Abstract

Hydrographic measurements, made with CTD and STD probes in the vicinity of Cabo Corveiro, NW Africa during the JOINT-I experiment in Spring 1974, are presented. Computer plots of the vertical profiles of temperature, salinity, and sigma-t are shown for each hydrographic station. Associated values of temperature, salinity, sigma-t, specific volume anomaly, dynamic height anomaly, and potential energy are tabulated at selected depth intervals. Meteorological and location information for each station is also given.

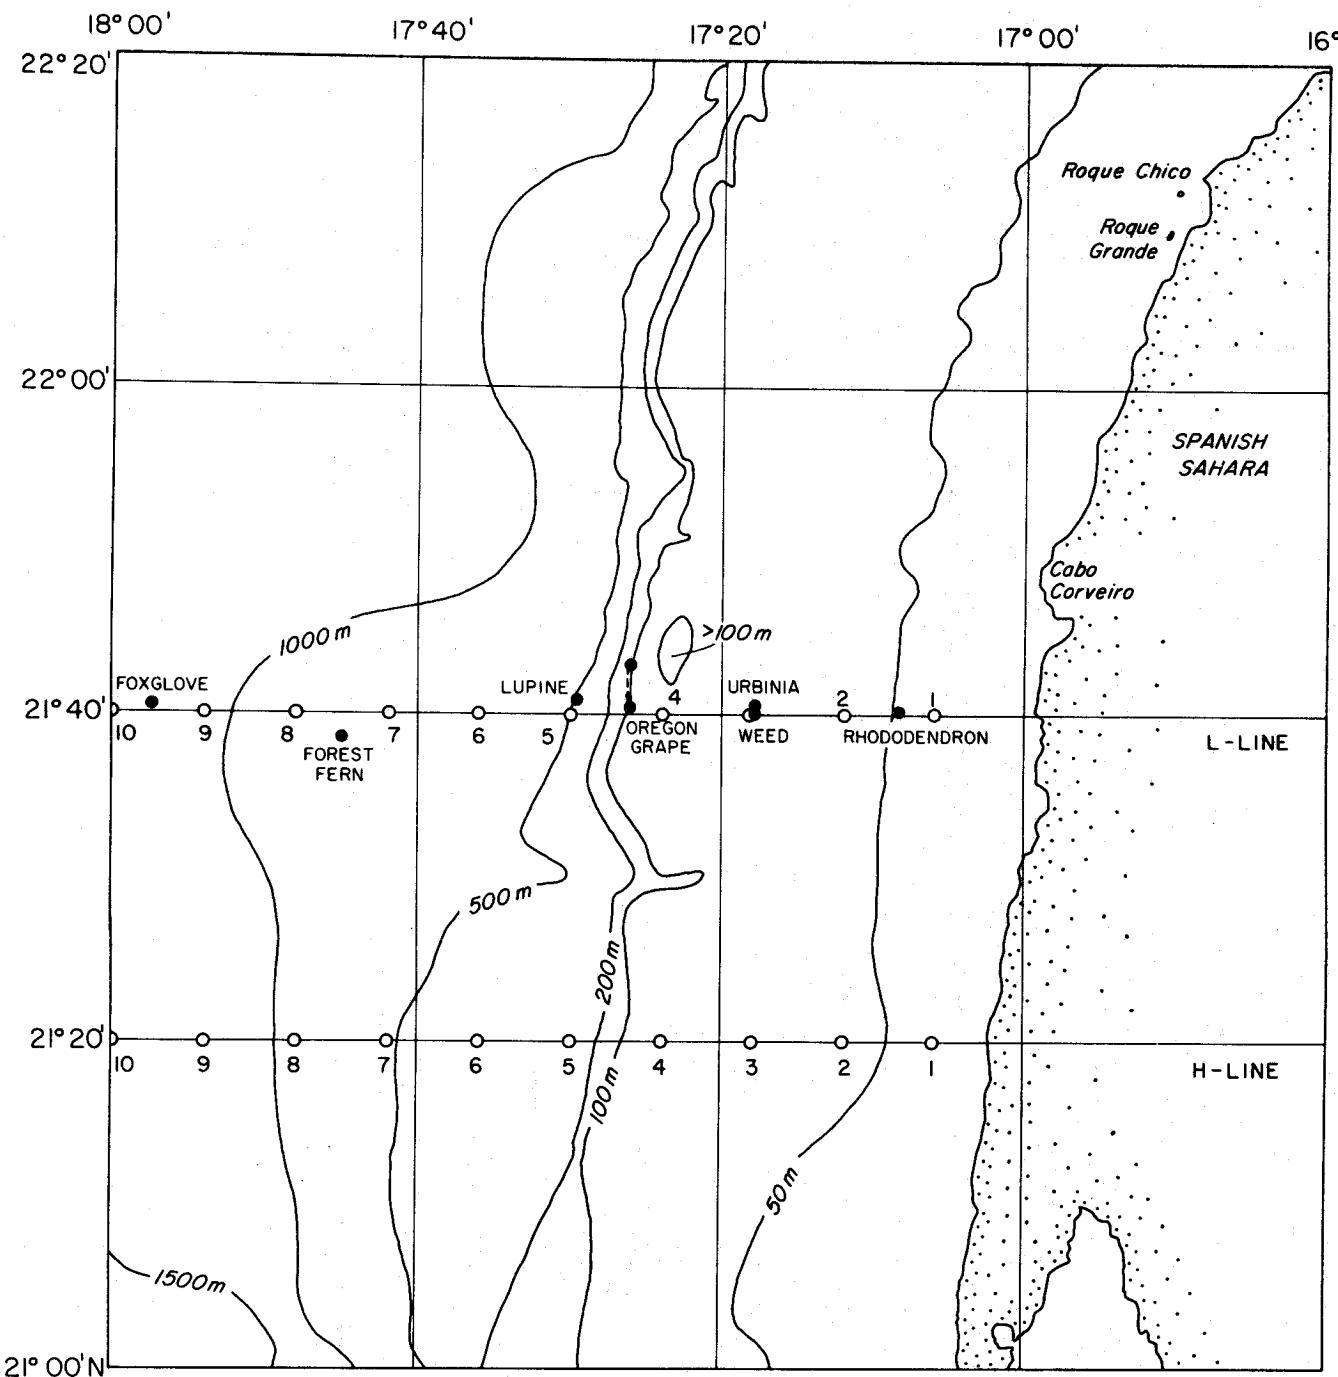

Fig. 1. Standard hydrographic stations and current meter moorings during JOINT-I.

Introduction

This data report contains a summary of the hydrographic data gathered by R/V GILLISS during February, March, and April 1974 as part of the Coastal Upwelling Ecosystems Analysis field program known as JOINT-I. Repeated hydrographic surveys were made at a series of stations over the Northwest African continental shelf and slope off Spanish Sahara (Fig. 1). The main line of stations sampled was situated along 21°40'N, the latitude of the Oregon State University current meter mooring array deployed during JOINT-I. A second station line at 21°20'N was surveyed twice during the cruise. In addition, several time series stations were made in conjunction with Profiling Current Meter (PCM) measurements and a number of casts were made while following parachute drogues. Observations from the moored current meters are reported separately (Pillsbury et al., 1975).

Cruise Information

R/V GILLISS cruise GS7401 proper was preceded by a shakedown cruise GS7401A designed to check out shipboard equipment and develop techniques for using O.S.U. instruments aboard the vessel. During the shakedown cruise, which departed Miami, Florida at 1600 (local time) 5 February and returned to Miami 0930 6 February, two test CTD casts were made. These are excluded from this report, as are all later test casts.

The cruise itself was divided into three scientific legs:

Leg 0 - Miami to Las Palmas, 9 - 27 February 1974;

Leg 1 - Las Palmas to Las Palmas, 3 - 19 March 1974;

Leg 2 - Las Palmas to Las Palmas, 22 March - 9 April 1974.

An outline of the work accomplished during each leg is given below.

Leg 0

GILLISS arrived in the JOINT-I experimental area late 22 February and surveyed both the L-line ($24^{\circ}40'N$) and the H-line ($21^{\circ}20'N$) once. Moorings Rhododendron and Urbinia, both with subsurface current meter strings and surface meteorological buoys, were installed on 23 and 24 February in depths of 42 meters and 67 meters respectively. The ship headed for Las Palmas on 25 February. Scientific personnel were from Oregon State University: Dr. R. L. Smith, Mr. R. E. Still, Mr. B. Moore, Mr. R. Kapaun, Mr. D. Root, Mr. D. Barstow and Mr. T. Wright; and from Environment Canada: Dr. A. Huyer.

Leg 1

During this leg, ten transects were made along the L-line and one along the H-line. An anchor station was maintained from 1315 GMT 8 March to 1431 GMT 9 March in 97 meters of water. At this station a number of PCM casts were interspersed between CTD casts. In association with drogue tracking experiments (between 1012 GMT 15 March and 0520 GMT 17 March), 17 CTD casts were made.

