ABSTRACT

CTD observations of temperature and salinity were made off Oregon and California between 34°N and 44°N from the R/V Wecoma, 5 Feb. - 17 Feb. 1981. The stations were from 2 - 360 km off shore, in water depths ranging from 30 to 4,300 meters. The maximum sampling depth at most stations was about 1000 m, but at some of the offshore stations the casts extended nearly to the bottom. The stations were made along seven sections across the continental shelf and slope at 34°45'N, 36°10'N, 37°00'N, 38°40'N, 39°30'N, 41°54'N and 43°13'N. Three of these sections extended 360 km from shore. The data are summarized in vertical sections and offshore profiles of selected variables. Vertical profiles of temperature, salinity, and sigma-theta, and listings of the data at standard depths are presented for each station. Near-bottom profiles of potential temperature, salinity and sigma-theta are shown for stations deeper than 2500 m.

INTRODUCTION

Through the cooperation of several projects and investigators, we were able to conduct a large-scale hydrographic survey (Fig. 1) in February 1981. The survey provides important background information for each of the four contributing projects: Shipboard Hydrography in the Coastal Ocean Dynamics Experiment (A. Huyer, principal investigator); A Large Scale West Coast Shelf Experiment (J. S. Allen, A. Huyer and R. L. Smith); Studies of the Physical Oceanography of the Oregon Continental Margin (A. Huyer and R. L. Smith); and the Low Level Waste Ocean Disposal Program (G. R. Heath). The choice of sections, station spacing, and maximum sampling depths reflects the combined interests of these four projects. Our goals were to obtain (1) closely spaced sampling to 1000 m over the continental shelf and slope at selected locations; (2) offshore sampling of the upper 1000 m with moderate spacing along the three sections between 37° and 42° N; and (3) to sample the deep and abyssal waters near the LLWODP site at $39^{\circ}30'$ N, $127^{\circ}40'$ W.

The R/V Wecoma departed from Newport, Oregon on 4 February 1981 and toward Crescent City. On 5 February, two current meter moorings were deployed over the continental shelf near Crescent City: in 50 fm of water at $41^{\circ}54.1'$ N, $124^{\circ}26.8'$ W, and in 90 fm of water at $41^{\circ}52.9'$ N, $124^{\circ}30.2'$ W; CTD casts (Stations 1 and 2) were made at both locations. The ship then proceeded toward Purisima Pt. On 7 February, current meter moorings were deployed in 50 fm of water at $34^{\circ}44.6'$ N, $120^{\circ}47.1'$ W and in 90 fm at $34^{\circ}47.1'$ N, $120^{\circ}50.7'$ W; a CTD cast (Station 4) was made at the offshore mooring site (Station 3 was aborted).

On 8 and 9 February, we completed hydrographic sections to 1000 db along $34^{\circ}45'$ N off Pt. Purisima (Stations 5-15, Table 1) and along

240° - 060°T off Pt. Sur or Esalen (Stations 16-22). The Wecoma stopped briefly in Monterey to disembark mooring personnel (J. S. Allen, R. L. Smith and R. E. Still). Another short section to 1000 db along 240° - 060°T was completed on 10 February, off Davenport (Stations 23-30). The Code Long Line (Stations 31-49), toward 060°T and intersecting the coast at 38°40'N, was completed on 12 February; deep casts (>3000 db), were made at four stations along this line (Table 2). The Laguna Line along 39°30'N (Stations 50-68), including six deep stations to within 40 m of the bottom (Table 2), was completed on 14 February. The Smith River section along 41°54'N (Stations 69-86), with three deep stations to within 40 m of the bottom, was completed on 16 February. The Five Mile Point section to 1000 db (Stations 87-96) along 43°13'N was completed on 17 February, and the Wecoma returned to Newport later that day. Wind speeds during the cruise were moderate and winds were predominantly from the south (Figure 2).

Personnel participating in the hydrographic data collection were Adriana Huyer, Dennis Barstow, Rich Schramm, Henry Pittock, Jane Fleischbein, Arliss Thompson and Nancy Rouse.

