ABSTRACT

CTD observations were made in the Code region near Pt. Arena on the northern California coast at 39°N, off Crescent City at 41°54'N, off Half Moon Bay at 37°25'N and off Pt. Purisima at 34°45'N during 2-13 July 1981. The observations in the Code region included three repeated sections along the Central Line, a mesoscale survey of the shelf slope region, and an alongshore section. The maximum sampling depth was 1000 m. This data report contains verticle sections, offshore survey maps, mesoscale maps and offshore profiles to summarize the data, and verticle profile plots and listings of the data at standard depths for each of the 141 CTD stations.

INTRODUCTION

The Coastal Ocean Dynamics Experiment (CODE) seeks to describe the response of continental shelf waters to a time-varying wind stress. The main purpose of the R/V Wecoma cruise CODE-1, Leg 7, was to make CTD observations in the CODE region between Pt. Arena and Pt. Reyes. A secondary purpose was to measure the near-surface flow field by using a doppler acoustic log and by deploying surface drifters that would be tracked from the coast or from the air. A third objective was to make CTD observations at distant alongshore locations. Finally, we hoped to recover a damaged current meter mooring near Crescent City. This report includes only the CTD observations.

The R/V Wecoma departed from Newport, Oregon on 1 July 1981 and began a CTD section (Stations 1-8) off Crescent City on 2 July (Figure 1, Table 1). The damaged current meter mooring was recovered during this section, and mooring personnel disembarked at Eureka on 3 July.

Surface drifters were deployed around Pt. Arena on 4 July, and we began a long CTD section (Stations 9-24) along the Code Central Line (Figure 1).

Infrared satellite images available just prior to the cruise indicated the presence of a well-defined tongue of cold water extending offshore in the vicinity of Pt. Arena. We used the Sea Surface Thermal Analysis for 1 July transmitted by the National Earth Satellite Service in Redwood City to design a survey of the front between the cold and warm water (Figure 2). After completing the Code Central Line on 5 July, we occupied stations in the offshore part of this pattern (beginning with Station 25), working gradually toward shore, and ending with Station 70 on the 100 fm isobath

