Motivation

Kesennuma

気仙沼

- ❖ The 9th largest fishery landig values in Japan.
- ❖ A base port for distant water tuna fisheries.

Photo: Yuma Sugawara

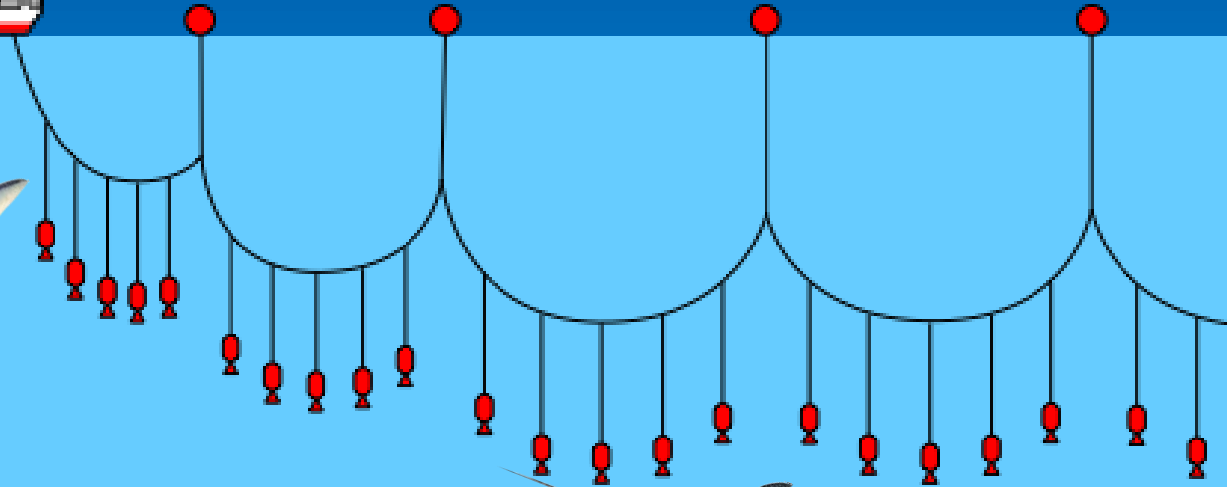

An aerial photograph capturing the devastating aftermath of the 2011 Great East Japan Earthquake. The foreground and middle ground are dominated by a vast expanse of dark, murky water, heavily littered with debris. Large, twisted metal beams, corrugated metal sheets, and other unrecognizable fragments of buildings and infrastructure are scattered across the water's surface. In the background, several multi-story buildings remain standing, though some show signs of damage. A prominent white building with a red roofline is partially visible on the right. The sky is overcast and grey, contributing to the somber and desolate atmosphere of the scene. The Japanese text '東北大震災' is overlaid in large white characters on the lower portion of the image.

Approach

Approach

to bring economic incentives

Explore **optimum fishing strategies** to maximize economic benefits from Swordfish fisheries .