Over the period 4 - 7 March, current meter moorings Weed (in 67 meters depth), Oregon Grape (with surface meteorological buoy in 104 meters depth), Lupine (in 400 meters depth), and Foxglove (meteorological buoy only, in 1200 meters of water) were installed. On 16 March the current meter string at Foxglove was installed and during the following day moorings Rhododendron and Urbinia were retrieved and reinstalled.

The scientific party was composed of contingents from Oregon State University: Dr. R. L. Smith, Dr. E. D. Barton, Mr. R. E. Still, Mr. T.

Wright, Mr. D. Root, Mr. D. Barstow, Mr. R. Kapaun, Mr. B. Moore; from Environment Canada: Dr. A. Huyer; from Inter-American Tropical Tuna Commission: Dr. M. Stevenson, Mr. R. Wagner, Mr. S. van Voorhis; from Deutsches Hydrographisches Institut, Hamburg, Germany: Dr. E. Mittelstaedt, Mr. K. Huber; and from the University of Liverpool, England: Mr. P. Hughes.

Leg 2

The work during this leg was again comprised of hydrographic sampling, drogue tracking, PCM anchor stations and mooring activities. The L-line was occupied on five occasions. Fifteen drogue stations were made between 1435 GMT 28 March and 0324 GMT 1 April. PCM stations were occupied in the periods 25 to 27 March, 29 to 31 March, and 1 to 3 April. On 24 March, the Forest Fern current meter string and surface meteorological buoy were moored in 788 meters depth. The Oregon Grape mooring and meteorological package were serviced the following day, and on 6 April moorings Foxglove, Lupine and Weed were retrieved intact.

Scientific personnel were from Oregon State University: Dr. R. D. Pillsbury, Dr. E. D. Barton, Dr. D. R. Johnson, Mr. R. E. still, Mr. D. Barstow, Mr. B. Moore, Mr. R. Kapaun; from the Inter-American Tropical Tuna Commission: Dr. M. Stevenson, Mr. R. Wagner, Mr. S. van Voorhis; from the Deutsches Hydrographisches Institut: Dr. E. Mittelstaedt, Mr. K. Huber; from the University of Ghana: Dr. R. Houghton; and from the Fishery Research Unit, Ministry of Agriculture, Ghana: Mr. Enoch Opey.

The hydrographic work is summarized in two figures. The temporal and spatial distribution of hydrographic casts made along the L-line

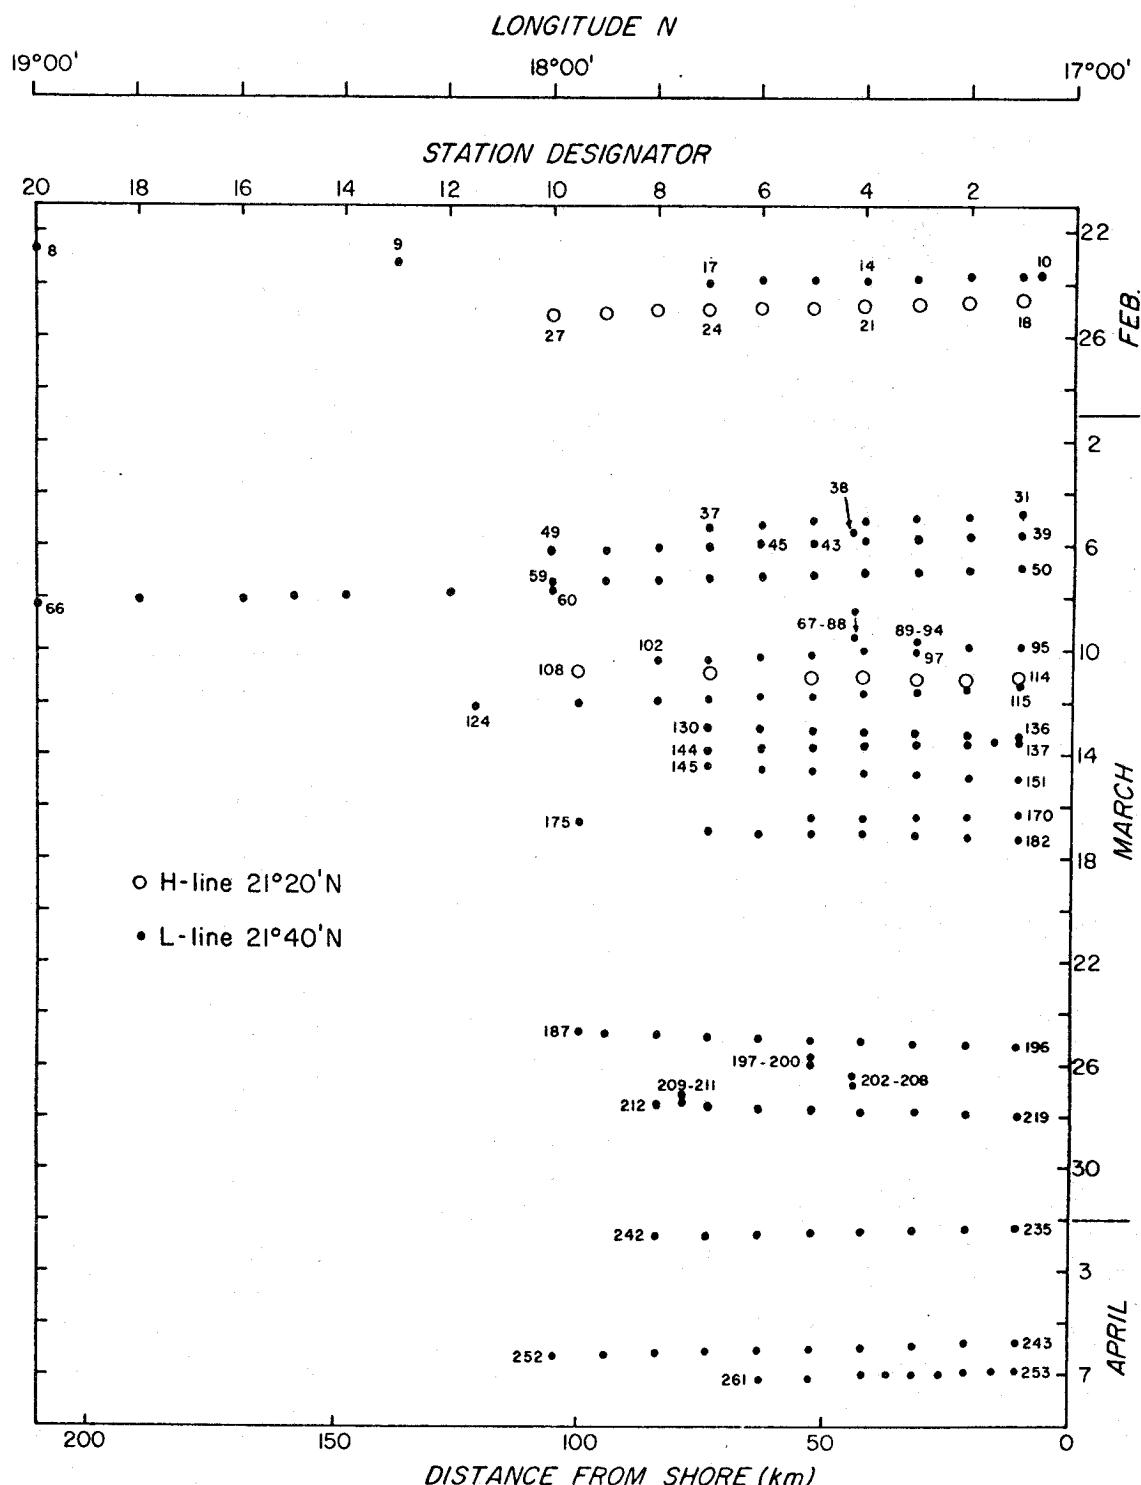

Fig. 2. Temporal and spatial distribution of hydrographic casts made along the L-line ($21^{\circ}40'N$) and the H-line ($21^{\circ}20'$).

($21^{\circ}40'N$) and the H-line ($21^{\circ}20'N$) is shown in Figure 2. This illustrates the dates and longitudinal positions of stations made during all the sections and anchor stations. Drogue station positions are shown in Figure 3.