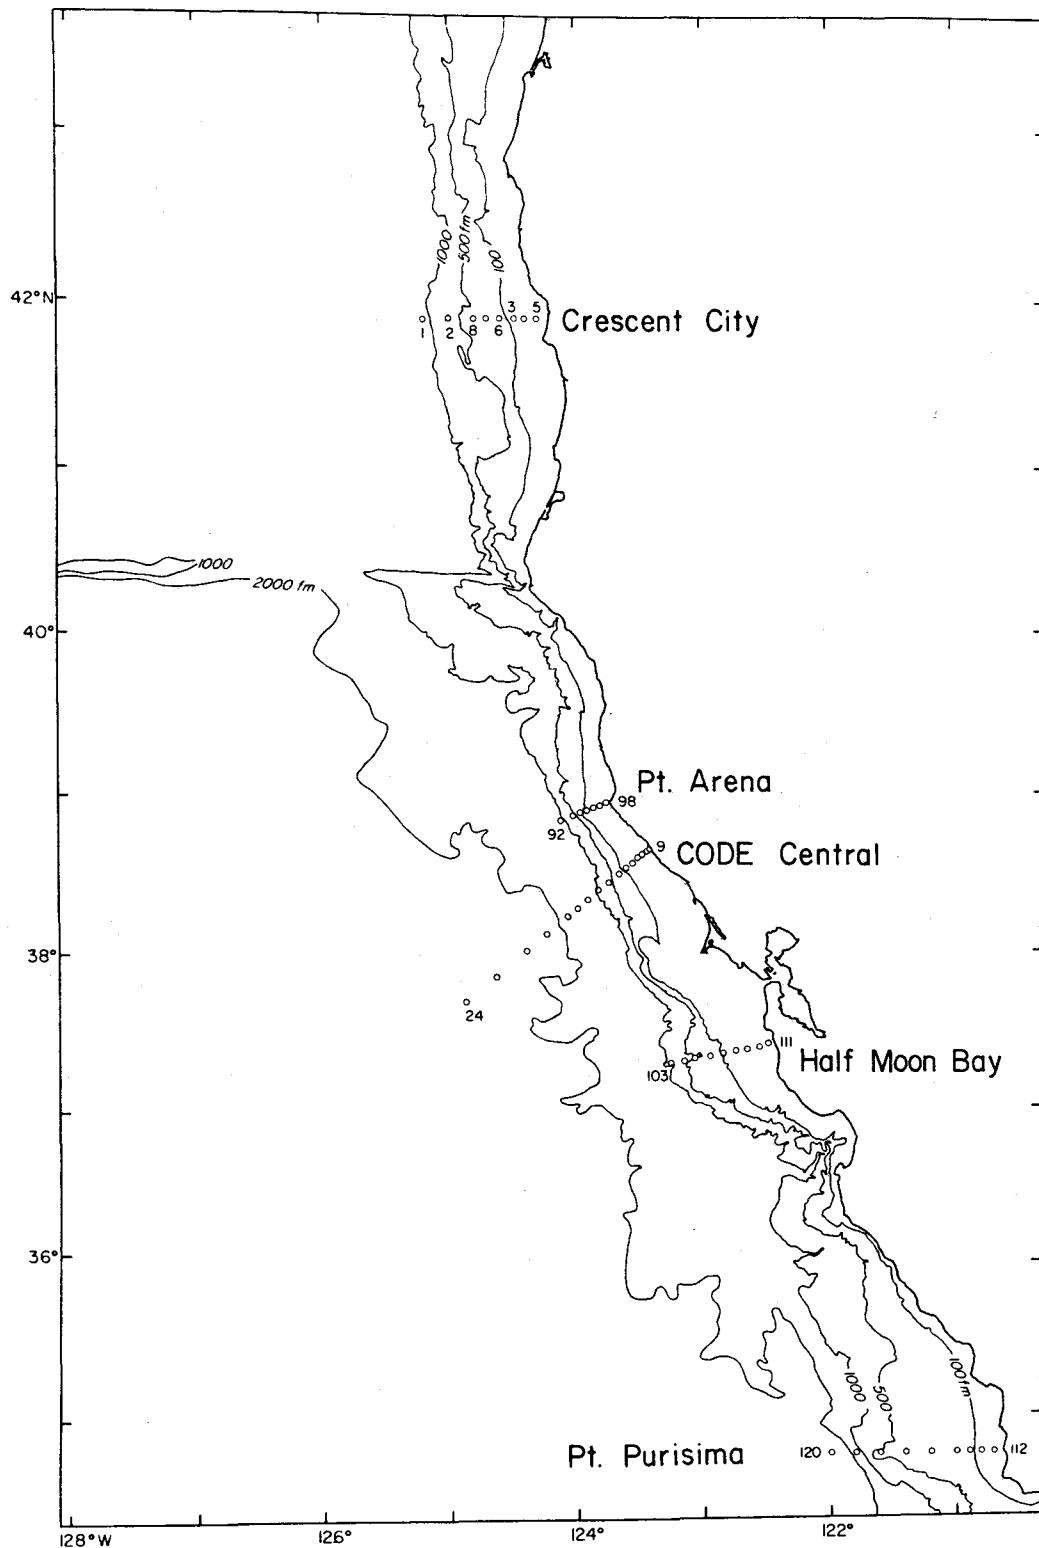

Figure 1. Location of stations off Crescent City and along the Code Central Line, 2-5 July 1981; and off Pt. Arena, Half Moon Bay and Pt. Purisima, 9-11 July 1981.