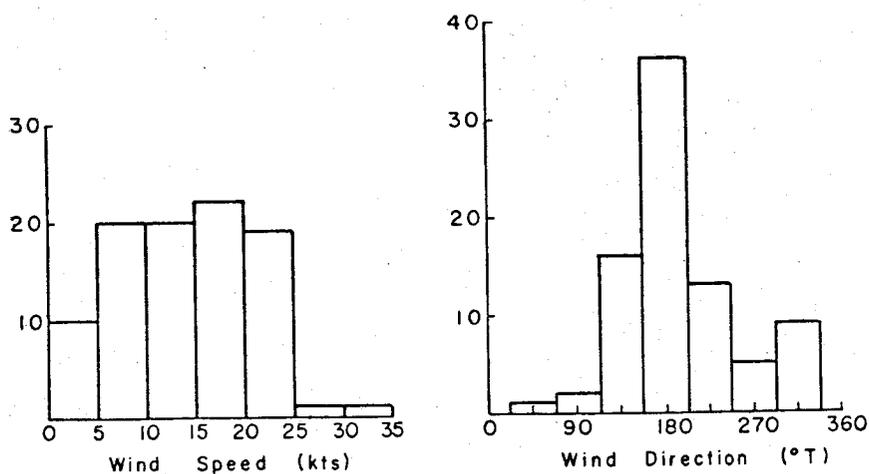

Figure 2. Histograms of wind speed and direction at each CTD station.

SAMPLING PROCEDURES

Continuous profiles of temperature and salinity versus pressure were obtained at each station using a Neil Brown Instruments Mark IIIb conductivity-temperature-depth probe (CTD). A station consisted of one CTD cast, recorded while lowering at about 45 m min^{-1} . On almost all casts a Niskin bottle equipped with 3 reversing thermometers was mounted about 1.5 m above the CTD sensor arm to obtain *in situ* calibration data. The bottle was tripped at the bottom of a cast or during retrieval after soaking for 5 minutes at the desired sample depth to allow the thermometers to equilibrate.

Two probes with different pressure sensor ratings were used (Table 3). Each probe measures pressure, temperature and conductivity sequentially using a sampling cycle of 32 milliseconds. The 1600 db probe was used for Stations 1-30 and 87-96 and the 6500 db probe was used for Stations 31-86. In each probe, the fast-response thermistor had been disabled and replaced in the circuitry with a precision 10 ohm resistor. The time constant (τ) of the platinum resistance thermometer of each probe was determined from the slope of the phase spectrum between the measured temperature and conductivity as suggested by Millard, Toole and Swartz (1980).

At several stations, there was a sudden downward jump in conductivity, apparently because some kind of detritus lodged in or slowly passed through the conductivity cell. In some cases, e.g. Stations 36 and 43 (Table 4) we noticed the problem during descent: the detritus seemed to flush out when the CTD was raised; we resumed sampling at a depth shallower than the observed jump. In other cases, when we did not notice the jump during sampling, we filled in the missing salinity data by linear interpolation (Table 4).

Table 3. Characteristics of the two CTD probes used.

Probe	Sample Interval	Temperature Time Constant	<u>Sensors</u>		
			P	T	C
2561	32 ms	280 ms	Range: 6500db Resolution: 0.1db Accuracy: <u>+6.5db</u>	-2 to 30°C .0005°C <u>+.005°C</u>	1 to 65 mmhos .005 mmhos <u>+.001 mmhos</u>
2567	32 ms	180 ms	Range: 1600db Resolution: 0.025db Accuracy: <u>+1.6db</u>	-3 to 32°C .0005°C <u>+.005°C</u>	1 to 65 mmhos .005 mmhos <u>+.001 mmhos</u>

Table 4. Stations with special data problems.

Station No.	Station Name	Nature of Problem	Cause	Remedy
17	ESA-6	Downward jump in conductivity at 476-478 db.	Probably detritus in cell.	Linear interpolation of salinity at 476-478 db in processed data file.
27		Small downward shift in conductivity from 181-298 db.	Probably detritus caught in cell at 181 db; flushed out at 299 db.	Added 0.03 o/oo to processed salinity data between 181 and 298 db.
36		Large downward conductivity jump at about 730 db.	Biological detritus visible on CTD after cast.	Raised CTD to ~700 db, resumed sampling; joined processed data files at 730 db; thus there is a ~15 min. time delay at 730 db.
40		Downward conductivity jump at 263 db, gradually increasing until 289 db.	Probably detritus in cell, slowly washed out.	Linear interpolation of processed salinity data, 263-289 db.
43		Large downward conductivity jump, 339-400 db.	Detritus in cell.	Repeated lower part of cast; joined processed files at 339 db; hence a 15 min. time delay at 339 db.
65		Eight minute delay at 2010 db.	Stopped to put new tape on data logger.	Processed data files from the two tapes were joined at 2010 db.
67		Three minute delay at 689 db.	Large wire angle; wire against ship.	Processed data files were joined at 689 db.