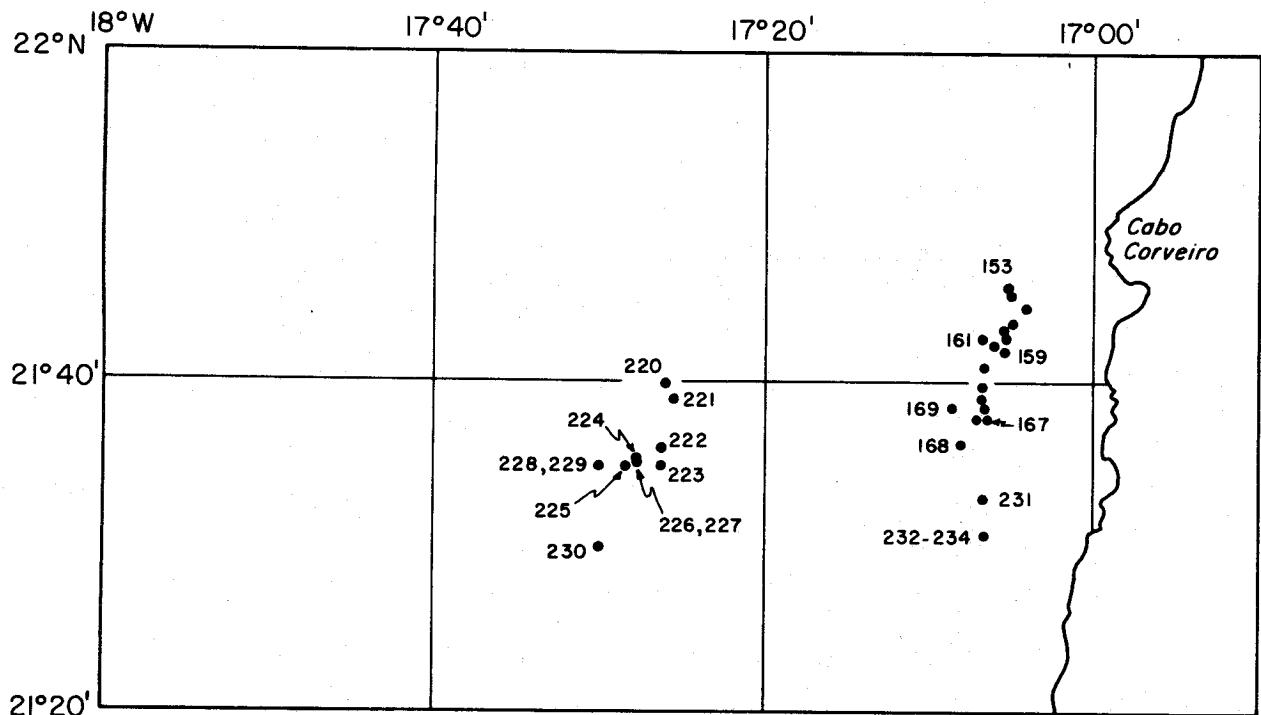

Fig. 3. Positions of hydrographic casts made during parachute drogue experiments. Casts 153-169 were made on 15 and 16 March; casts 200-234 between 28 March and 1 April.

Data acquisition

During the course of the cruise four different probe units were used, three Geodyne conductivity-temperature-depth (CTD) units and one self-contained Bissett-Berman 9060 salinity-temperature-depth (STD) unit. One

of the Geodyne units, CTD 1, had been used extensively in CUE-I and CUE-II (Huyer, 1974). None of the CTD units functioned well throughout the whole cruise. Backup unit CTD 2 produced noisy profiles and was rejected. CTD 1 produced good profiles but became unreliable after striking the ship's hull in high seas and was not used thereafter. CTD 3, the primary instrument, although it suffered from a persistent fault discussed later, was preferred to the STD because of its higher resolution and greater depth range. It was eliminated, however, at station 200 by colliding with the hull of the GILLISS in a moderate swell and sustaining irreparable damage. As the sampling rates of the three CTD probes were different, depth intervals between observations were also different for a given descent rate (ideally 15 m/minute, usually faster). The obtained frequency of observation was usually better than one observation every 3 meters for all CTD units and almost one per meter for CTD 3 which had the fastest sampling rate (see Table 1). The STD probe salinity and temperature data were recorded as continuous analog plots versus depth on an internal two pen recorder. As a rule, data was recorded during both lowering and raising of the probes. Descent and ascent rates, therefore sampling rates, were comparable.

Table 1

<u>Probe</u>	<u>Sampling Rate</u>	<u>Stations where used</u>
CTD 1	Once in 4 sec	30, 92-107
CTD 2	Once in 2 sec	207-216
CTD 3	Three times in 4 sec	8-29, 31-91, 108-200
STD	Produces analog trace	202-206, 217-261

Identical sampling procedures were used with all instruments. At shallow stations measurements were taken to within 10 m of the bottom where possible. An NIO water bottle, mostly with reversing thermometers, was routinely placed 2 m above the probe sensors. The bottle was tripped with a messenger at some known depth after a wait of 5 minutes for the reversing thermometers to reach a steady value at that depth. For each CTD cast, a salinity sample was drawn and the reversing thermometers read by two observers. On occasion more than one NIO bottle was hung on the CTD wire.

Weather observations, with the exception of wet and dry bulb air temperatures which were measured by the scientific watch, were recorded by the bridge officers.

Data processing

The CTD and STD data sets, by necessity, were processed differently.

a) CTD data

The CTD units have sensors to measure pressure, temperature, and conductance. The sensor outputs are digitized sequentially at regular intervals and recorded on magnetic tape, and on paper tape as a backup. The data is also made immediately available aboard ship as a teletype listing and as a graphical output.

The recorded digital output was converted to nominal values of pressure, temperature and conductivity by means of formulae previously derived for each probe. Depths in meters were assumed to be equal to pressures in decibars rounded off to the nearest whole number. Depth resolution of the probes is about 1 meter. The data from each CTD cast were divided into a

profile obtained while lowering the probe and one obtained while raising it. In these profiles, observations at the same depth were averaged and values outside prescribed limits were deleted. NIO bottle salinity data and reversing thermometer data were used to derive a correction for the probe values. Temperature and salinity samples were collected on most CTD casts. The sample depths were 2 meters less than the probe depth at the time when the sample was taken, except when there was more than one bottle on the wire.

CTD temperatures were compared with reversing thermometer temperatures at the same depth. The mean and standard deviations of the differences were calculated. In no case did a temperature correction appear necessary.

An inductive salinometer was used to determine sample salinity. The error is estimated at less than 0.01 o/oo. The conductivity of each water bottle sample was computed from depth, sample temperature and sample salinity. In the case where no reversing thermometers were used, CTD temperature at the sample depth was assumed to be the same as sample temperature. For each set of data, sample and CTD conductivities were compared and the best fit straight line according to the least squares criterion was calculated. The derived linear function was used to correct all CTD conductivity data in that set. Corrected salinity was calculated from depth, temperature and conductivity using the equations of Perkin and Walker (1972).

The conversions from sensor digital output to nominal engineering units are listed in Table 2 for each probe. Statistics of the temperature calibrations are shown in Table 3. The derived conductivity corrections are listed in Table 4.

Table 2. Original conversions from sensor digital outputs to nominal engineering units. PWORD, TWORD, CWORD are the segments of the digital output corresponding to pressure, temperature and conductivity.

$$\text{CTD 3 } T = -2.0534 + 8.977442 \times 10^{-3} \times \text{TWORD} + 1.188935 \times 10^{-8} \times \text{TWORD}^2 \text{ (}^{\circ}\text{C)}$$

$$C = 28.6176 + 0.95837 \times 10^{-2} \times \text{CWORD} \text{ (mhos/cm}^2\text{)}$$

Table 3. Temperature Calibrations

CTD Unit	Number of Comparisons	Sample temperature-CTD temperature	
		Mean	Standard deviation
1	17	-0.02	± 0.03
2	12	-0.01	± 0.04
3(Leg 0)	26	0.01	± 0.03
3(Leg 1)	191	0.00	± 0.02
3(Leg 2)	3	0.04	----

Table 4. Coefficients of the least squares straight line fit, $y = a + bx$, between sample conductivity and CTD conductivity.

CTD unit	Number of comparisons	a	b
1	17	-0.6792	0.98698
2	12	0.0600	1.00000
3(Leg 0)	26	0.0904	0.99688
3(Leg 1)	102	0.1591	0.99500
3(Leg 2)	20	-0.0644	1.00020

Because of the small number of comparisons and their limited conductivity range, a straight line fit was not made to the set of data from CTD 2. Instead, the mean difference between sample conductivity and CTD conductivity was used to correct the latter.

A fault in CTD 3 caused erroneously low conductivity values to be recorded during the descent through the upper 30 meters. All salinity values in the depth range 0-30 meters were excluded from the calibration procedure. Temperature samples at the same depths were included. The data were separated into groups from Legs 0, 1, and 2 for calibration.

Conductivity calibrations for Legs 0 and 1 were carried out using deep samples only. Then, for both legs, sample salinities in the upper layers were compared with the CTD salinities based upon calibrated conductivity. Salinities from 'down' profiles and 'up' profiles were compared separately (Figure 4). CTD salinities in the descending profiles deviate widely above 20 meters from sample salinities and have a large scatter, whereas those from ascending profiles agree well considering that there was usually a significant time lag between the taking of the bottle sample and the CTD's reaching that depth. Descending profiles obtained by CTD 3 were discarded in favor of ascending profiles wherever possible. If no up trace existed, then the down trace was corrected in the upper layers by reference to the salinity samples. When there were none, it was assumed that the upper 20 meters were well mixed with respect to salinity. In 34 cases, it was necessary to use the down trace. Of these, five profiles were assumed to be of constant salinity in the upper 20 m even though temperature was not uniform in that layer.

