

# **CATCH QUOTAS FOR THE PACIFIC HAKE FISHERY IN THE GULF OF CALIFORNIA**

MAURICIO RAMÍREZ RODRÍGUEZ

Interdisciplinary Center of Marine Sciences  
National Polytechnic Institute

**INDIVIDUAL VESSEL QUOTAS** offers advantages for fishery management, BUT it requires abundant high-quality information regarding the resource and the fleet.

**Is it possible to define IVQ when information is scarce?**

**Pacific Hake fishery in the northern Gulf of California:**

- Currently under development
- Requires management actions to maintain the resource in a manner that contributes to a stable income for fishers.

**HOW MUCH CATCH IS NEEDED FOR A  
PROFITABLE HAKE FISHERY?**

**WHICH IS THE TOTAL ALLOWABLE CATCH (TAC)?**

**WHICH IS THE NUMBER OF VESSELS  
TO ACHIEVE TAC?**

# SHRIMP-PACIFIC HAKE-FINFISH FLEET

**Shrimp:** October to December

**Pacific hake:** February and March

**Finfish:** April to June

## METHODS

# Representative Production Units (RPU)

Panels of producers from actual firms that are similar in terms of infrastructure, production scale and operation modality.

### PANELLISTS AGREED ON:

- ✓ prices of supplies
- ✓ operation costs
- ✓ landed catch value
- ✓ product sales price

# COST-BENEFIT ANALYSES

## Total annual income

$$TI = VLC + DS + RVAT$$

$$\begin{array}{ccccc} \text{Value of} & & \text{Diesel} & & \text{Refund of} \\ \text{landed catch} & + & \text{Subsidy} & + & \text{provisional VAT} \\ & & & & \text{payments} \end{array}$$

