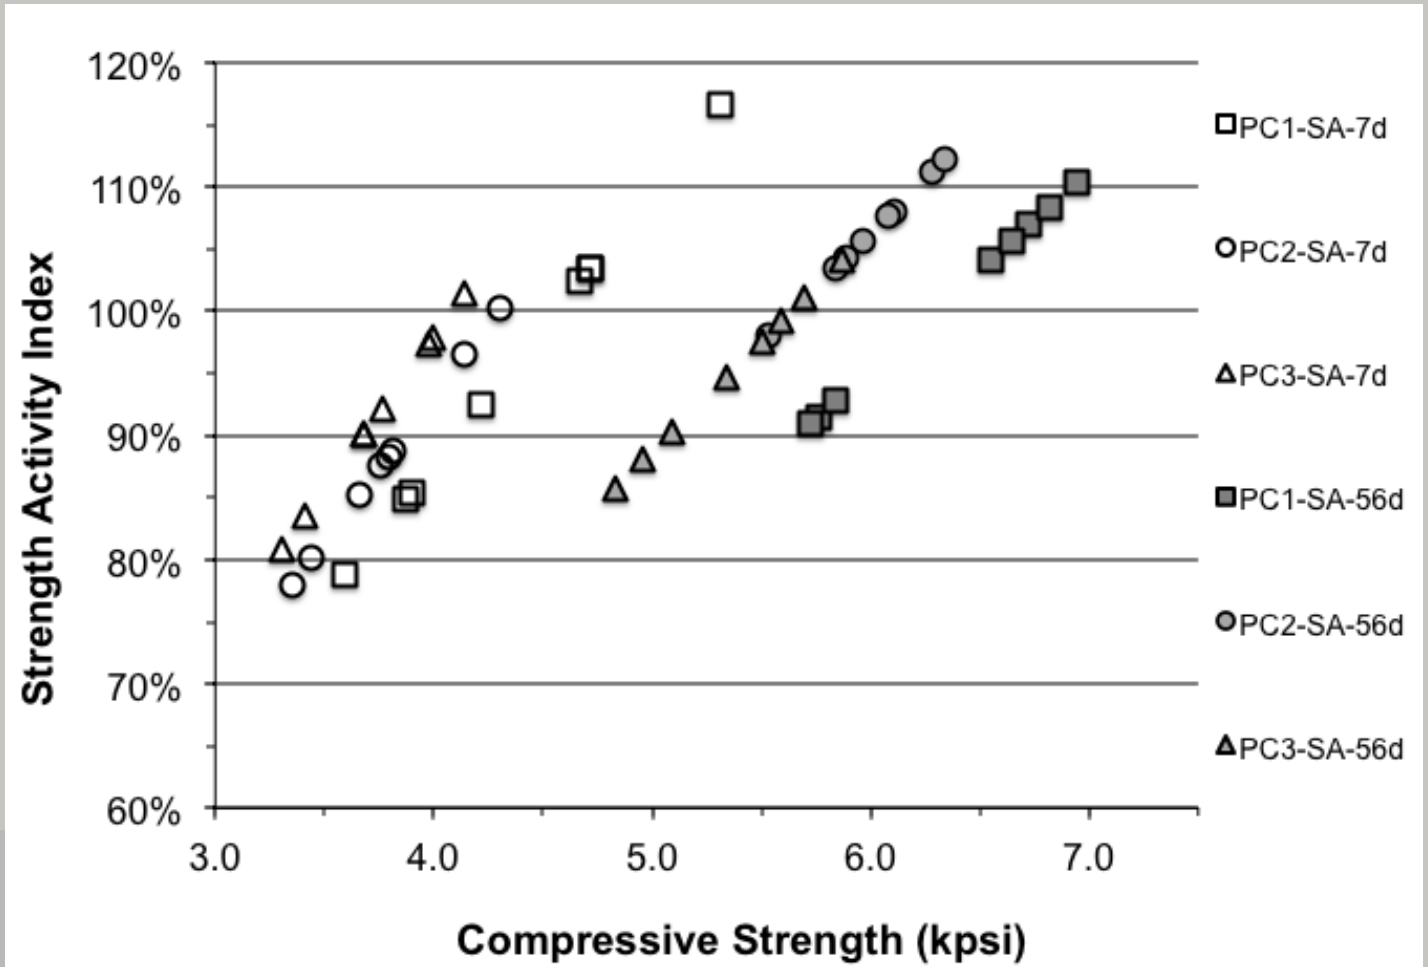
MichiganTech

Keil Hydraulic Index



Strength Activity Index



Strength Test Study

- *Take Aways*
  - The Keil Hydraulic Index provided a test that identified strength contribution separate from “filler” effects
  - The test was sensitive to the cement used
  - Other evaluations of the existing strength activity index showed increasing the specification limit to 85% eliminated inert materials
  - Need to change the time required for testing to accomdate some Class F ash

Carbon Effects on Air Entrainment Study

- *Effect of Carbon on Air Entrainment*
  - The LOI test is adequate for estimating the total carbon but does not adequately identify if the carbon will effect air entrainment
  - There is a need for a test to directly determine adsorption capacity
  - The foam index test is useful at determining the interaction of the fly ash with air entrainment admixtures but has not been standardized and is not part of AASHTO M 295 or ASTM C311

Carbon Effects on Air Entrainment Study

- Four tests evaluated:
  - Foam Drainage
  - Foam Index
  - Direct Adsorption Isotherm
  - Coal Fly Ash Iodine Number

MiSTI
Materials in Sustainable Transportation Infrastructure

Foam Index Test

- Evaluated 16 published versions
- Adopted the methodology of Harris with some modifications

Harris, N. J., K. C. Hover, K. J. Folliard, and M. T. Ley. The Use of the Foam Index Test to Predict AEA Dosage in Concrete Containing Fly Ash: Part I-Evaluation of the State of Practice. Journal of ASTM International, Vol. 5, No. 7, 2008.

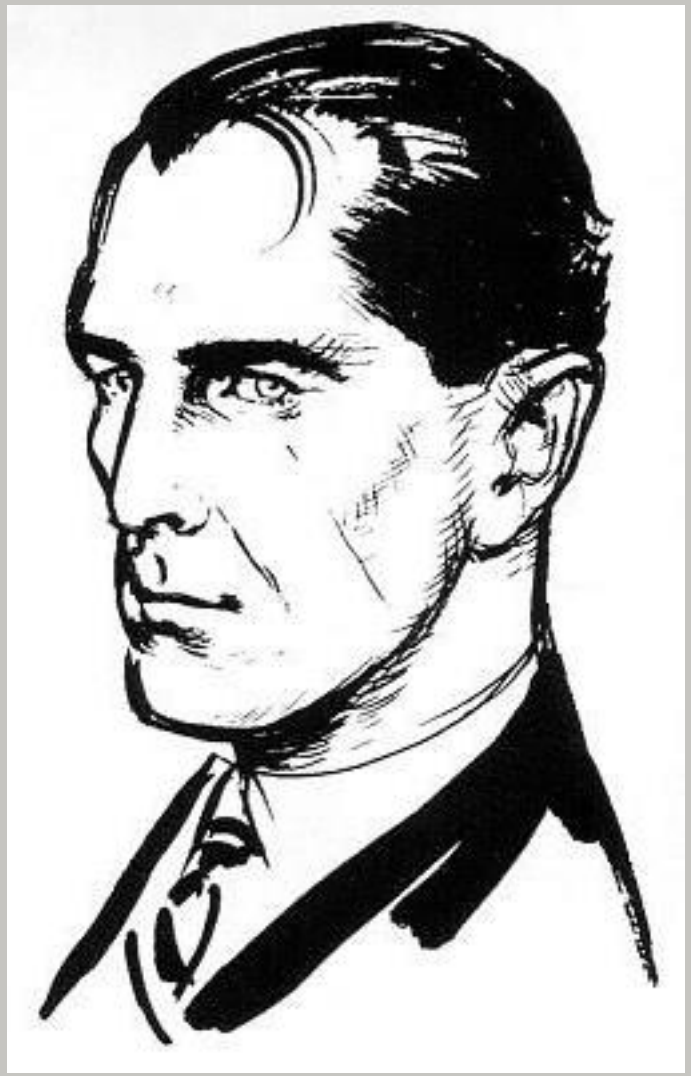
Harris, N. J., K. C. Hover, K. J. Folliard, and M. T. Ley. The Use of the Foam Index Test to Predict AEA Dosage in Concrete Containing Fly Ash: Part II-Development of a Standard Test Method: Apparatus and Procedure. Journal of ASTM International, Vol. 5, No. 7, 2008.

Harris, N. J., K. C. Hover, K. J. Folliard, and M. T. Ley. The Use of the Foam Index Test to Predict AEA Dosage in Concrete Containing Fly Ash: Part III-Development of a Standard Test Method: Proportions of Materials. Journal of ASTM International, Vol. 5, No. 7, 2008.