Two decision variables for optimum fishing trip strategies

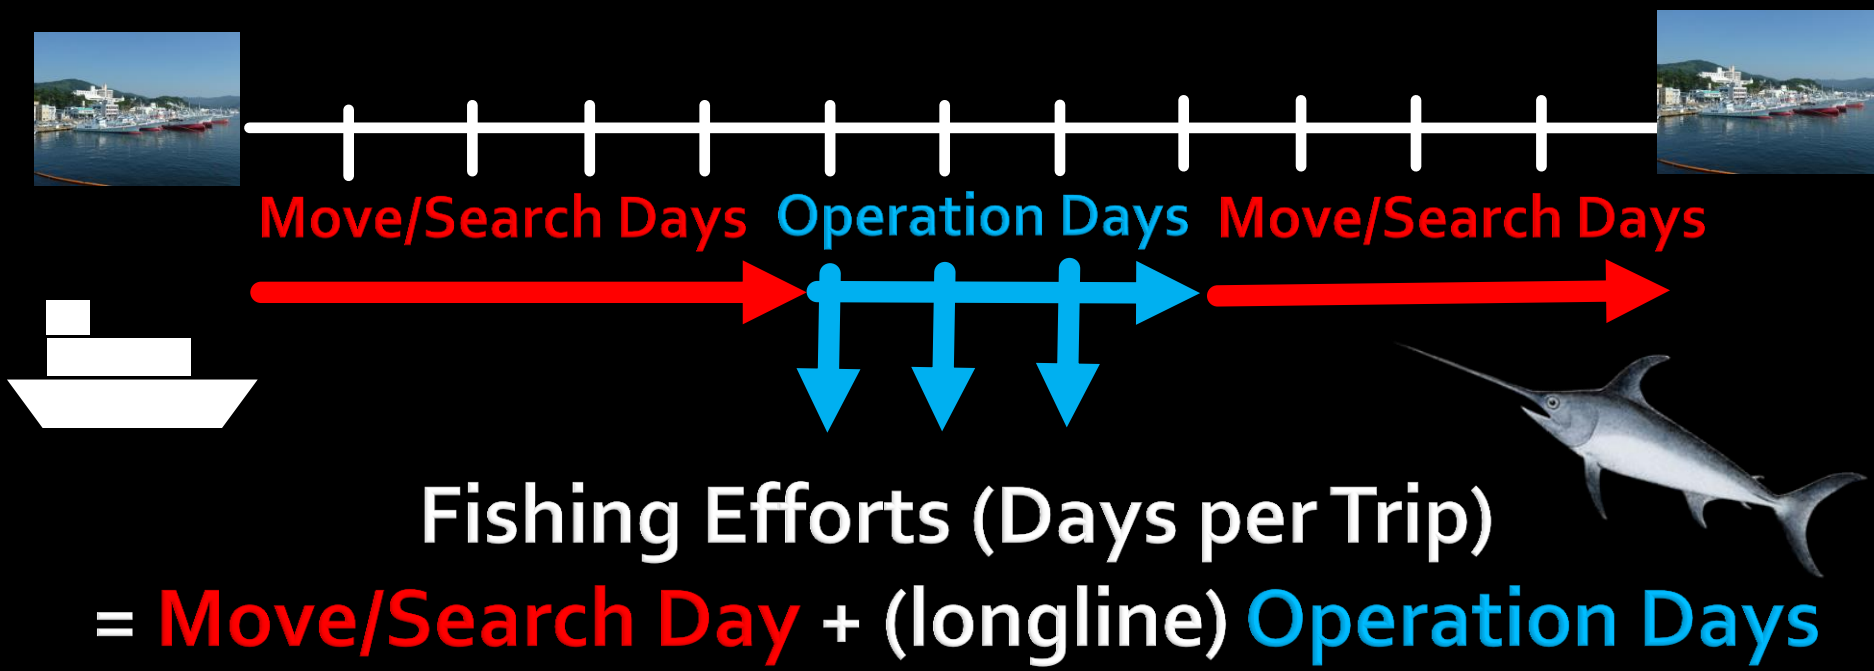

① Fishing Efforts
(= days per trip)

How many days per trip?

② Fishing Locations

Where shall we fish?

① Combine Catch, Cost, Revenue from the 2005-2010 trip-based data under the competitive individual operation to explore optimum fishing efforts to maximize economic benefits from Swordfish fisheries .

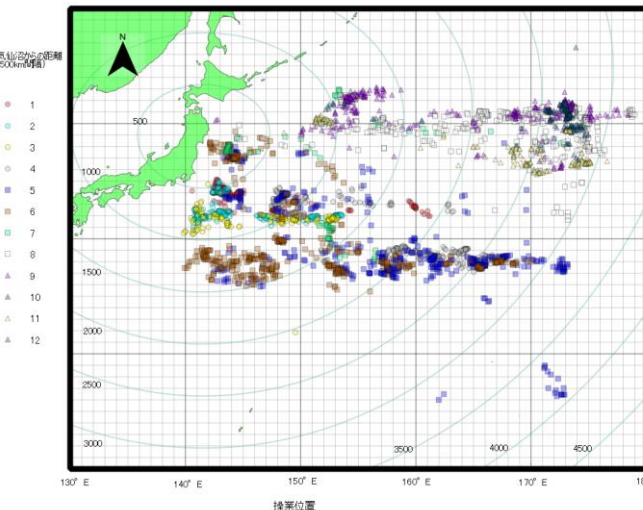

Harvest model + Price model + Cost model
(Production) (Demand)