## AVERAGE 2013 PRICES

Mex\$

# Percent distribution of RPU income by type of fishery

**TOTAL INCOME = Mex\$ 6,208,770**

**Product sales 86%**

**Diesel subsidy 8%**

**VAT refund 6%**

## Annual operating cost (TC)

$$TC = A_i + SA_i + M_i + R_i + D_i$$

**$A_i$**  = Management costs

**$SA_i$**  = wages for fishers and administrative staff, including owner

**$M_i$**  = Maintenance of vessels and fishing gear

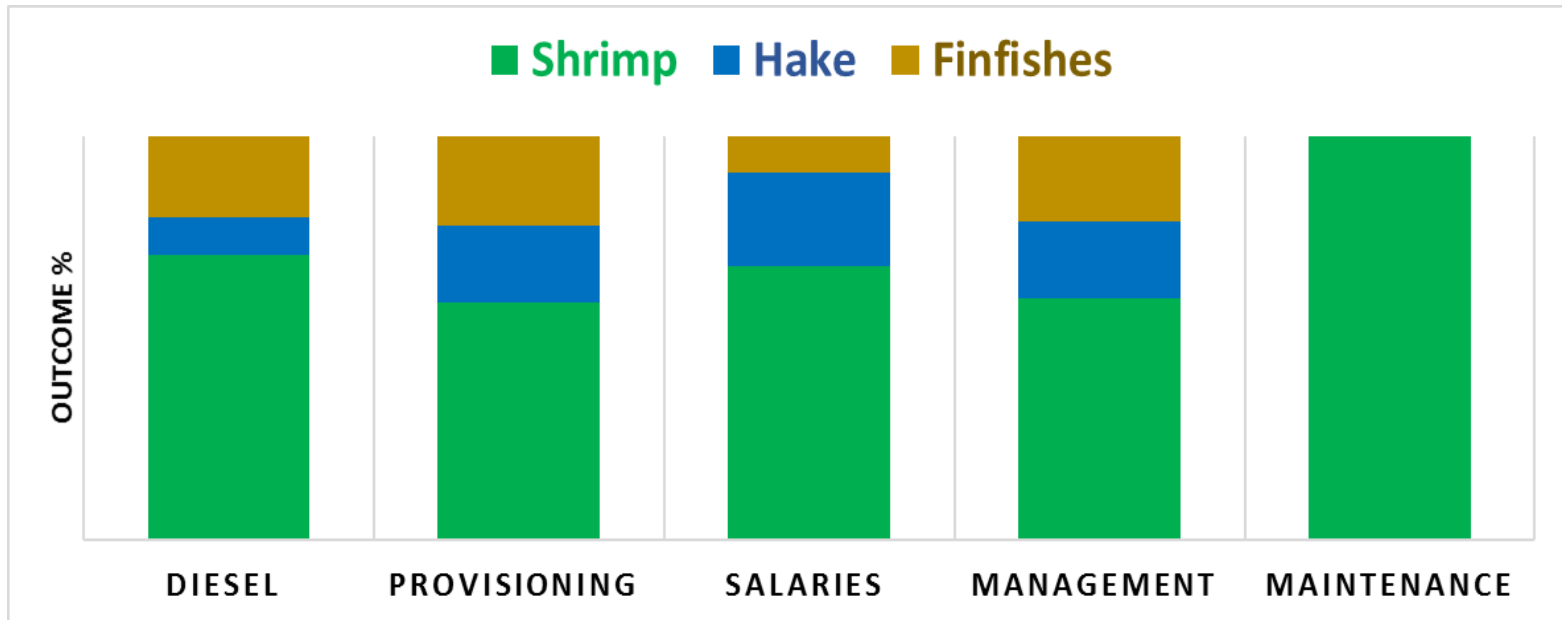

**$R_i$**  = Materials acquisition

**$D_i$**  = Diesel purchases

**$i=1$**  shrimp,  **$i=2$**  hake,  **$i=3$**  finfishes

# Percent distribution of RPU outcome by type of fishery

**Total operation cost = Mex\$5,902,297**

**Shrimp 70 %**

**Hake 14 %**

**Finfish 16 %**

# ECONOMIC PERFORMANCE INDICATORS

**NET CASH AT THE END OF YEAR = TI - TC**

**TI Total Annual Income**

**TC Total Annual Operating Cost**

**BENEFIT/COST  
(TI/TC)**

**PROFITABILITY = NCa/ TC \* 100**

**NCa Net Cash at the end of the year**

# ECONOMIC PERFORMANCE INDICATORS

**NET CASH AT THE END OF 2013**

**Mex\$ 306.482**

**BENEFIT/COST**

**1.05**

**PROFITABILITY**

**5.2%**

**How much is a good net cash at the end of the year?**  
**30% increase in the RPU's net income**

To increase net income by 30% by modifying Hake catches only, it would have to increase from  
72 t to 90.4 t.

**100 t** represents a **45%** increase in net income

**HOW MUCH TOTAL HAKE CATCH (TAC)  
IS NEEDED FOR A PROFITABLE AND  
SUSTAINABLE PACIFIC HAKE FISHERY**

Total Catch (tons)  
54 vessels

3888

4882

5400

72

90.4

100

Pacific Hake Catch per Vessel per Year (tons)