Michigan Tech

Foam Index Test

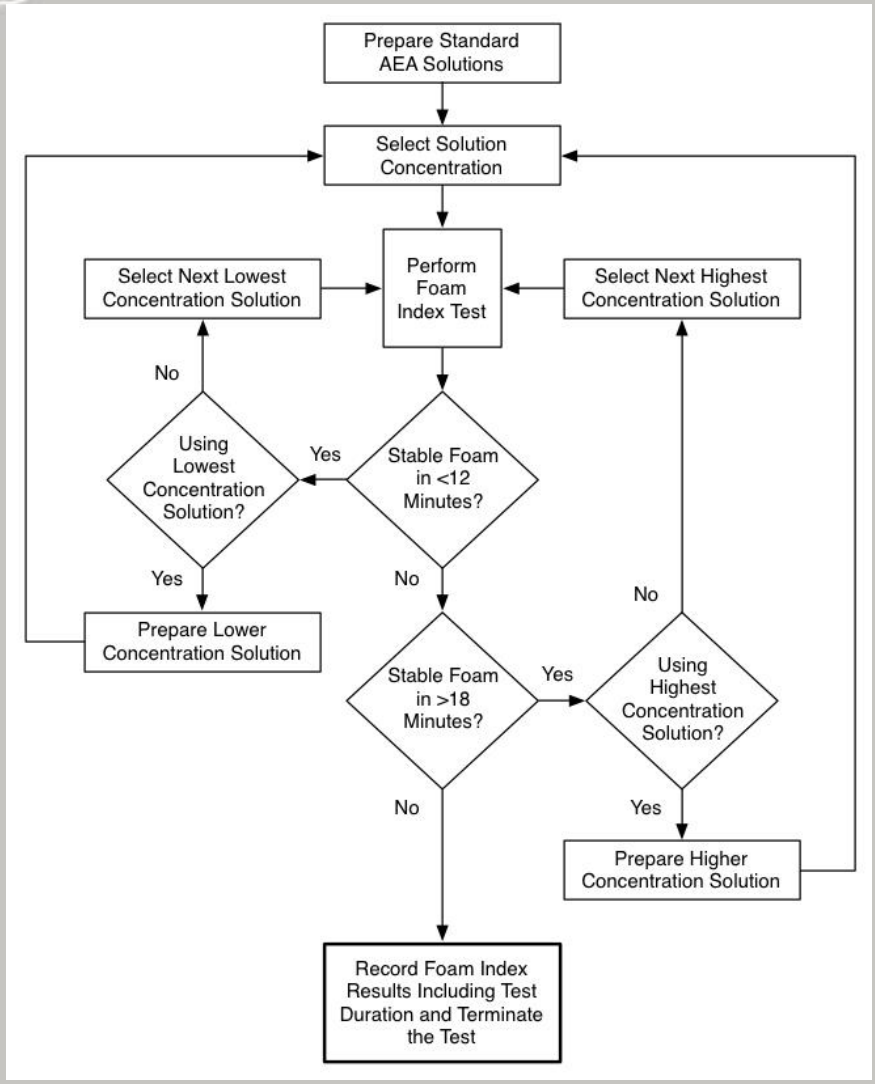
- 2 g ash, 8 g cement
- 25 mL water
- Add AEA solution drop-wise
  - 5 % vol. AEA / Water solution
  - (0.02 mL/drop)
- Shaken, not stirred
- Look for a stable foam
- Repeat…



MiSTI
Materials in Sustainable Transportation Infrastructure

Foam Index Test

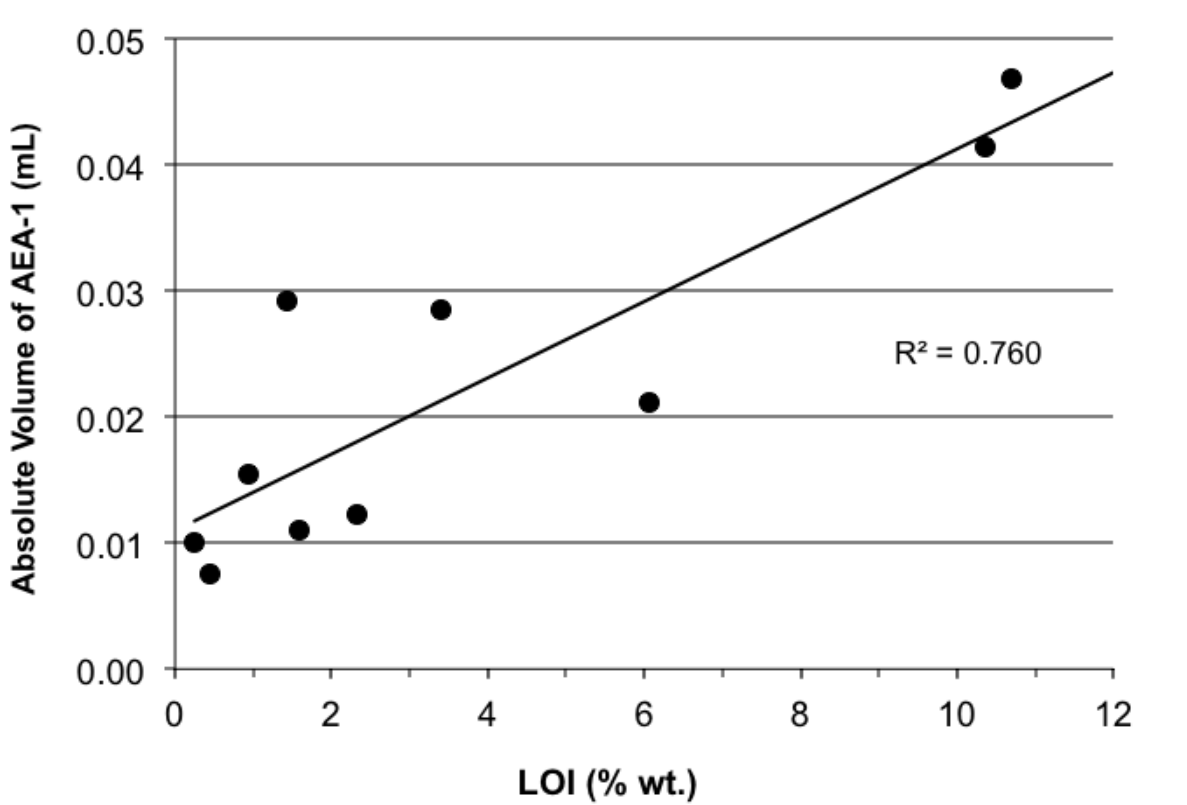
- Vary Solution Strength
  - 2, 6, 10, 15 %vol. AEA
- Achieve uniform contact time
  - 12 to 18 minutes
- Determine total AEA added
  - Foam Index



MiSTI
Materials in Sustainable Transportation Infrastructure

Foam Index Test

- Benefits
  - Cheap & Easy
- Issues
  - Not achieving equilibrium
  - Not quantitative
  - Subjective
    - Agitation?
    - What is a stable foam?