INSTRUMENT CALIBRATION

The CTD probes were calibrated for pressure, temperature and conductivity at the manufacturer prior to their delivery in September and November 1980. *In situ* calibration data were also collected for the temperature and conductivity sensors. A Niskin bottle mounted with 3 protected reversing thermometers provided samples. The thermometers have an accuracy of $\pm 0.02^{\circ}\text{C}$ and are corrected using the results of calibrations done once every 2 years. Water sample salinity is determined by a Guildline Model 8400 "Autosal" salinometer with a precision of better than ± 0.002 o/oo and accuracy of ± 0.003 o/oo.

CTD data are recorded at the actual sample depth after the bottle is tripped. Occasionally due to large wire angles the CTD and sample bottle do not remain at the same depth (and temperature) during soak time. Since the thermometers have a much longer response time than the CTD temperature sensor, this can result in relatively large differences between the sample and CTD temperature readings. These points are eliminated from the overall CTD-sample comparisons.

Results of the comparison between *in situ* sample data and the CTD output are summarized in Table 2. The sample conductivity was calculated using the CTD temperature data and sample salinity. CTD conductivity was corrected for the pressure and temperature effects on the cell prior to the comparison.

Since these temperature and conductivity differences are well within the sampling and instrument errors, no further corrections were applied prior to processing the data.

Table 5. Summary of the comparisons between the Neil Brown CTD probes and *in situ* calibration data.

CTD No.	Temperature $\Delta T(^{\circ}\text{C})$			Conductivity ΔC (mmhos cm^{-1})			Salinity ΔS (o/oo)		
	N	mean	s.d.	N	mean	s.d.	N	mean	s.d.
2561	50	-0.003	0.017	55	-0.001	0.003	55	-0.001	0.003
2567	42	0.001	0.014	46	-0.001	0.005	46	-0.001	0.005

DATA PROCESSING PROCEDURES

The time constant of the platinum resistance thermometer of the CTD was determined from the slope of the phase spectrum between the measured temperature and conductivity data (Millard, Toole, and Swartz, 1980). We obtained a time constant (τ) of 0.280 sec for Probe 2561 and 0.200 sec for Probe 2567. We then applied a simple recursive filter to the conductivity and pressure data of the form

$$C(n) = \alpha C(n - 1) + (1 - \alpha) C_0(n)$$

where $C_0(n)$ is the observed value and $C(n)$ is the filtered value of the n^{th} scan, and α is determined from τ and the time interval (Δt) between scans,

$$\alpha = \tau / (\tau + \Delta t).$$

We used values of α of 0.90 for Probe 2561 and 0.862 for Probe 2567.

The data are recorded at sea on a Kennedy 9-track data logger, with many stations on each tape. Data logging frequently begins as soon as the CTD is in the water, and continues until after the CTD has reached the maximum depth. The first step in data processing is to obtain a directory of the data tape which lists the header data, the block number in which the instrument descent begins, and the maximum pressure; conductivity data are corrected for cell variations due to pressure and temperature. The next step in data processing is to check for extraneous values and extreme gradients, apply the recursive filter to pressure and conductivity and compute salinity from the algorithm given by Fofonoff, Hayes and Millard (1974). The filtered pressure data are used to eliminate ascending data caused by wave action. Data collected during descent are sorted into 1 db or 2 db bins, and the extremes and averages computed for each bin.

(The 1 db resolution seems justified for Probe #2567 with a time constant of 200 msec, but not for Probe #2561 with a time constant of nearly 300 msec). Profiles of the extremes of temperature and salinity are plotted to determine whether the input data files need further editing. Usually no editing is needed, and the 1 db or 2 db mean temperatures and salinities constitute the processed data. When editing appears to be necessary, the original data files are examined, data points that are rejected are replaced by linearly interpolated values, and the files are reprocessed. Schematic flow charts of some of the data processing programs were presented by Gilbert, Huyer and Schramm (1981).