## WHICH IS THE TOTAL ALLOWABLE CATCH (TAC)?

$$\text{TAC} = \text{MSY} = 0.37 * M * B *$$

**B = AVAILABLE ESTIMATES OF  
HAKE BIOMASS**

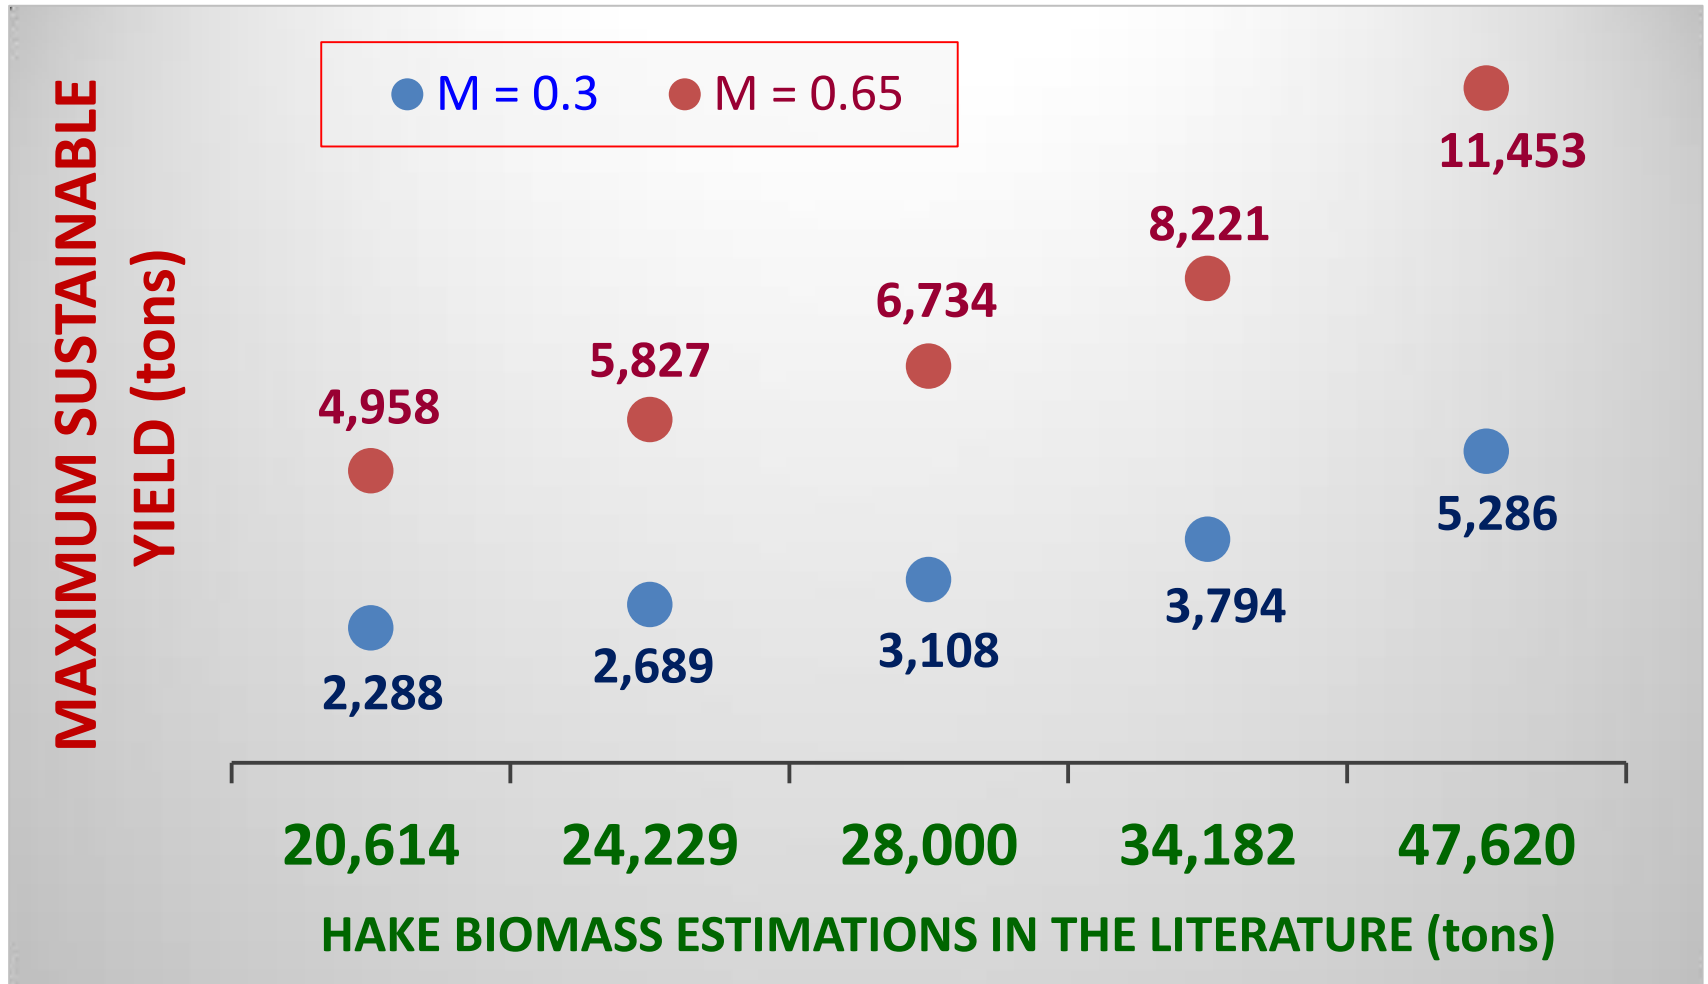

**M = NATURAL MORTALITY**

(0.3 and 0.65) \*\*

\* Sparre, P. and S. C. Venema. 1995. FAO Documento Técnico Pesca 306/1

\*\* Bayley, K. M., R. C. Francis and P. R. Stevens. 1982. CalCOFI Reports 23

## MAXIMUM SUSTAINABLE YIELDS FOR DIFFERENT AVAILABLE BIOMASS ESTIMATES AND NATURAL MORTALITY VALUES

# Number of Vessels necessary to achieve TAC

$$NV = TAC / \text{optimal harvest level}$$

## Representative Production Unit

- The RPU analyzed is multi-fisheries: shrimp, Pacific hake and finfishes.
- This work only considered the change in hake catch, keeping everything else constant.
- Maximum Sustainable Yield approximations are highly uncertain
- IVQ figures result from improving profits by increasing catches only.
