Keywords:
2-Dominating set, 2-Domination polynomials, Simple graph, Tensor product

#### Abstract

Consider a simple finite graph $G$. The 2-domination polynomial for any simple non isolated graph $G$ in [7] and is defined by $D_{2}(G, x)=\sum_{i=\gamma_{2}(G)}^{|V(G)|} d_{2}(G, i) x^{i}$, where $d_{2}(G, i)$ represents cardinality of 2-dominating sets of size $i$ of graph $G$, and $\gamma_{2}(\mathrm{G})$ is the 2-domination number of $G$. We have calculated the 2-domination number of the tensor product of $P_{2}$ and $P_{n}$. We have derived the 2-distance domination polynomials of tensor product of $P_{2}$ and $P_{n}$.

## 1. Introduction

Consider $G=(P, Q)$ be a simple graph having $n$ vertices.Where $P$ represent the vertices and $Q$ represent edges of graph $G$. A subset $S \subseteq P$ is a 2-dominating set of the graph $G$, if every vertex $v \in$ $P-S$ is adjoining to at least 2 vertices of $S$. The minimum cardinality of the 2 -dominating sets in $G$ is the 2 - domination number of a graph $G$, denoted by $\gamma_{2}(G)$. The smallest integer greater than or equal to $n$ is represented by the notation $\lceil n\rceil$ in this paper.

## 2. 2-Distance Domination Polynomial

Here we define the 2-domination polynomial and recall some properties from the past works.

### 2.1 Definition

Consider graph $G$ without secluded vertices. Let $\mathfrak{D}_{2}(G, i)$ be a group of 2 -dominating sets of $G$ with cardinality $i$ and let $d_{2}(G, i)=\left|\mathfrak{D}_{2}(G, i)\right|$. Then the 2domination polynomial $D_{2}(G, x)$ of $G$ is explaimed as $D_{2}(G, x)=\sum_{i=\gamma_{2}(G)}^{|V(G)|} d_{2}(G, i) x^{i}$, where $\gamma_{2}(G)$ is the 2-domination number of $G$.

### 2.2 Tensor Product of Graphs

Consider $G_{1}=\left(V_{G_{1}}, E_{G_{1}}\right)$ and $G_{2}=\left(V_{G_{2}}, E_{G_{2}}\right)$ be two simple graphs. The tensor product of $G_{1}$ and $G_{2}$, represented by $G_{1} \otimes G_{2}$, is a graph with vertex set $V_{G_{1}} \times V_{G_{2}}$ and two vertices $u=\left(u_{1}, v_{1}\right), \quad v=$ $\left(u_{2}, v_{2}\right)$ are said to be adjoining if $u_{1}$ is adjoining to $u_{2}$ in $G_{1}$ and $v_{1}$ is adjoining to $v_{2}$ in $G_{2}$. That is, $G_{1} \otimes G_{2}=\left(V_{G_{1}} \times V_{G_{2}}, E_{G_{1}} \otimes E_{G_{2}}\right) \quad$ where $E_{G_{1}} \otimes E_{G_{2}}=\left\{u v / u_{1} u_{2} \in E_{G_{1}}\right.$ and $\left.v_{1} v_{2} \in E_{G_{2}}\right\}$

$G_{2}$ :

$G_{1} \otimes G_{2}:$

## 3. 2-Domination Polynomial of Path

Lemma 3.1 If a graph $G$ comprises of two parts $\mathrm{G}_{1}, \mathrm{G}_{2}$. Then

$$
D_{2}(G, x)=D_{2}\left(G_{1}, x\right) \cdot D_{2}\left(G_{2}, x\right)
$$

Lemma 3.2 Consider a path $P_{n}$ be the path having $n$ vertices, thendomination- 2 number of $P_{n}$ is $\Upsilon_{2}\left(P_{n}\right)=\left\lceil\frac{n+1}{2}\right\rceil$.

Lemma 3.3 "Let $\mathfrak{D}_{2}\left(P_{n}, i\right)$ be a family of 2dominating sets of $P_{n}$ with cardinality $i$ and let $d_{2}\left(P_{n}, i\right)=\left|\mathfrak{D}_{2}\left(P_{n}, i\right)\right|$.

Then, $d_{2}\left(P_{n}, i\right)=d_{2}\left(P_{n-1}, i-1\right)+$ $d_{2}\left(P_{n-2}, i-1\right), i \geq\left\lceil\frac{n+1}{2}\right\rceil . "[6]$

Lemma 3.4 "Let $P_{n}, n \geq 3$ be a path having $n$ number of vertices."
(i)

$$
\begin{aligned}
& " d_{2}\left(P_{n}, i\right)=\phi \text { if } i< \\
& \Upsilon_{2}\left(P_{n}\right) \text { or } i>n "
\end{aligned}
$$

(ii) " $D_{2}\left(P_{n}, x\right) s$ has no constant term and first degree terms."
(iii) " $D_{2}\left(P_{n}, x\right)$ is a strictly increasing function on

$$
[0, \infty) . " \quad[6]
$$

Theorem 3.4 For every $n \geq 5, \quad D_{2}\left(P_{n}, x\right)=$ $x\left[D_{2}\left(P_{n-1}, x\right)+D_{2}\left(P_{n-2}, x\right)\right]$ with the initial values $D_{2}\left(P_{2}, x\right)=x^{2}$ and $D_{2}\left(P_{3}, x\right)=x^{2}+x^{3}$.