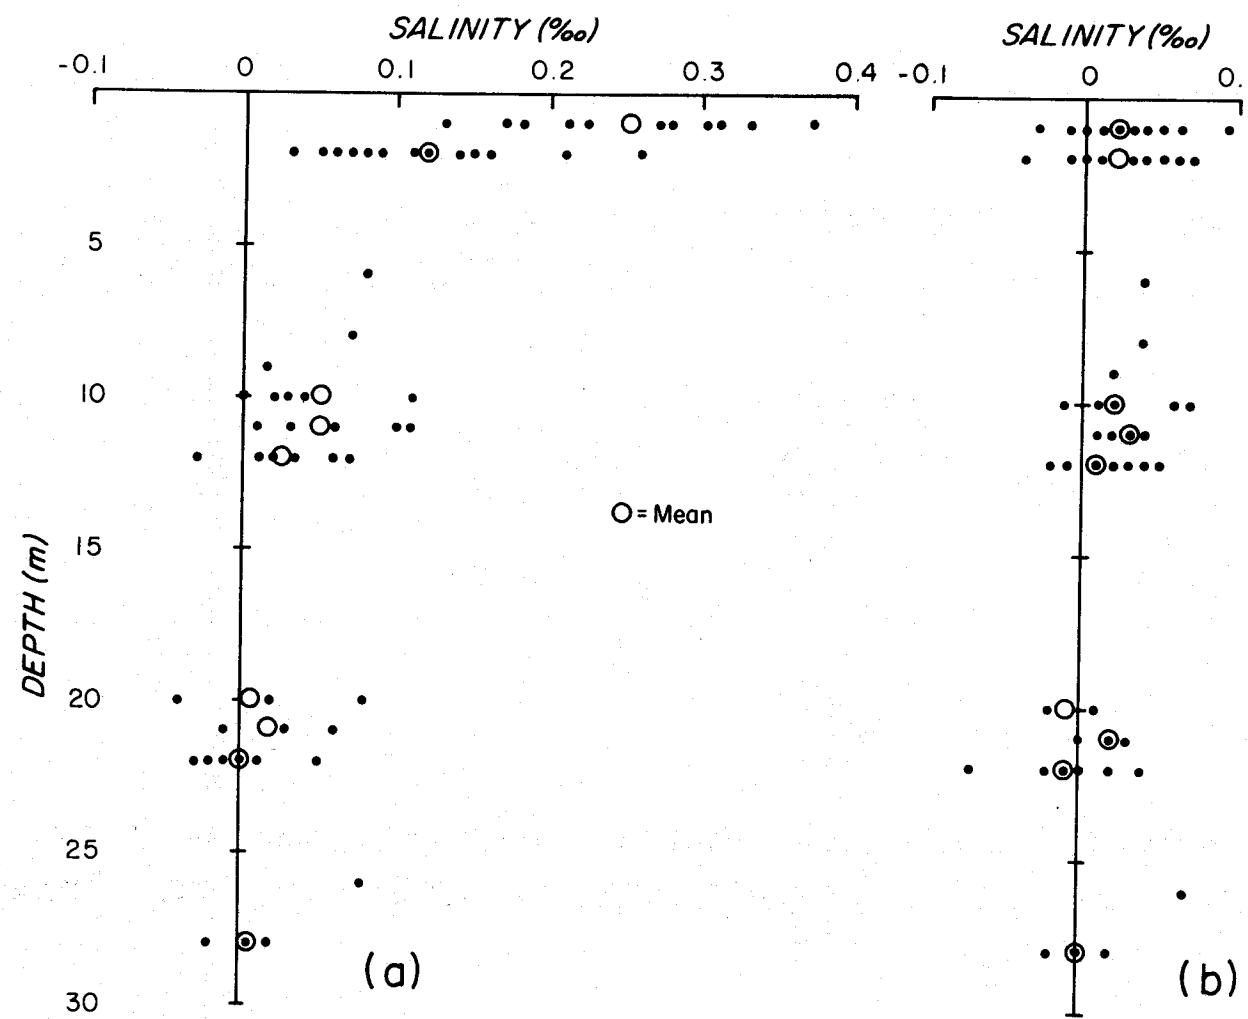

Fig. 4. For CTD 3: a) Differences between salinity samples and probe salinities measured during probe descent plotted versus depth
 b) Differences between salinity samples and probe salinities measured during recovery of probe plotted versus depth.

They are casts 12, 38, 39, 58, and 65. Conductivity calibration for Leg 2 included shallow samples and the corresponding CTD conductivities obtained during ascent of the probe.

Figures 5, 6, 7, 8 and 9 show for each set of separately calibrated data the differences between sample temperatures and CTD temperatures plotted versus (a) sample temperature and (b) station number, and the corresponding salinity differences plotted versus (c) sample salinity and (d) station number. Only salinities are shown in Figure 9 because of the insignificant number of temperature comparisons for CTD 3 Leg 2.

Sigma-t was computed from the calibrated data using Knudsen's equation as reported by Sweers (1971). Profiles of temperature and salinity were examined for anomalous values. Obviously erroneous values were deleted or, if a correct value was evident, replaced. Sigma-t was corrected when temperature or salinity values were replaced. To complete the basic data file, location and weather data for each profile were punched on cards and merged with the CTD observations. For probes CTD 1 and CTD 2 the descending profiles have been preferred because of their marginally smaller sampling interval in depth.

An undesirable degree of noisiness was evident in the salinity (therefore sigma-t) profiles, mainly associated with regions of relatively high temperature gradient. To suppress this effect, a smoothing routine for salinity was developed. For each profile, the temperature gradient at each level was calculated by fitting a quadratic function through each set of three temperature observations adjacent in depth. The temperature gradient at the center point is given by the differential of the quadratic function at that depth. The salinity profile was smoothed using a filter

Fig. 5. (d)

Fig. 9. For CTD (Leg 2): same as Fig. 5 c) and d).

based on the inverse of the temperature gradients. For every five observations, weights were calculated equal to the reciprocal of the modulus of the corresponding temperature gradients. The five weights were then normalized by dividing each by their sum. A new value of salinity was assigned to the mid-depth level as the weighted sum of salinity over the five points. This filter gives least weight to salinities associated with strong temperature gradients, thus reducing salinity spiking. Figures 10 and 11 show the effects of the routine on two profiles. It can be seen that the filter is effective in significantly reducing the noise in both salinity and sigma-t, even in very noisy profiles such as cast 64 (Figure 11).

The unsmoothed profiles are illustrated to depict the quality of the original data, but the listings of data at standard depths are from the filtered profiles to suppress the spiking errors in the numerical values.

b) STD data

Measurements of temperature and salinity were made with a self-contained Plessey Environmental Systems Model 9060 Salinity/Temperature/Depth (STD) instrument and were recorded in an analog mode on a 2-pen recorder. During the cruise, data were recorded on both the descent and ascent parts of each cast. On almost every cast, the STD was calibrated with NIO bottles and reversing thermometers. In addition, surface water samples were taken each time an STD cast was made and salinity determinations were made from these samples with an inductive Autolab salinometer. The uncertainty in these determinations is considered to be $\pm 0.003 \text{ o/oo}$ (Brown and Hamon, 1961).

Many STD users prefer to collect data on the descent part of each cast. The reasons are diverse and will not be reviewed here other than to note