MiSTI
Materials in Sustainable Transportation Infrastructure

Adsorption Based Tests

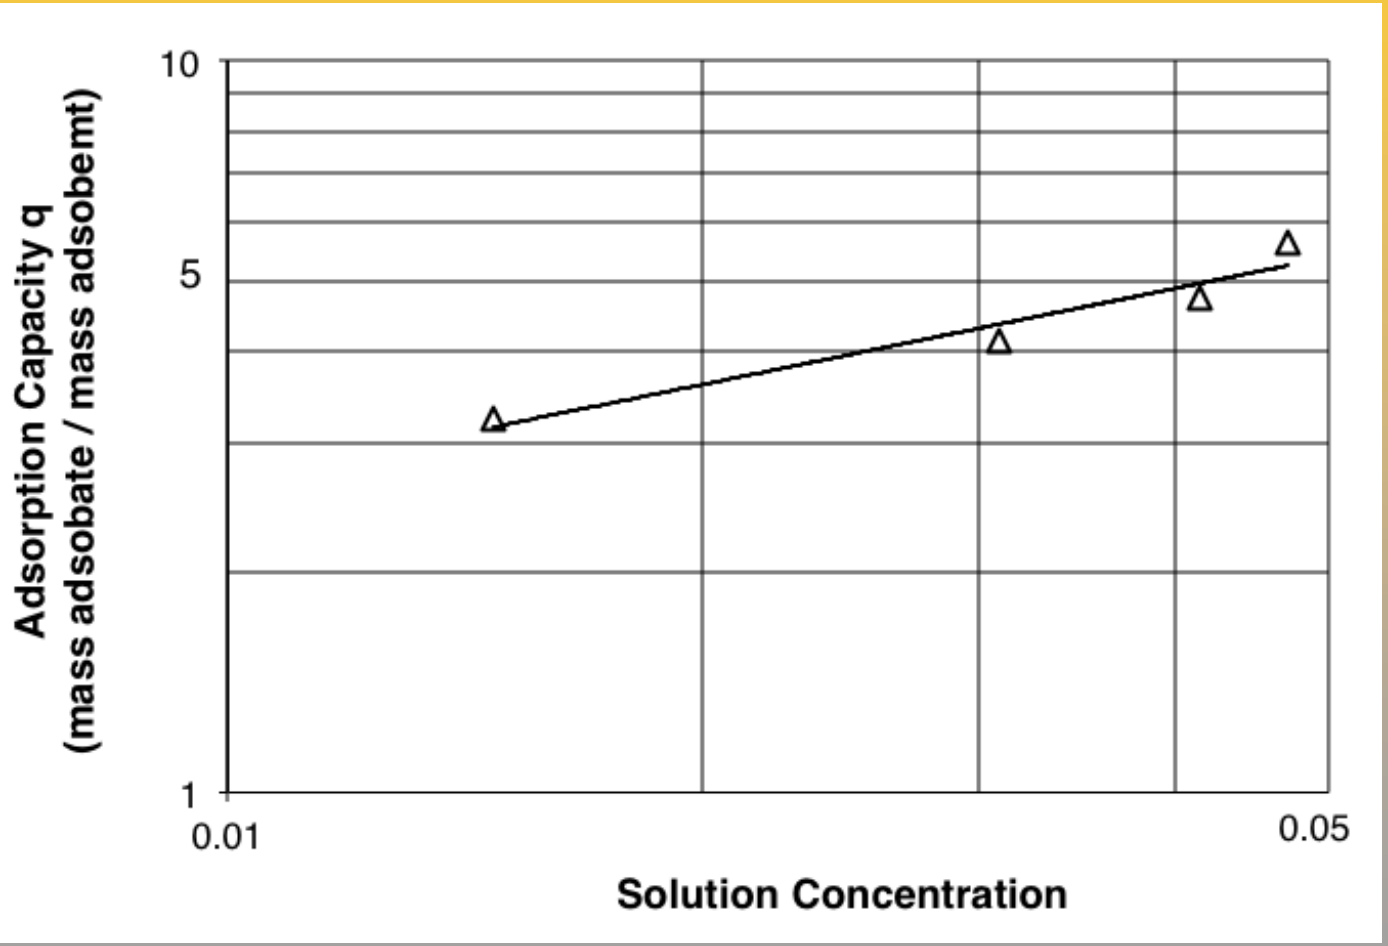
- Adsorption characterized by an adsorption isotherm
- Multiple adsorption models and isotherms
- Freundlich Isotherm

$$q = K \cdot C^{1/n}$$

  - q = mass of adsorbate adsorbed per unit mass of adsorbent, mg/g
  - K = Freundlich isotherm capacity parameter, (mg/g) (L/mg)$^{1/n}$
  - C = Solution concentration, mg/L
  - 1/n = Freundlich isotherm intensity parameter, dimensionless

Freundlich Isotherm

Slope = 1/n Intercept = log K



Direct Adsorption Isotherm

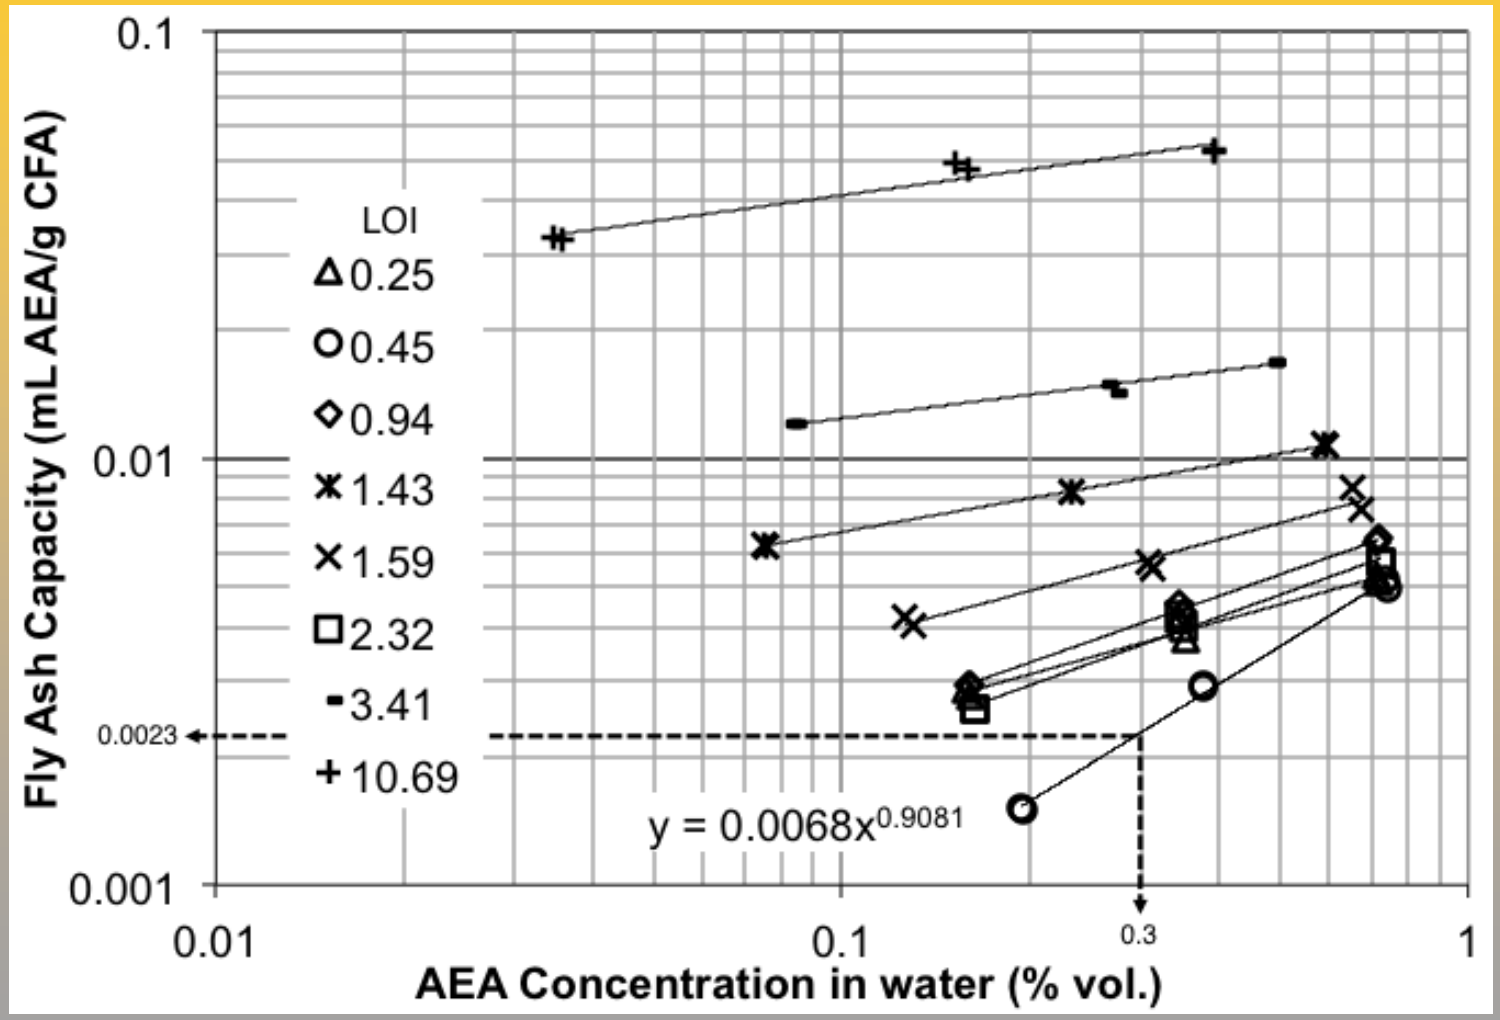
Designation: D3860 – 98 (Reapproved 2008)

Standard Practice for
Determination of Adsorptive Capacity of Activated Carbon by Aqueous Phase Isotherm Technique[1]

- Based on existing ASTM test method with modifications:
  - Modified procedure for determining solution concentration
    - COD test versus spectroscopic methods
  - Needed to account for the contribution of cement

Direct Adsorption Isotherm

determines AEA adsorption "capacity"