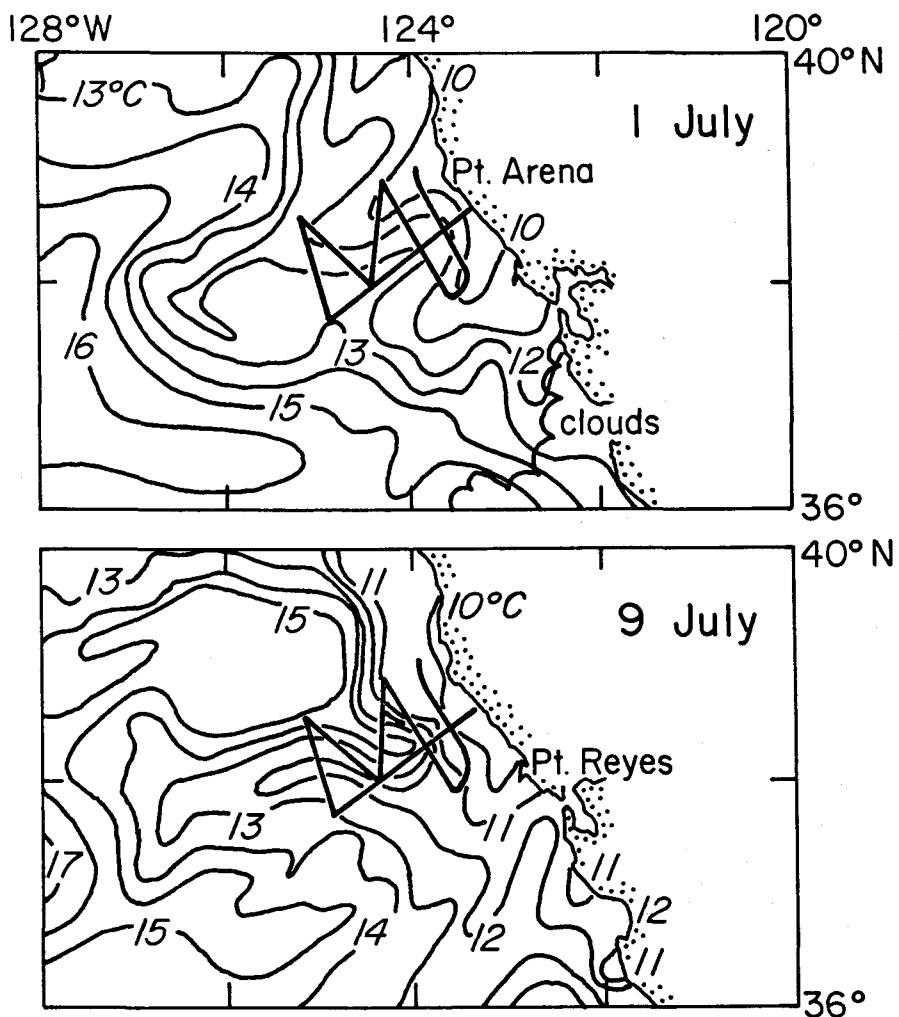

Figure 2. The Sea Surface Thermal Analysis for 1 July and 9 July, transmitted by the National Weather Service and received on the Wecoma during the cruise. These maps originate at the National Earth Satellite Service, Redwood City. The survey pattern designed from the 1 July map and an infrared satellite image for 26 June is superimposed.

Table 1. List of CTD stations occupied during Code-1, Leg 7, 1-14 July 1981, showing date and time, location, atmospheric pressure, wind speed and direction, and dry and wet air temperature.

near Pt. Reyes on 8 July (Figure 3, Table 1). The nearshore part of the Code Central Line (Stations 71-80) was repeated before continuing stations along the 100 fm isobath (Stations 81-91), and a section off Pt. Arena (Stations 92-98) was completed on 9 July (Figure 4). Surface drifters were deployed around Pt. Arena on 9 July. Additional CTD stations (100-102) were made off Pt. Reyes before occupying the section (Stations 103-111) off Half Moon Bay on 10 July (Figures 1, 3).

A section (Stations 112-120) was occupied off Purisima Pt. (Figure 1) on 11 July. A final survey of the Code region consisting of sections along the Code Central Line (Stations 121-129), the Arena Line (Stations 135-141) and a few stations (130-134) between these lines (Figure 4) was completed on 13 July. The final set of drifters was deployed around Pt. Arena on 14 July 1981. The R/V Wecoma arrived in Yerba Buena Island on 14 July after completing 141 CTD stations, recording 12 days of continuous doppler acoustic velocity data, and releasing 41 surface drifters.

Wind speed increased from the beginning of the cruise to a maximum of 30 kts on 7 July, after which it remained between 10 and 25 kts (Figure 5). Wind direction was predominantly between 300°T and 340°T throughout the cruise (Figure 5). The most common wind speed observed at CTD stations was between 20 and 24 kts, and the most common wind direction was between 315° and 344°T (Figure 6). The mean wind speed was 19 kts and the mean direction was 328°T; the standard deviations of speed and direction were 6 kts and 13°. Winds were generally alongshore (southeastwards) in the Code region between Pt. Arena and Pt. Reyes (Figures 7, 8). Winds in this region were similar to those observed in April and May 1981 (Fleischbein et al., 1982; Gilbert et al., 1981, 1982).

Scientific personnel on the cruise were Adriana Huyer, Robert Still, Dennis Barstow, Richard Schramm, Henry Pittock, Henry Schaechterle, David Still, Jane Fleischbein, Cydne Perhats, Mirth Miller, and Martin Olivera of Oregon State University, and Dan Rudnick of Scripps Institution of Oceanography.

SAMPLING PROCEDURES, CALIBRATION AND DATA PROCESSING

A Neil Brown Instruments Mark IIIb conductivity-temperature depth probe (CTD) was used to obtain continuous profiles of temperature and salinity versus pressure at each station. Characteristics of the CTD probe are presented in Table 2. Sampling procedures were identical with those described by Fleischbein, et al. (1981).

The CTD probe was calibrated for pressure, temperature and conductivity by the manufacturer prior to delivery in the fall of 1980. *In situ* calibration data were also collected for temperature and conductivity sensors. A Niskin bottle equipped with 3 protected reversing thermometers was mounted about 2 m above the CTD sensors to provide calibration samples. The thermometers have an accuracy of $\pm 0.02^{\circ}\text{C}$ and are corrected using the results of calibrations done once every 2 years. Water sample salinity is determined by Guildline Model 8400 Autosal salinometers with precision of better than $\pm 0.002\text{‰}$ and accuracy of $\pm 0.003\text{‰}$, using equations given by Bennett (1976).

CTD data are recorded at the actual sample depth after the bottle is tripped. Occasionally due to large wire angles the CTD and sample bottles do not remain at the same depth (and temperature) during soak time. When this resulted in relatively large differences between the sample and CTD temperature readings, these points were eliminated from the overall CTD-sample comparisons.

Duplicate salinity samples were drawn from the Niskin bottle at each station. One set of samples was sent to the Northwest Regional Calibration Center (NRCC), Bellevue, Washington for analysis (Keir, 1981). The second set of samples was analyzed on OSU's Autosal #1. The two sets of salinity

Table 2. Characteristics of CTD probe 2567.

Probe	Sample Interval	Temperature Time Constant	Sensors			
			P	T	C	
2567	32 ms	180 ms	Range: Resolution: Accuracy:	1600db .025db ± 1.6 db	-3 to 32°C .0005°C $\pm .005$ °C	1 to 65 mmhos .005 mmhos $\pm .001$ mmhos

Table 3. Summary of the differences between the *in situ* calibration data and the Neil Brown CTD probe.