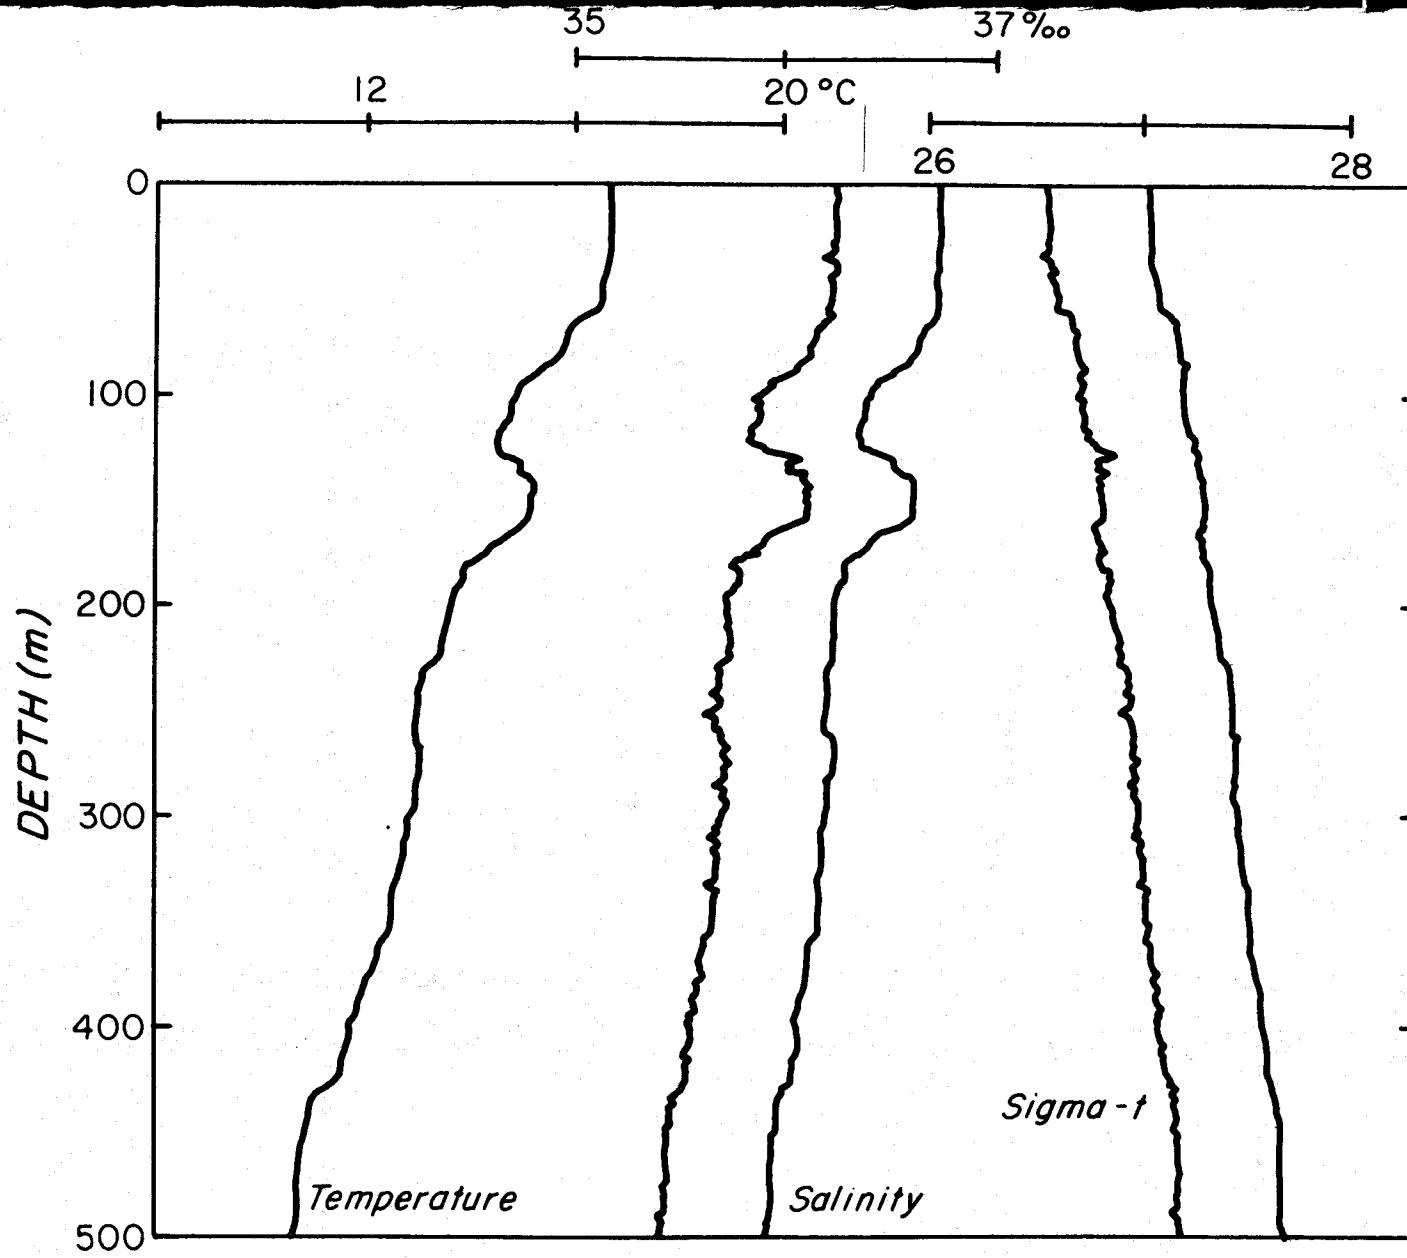

Fig. 10. Effect of smoothing salinity profile on salinity and sigma-t on CTD cast 15. Smoothed salinity and sigma-t profiles are offset to right by 0.5 ‰ and 0.5 sigma-t units.

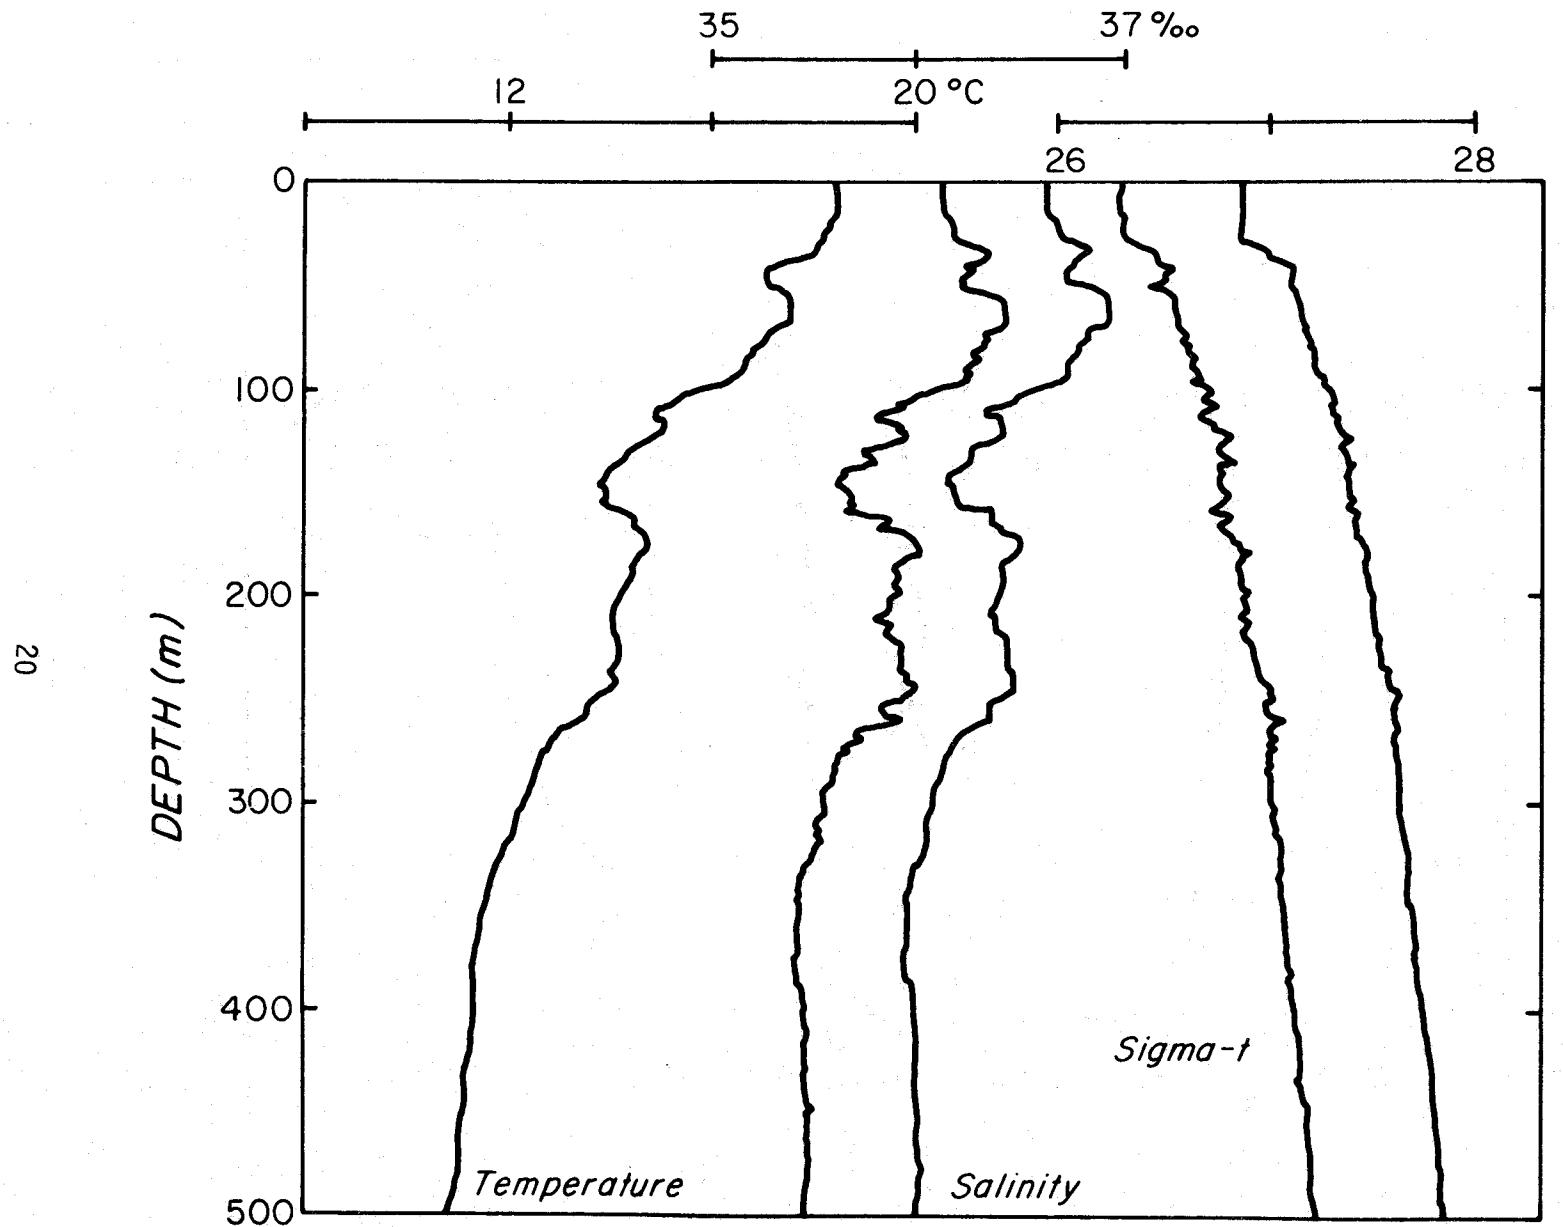

Fig. 11. Same as Fig. 10 but for CTD cast 64.