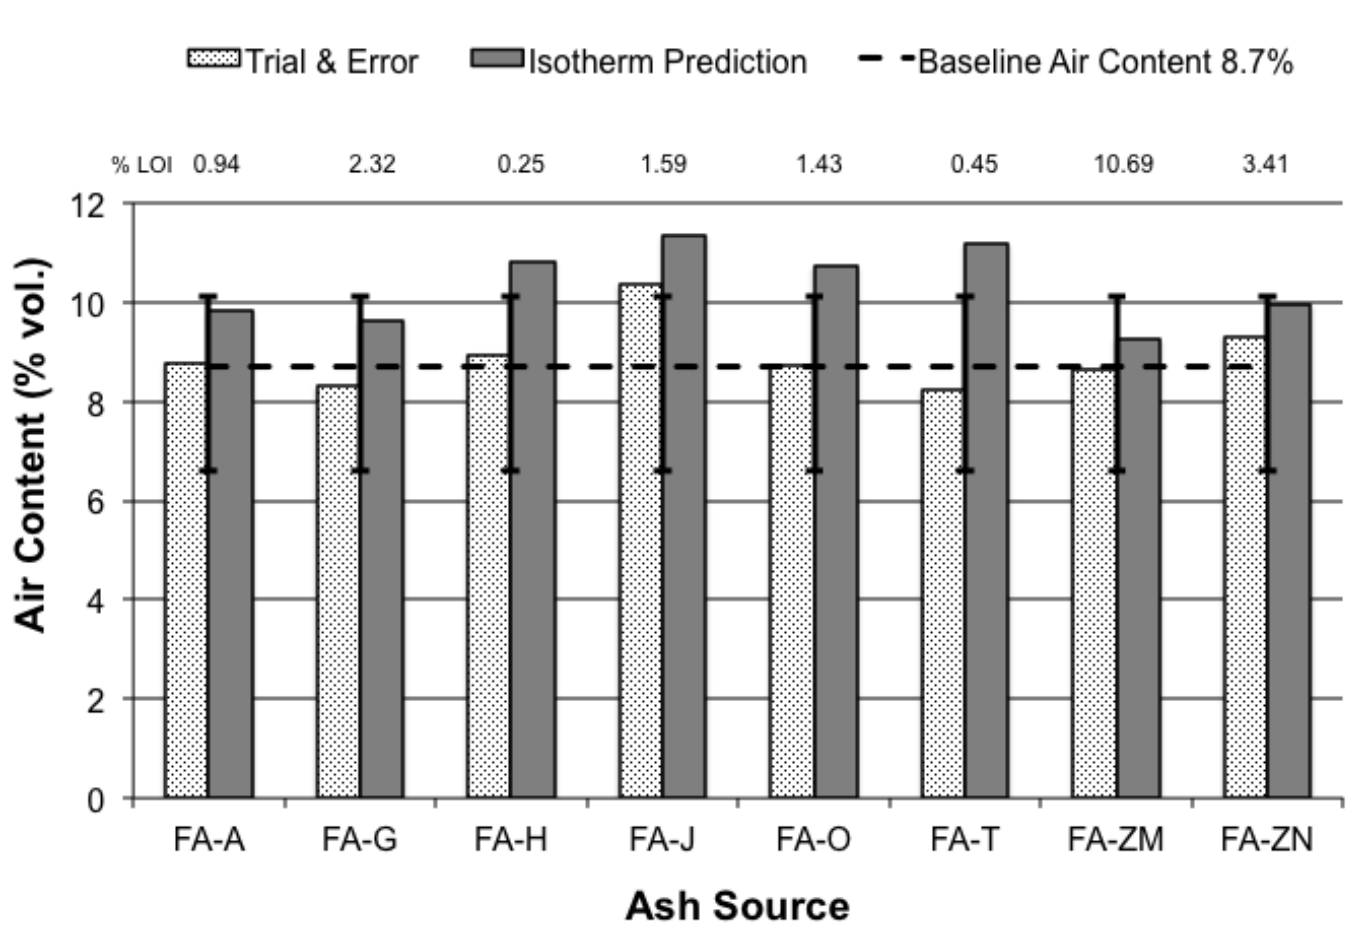


Direct Adsorption Isotherm

- Measures the adsorption capacity of the ash *AND* the adsorption capacity of the AEA
- Can be used to estimate AEA dosage
- Simple execution
  - Scales
  - Beakers & Stir Plate & Filtration
  - COD Kits & Colorimeter