Sta. No.	Temperature ΔT (°C)			Conductivity ΔC (mmhos cm^{-2})			Salinity			Conductivity Correction
	N	mean	s.d.	N	mean	s.d.	N	mean	s.d.	
1-24	22	-0.001	0.007	23	0.000	0.002	23	0.001	0.002	0
25-61	35	-.004	.008	35	.006	.003	35	.006	.003	+0.006
62-141	67	-.002	.010	68	.011	.002	68	.012	.002	+0.011

samples were not in complete agreement. Analysis procedures at OSU included more frequent standardizations of the salinometer using International Standard Seawater. In addition, analysis of NOAA's Secondary Standard Seawater and other duplicate samples showed that OSU's Autosal #1 was operating within specifications in the salinity range of 30°/oo to 40°/oo. We therefore used the samples analyzed at OSU to determine the *in situ* conductivity calibration.

Results of the comparison between *in situ* sample data and the CTD output are summarized in Table 3. The sample conductivity was calculated using the CTD temperature and sample salinity. CTD conductivity was corrected for the pressure and temperature effects on the cell prior to the comparison. The temperature differences are within the sampling and instrument errors so no further corrections were applied to temperature prior to processing the data. Analysis of the conductivity differences showed a change in calibration after Station 24 and after Station 61 (Figure 9). Therefore the comparison of the *in situ* sample data and the CTD output was divided into sections based on the changes: stations 1-24, 25-61, and 62-141. The changes in conductivity calibration might have been the result of cleaning the conductivity cell with a solution of granular "Labtone" soap and/or a weak (5%) solution of hydrochloric acid. The cell was cleaned with soap and acid before Stations 9, 25, 80 and 134, and with acid alone before Stations 43, 62, 112 and 118, but changes in calibration occurred only at Stations 25 and 62. We do not understand why or how cleaning the cell at these stations differed from cleaning the cell at the other stations. We have since stopped routine cleaning of the conductivity cell.

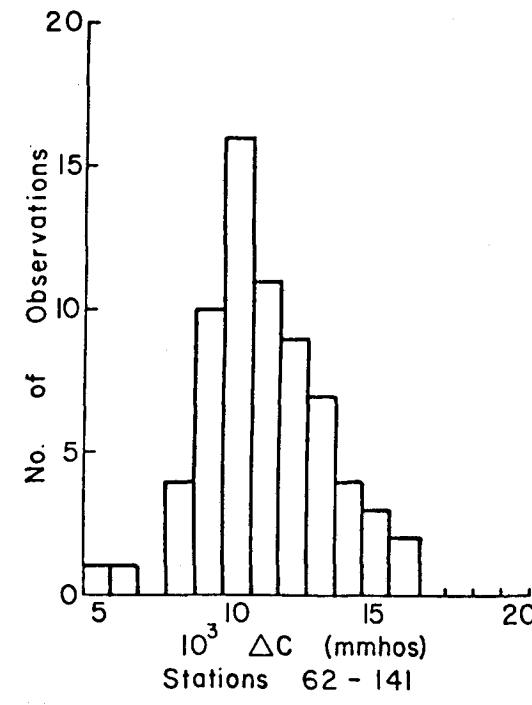

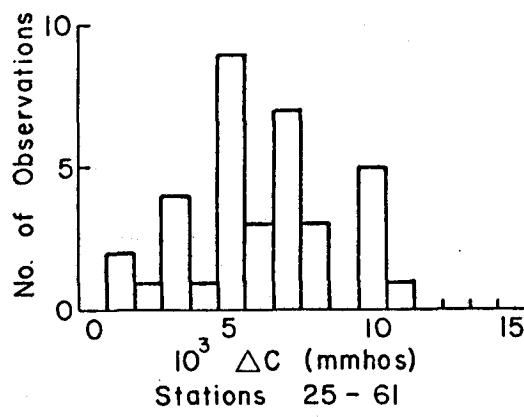

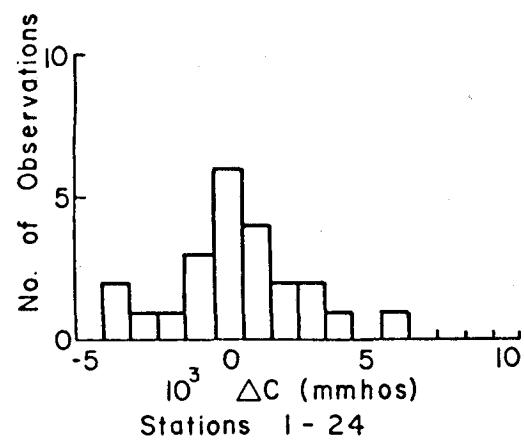

Figure 9. Histograms of the differences in conductivity between the calibration sample and the uncorrected CTD output.

The conductivity differences at Stations 1-24 had a mean of 0.000 and standard deviation of 0.002 so no further corrections were applied prior to processing the data at these stations. Conductivity corrections of mean $+0.006 \text{ mmhos cm}^{-2}$ and $+0.011 \text{ mmhos cm}^{-2}$ were applied from Stations 25-61 and Stations 62-141, respectively.