② Cluster Analysis to

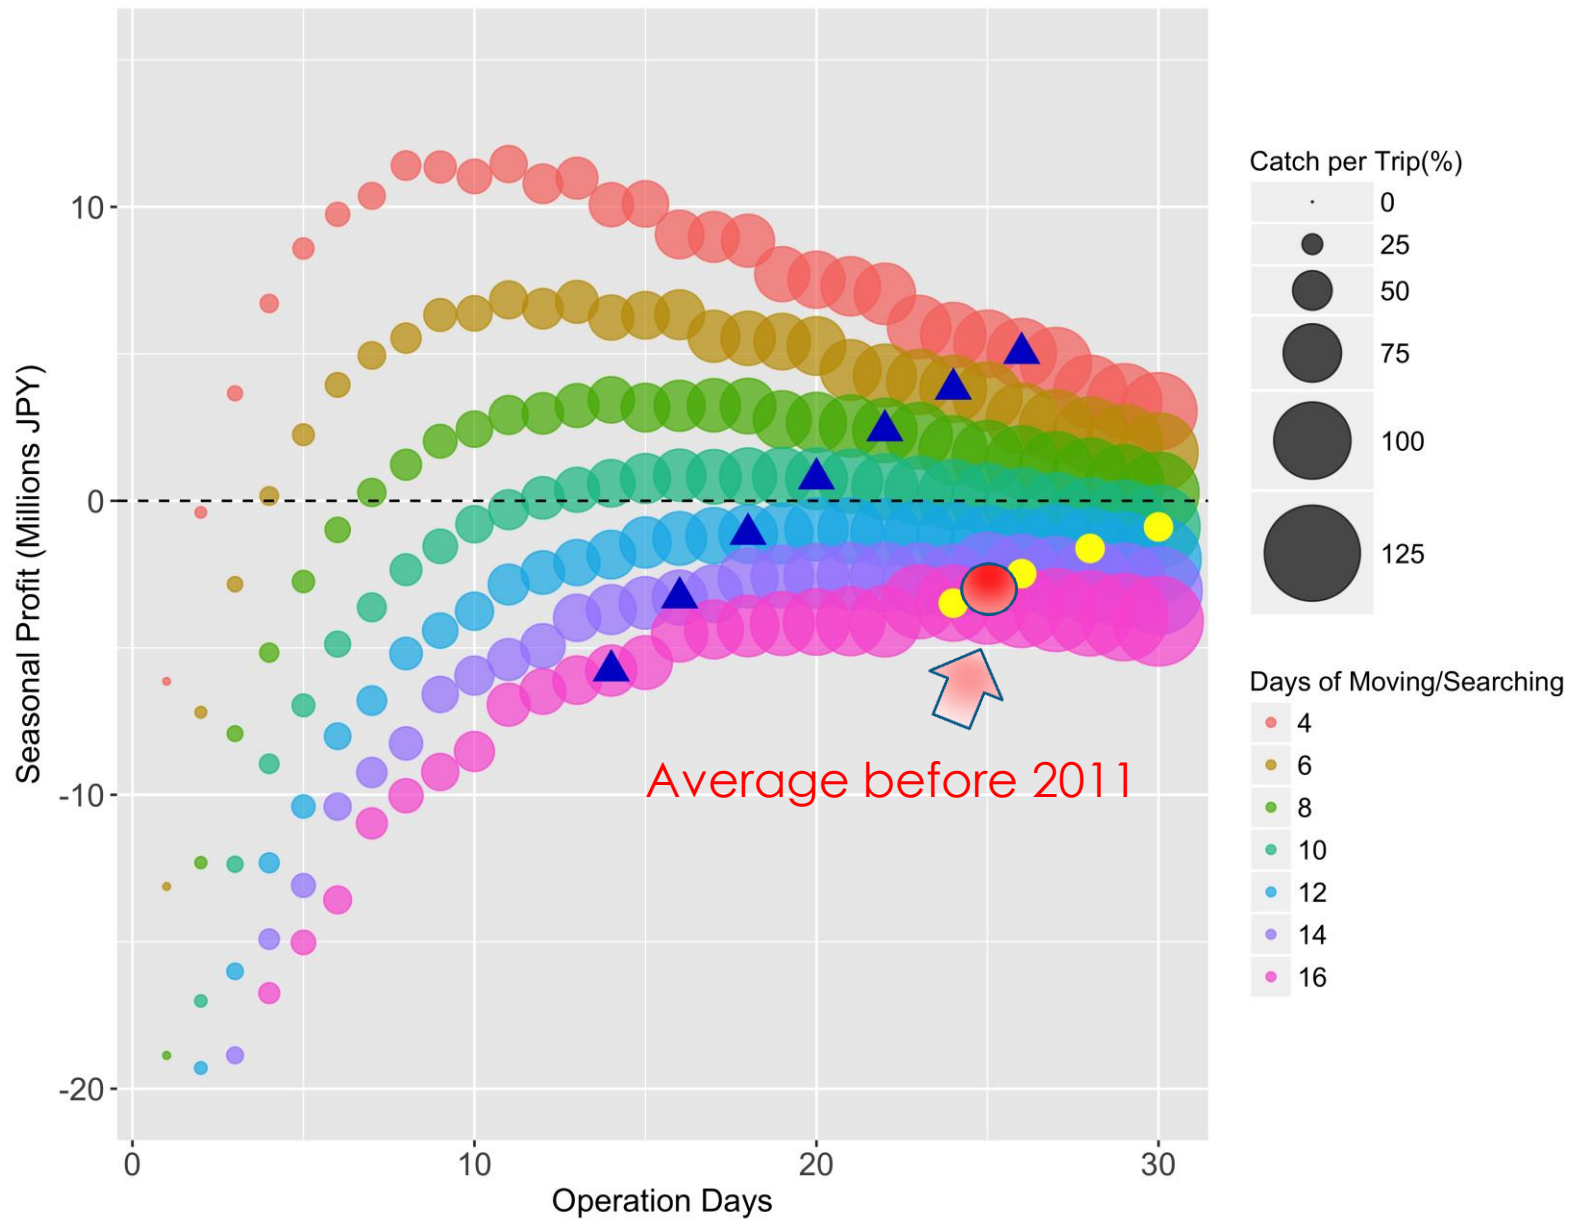

identify the location/profile of the fishing grounds

from 2012-2014 log-book data

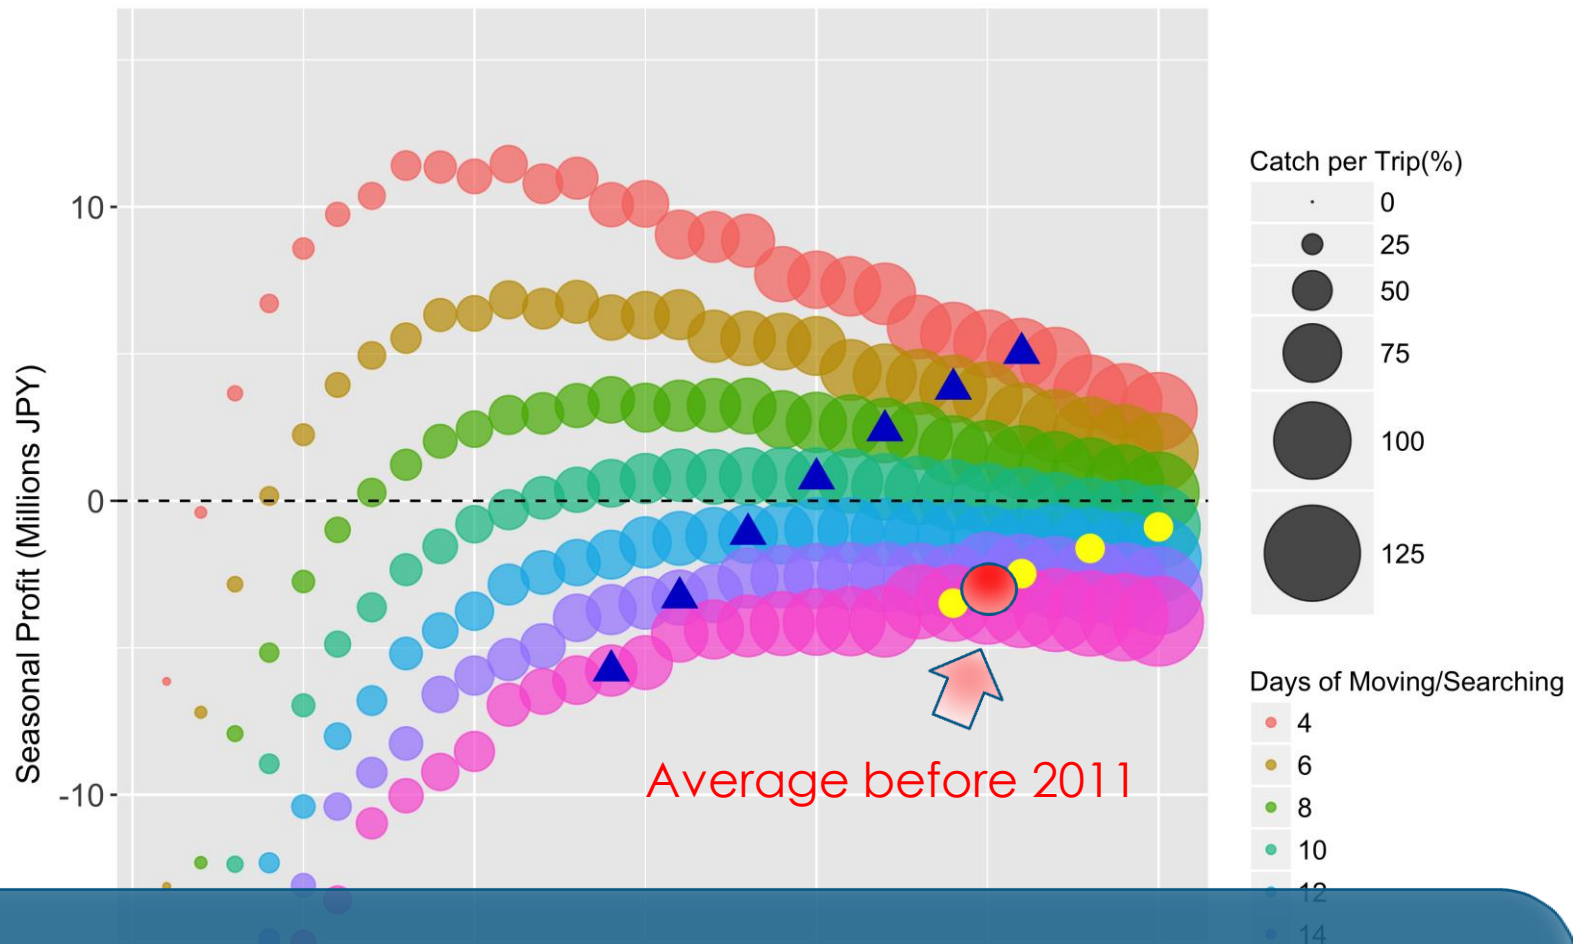

Clustered by distances of operation points

Result

The seasonal profit and harvest per trip on operation days when search/move days are 4, 6, 8, 10, 12, 14 and 16 days.

Less search/moving days yield higher profit due to the higher unit price of swordfish and lower fuel cost.

Average trip before 2011

(M/S days 14 + Op days 26 = total 40 days) is not profitable.

