OBSERVATION OF A LOW-LYING NEUTRON UNBOUND STATE IN 25F

<u>Alison Smith</u> and Nathan Frank* Physics Department, Illinois Wesleyan University

A neutron unbound state from ²⁵F has been observed for the first time. Prior experimental data on neutron-rich fluorine isotopes indicate differences for bound excited states as compared to nuclear shell model predictions. The ²⁵F isotopes were produced by one-proton removal from an 86 MeV/u 26Ne beam on a Beryllium target at the fast-fragmentation radioactive beam facility of the National Superconducting Cyclotron Laboratory at Michigan State University. The subsequent decay of the ²⁵F isotopes resulted in ²⁴F and neutrons which were detected in coincidence. The charged particles were bent away from the neutrons with a superconducting magnet and analyzed in a suite of charged particle detectors. The neutrons were detected in the Modular Neutron Array (MoNA). The properties of the charged particles and neutrons were used to reconstruct a decay energy spectrum for ²⁵F which was compared to simulations. Preliminary results indicating a resonant state at approximately 30 keV will be discussed.