The procedures for data processing were described by Gilbert, Huyer and Schramm (1981). The coefficient (α) for the conductivity filter was 0.862. Stations that showed a sudden jump or shift in conductivity that was probably due to detritus in the cell were edited during processing and are presented in Table 4. These stations also have footnotes to the listings in the body of the data report: the linear interpolation refers to processed salinity or raw conductivity only.

Table 4. Stations edited during data processing.

Station No.	Depth of Jump in Conductivity	Remedy
28	53-58db	Linear interpolation of processed salinity at 53-58db.
46	22-27db	Linear interpolation of processed salinity at 22-27db.
47	24-42db	Linear interpolation of processed salinity at 24-42db.
62	21-27db	Replaced data from 21-27db with data from recast.
65	119-124db, 152-154db	Linear interpolation of processed salinity at 119-124db, 152-154db.
74	22-33db	Linear interpolation of processed salinity at 22-33db.
84	68db	Linear interpolation of three lines of raw conductivity data at 68db; then reprocessed.
104	48-53db	Linear interpolation of processed salinity at 48-53db.
117	112-116db	Linear interpolation of processed salinity at 112-115db.
124	81-84db	Linear interpolation of processed salinity at 81-84db.
128	169-175db	Linear interpolation of processed salinity at 169-175db.
130	26db	Linear interpolation of 30 lines of raw conductivity data at 26db; then reprocessed.
133	35-45db	Joined data from 1-54db with data from recast to 55-505db from original cast.
136	204-208db	Linear interpolation of processed salinity at 204-208db.

DATA PRESENTATION

The hydrographic data are summarized in vertical sections, maps and offshore profiles. For each section, we show the vertical distribution of temperature, salinity, and sigma-theta, contoured by hand. Tick marks at the top of each section indicate station positions at which a CTD cast was made, and an inverted "T" marks the maximum depth of each cast.

For the offshore survey of 4-10 July, we show maps of temperature, salinity, sigma-theta and dynamic height at selected depths. The distributions have been contoured by hand, using data from Stations 71-80 for the inshore portion of the Code Central Line, where stations were occupied twice. In these maps, we have not attempted to extrapolate the dynamic height into water shallower than the reference level - only data from stations as deep as 500 db are used.

For the mesoscale surveys of the Code region between Pt. Arena and Pt. Reyes, we show maps of surface temperature, salinity and sigma-theta, and of dynamic height at 0 db, 100 db and 200 db relative to 500 db. In this region, dynamic height at stations shallower than the reference level was computed using the extrapolation method described by Reid and Mantyla (1976); bottom contours are included to show where extrapolation was used.