The processed data files containing integral pressure, average temperature, and average salinity are archived. These files are used to calculate other parameters of interest such as potential temperature (θ), potential density anomaly ($\sigma\text{-}\theta$), specific volume anomaly, dynamic height, Brunt-Vaisala Frequency, and sound velocity (see Gilbert et al., 1981 for subroutines). Files including all of these variables are available on request. In this data report we show only profile plots of temperature, salinity and $\sigma\text{-}\theta$ versus pressure, and listings at selected pressures of temperature, salinity, potential temperature, $\sigma\text{-}\theta$, specific volume anomaly and dynamic height.

DATA PRESENTATION

The hydrographic data is summarized in vertical sections of temperature, salinity, and sigma-theta. The distributions were contoured by hand. Tick marks at the top of each section indicate station positions at which a CTD cast was made, and an inverted "T" marks the maximum depth of each cast.

For each hydrographic section, we also show offshore profiles of temperature, salinity, sigma-theta and dynamic height relative to 500 db and 1000 db. Dynamic height at shallow stations was computed using the extrapolation method described by Reid and Mantyla (1976); the extrapolated portion of each profile is dashed.

Vertical profiles of temperature, salinity and sigma theta vs. pressure are shown for each station. Header information for each station is as follows:

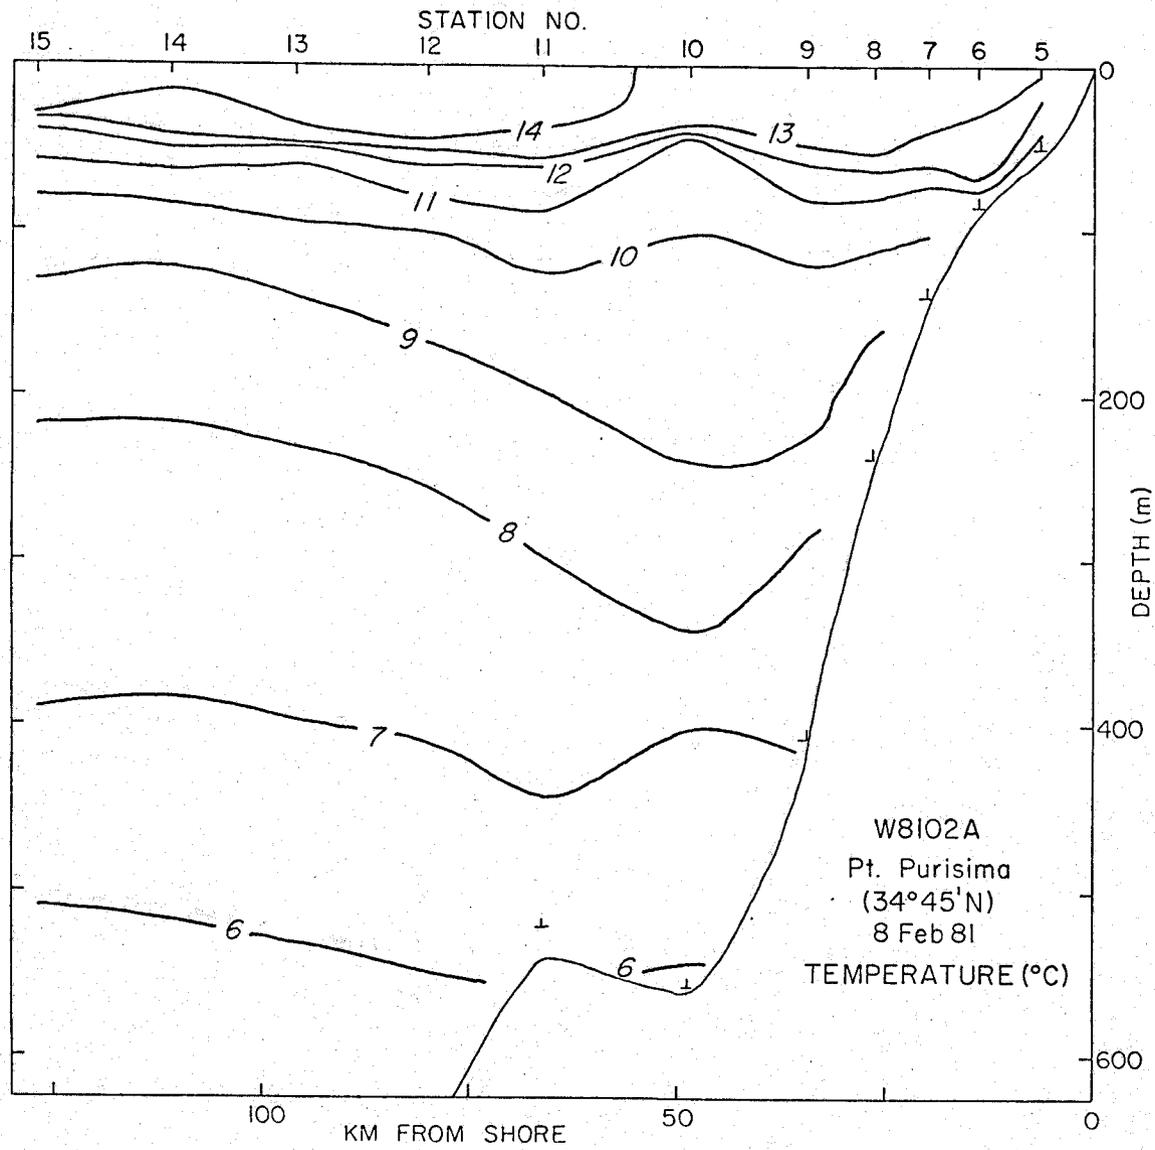

CAST NO	Consecutive cast number.
LAT	Latitude in degrees and minutes north of the equator.
DATE	Day/Month/Year.
TIME	Time in Greenwich Mean Time.
STATION	The CTD section name (initialed) and number of the station on the line (Refer to Figure 1).
LONG	Longitude in degrees and minutes west of Greenwich.
DEPTH	Sonic depth in meters, corrected according to Matthews Tables appearing in the Handbook of Oceanographic Tables, U.S. Naval Oceanographic Office Publication SP-68 (1966).
PROBE	CTD probe number.