that with the larger shipboard STD systems, the sensor packages are often large and may stir up the water as they pass through the water column. The descent casts are preferred because the sensors are placed near the base of the sensor cage where mixing action is minimal. During JOINT-I, STD records were made on both descent and ascent parts of the cast.

Intercomparisons between the STD and CTD were made on two occasions and included NIO bottles and reversing thermometers. Comparisons between NIO bottle data and STD data are shown in Figures 12a and b. STD data were compared with NIO bottle data in two ways. First, STD temperature and salinity observations were compared with those from the simultaneous NIO cast; then the ΔT and ΔS from matched STD and NIO observations were compared as a function of time as shown in Figures 13a and b. Equations for lines shown in Figures 13 a and b are given below. Because both temperature and salinity were found to vary with time, ΔT and ΔS corrections were determined for both variables over the time interval of the STD measurements.

For temperature the corrections to be added were Eq.

$$\Delta T = 0.01083t + 0.0638 \quad 1$$

where t (in days) ≤ 7.5 (April 1 at noon) and

$$\Delta T = -0.00545t + 0.1858 \quad 2$$

where $t > 7.5$.

For salinity the corrections to be added were

$$\Delta S = -0.0244t + 0.0334 \quad 3$$

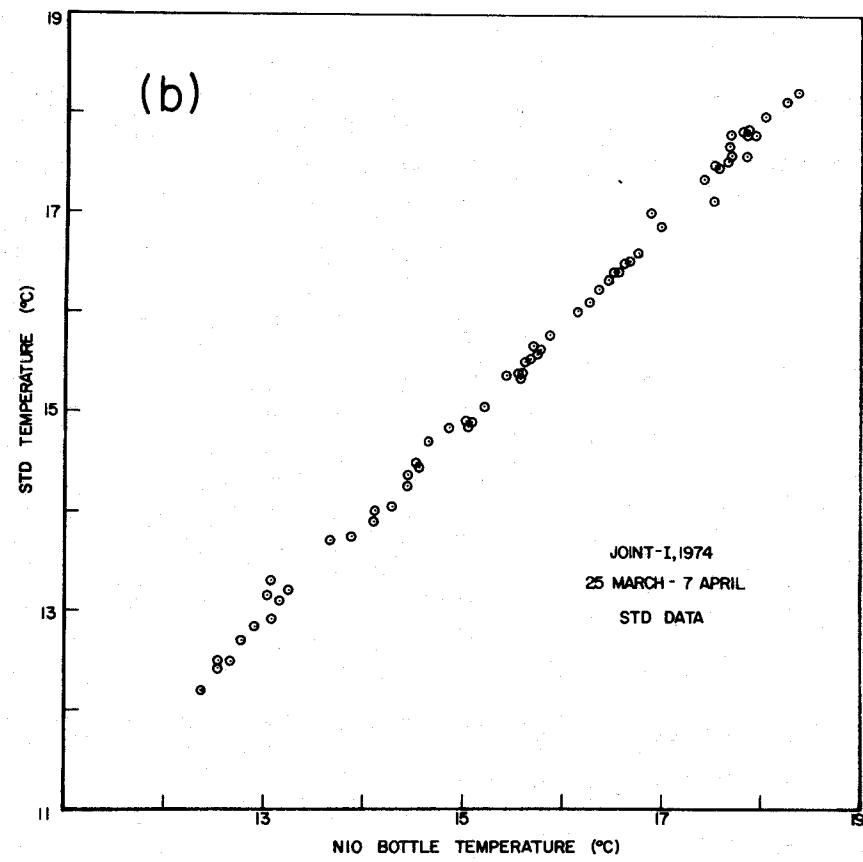

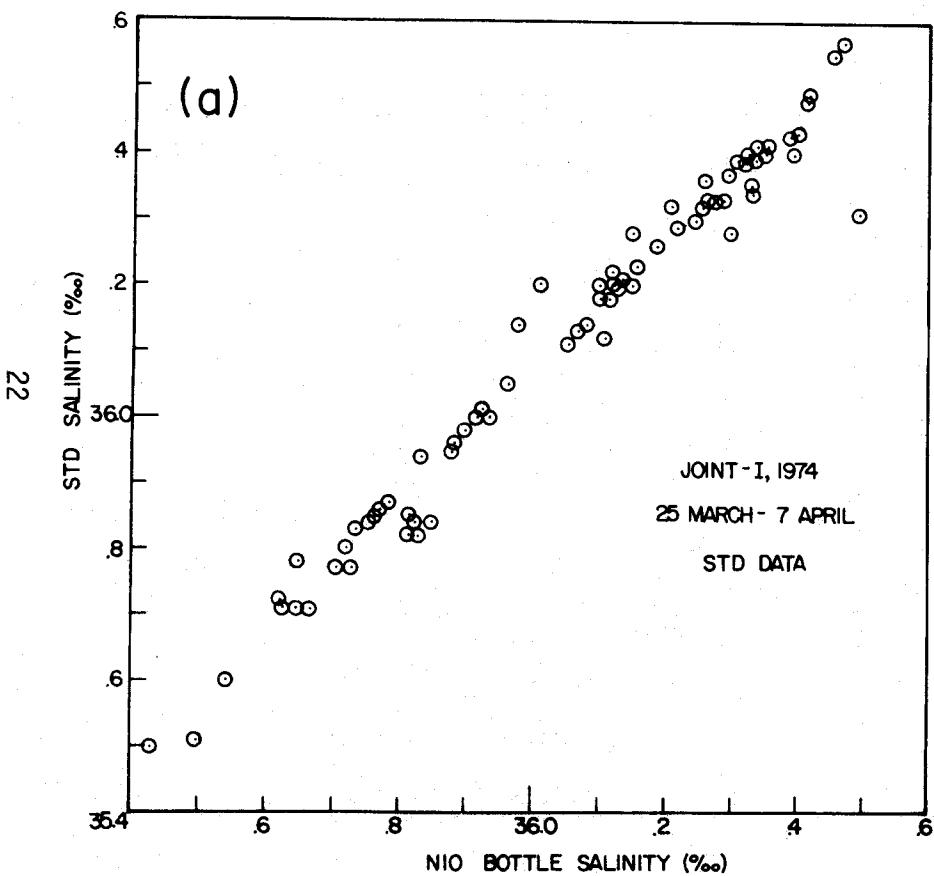

Fig. 12. a) Comparison between NIO bottle and STD probe salinity measurements b) Comparison between reversing thermometer and STD probe temperature measurements.