## 4. 2 - Distance Domination Polynomial of Tensor product of $\boldsymbol{P}_{\mathbf{2}}$ and $\boldsymbol{P}_{\boldsymbol{n}}$

Lemma 4.1 Let $P_{n}$ be the path with $n$ vertices, then 2-domination number of $P_{2} \otimes P_{n}$ is $\Upsilon_{2}\left(P_{2} \otimes\right.$ $\left.P_{n}\right)=\left\lceil\frac{n+1}{2}\right\rceil+\left\lceil\frac{n+1}{2}\right\rceil$.

Lemma 4.2 Let $P_{n}, n \geq 3$ be a path having $n$ number of vertices.
$d_{2}\left(P_{2} \otimes P_{n}, i\right)=\phi$ if $i<\Upsilon_{2}\left(P_{2} \otimes P_{n}\right)$ or $i>$ $2 n$.

1. $D_{2}\left(P_{2} \otimes P_{n}, x\right)$ has no constants, $1^{\text {st }}$ degree terms, $2^{\text {nd }}$ degree terms and $3^{\text {rd }}$ degree terms.
2. $D_{2}\left(P_{2} \otimes P_{n}, x\right)$ is a surely increasing function on $[0, \infty)$

### 4.3 2-Distan Domination Polynomial of Tensor product of $\boldsymbol{P}_{\mathbf{2}}$ and $\boldsymbol{P}_{\boldsymbol{n}}$

## Theorem 4.3

For every $\quad n \geq 5, \quad D_{2}\left(P_{2} \otimes P_{n}, x\right)=$ $x^{2}\left[D_{2}^{2}\left(P_{n-1}, x\right)+2 D_{2}\left(P_{n-2}, x\right)+\right.$ $\left.D_{2}^{2}\left(P_{n-2}, x\right)\right]$ with the initial values $D_{2}\left(P_{2}, x\right)=x^{2}$ and $D_{2}\left(P_{3}, x\right)=x^{2}+x^{3}$.

Proof: Let $\mathfrak{D}_{2}\left(P_{2} \otimes P_{n}, i\right)$ be group of 2-dominating sets of $P_{2} \otimes P_{n}$ having cardinality $i$ and consider
$d_{2}\left(P_{2} \otimes P_{n}, i\right)=\left|\mathfrak{D}_{2}\left(P_{2} \otimes P_{n}, i\right)\right| . \quad$ Then the domination-2 polynomial $D_{2}\left(P_{2} \otimes P_{n}, x\right)$ of $P_{2} \otimes P_{n}$ is specified as $\quad D_{2}\left(P_{2} \otimes P_{n}, x\right)=$ $\sum_{i=\gamma_{2}\left(P_{2} \otimes P_{n}\right)}^{2 n} d_{2}\left(P_{2} \otimes P_{n}, i\right) x^{i}$,where $\gamma_{2}\left(P_{2} \otimes P_{n}\right)$ is the domination-2 number of $P_{2} \otimes P_{n}$. The domination2 polynomial of the graph $P_{n}$ is $D_{2}\left(P_{n}, x\right)=$ $x\left[D_{2}\left(P_{n-1}, x\right)+D_{2}\left(P_{n-2}, x\right)\right]$ for every $n \geq 5$, with the initial values $D_{2}\left(P_{2}, x\right)=x^{2}$ and $D_{2}\left(P_{3}, x\right)=x^{2}+x^{3}$. The tensor product of $P_{2}$ and $P_{n}$ consists two components $P_{2}$ and $P_{n}$. So, the 2-domination polynomial of the tensor product of $P_{2}$ and $P_{n}$ is the product of the 2-domination polynomials of $D_{2}\left(P_{n}, x\right)$ and $D_{2}\left(P_{n}, x\right)$. Therefore, the minimal 2-dominating set of $P_{2} \otimes P_{2}$ consist of only one 2-dominating set with four vertices. Hence $\quad D_{2}\left(P_{2} \otimes P_{2}, x\right)=$ $D_{2}\left(P_{2}, x\right) . D_{2}\left(P_{2}, x\right)=x^{4}$.

Similarly, $D_{2}\left(P_{2} \otimes P_{3}, x\right)=D_{2}\left(P_{3}, x\right) . D_{2}\left(P_{3}, x\right)=$
$\left(x^{2}+x^{3}\right)\left(x^{2}+x^{3}\right)=x^{4}+2 x^{5}+x^{6} \quad$ And
$D_{2}\left(P_{2} \otimes P_{4}, x\right)=D_{2}\left(P_{4}, x\right) . D_{2}\left(P_{4}, x\right)=\left(2 x^{3}+\right.$
$\left.x^{4}\right)\left(2 x^{3}+x^{4}\right)=4 x^{6}+4 x^{7}+x^{8}$.
Hence, $D_{2}\left(P_{2} \otimes P_{n}, x\right)=D_{2}\left(P_{n}, x\right) \cdot D_{2}\left(P_{n}, x\right)$

$$
\begin{gathered}
=x\left[D_{2}\left(P_{n-1}, x\right)+D_{2}\left(P_{n-2}, x\right)\right] x\left[D_{2}\left(P_{n-1}, x\right)\right. \\
\left.+D_{2}\left(P_{n-2}, x\right)\right] \\
=x^{2}\left[D_{2}^{2}\left(P_{n-1}, x\right)+2 D_{2}\left(P_{n-2}, x\right)+D_{2}^{2}\left(P_{n-2}, x\right)\right]
\end{gathered}
$$

## 5. Conclusion and Future Enhancements

In this article, we have derived the domination-2 polynomials of tensor product of paths $P_{2}$ and $P_{n}$ from its 2-dominating sets of $P_{n}$. Presently, we are working on the 2-domination polynomials of tensor product of paths $P_{n}$ and $P_{m}$.

## 6. Acknowledgements

The authors express gratitude to their families and colleagues for their full support and encouragements. Also, they express deep gratefulness to the judeges for their valuable obervations and suggestions.