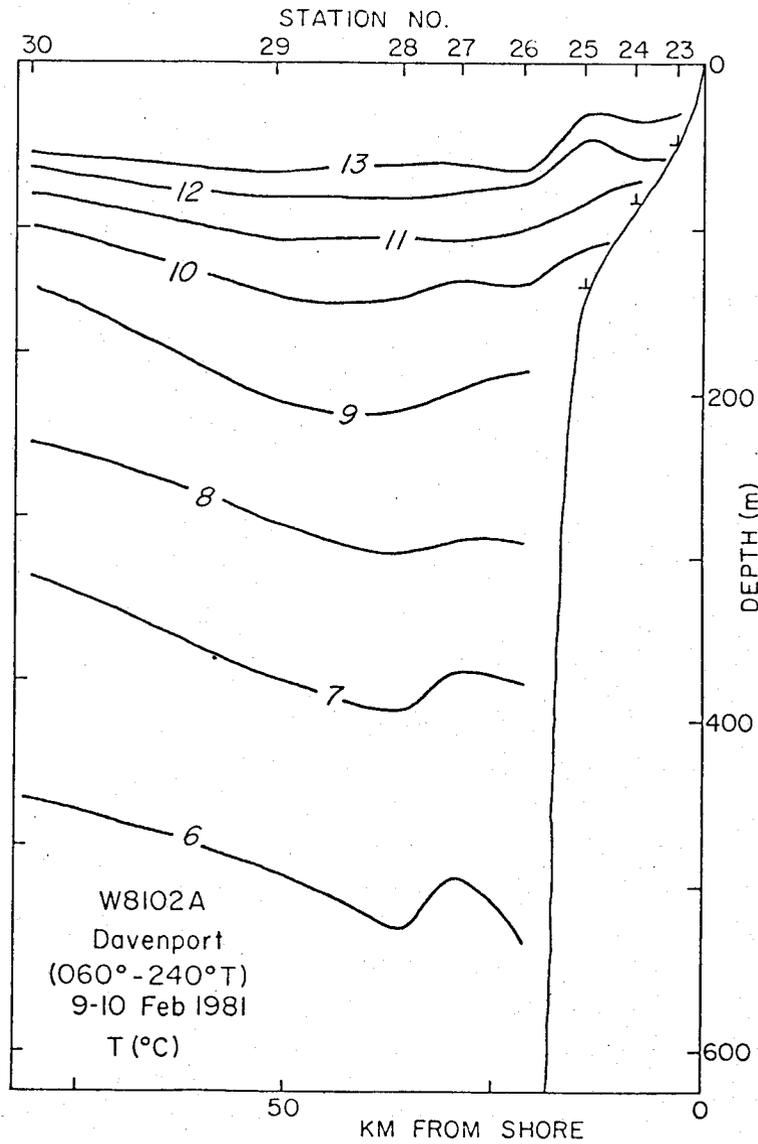

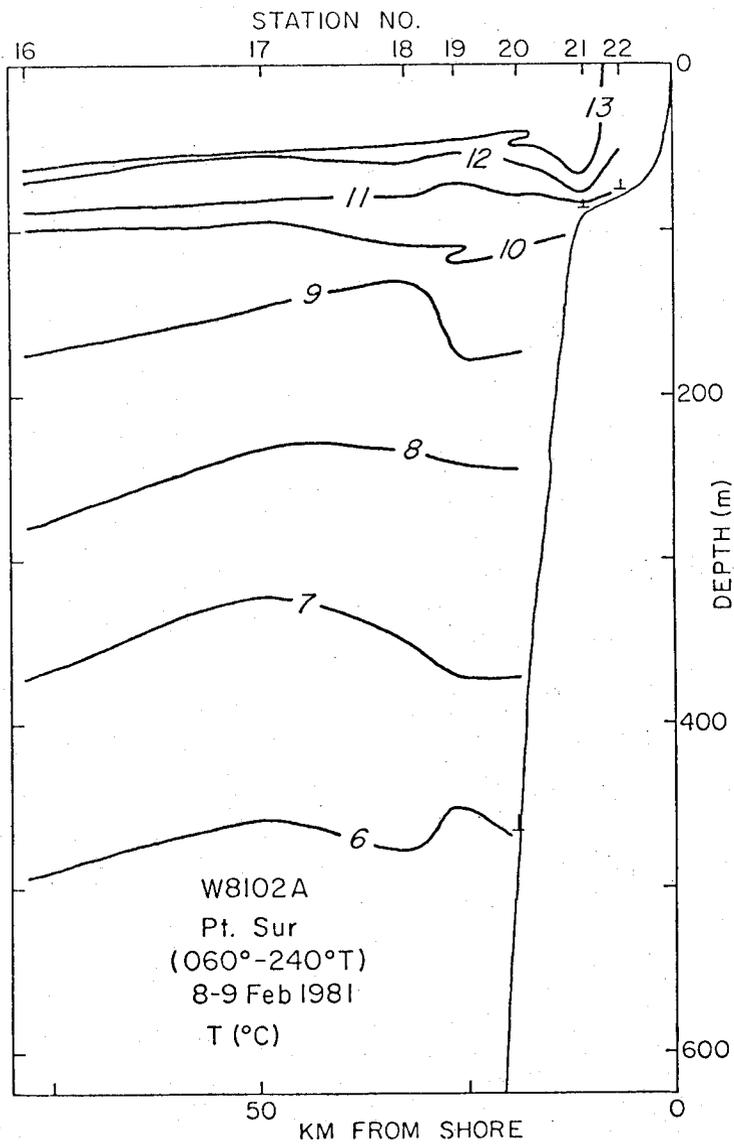

The data listing for each station gives values at standard pressures including observed and calculated parameters at the shallowest and deepest observation levels.