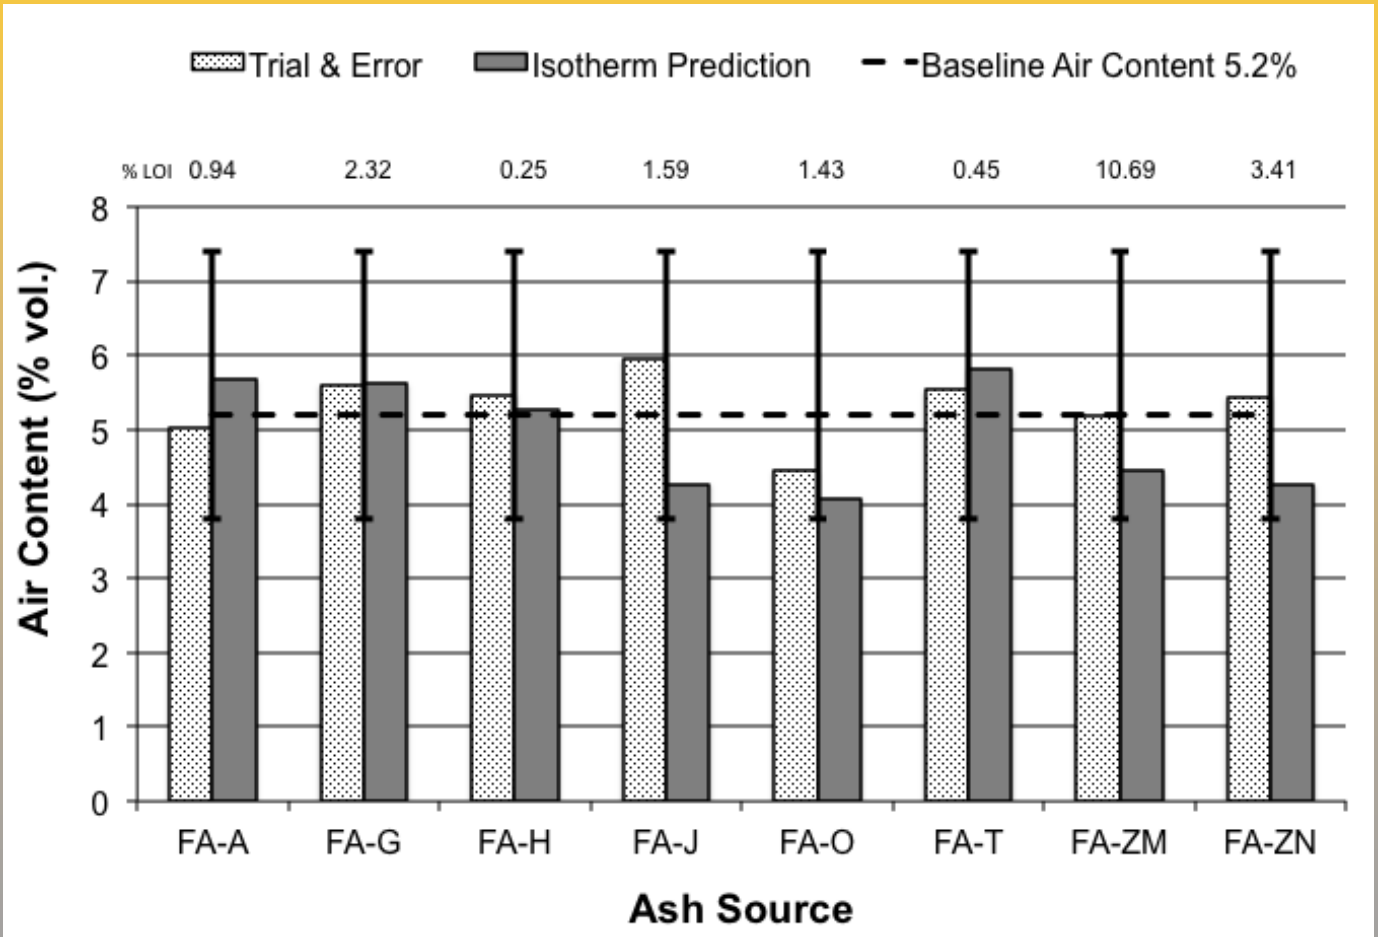
Direct Adsorption Isotherm

Vinsol resin



Direct Adsorption Isotherm

Alpha olephin sulfonate



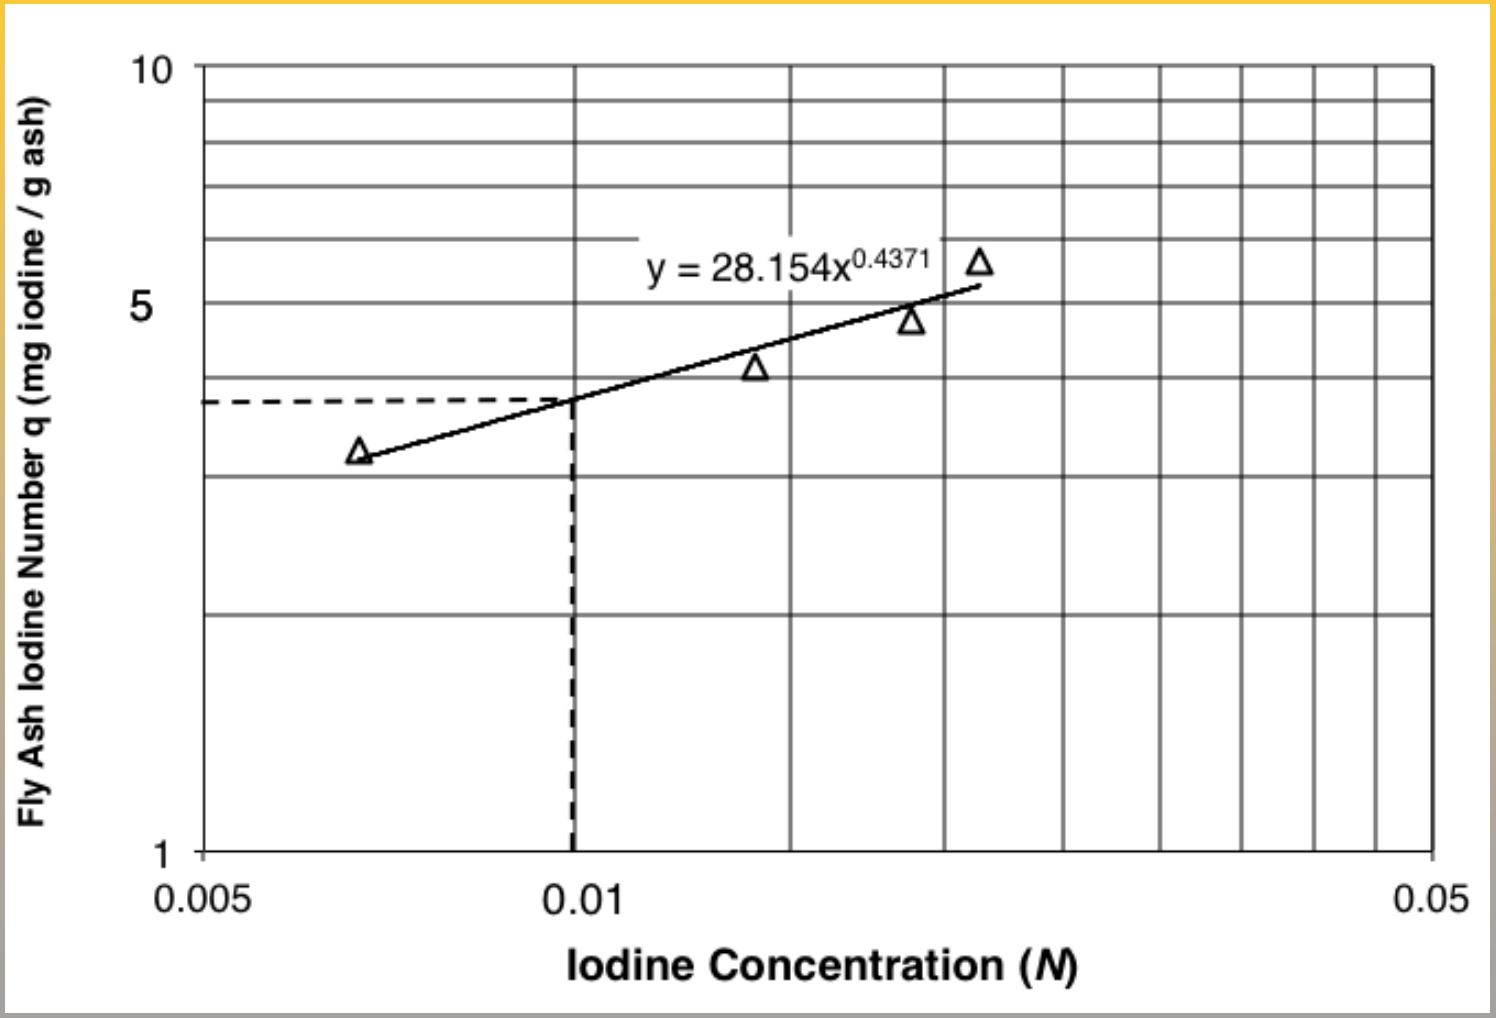
Coal Fly Ash Iodine Number

Designation: D4607 – 94 (Reapproved 2006)

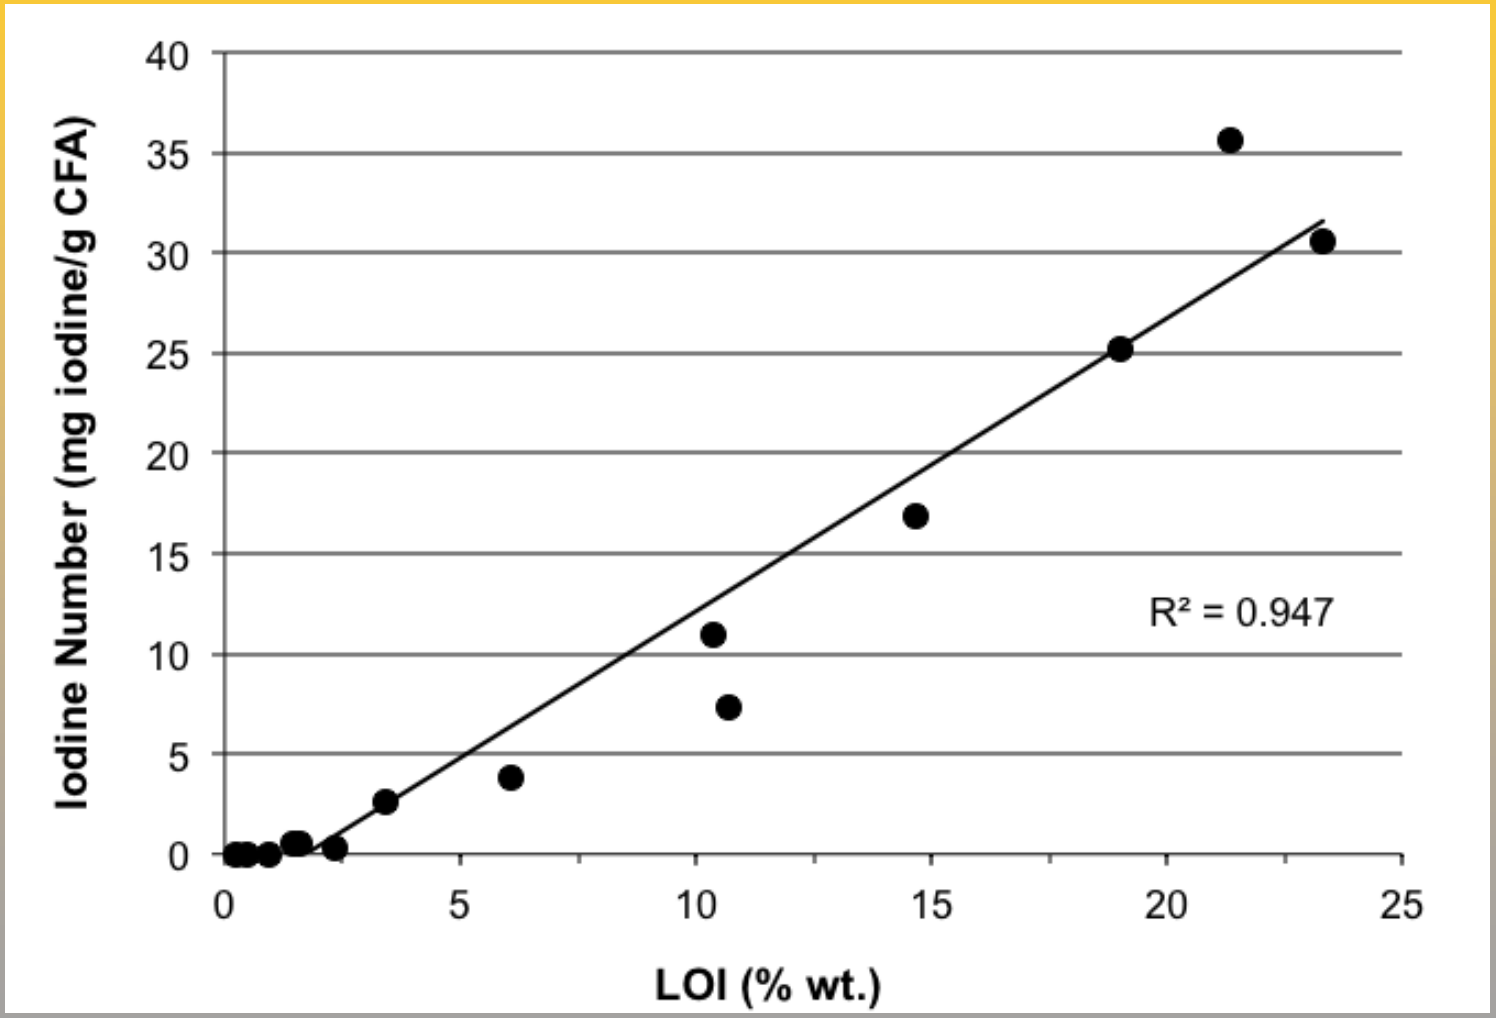
Standard Test Method for
Determination of Iodine Number of Activated Carbon[1]