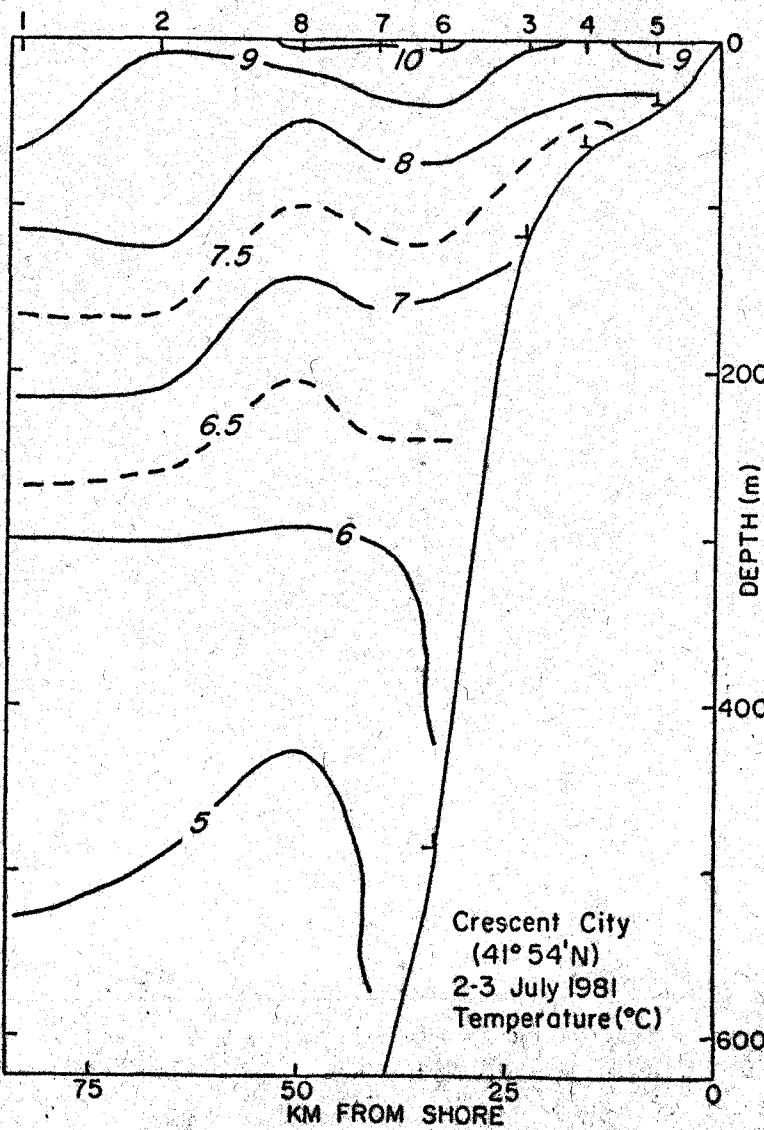

For each hydrographic section in Figure 1 and repeated Code Central Line sections, we also show offshore profiles of temperature, salinity, sigma-theta and dynamic height relative to 500 db. Dynamic height at shallow stations was computed using the extrapolation method described by Reid and Mantyla (1976); the extrapolated portion of each profile is dashed.