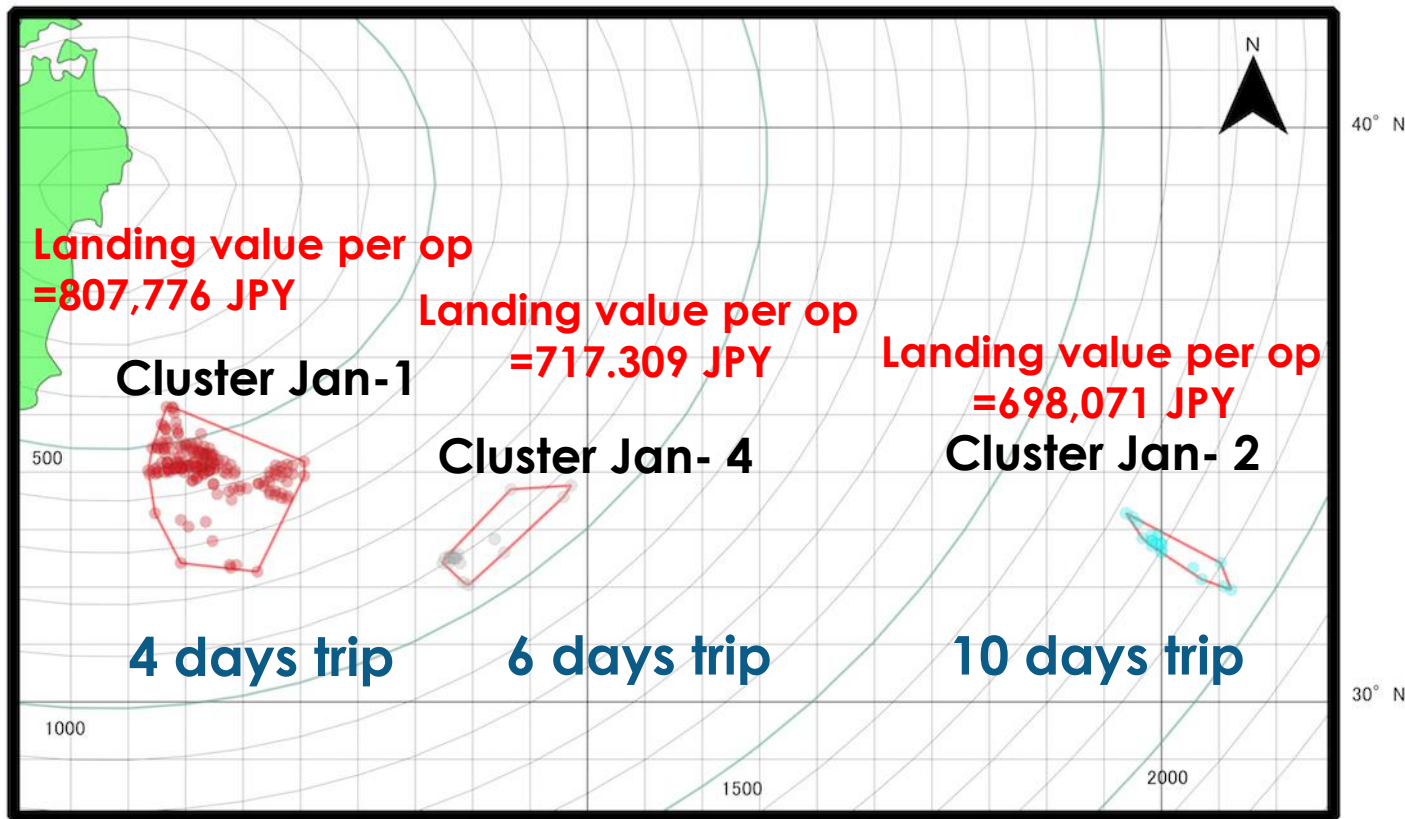

Fishing Grounds in January

Cluster Number	1	2	4
n	172	19	19
Data Share within Month	79%	9%	9%
Average Landing Values per Operation (JPY)	807,776	698,071	717,309
Share of Swordfish Landing	86%	79%	78%
Distance from Port (km)	561	1806	907
Search/Moving Days	4	10	6
Operation Days for Maximized Profit per Trip	15	16	18
Total Days for Maximized Profit per Trip	19	26	22
Operation Days for Maximized Profit per Season	11	16	13
Total Days for Maximized Profit per Season	15	26	17
Total Days for Break-Even Points	10 & 41	21 & 36	9 & 41