- Based on existing ASTM test method with modifications:
  - HCl treatment to acidify the ash and remove SO_3
  - Initial solution strengths modified (0.025 N vs 0.1 N)
  - Target concentration for determining capacity differs from published test method (0.01 N vs 0.02)

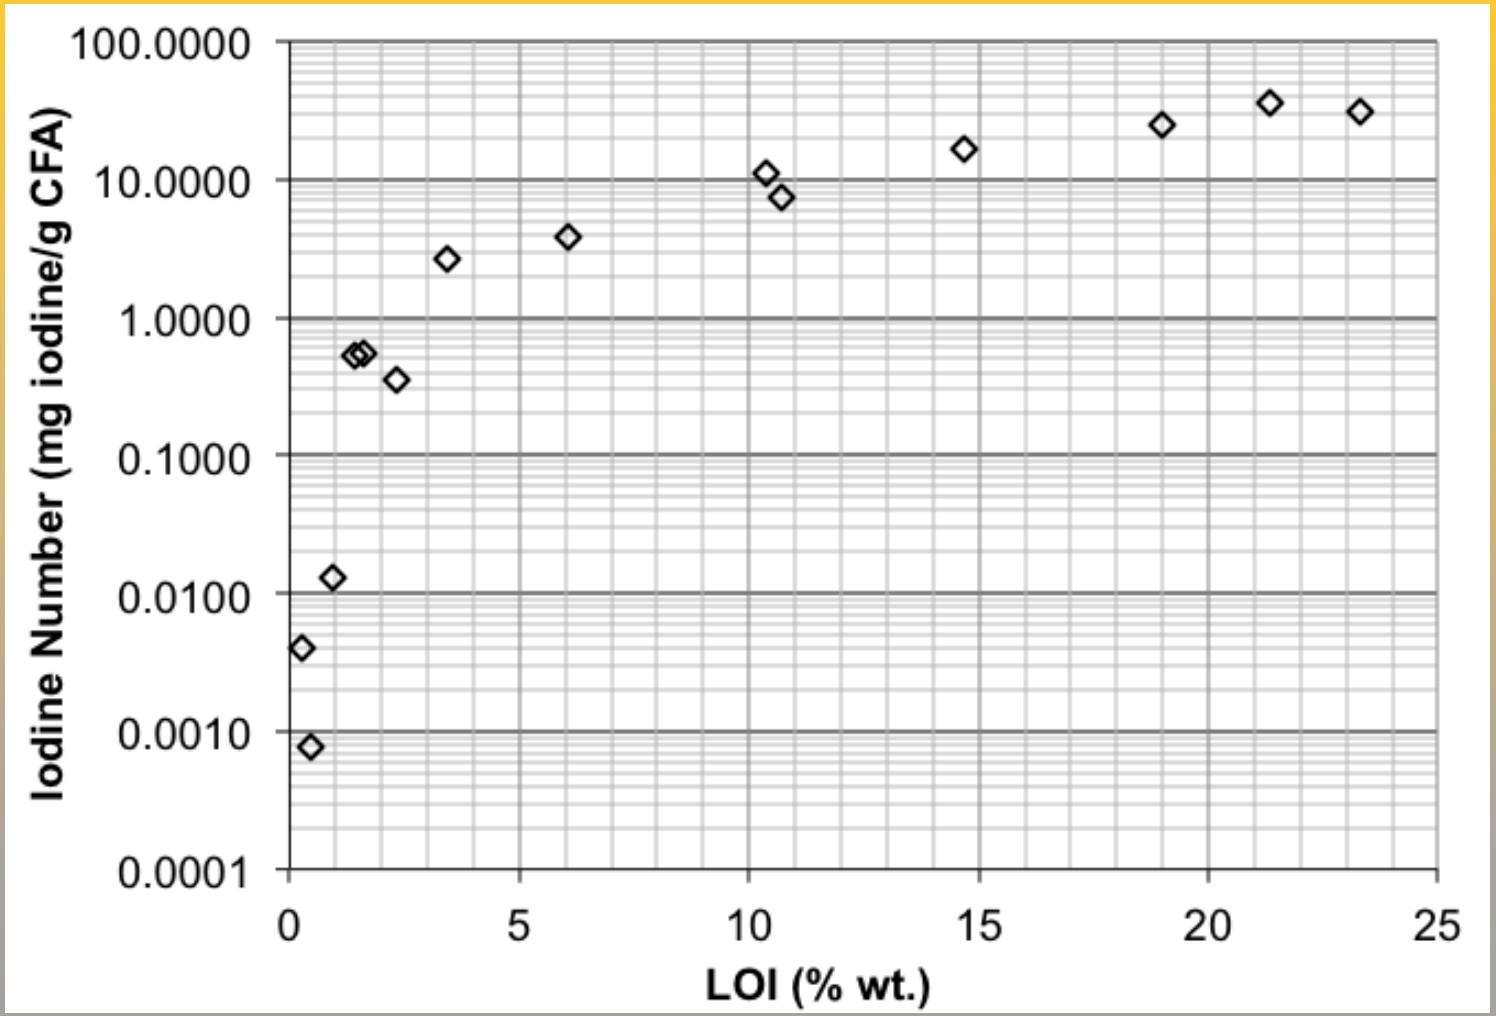
Coal Fly Ash Iodine Number



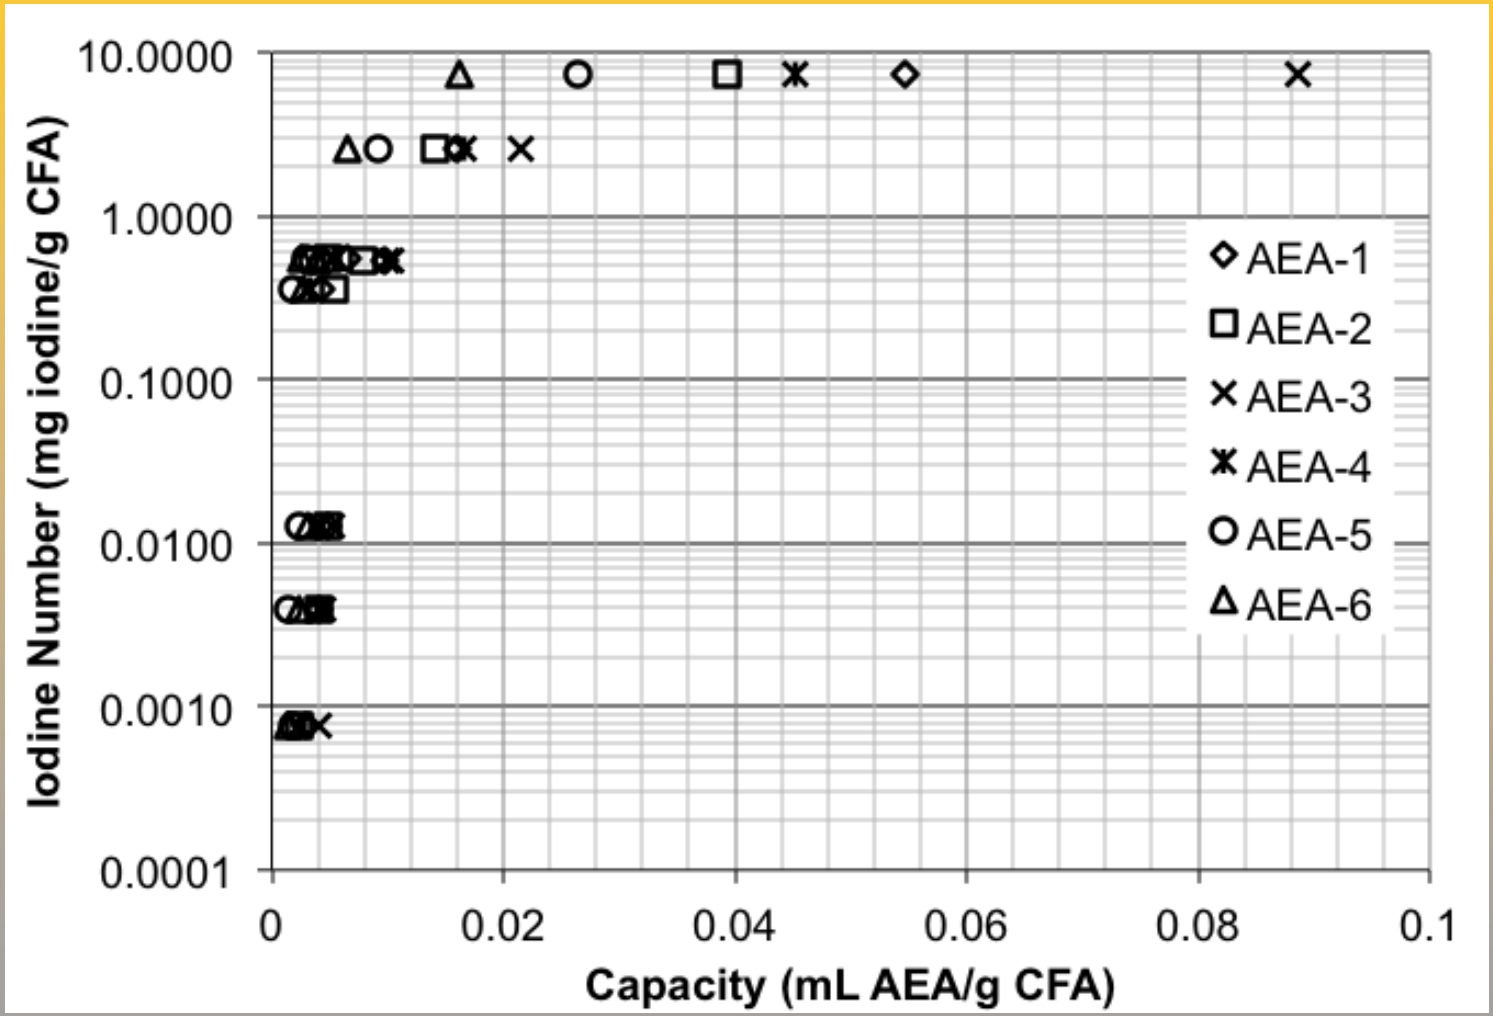
Coal Fly Ash Iodine Number



Coal Fly Ash Iodine Number



Iodine Number vs. Capacity



Coal Fly Ash Iodine Number

- Measures the adsorption capacity of the ash
- Does not account for the adsorption capacity of the AEA
- Simple execution
  - Scales
  - Beakers & Stir Plate & Filtration
  - Titration

Carbon Effects on Air Entrainment Study

