INTERPARTICLE POTENTIAL IN A 1-D MANY-BODY COLLOID

Nathan Mueggenburg, Matthew T. Dearing, and Gabriel Spalding*
Physics Department, Illinois Wesleyan University

We present a study of the interparticle potential in a 1-dimensional colloid. Using a scanning optical tweezer we fabricate a line trap confining many silica spheres one-micron in diameter. Optical forces result from an interaction between induced dipoles within each sphere and scattered laser light from neighboring spheres¹. These interactions create a potential which induces a preferred separation between spheres. Furthermore, many-body effects may alter the interactions in colloidal systems². Brownian effects cause random motion of the particles within the trap allowing the system to exhibit a range of interparticle separations. Using statistical analysis we look at the distribution of separation distances as a means of exploring the interparticle potential in the 1-dimensional, many-body colloidal system.