Calculated from optimal efforts

Fishing Grounds in January

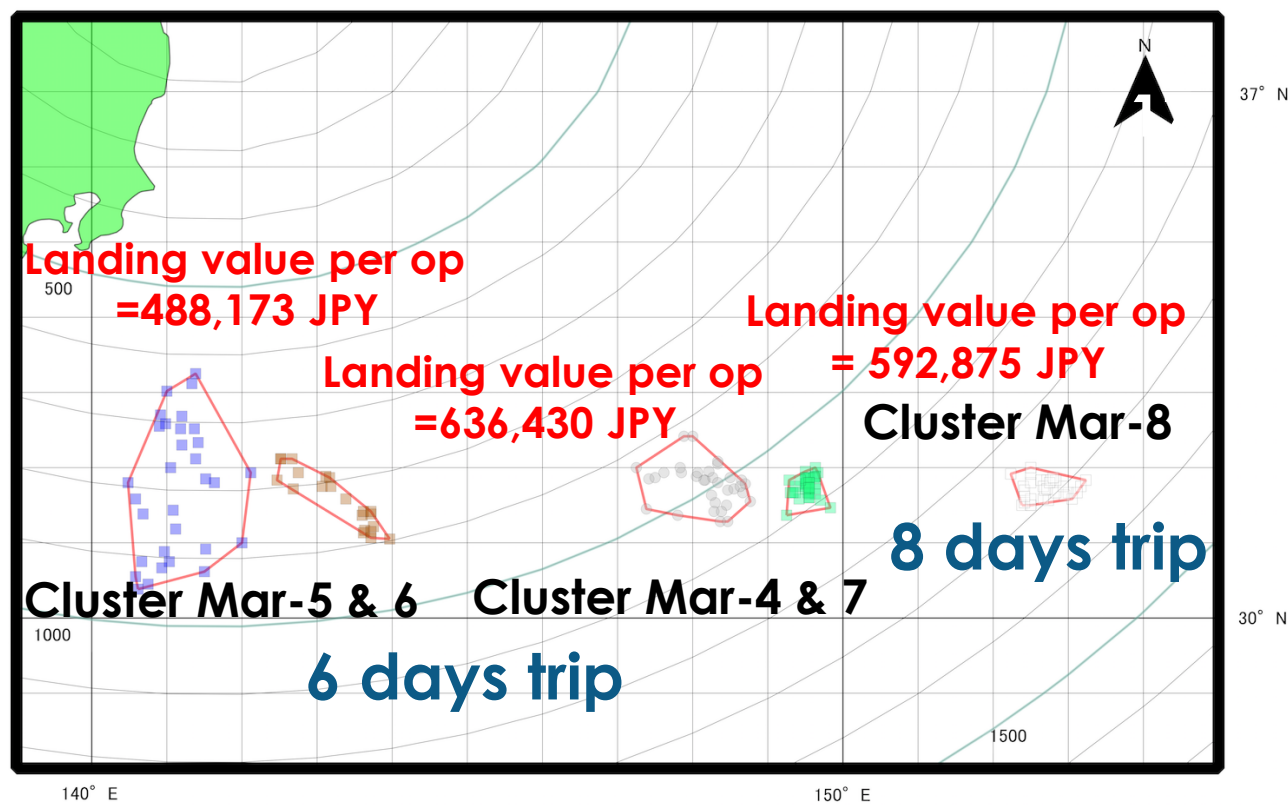

Cluster Number	1	2	4
n	172	19	19
Data Share within Month	79%	9%	9%
Average Landing Values per operation (JPY)	807,776	698,071	717,309
Distance from Port (km)	561	1806	907
Operation Days for Maximized Profit per Trip	15	16	18
Total Days for Maximized Profit per Trip	20	22	22
Operation Days for Maximized Profit per Season	11	16	13
Total Days for Maximized Profit per Season	15	26	17
Total Days for Break-Even Points	10 & 41	21 & 36	9 & 41

Support the result from ① optimal fishing efforts - Less search/moving days yield higher profit due to the higher unit price of swordfish and lower fuel cost..