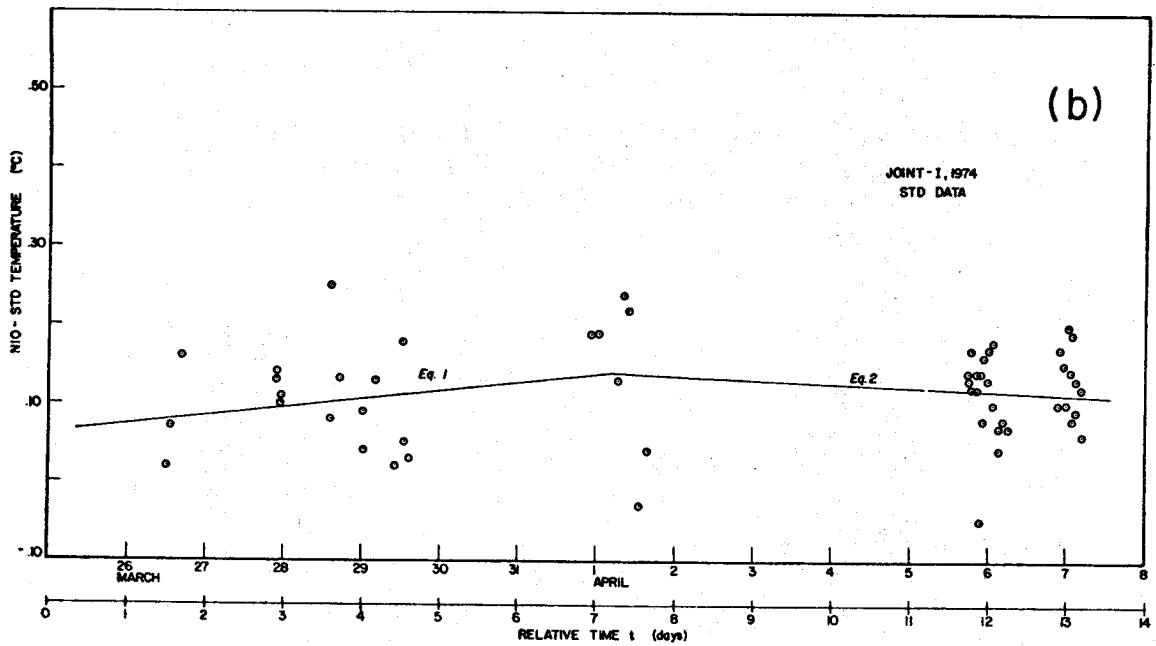

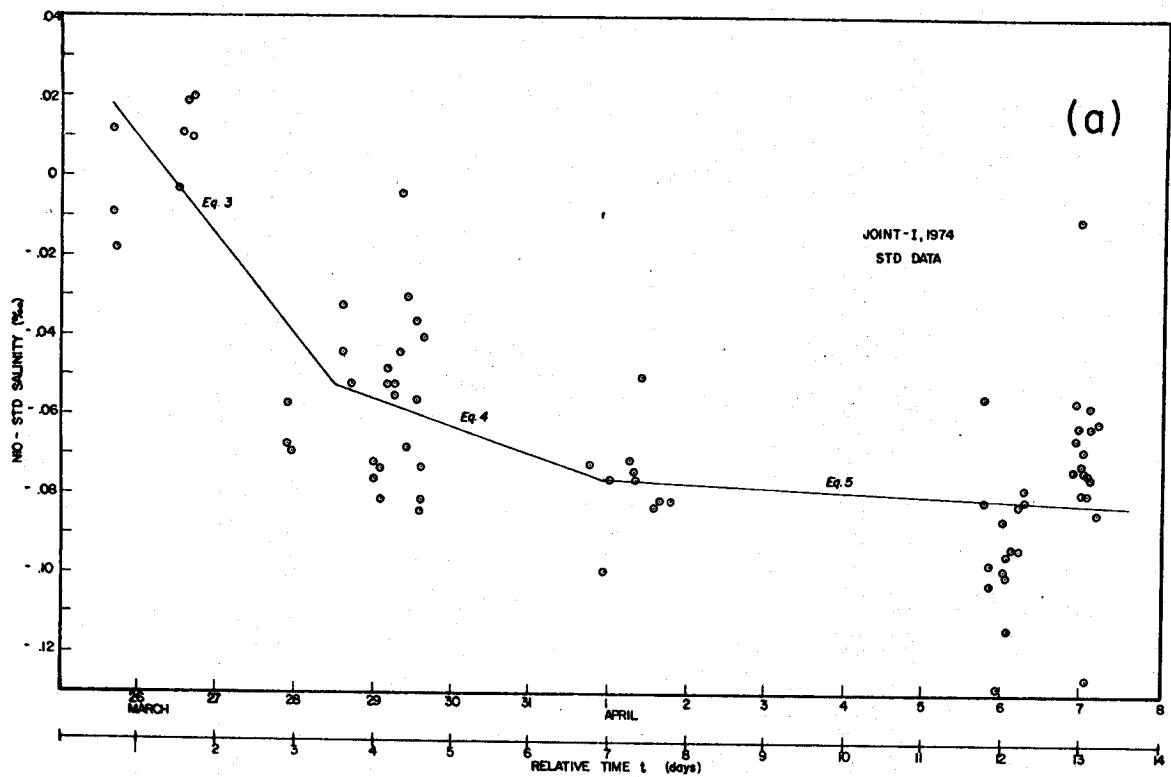

Fig. 13. a) Differences between NIO bottle and STD probe salinities plotted versus time b) Differences between reversing thermometer and STD probe temperatures plotted versus time.

where t (in days) < 3.5 (March 28 at noon)

$$\Delta S = -0.0068t - 0.028$$

4

where $3.5 \leq t \leq 7$ and

$$\Delta S = -0.001t - 0.069$$

5

where $t > 7$ (April 1).

All analog traces from the STD were manually digitized. The procedure used on the STD traces differed, depending upon whether or not the cast consisted of single or double traces, that is, whether the instrument recorded data on only the descent or on both the descent and ascent parts of the cast. If the trace was double, as was mostly the case with STD data from JOINT-I, the two traces differed and an envelope was produced due to time constant limitations in the temperature sensor and compensation circuitry. The two sides of the envelope represent the error limits for changes in temperature and salinity one might expect for a particular cast. Temperature and salinity values were read from a new trace produced by a bisection of the envelopes. While the bisection technique is somewhat subjective, the resulting profiles are reasonably free of errors caused by the compensation problem.

An adequate sampling or digitizing interval is important so that the digitized data may be used to reconstruct a clean and calibrated version of the original raw data. The basic procedure was to routinely digitize the temperature and salinity at 1-3 m depth intervals where the curves possessed maximum, minimum, inflection points. In the event that an inflection point was present in only one parameter at a certain depth, the other parameter was also digitized. These uncorrected STD data were then put onto punch cards.

prior to processing with an STD computer program. The program used has been modified from an earlier magnetic tape compatible version (Jones, 1969). The program consists of a short main program and several subroutines. The first subroutine is used to smooth each of the parameters (including depth) using a 3-point filter for the second and the next to last data points in the series. No smoothing correction is applied to the first and last data points. The remaining parts of the temperature, salinity and depth series are smoothed with a 5-point cosine filter. The smoothed series are next passed to a subroutine where temperature, salinity and depth are linearly interpolated at 1 m intervals. At this point there is a difference in the subsequent methods used to process the data. If the original data came from a double trace no thermal gradient compensation is needed and the calibration factors are added and the data printed out in a tabular format and punched onto cards. If the STD cast is a single trace (descent), the data are passed through a subroutine for temperature and salinity compensation.

STD/CTD Intercomparison

An intercomparison between the Bissett-Berman STD unit and CTD 3 was made during casts 197 and 198. The STD was hung below the CTD probe and both units were lowered to 300 m, the depth limit of the STD. In Figures 14a and b, data from the descending and ascending CTD profiles are plotted on the same axes as the STD data. The CTD and STD data have been filtered by the methods described in the previous section.

At many depth levels in both sets of profiles, differences in temperature and salinity occur between 'up' and 'down' CTD data. These are more