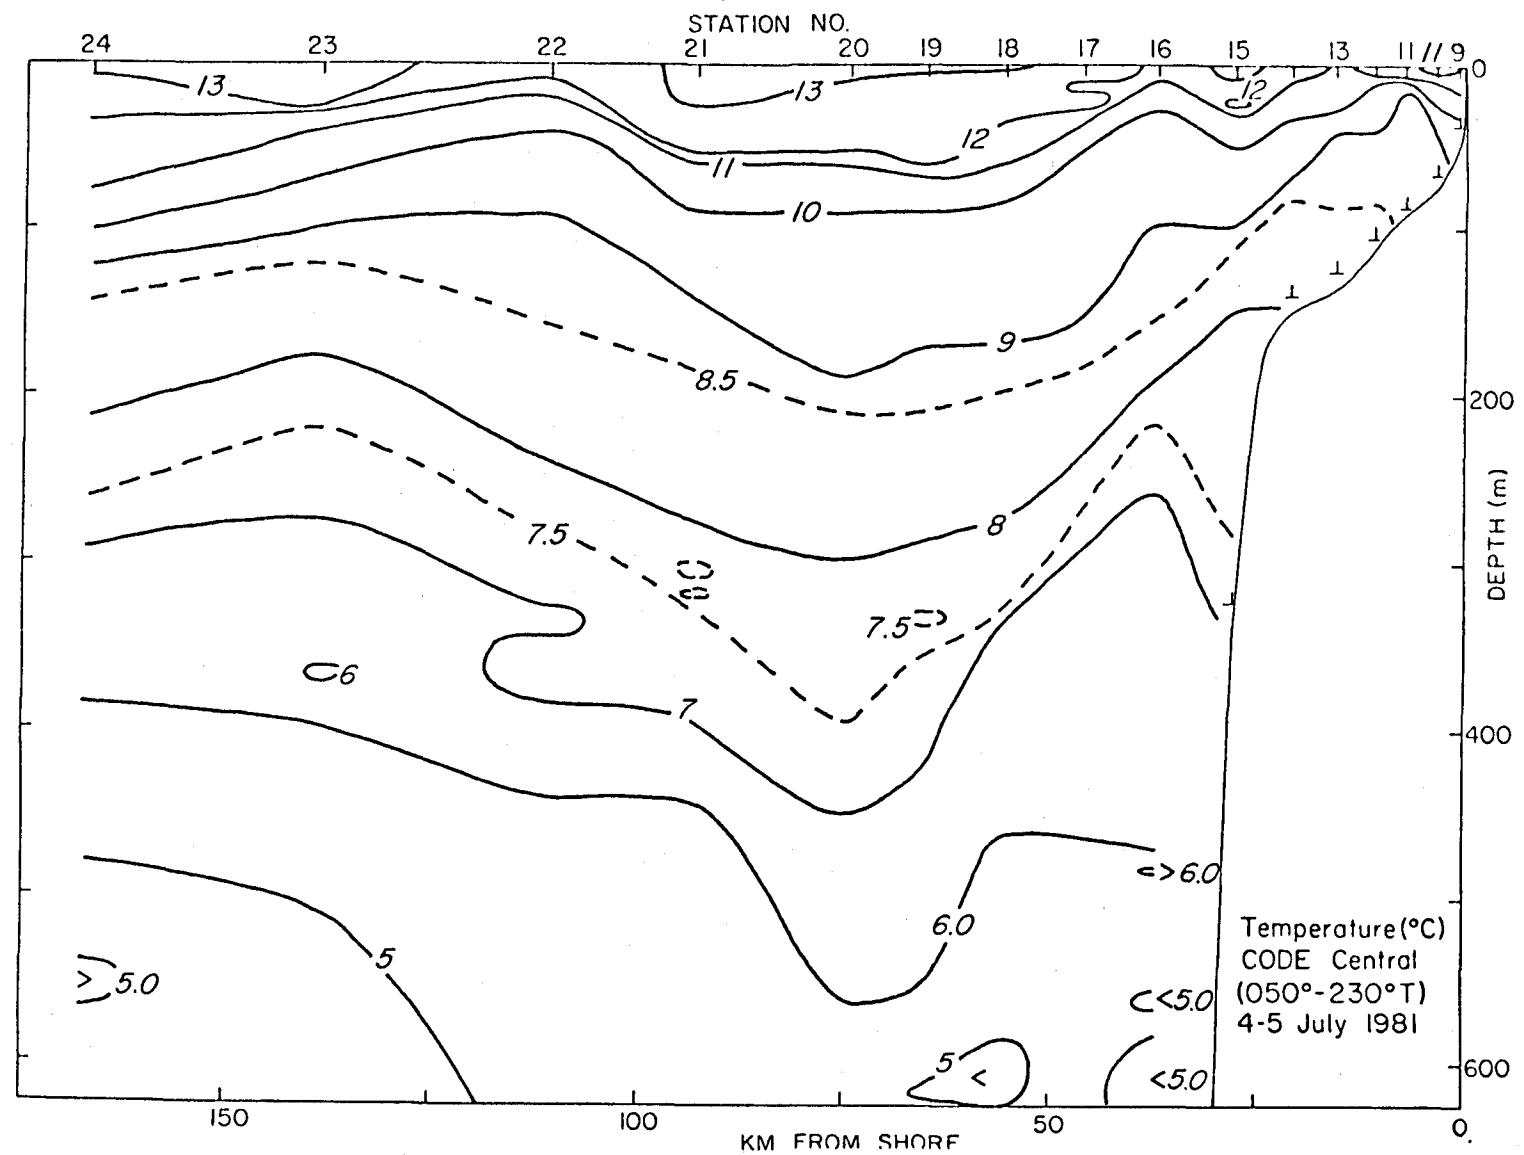

Vertical profiles of temperature, salinity and sigma-theta vs. pressure are shown for each station. Header information for each station is as follows:

