Multidecompositions of complete graphs into a graph pair of order 6

Yizhe Gao * Dan Roberts

A *n*-cycle, denoted C_n , is a connected 2-regular graph on *n* vertices.

▲□▶ ▲□▶ ▲□▶ ▲□▶ = 三 のへで

Given a graph *G* on *n* vertices, the complement of *G*, denoted \overline{G} , is the graph on the same vertex set with edge set $E(K_n) \setminus E(G)$.

Let G and H be graphs. A G-decomposition of H is a partition of the edges of H into copies of G.

Let *G* and *H* be graphs. A (G, H)-multidecomposition of order *n* is a partition of the edges of K_n into copies of *G* and *H* with at least one copy of *G* and at least one copy of *H*.

Let *G* and *H* be graphs. We call (G, H) a graph pair of order *n* if all of the following hold.

- Both G and H have n vertices, none of which are isolated,
- 2 $G \not\cong H$, and
- $3 \quad G \cup H = K_n.$

Figure: The graph pairs of order 5.

The graph pair of order 4

Theorem (Abueida and Daven, 2003) There is a $(C_4, 2K_2)$ -multidecomposition of order n if and only if $n \equiv 0, 1 \pmod{4}$ where $n \ge 4$ and $n \ne 5$.

Graph pairs of order 5

Let (G, H) be a graph pair of order 5. The necessary and sufficient conditions for (G, H)-multidecompositions of order *n* are as shown below (Abueida and Daven, 2003). Assume that n > 5.

C₆-decompositions

```
Theorem (Rosa, 1966)
```

A C₆-decomposition of K_n exists if and only if $n \equiv 1,9 \pmod{12}$.

◆□▶ ◆□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Theorem (Sotteau, 1981)

A C_6 -decomposition of $K_{m,n}$ exists if and only if

- 1 m and n are both even,
- **2** $m, n \ge 3$, and
- **3** 6 divides mn.

\overline{C}_6 -decompositions of K_n

Theorem (Kang et al., 2008)

A \overline{C}_6 -decomposition of K_n exists if and only if $n \equiv 1 \pmod{9}$.

Necessary conditions for a (C_6, \overline{C}_6) -multidecomposition of order *n*

(Order) $n \ge 6$,

(Size)
$$\frac{n(n-1)}{2} = 6x + 9y$$
 for some $x, y \ge 1$, and

(Degree) n-1 = 2p + 3q for some $p, q \ge 0$.

Therefore
$$n \equiv 0, 1, 3, 4 \pmod{6}$$

Case: n = 6x + 1

A (C_6, \overline{C}_6) -multidecomposition of order 7 does not exist.

$$\binom{7}{2} = 21 = 6x + 9y \Rightarrow x = 2 \text{ and } y = 1$$

 $6 = 2p + 3q \Rightarrow (p = 0 \text{ and } q = 2) \text{ or } (p = 3 \text{ and } q = 0)$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ - 三 - のへぐ