- *Take Aways*
  - Publish a standardized version of the foam index test that provides a uniform test time and mechanical agitation
  - Specify use of the the coal fly ash iodine number to evaluate ash adsorption potential
  - Specify use of the direct adsorption isotherm test to evaluate fly ash – air entrainer combinations

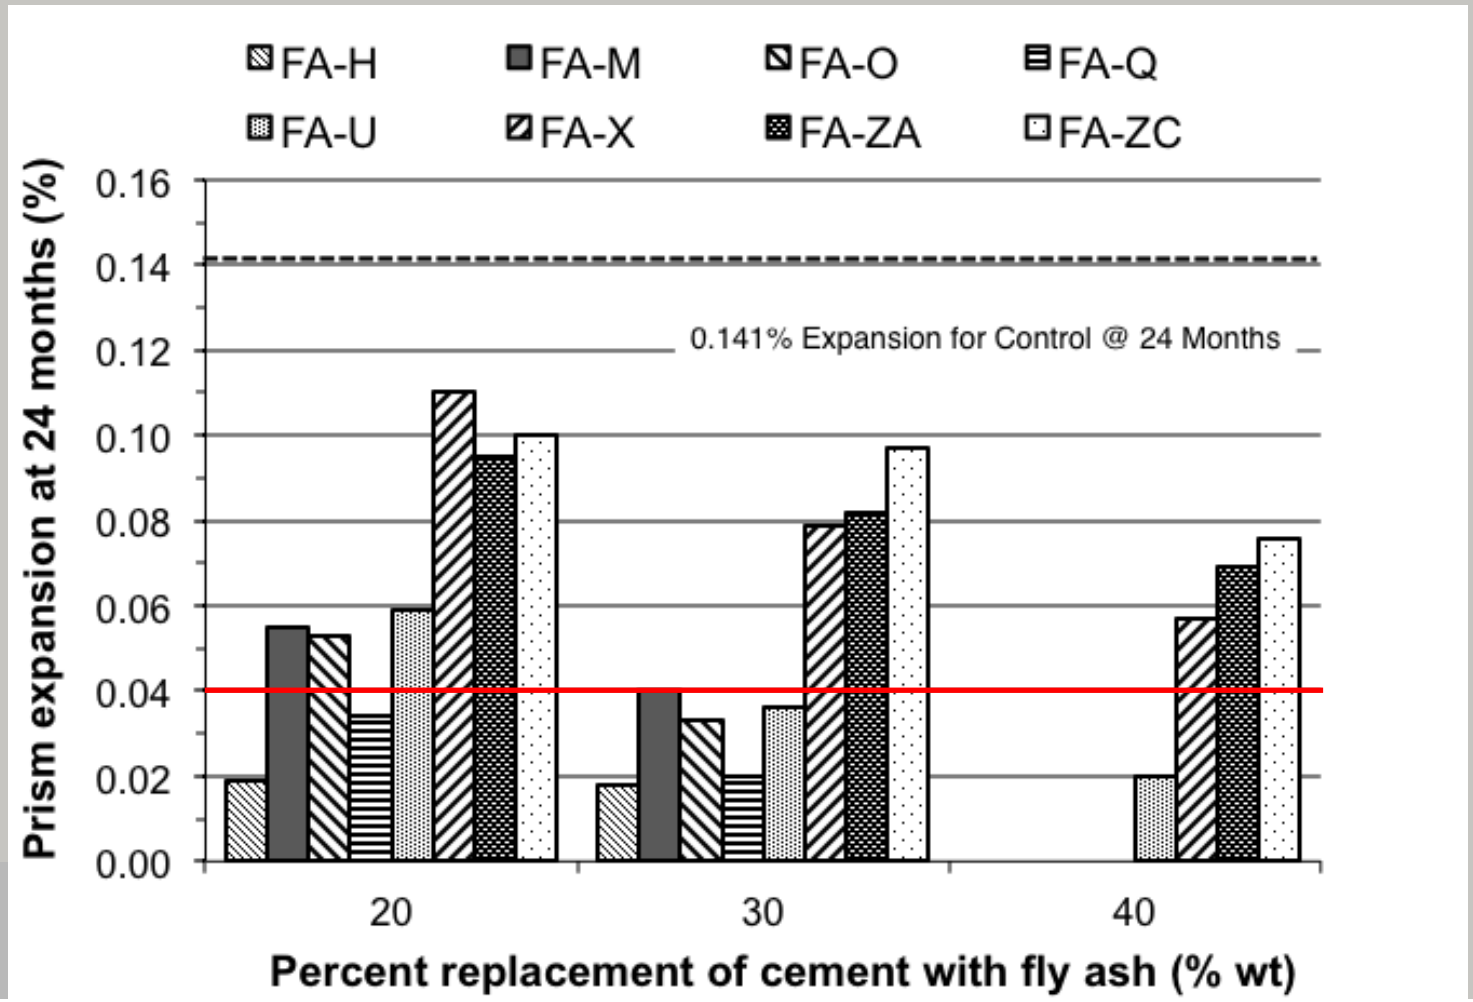
ASR Mitigation Study

- Evaluate protocols for applying existing test methods (ASTM C1567 and ASTM C1293)
- Evaluate the Alkali Leaching Test (Shehata and Thomas, 2006) and correlate with the results of ASTM C1293 and ASTM C1567
  - The alkali leaching test is used to determine the free alkalis available to be leached from a particular combination of cement and fly ash

