PREFACE

Miscellaneous Paper 105, Agricultural Experiment Station, Oregon State University, entitled "A Summary of Climate and Weather for Corvallis, Oregon, 1889 through 1960" by Wheeler Calhoun was published in March 1961. The United States Department of Commerce Weather Bureau, working with the Farm Crops Department at Oregon State University, has instrumented the Hyslop Farm Weather Station to measure additional elements important to agricultural scientists. There will be a continuing need for a publication to make these data readily available to researchers. It is planned that local climatological data from the Hyslop Farm Weather Station will be published annually.

Wheeler Calhoun, Jr.
Associate Prof. of Agronomy
Oregon State University
Corvallis, Oregon

HISTORY OF OREGON STATE UNIVERSITY WEATHER STATION

The cooperative Oregon State University--U. S. Weather Bureau station is in an open field located at the Hyslop Crop Science Farm six miles northeast of Corvallis, Oregon, just off Highway 20. It is situated on the main Willamette Valley floor a few miles to the east of the coast range foothills. The elevation is 225 feet above sea level at a latitude of 44° 38' North and longitude 123° 12' West. The station is operated by the Farm Crops Department of Oregon State University

A cooperative weather station was first established at Corvallis by Captain E. Grimm of the U. S. Army Signal Corps in October, 1889. In 1891 the U. S. Weather Bureau was established and took charge of this station with John Fulton assuming the duties as observer. He made weather and special soil temperature observations until 1895. Ellsworth Erwin carried on the work until January 1910, when W. L. Powers was assigned this duty. At this time the observations taken were expanded to include evaporation and other items related to drainage, irrigation, and soil moisture. E. F. Torgerson kept the record from 1918 to 1946 with R. O. Swan assisting. From 1946 until 1950 Powers again assumed responsibility for the observations and records. Eugene Dannen was observer from 1950 to May 1952. In May 1952 the weather station was moved from the campus of Oregon State College to its present location at Hyslop Crop Science Farm. Wheeler Calhoun, Superintendent of Hyslop, has been the official weather observer since 1952.

WEATHER RECORDS AT OREGON STATE UNIVERSITY

For many years prior to the station's move to the Hyslop Farm, campus observations were taken at a roof-top exposure during the "winter" season and at a nearby ground site during "summer." This twice-a-year move of the station and the move from the campus to Hyslop Farm have introduced some discrepancies in temperature "normals," or averages. Temperatures at the present site are a little lower, especially on clear, calm nights, than at the previous campus location. To compute "normals" or averages which reflect the new location and are, therefore, more meaningful for comparisons, temperature records prior to 1953 were adjusted. Most climatological stations of the U. S. Weather Bureau publish and use a 30-year "normal" or average for temperatures and precipitation (presently 1931-1960). To facilitate direct comparison of Hyslop Weather Station temperature and precipitation "normals" with other published "normals," the 1931-1960 period is used herein.

The move from the campus site to Hyslop Farm also affected precipitation catch. This became apparent when comparisons for several years before and after the move were made with nearby stations whose locations remained unchanged. The present site is slightly wetter than was the campus site. Adjusted precipitation "normals" or averages for the 1931-1960 period represent the present location of the gage.

The present site at Hyslop Crop Science Farm is an excellent one for an agricultural weather station. Increased instrumentation has been used at the Crop Science Farm.

NARRATIVE CLIMATOLOGICAL SUMMARY FOR MID-WILLAMETTE VALLEY

The mid-Willamette Valley, that valley area from a latitude just north of Salem to just south of Corvallis, is a homogeneous area with respect to climate. The usual movement of very moist maritime air masses from the Pacific Ocean inland over the Coast Range produces near its crest some of the heaviest yearly precipitation (nearly all rain) in the United States. An annual total of almost 170 inches has been recorded, and one station situated in the Coast Range has established a period-of-record annual average near 125 inches. From the ridge crest of the Coast Range, approximately 3,000 feet above sea level, there is a gradual decrease of rainfall downslope to the valley floor where annual totals average near 40 inches. As these marine-conditioned air masses continue to move farther inland, they are forced to ascend the west slopes of the Cascades to elevations generally near or above 5,000 feet above sea level, and again precipitation amounts increase substantially with elevation.

Most of this precipitation in both the valley and its bordering mountain ranges occurs during the winter. In the mid-Willamette Valley about 70 percent of the annual total occurs during the five months November through March, while only 5 percent occurs during the three summer months. In this area, on the average, there are only three or four days during the year with measurable amounts of snow. Its depth on the ground rarely exceeds two or three inches and usually melts in a day or two. The few thunderstorms that occur in the valley each year are not generally severe and seldom

do they, or the hail that occasionally accompanies them, cause serious damage.

The seasonal differences in temperatures are much less marked than those of precipitation. The range in mean temperatures during January, the coldest month, and July, the warmest, is just under 30 degrees. Maximum temperatures of 100 degrees or higher are very infrequent, averaging less than one per year for the past 75 years. Minimum temperatures below zero are even more infrequent and occur only in about one year out of fifteen on the average. At Corvallis the average length of time between killing frosts during the growing seasons (1936--1964) is 215 days. Since 1900 the latest killing frost in spring was May 31 and the earliest in fall was September 24.

AVERAGE MONTHLY MAXIMUM TEMPERATURES
1931-1967

Add one hour for Daylight Saving Time if and when in use.

This table was prepared using official sunrise and sunset tables of the U.S. Naval Observatory for Salem, Oregon and Eugene, Oregon.

This table may be used in any year of the twentieth century and within the geographical boundary of the stated place with an error not exceeding 2 minutes and generally less than 1 minute.

EXPLANATORY NOTES FOR DAILY CLIMATOLOGICAL DATA (pp 17 - 28)

- Column 1. Date of Observation.
2. Maximum Air Temperature, 24-hour period ending 8:00 a.m.
3. Minimum Air Temperature, 24-hour period ending 8:00 a.m.
4. Average Air Temperature, 24-hour period ending 8:00 a.m.
5. Growing Degree Days, base 40°, computed from Average Temperature.
6. Growing Degree Days, base 50°, computed from Average Temperature.
7. Precipitation, water equivalent, inches, for 24-hour period ending at 8:00 a.m.
8. Snow, Sleet or Other Frozen Precipitation in inches.
9. Wind Direction at observation time, 8:00 a.m.
10. Wind Speed, mph, at observation time, 8:00 a.m.
11. Maximum and Minimum Soil Temperatures, 2-inch depth, 24-hour period ending at 8:00 a.m.
12. Maximum and Minimum Soil Temperatures, 4-inch depth, 24-hour period ending at 8:00 a.m.
13. Maximum and Minimum Soil Temperatures, 8-inch depth, 24-hour period ending at 8:00 a.m.
14. Evaporation of Water from Standard Weather Bureau Pan, inches.
15. Total 24-hour Wind Movement, miles, from anemometer 1-1/2 feet above ground at Evaporation Pan Site.
19. Day length, sunrise to sunset, hours and minutes.
- 20 - 23. Relative Humidity expressed in percent from hygro-thermograph in standard Weather Bureau shelter, 4:00 a.m., 10:00 a.m., 4:00 p.m. and 10:00 p.m.
24. Date of Observation.