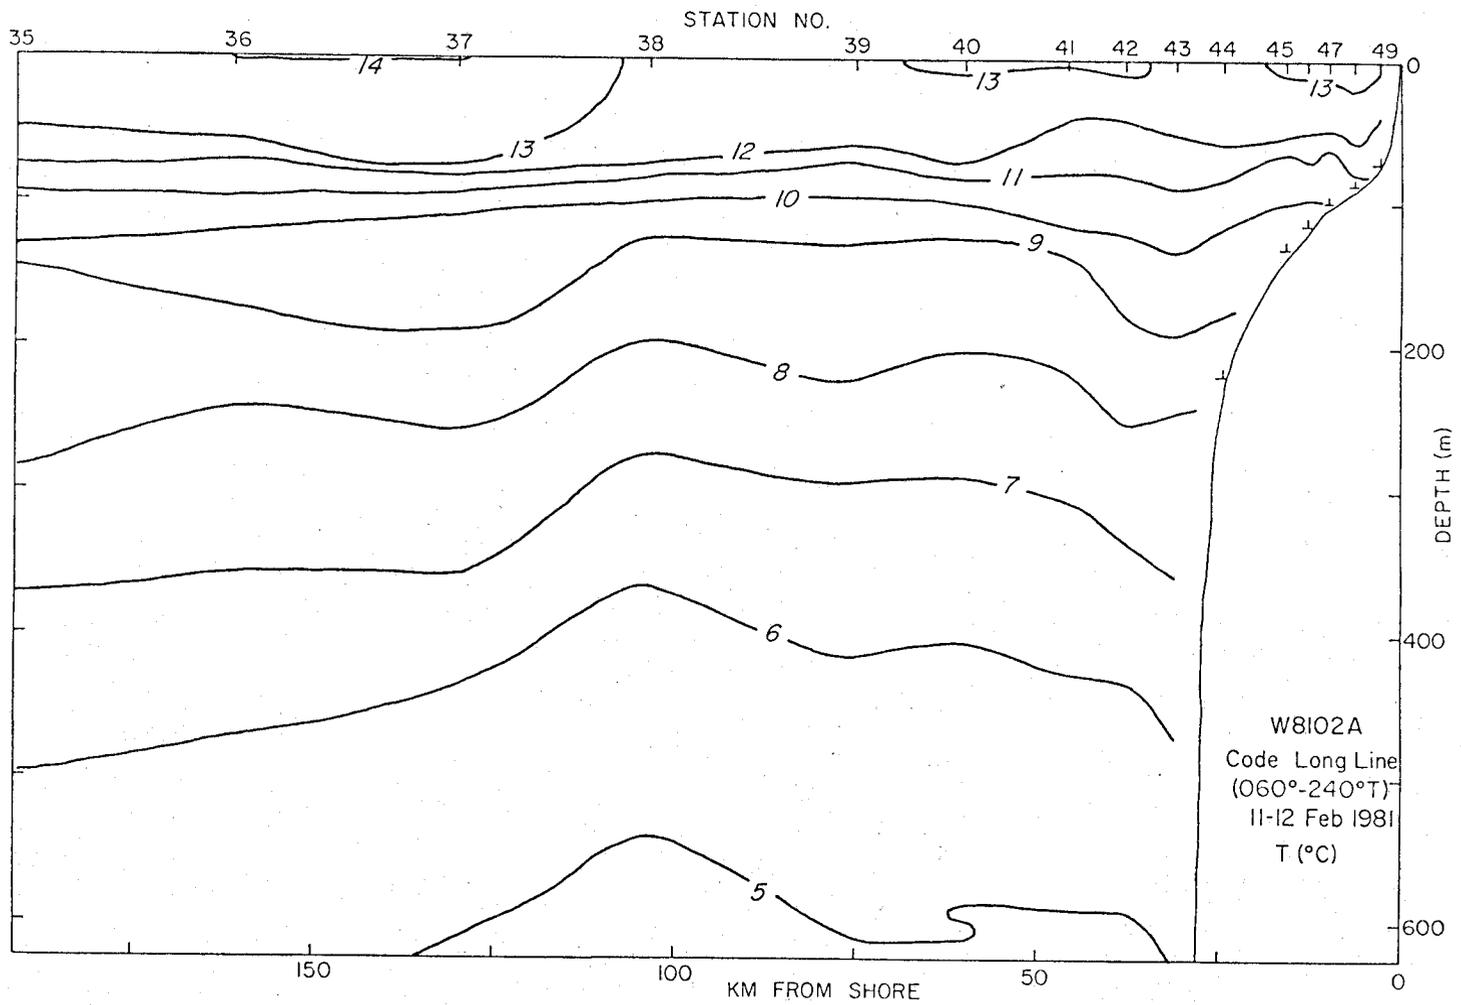

Temperature (TEMP), salinity (SAL), potential temperature (POTEN TEMP), sigma theta (SIGMA THETA), specific volume anomaly $\times 10^5$ (SVA) and dynamic height (DELD) in dynamic meters are given for each pressure (PRESS) in decibars. Computed parameters are calculated from the complete data array.