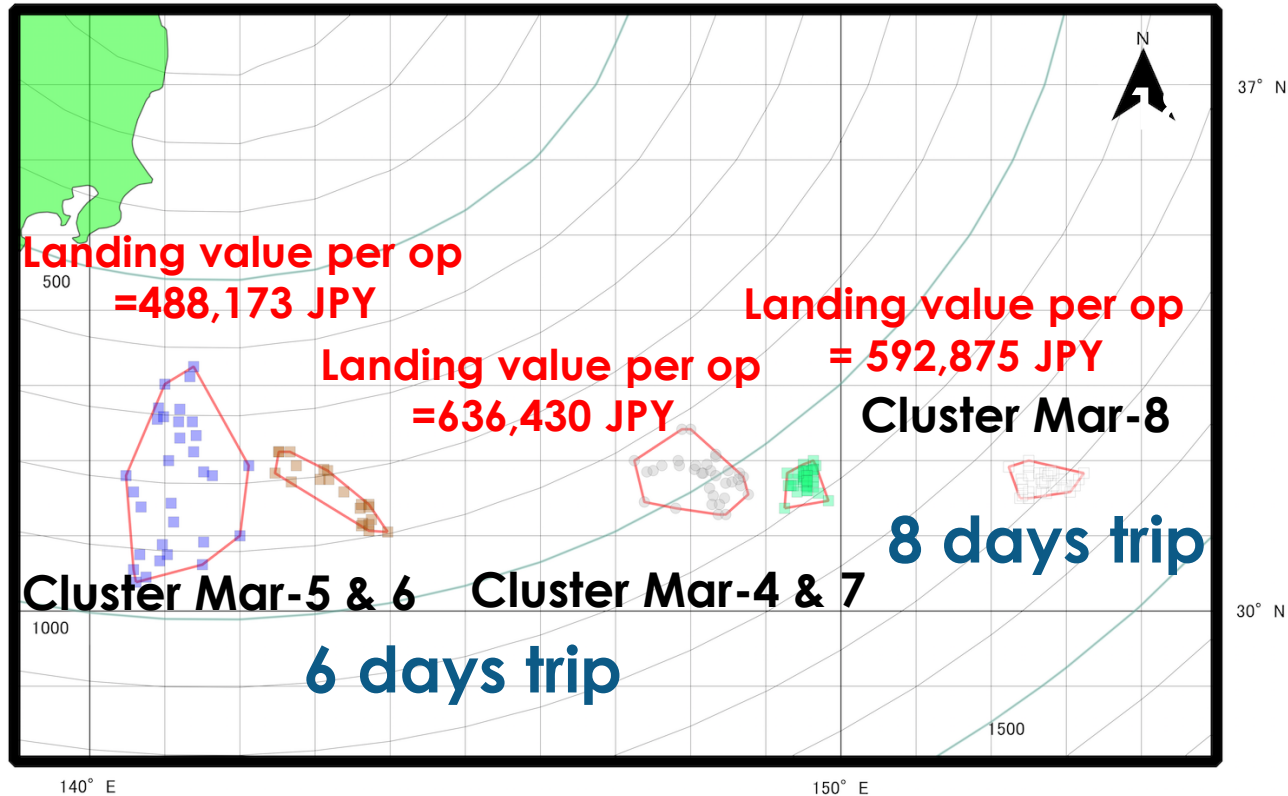

optimal efforts

Fishing Grounds in March

Cluster Number	4	5	6	7	8

Total Days for Break-Even Points	9 & 41	9 & 41	9 & 41	9 & 41	14 & 39

As the season reach to the end, the fishing grounds have homogeneous profiles.

Next Step

Extend analysis for blue shark and the joint production function.

Explore optimum choice of fishing grounds and fishing efforts under uncertainties.

As all vessels will join the new company, develop the group-vessel schedule to make this fishery sustainable .

Next Steps

Thanks!