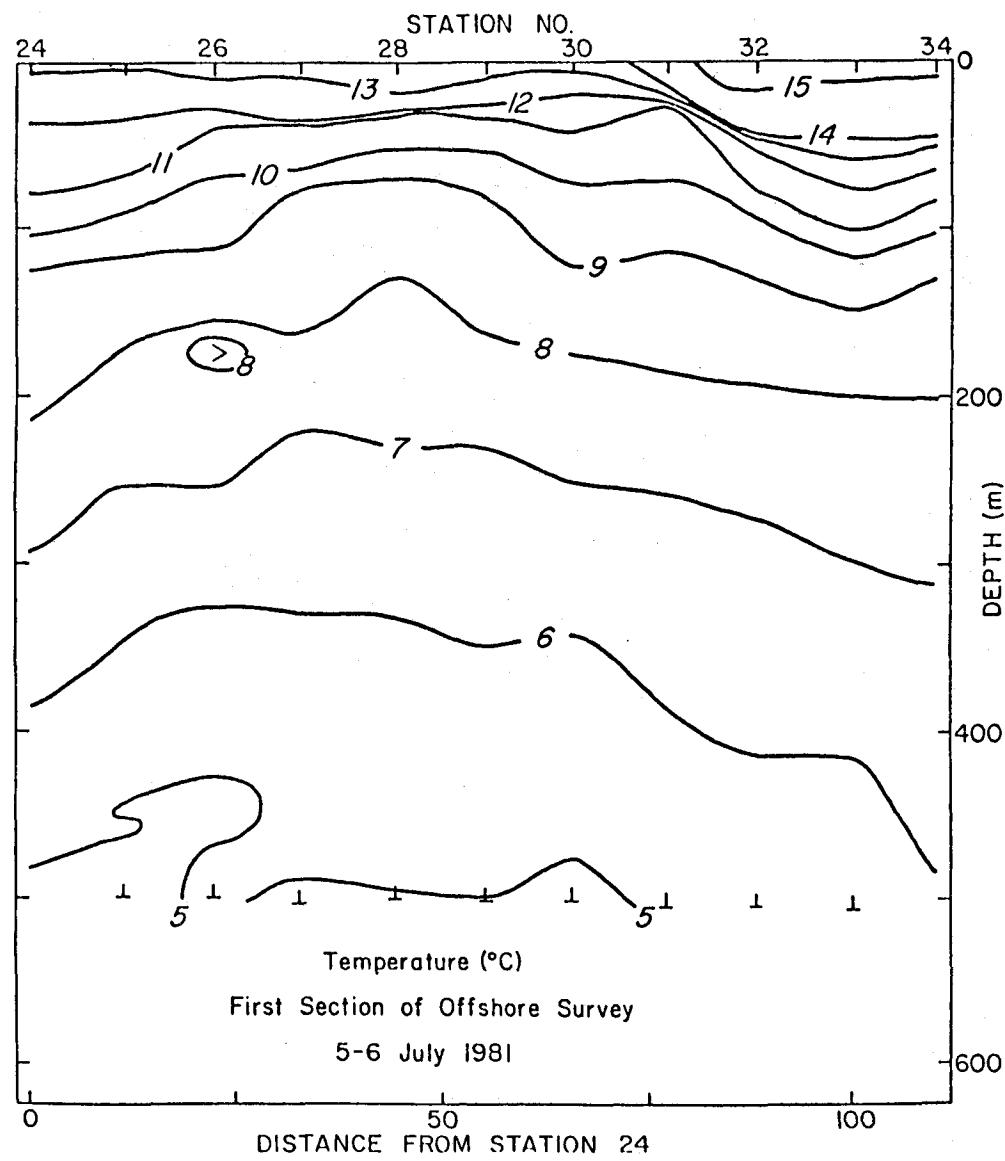

STA NO	Consecutive station number.
STATION	The CTD section name (initialled) and number of the station on the line (Refer to Figures 1 and 2).
LAT	Latitude in degrees and minutes north of the equator.
LONG	Longitude in degrees and minutes west of Greenwich.
DATE	Day/Month/Year.
TIME	Time in Greenwich Mean Time.
PROBE	CTD probe number.
DEPTH	Sonic depth in meters, corrected according to Matthews Tables appearing in the Handbook of Oceanographic Tables, U.S. Naval Oceanographic Office Publication SP-68 (1966).

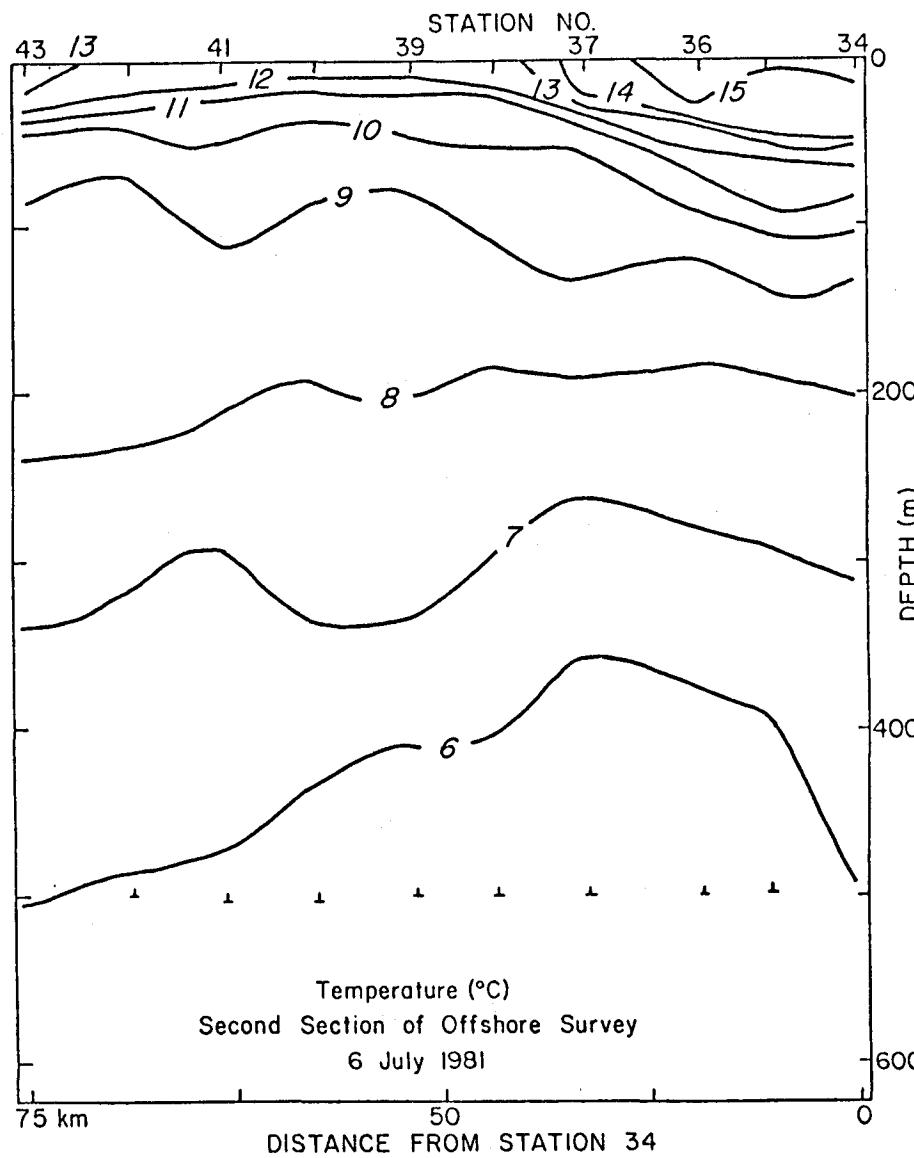

The data listing for each station gives values at standard pressures including observed and calculated parameters at the shallowest and deepest observations levels. Temperature (TEMP), salinity (SAL), potential temperature (POTEN TEMP), sigma-theta (SIGMA THETA), specific volume anomaly $\times 10^5$ (SVA) and dynamic height (DELD) in dynamic meters are given for each pressure (PRESS) in decibars. Computed parameters are calculated from the complete data array.

ACKNOWLEDGMENTS

Hydrography in the Coastal Ocean Dynamics Experiment is supported by the National Science Foundation through grant OCE-8014939. Additional support for the sections off Crescent City, Half Moon Bay and Purisima Point was provided through NSF Grant OCE-8026131. One of us, Martin Olivera, was supported by a fellowship from the Organization of American States.