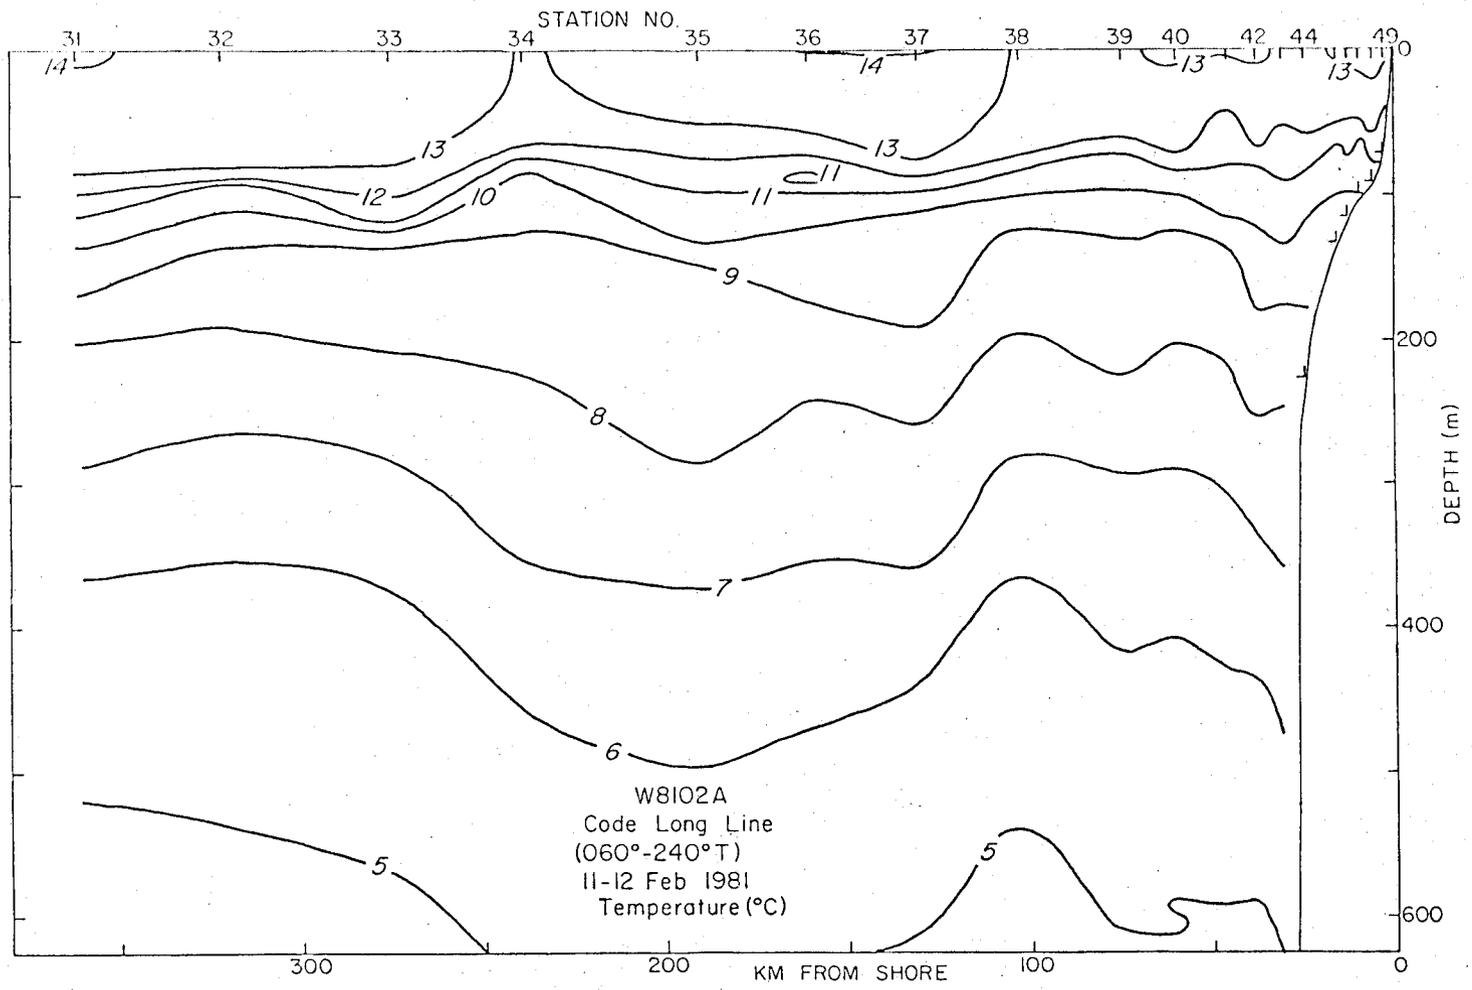

For each of the deep stations (Table 2), we also show near-bottom profiles of potential temperature, salinity and sigma-theta vs. depth; the bottom depth is indicated on each profile.