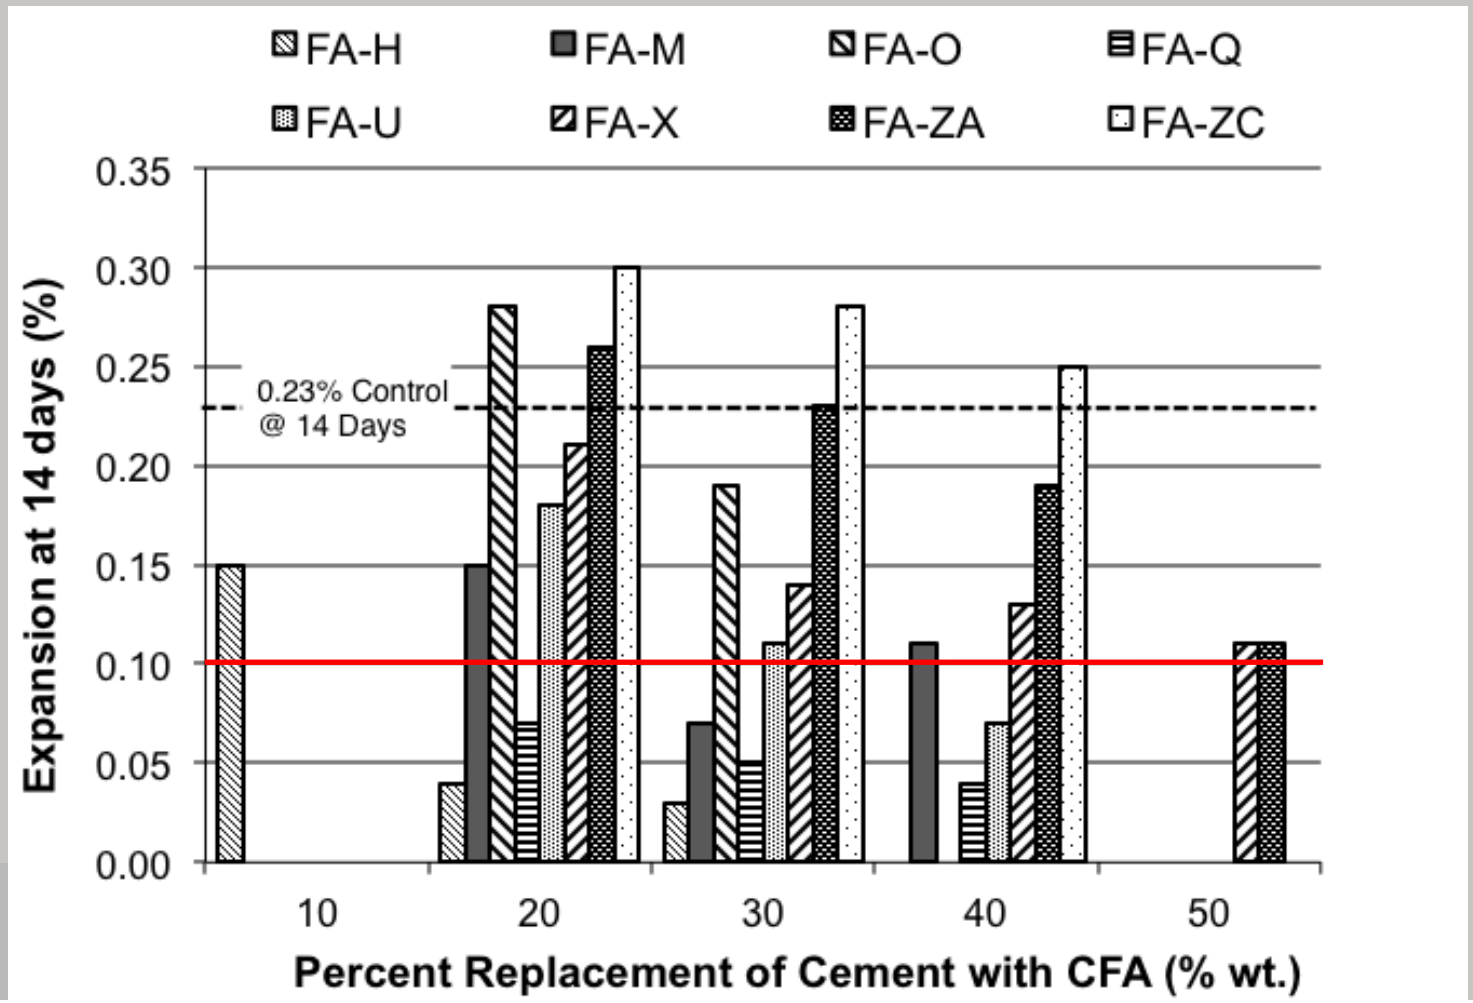
MiSTI
Materials in Sustainable Transportation Infrastructure

MichiganTech

ASTM C1293

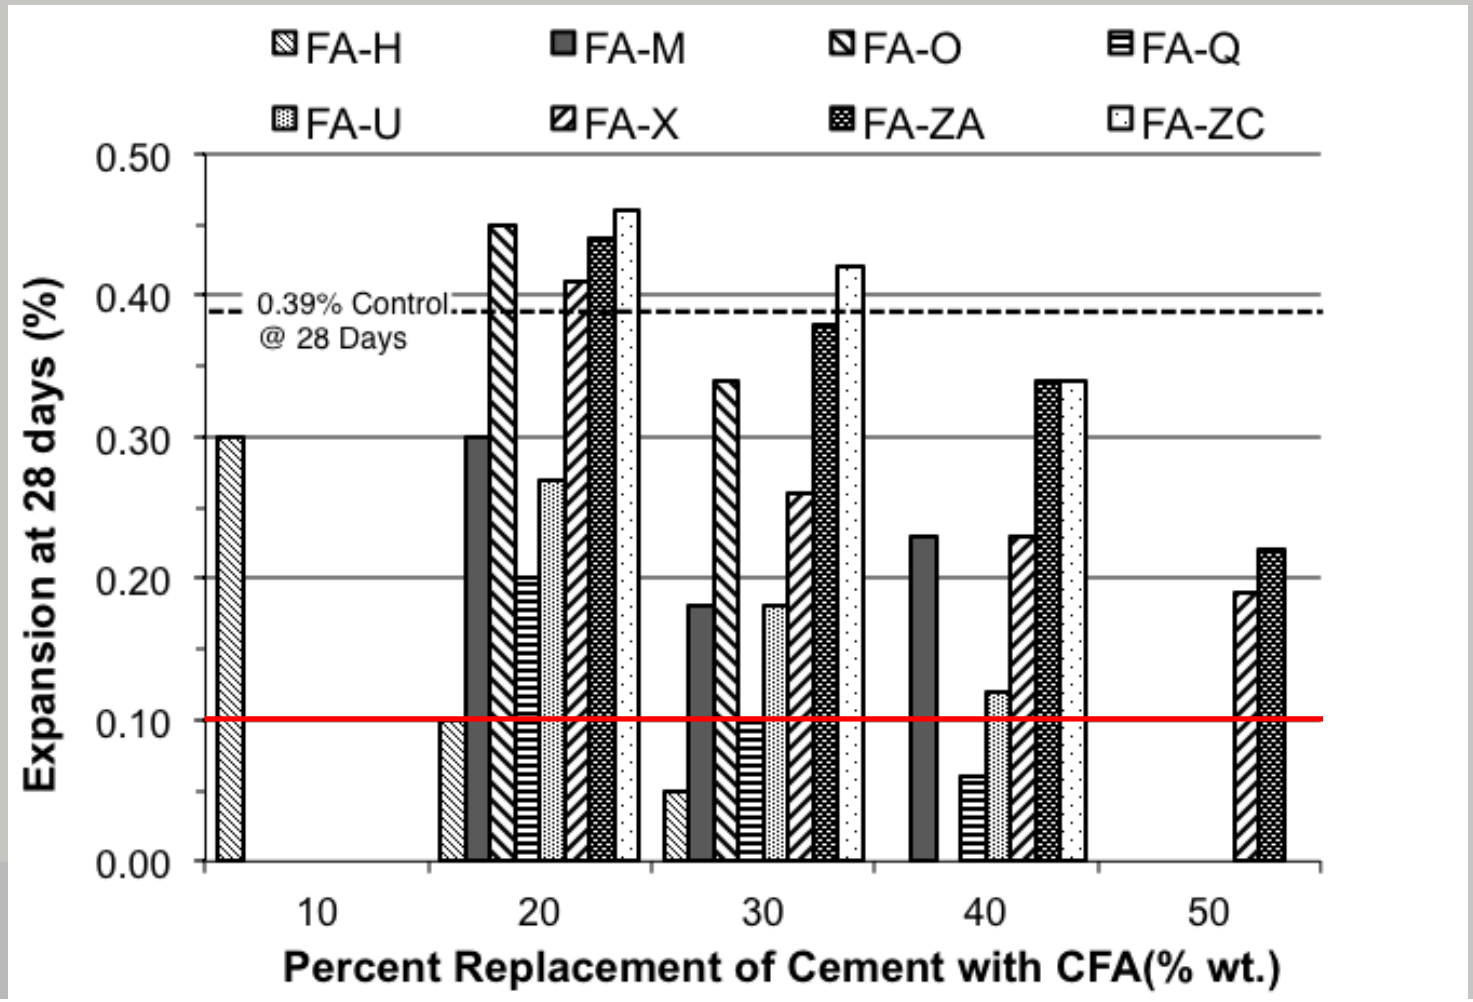


ASTM C1567 – 14 days



MichiganTech

ASTM C1567 – 28 days



ASR Mitigation Study

- *Take Aways*
  - Confirmed the AASHTO PP-65 limits of 0.1% expansion @ 14 days for ASTM C1567
  - Provided data showing a 28-day limit on ASTM C1567 does not correlate with ASTM C1293
  - Alkali Leaching Test – no clear threshold of alkali release was identified that correlated with a 0.04% ASTM C1293 expansion

MiSTI
Materials in Sustainable Transportation Infrastructure

Michigan Tech

Recommended Changes to AASHTO M 295

- Add a maximum sum of the oxide limit (i.e., 70%) to the Class C classification
- Report CaO, MgO, Na_2O, and K_2O
- Adopt the use of the Iodine Number Test and the Direct Adsorption Isotherm Test under Optional Chemical Requirements

MiSTI
Materials in Sustainable Transportation Infrastructure

Recommended Changes to AASHTO M 295

- Raise the the Strength Activity Index to 85% of control BUT allow the material to be qualified at 7, 28, **OR** 56 days
- Delete the available alkali limit
- Delete use of ASTM C441 (Pyrex Glass Test) and adopt ASTM C1567 with a 14 day limit of 0.1%