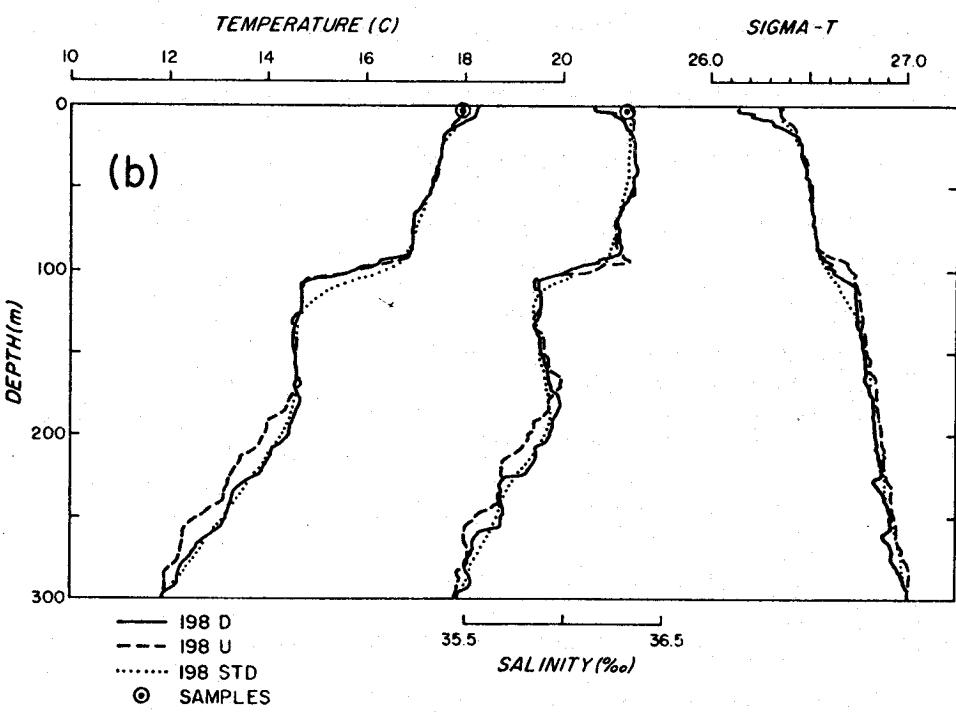

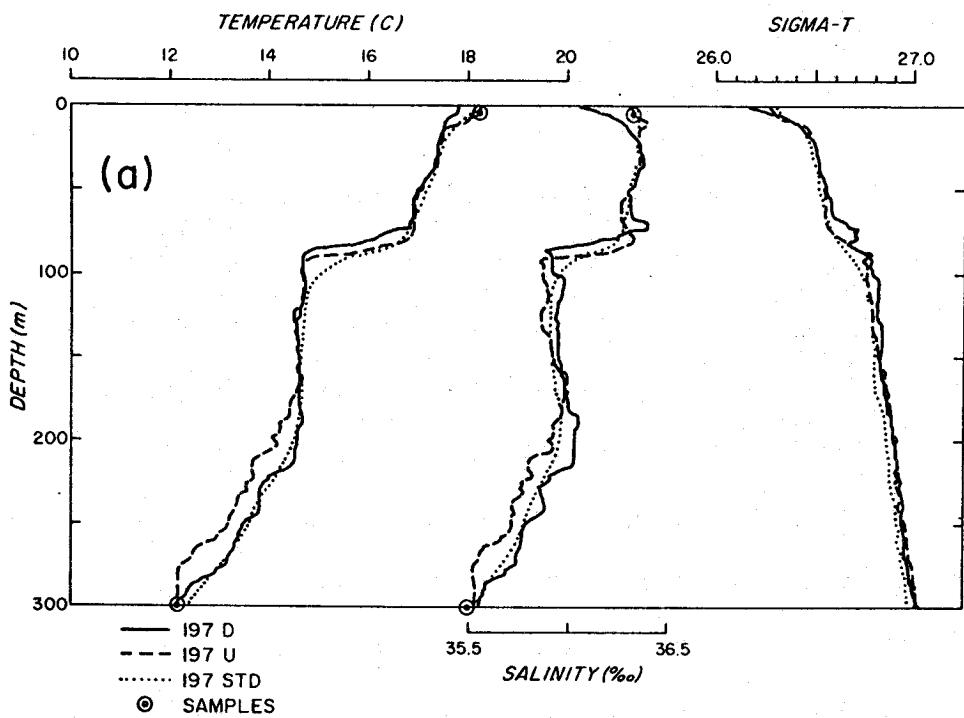

Fig. 14. Intercomparison of CTD and STD probes at:
 a) Station 197
 b) Station 198.

likely due to real changes in the hydrography than to instrumental behavior as they are not consistent in sign throughout the depth range observed. Also, in other profiles made near this location, differences similar in magnitude but opposite in sign were apparent between 'up' and 'down' traces.

Reasonable agreement is evident between CTD and STD data. However, the latter have been more heavily smoothed and consequently show less structure than the CTD profiles. Agreement in sigma-t is good for cast 198, less so for cast 197. Below 100 m, STD values are about 0.05 sigma-t units lower than CTD values. Because of the weak stratification, this could cause an uncertainty in isopycnal depth of up to 50 m.

Data presentation

Profiles of temperature, salinity and sigma-t are presented in groups corresponding to hydrographic lines, drogue stations, or anchor stations. Long series of profiles are broken into subsets. Temperature profiles are offset by 2°C, salinity profiles by 0.25 o/oo, and sigma-t profiles by 0.5 sigma-t units. Each profile is identified by station number shown to its right. The origin for the temperature, salinity, or sigma-t scale for each profile is denoted by a tick mark on the bottom of the diagram.

For each cast, observed and computed parameters are listed at a series of standard depths. The header data, which precedes each listing, giving location and weather information is coded as follows:

CAST NO	Consecutive cast number. For CTD casts, the number is followed by 'U' if the profile was obtained during ascent of the probe or 'D' if it was obtained during descent.
STATION	Station designator for positions along the L or H lines, or indicating parachute drogue stations (D).

LAT	Latitude in degrees and minutes north of the equator.
LONG	Longitude in degrees and minutes west of Greenwich.
DATE	Month/day/year
TIME	Hours and minutes, Universal time
DPTH	Bottom depth in meters
PROBE	OSU1, OSU2, OSU3 - CTD units 1, 2, 3. STD - Bissett Berman self-contained probe unit.
SWELL DIR	Direction in degrees True from which the swell propagates.
HT	Swell height in feet
PER	Swell period in seconds
BAR	Atmospheric pressure in excess of 1000 mb.
WEATHER	See WMO weather code.
WIND DIR	Direction in degrees True from which the wind blows.
SPD	Wind speed in knots.
CLOUD TYPE	The two predominant cloud types (see WMO Cloud Type code).
AMOUNT	Coded cloud amount (see WMO Cloud Amount code).
AIR TEMP	Air temperature in degrees Celsius.
WET BULB	Wet bulb temperature in degrees Celsius.

The data listing includes observed and calculated parameters at the shallowest and deepest observation levels. If there was no observation at 0 m, sea surface values are assumed to be the same as those of the shallowest observation. For each depth, the temperature (TEMP) and salinity (SAL) values are as observed or interpolated linearly from the nearest neighboring values. Sigma-t (SIGMA), specific volume anomaly $\times 10^5$ (SVA), dynamic height (DELD) in dynamic meters, and potential energy in 10^8 ergs

cm^{-2} (POTE) are given for each depth. Computer parameters are calculated from the complete data array.

Acknowledgments

The cooperation and assistance of Captain Hagen, the officers, and crew of R/V GILLISS during JOINT-I is greatly appreciated. Special thanks are due to Ms. Karie Tamura for typing this report. The observational program was supported by National Science Foundation Grant GX-33502.

	01	Clouds generally dissolving or becoming less developed	
	02	State of sky on the whole unchanged	
	03	Clouds generally forming or developing	
	04	Visibility reduced by smoke, e.g. veldt or forest fires, industrial smoke or volcanic ashes	
	05	Haze	
	06	Widespread dust in suspension in the air, not raised by wind at or near the station at the time of observation	
	07	Dust or sand raised by wind at or near the station at the time of observation, but no well developed dust whirl(s) or sand whirl(s), and no duststorm or sandstorm seen	
	08	Well developed dust whirl(s) or sand whirl(s) seen at or near the station during the preceding hour or at the time of observation, but no duststorm or sandstorm	
	09	Duststorm or sandstorm within sight at the time of observation, or at the station during the preceding hour	
Haze, dust, sand or smoke	10	Mist	
	11	Patches of shallow fog or ice fog at the station, whether on land or sea, not continuous	
	12	More or less deeper than about 2 metres on land or 10 metres at sea	
	13	Lightning visible, no thunder heard	
	14	Precipitation within sight, not reaching the ground or the surface of the sea	
	15	Precipitation within sight, reaching the ground or the surface of the sea, but distant (i.e. estimated to be more than 5 km) from the station	
	16	Precipitation within sight, reaching the ground or the surface of the sea, near to, but not at the station	
	17	Thunderstorm, but no precipitation at the time of observation	
	18	Squalls at or within sight of the station during the preceding hour	
	19	Funnel clouds or at the time of observation	
		ww = 20 - 29	Precipitation, fog, ice fog or thunderstorm at the station during the preceding hour but not at the time of observation
		20	Drizzle (not freezing) or snow grains
		21	Rain (not freezing)
		22	Snow
		23	Rain and snow or ice pellets, type (a)
		24	Freezing drizzle or freezing rain
		25	Shower(s) of rain
		26	Shower(s) of snow, or of rain and snow
		27	Shower(s) of hail, or of rain and hail
		28	Fog or ice fog
		29	Thunderstorm (with or without precipitation)
		ww = 30 - 39	Duststorm, sandstorm, drifting or blowing snow
		30	- has decreased during the preceding hour
		31	- no appreciable change during the preceding hour
		32	- has begun or has increased during the preceding hour
		33	- has decreased during the preceding hour
		34	- no appreciable change during the preceding hour
		35	- has begun or has increased during the preceding hour
		36	Slight or moderate blowing snow
		37	Heavy drifting snow
		38	Slight or moderate blowing snow
		39	Heavy blowing snow
		ww = 40 - 49	Fog or ice fog at the time of observation
		40	Fog or ice fog at a distance at the time of observation, but not at the station during the preceding hour, the fog or ice fog extending to a level above that of the observer
		41	Fog or ice fog in patches
		42	Fog or ice fog, sky visible
		43	Fog or ice fog, sky invisible
		44	Fog or ice fog, sky visible
		45	Fog or ice fog, sky invisible
		46	Fog or ice fog, sky visible
		47	Fog or ice fog, sky invisible
		48	Fog, depositing rime, sky visible
		49	Fog, depositing rime, sky invisible

NO PRECIPITATION ON STATION AT TIME OF OBSERVATION

PRECIPITATION ON STATION AT TIME OF OBSERVATION

ww = 50 - 59 Drizzle

- | | | |
|----|--|--|
| 50 | Drizzle, not freezing, intermittent | } slight at time of observation |
