# A systematic review of violence risk assessment tools currently used in emergency care settings

# WHAT DO WE KNOW?

- Staff working in emergency care settings (Emergency Departments [EDs] and Acute Medical Units [AMUs]) experience violence from patients and visitors at a disproportionate rate.
- Violence risk assessment is commonplace in mental health settings and is becoming more accepted in emergency care.

Any non-verbal, verbal, or physical behaviour exhibited by a person which makes it difficult to deliver good care safely.

> The situation in the UK

of UK nursing staff in acute and urgent care settings experienced 44% physical violence from a patient or relative in the last 12 months (2021 data)1

It's estimated that 2% of staff are lost as a consequence of workplace violence<sup>2</sup>

# **OBJECTIVE**

**METHODS** 

To examine the psychometric properties, acceptability, feasibility and usability of violence risk assessment tools currently used in emergency care.

#### **PICOC**

- P Violence towards others, perpetrated by emergency care attendees
- C Structured risk assessment tools
- O N/A

Psychometric properties (including validity, reliability, internal consistency and

predictive validity), feasibility, usability and acceptability

Emergency care pathways

### **SEARCHES & SCREENING**

CINAHL, Embase, Medline, Web of Science, Google Scholar

Published since 2007

Exclusion criteria: Studies within specialist emergency care pathways (e.g., paediatric, psychiatric)

### **QUALITY APPRAISAL**

Intervention studies assessed for risk of bias using ROBINS-I tool

Tool development/ testing studies appraised against scale development criteria

#### **SYNTHESIS**

Unable to undertake statistical meta-analysis due to methodological and clinical heterogeneity, therefore narrative synthesis undertaken

8 included studies

# **Study settings**

Countries

ED (n=8)\*

Australia (n=4) USA (n=4)

### **Tools**

\* One study included observations of which 82.4% were conducted in ED

Newly developed (n=3) Extant (n=3)Adaptation of extant tool(n=1)

TOTAL: n=7

Target staff group

Nurses (n=5) Not specified (n=2)

1 RCN (2022) Employment Survey Report 2021: Workforce diversity and employment

2 Ipsos Mori (2010) Violence against frontline NHS staff [Online]. Available:

# **TOOL PROPERTIES**

- · Predictive efficacy: moderate or good
- Interrater reliability: moderate
- Usability: good
- · Levels of tool adoption were mixed
- Implementation of tools did not reduce restraint use

### **CONCLUSIONS**

- Violence risk assessment tools may be feasible for use in ED. However, there is currently insufficient high-quality evidence to draw conclusions about the predictive capacity of these tools.
- Additional research is needed to ascertain the acceptability, feasibility, and usability of these tools.
